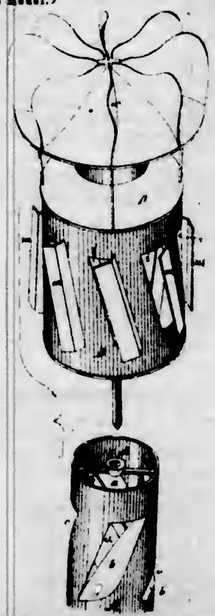
2. The non-conducting or insulated plug F, in combination with the horn, the holder E, and the plunger, substantially as and for the purposes hereinbefore set forth.

3. The holder E, surmounted by a non-conducting overflow, *e*, in combination with the plunger, the non-conducting or insulated plug F, and the horn, substantially as hereinbefore set forth.

4. The combination of the movable upper-carbon holder, the case or box B, provided with insulated bearings at the point or points where the holder has contact with said case, and the lower-carbon holder, insulated also from said case, substantially as and for the purposes set forth.

5. In an arc lamp, the combination, with the carbon-holders and other parts embraced in the lamp-circuit, of the horn and the frame, insulated from said parts, substantially as and for the purposes set forth.



258,467. SHOW-CASE FOR SHOT. CHARLES PALMER, Springfield, Tenn. Filed Jan. 23, 1882. (Model.)

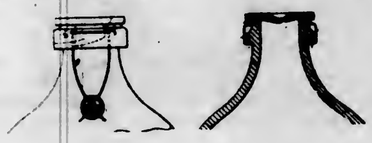
Claim.—1. The combination, with the show-case A, subdivided into compartments B, of the gates L, each provided with an opening, N, and a lug, M, the standard F, provided with a recess, O, and the spring P, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the bottom of case A, of the gate L, having one end pivoted to said bottom, a lug, M, projecting against a spring, P, and an end or corner projecting beyond the case, whereby a simple pressure of the salesman's person will open a gate for the outlet of the article which is wanted, as described.

258,468. CHIMNEY-CAP. WILLIAM H. PAYNE, Camden, N. J., assignor of one-half to Alvin Wilke, same place. Filed Feb 28, 1882. (No model.)

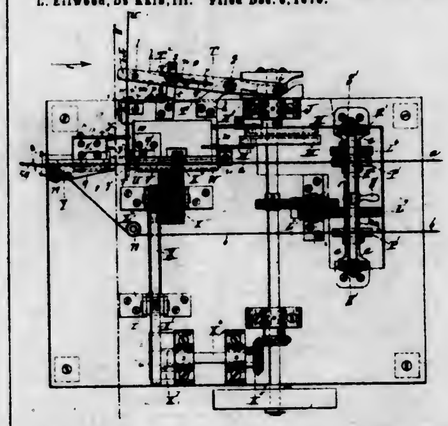
Claim.—1. The combination, in a chimney cap of the central fixed casing, A, having inclined openings *a* and internal vanes, *b*, with the rotating drum D, inclosing said casing, and having inclined internal vanes, *n*, all substantially as set forth.

2. The combination, in a chimney-cap, of the fixed central casing, A, having inclined openings *a* and internal vanes, *b*, with the rotating drum D, inclosing said casing, and having inclined openings *i*, and inclined internal vanes, *n*, as set forth.



3. The combination, in a chimney-cap, of the fixed central casing, A, having inclined openings *a* and internal vanes, *b*, with the rotating drum D, inclosing said casing, and having inclined openings *i*, inclined internal vanes, *n*, and exterior vanes, *m*, as specified.

258,469. WAGON-JACK. JOHN V. PHILLIPS, New Buffalo, Mich. Filed Nov. 16, 1881. (No model.)



Claim.—The iron plate Fig. 1, with hook-shaped notches on the outer surface, with the lateral projections on the upper end, dowel-pin *c*, and a tenon or tongue and shoulder, as shown at *d*, substantially and for the purpose as set forth.

258,470. BOTTLE-STOPPER. FERDINAND PRAUNEGGER, Gratz, Austria. Filed Oct. 18, 1881. (No model.) Patented in Austria-Hungary Aug. 6, 1880.

Claim.—The cap having inwardly-projecting lips and holes on opposite sides of and above one of such lips, and the vessel having locking-shoulders with upright ends, in combination with a sealing-cord passing through the holes and flanking one of the shoulders at its opposite ends, and a seal attached to the vessel and securing the cord, substantially as and for the purpose described.

258,471. MACHINE FOR MANUFACTURING BARBED FENCE-WIRE. HENRY W. PUTNAM, LEVI BRADBURY, and LEWIS WILLIAMS, Bonalagton, Vt.: said Bradbury and Williams assignors to said Putnam; said Putnam assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Dec. 6, 1879.

Claim.—1. The combination, with shaft Q' and lifting-shaft S', of hand-lever S, hinged linked pieces S' S', top plate, *e*, springs *e e*, adjusting-screws *f f*, and plates *d d*, substantially as and for the purposes set forth.

2. The combination, with wrapping-spindle U and sliding block T', of bearing-piece V, sliding bearing W and its retaining-spring 20, cam N, and link-piece N', substantially as and for the purposes set forth.

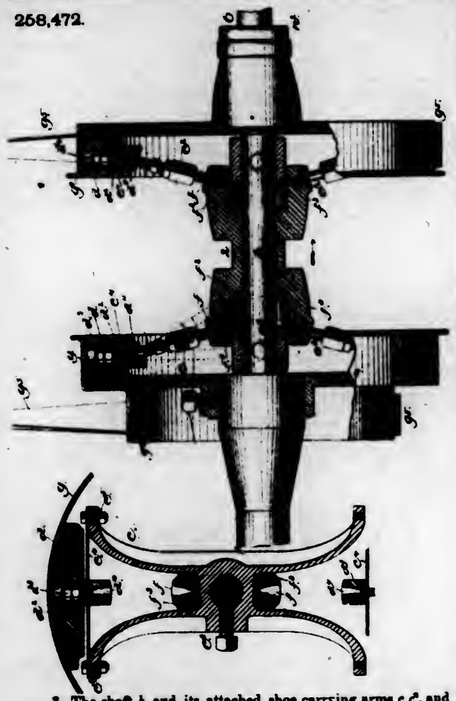
3. The combination, with sliding block T' and wrapping-spindle U, provided with bearings V and W, of sliding block Z, cam N, and link-piece M', substantially as and for the purposes set forth.

4. The combination, with the notched winding-pin *s'*, wrapping-spindle U, provided with gear X' and the yielding bearing W, of operating-gears X' and X', and rack-bar X, provided with slot 7, substantially as and for the purposes set forth.

5. The combination, with feed-arm T, of gripping-lever *k*, spring *n*, pin *m*, and adjusting-screw *p*, substantially as and for the purposes set forth.

6. The combination, with feed-lever T and gripping-lever *k*, of spring *g* and wedge-piece *o*, substantially as and for the purposes set forth.

7. The combination, with guide-arm *y*, of hinged guide-arm support 13, adjusting-screw 17, and angular holding-plate 16, substantially as and for the purposes set forth.



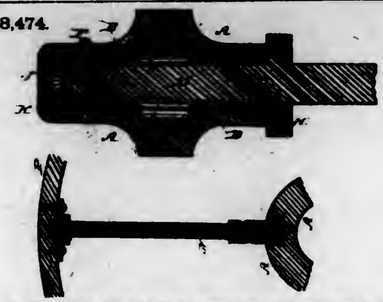
8. The combination, with wrapping-spindle U, of feed-guide arm *y* and guide-piece 8, substantially as and for the purposes set forth.

258,472. CLUTCH MECHANISM FOR COUNTER-SHAFTING. BENJAMIN F. RADFORD, Hyde Park, Mass. Filed Feb. 23, 1882. (No model.)

Claim.—1. The counter-shaft *b*, adapted to be rotated continuously in one direction, clutches carried and moved in unison with it, and two pulleys loose on the said counter-shaft, combined with a reversing-belt extended about both of the said loose pulleys, and supported on suitable pulleys, whereby when one of the said loose pulleys is being driven in unison with the said counter-shaft the other pulley will at the same time be driven in opposite directions, substantially as and for the purpose described.

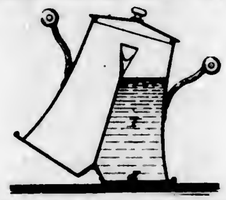
2. The shaft *b*, its attached arms *c c'*, the quill loose on the said shaft, and the struts supported by the said quill, combined with the plates, and shoes, and two loose pulleys, either of which may be driven at will with and in the direction of rotation of the shaft *b*, for the purpose described.

258,472.



3. The shaft *b*, and its attached shoe carrying arms *c c'*, and struts, combined with the quill loose on the said shaft, and having prongs engaged at all times with the said arms to insure the rotation of the quill with the shaft *b*, substantially as described.

4. The shaft *b*, adapted to be moved continuously in one direction, two loose pulleys thereon, one of which carries a pulley, *m*, and has a belt-receiving portion, *g'*, of smaller diameter than the belt-receiving portion of the other loose pulley, combined with a reversing-belt, and means, substantially as described, to connect either of the said two loose pulleys with and move it in unison with the said shaft, and reverse the movement of the other loose pulley, as and for the purpose set forth.

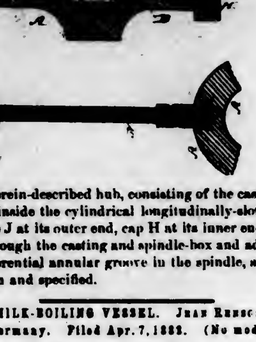


5. The adjustable struts, the arms *c c'*, yielding plates, shoes, and socketed pieces *d'*, combined with the quill having sockets *f*, to receive one end of each strut, substantially as and for the purpose described.

258,474.

2. The herein-described hub, consisting of the casting A, having arranged inside the cylindrical longitudinally-slotted spindle-box B and cap J at its outer end, cap H at its inner end, and screw F, passing through the casting and spindle-box and adapted to enter a circumferential annular groove in the spindle, as and for the purpose shown and specified.

258,475. MILK-BOILING VESSEL. JUAN RUESCH, Duisburg, Prussia, Germany. Filed Apr. 7, 1882. (No model.)



Claim.—A milk-boiler composed of a vessel having a central partition extending from the bottom to some distance from the top, and a bottom provided with a narrow center portion, and with upwardly-inclined portions at both sides of the center portion, substantially as specified.

258,476. GROCER'S SCOOP. CHARLES H. ROBERTS, Montour, Iowa, assignor of one-half to O. H. Mills. Filed Feb. 17, 1882. (No model.)

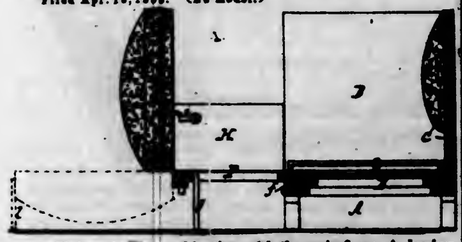
Claim.—The scoop A, in combination with the pivoted handle B, the flat bar C, the link *b*, and the scale-beam D, provided with a counterpoise, E, constructed to operate substantially as and for the purpose set forth.

258,477. MACHINE FOR BEATING UP NAPPED HATS. JAS. R. RUSSELL, Boston, Mass. Filed Mar. 22, 1882. (No model.)

Claim.—1. The combination, substantially as shown and described, of a hot-water supply, a plank supported on rollers, means to reciprocate said plank longitudinally, beating-up sticks overlying such plank, and means to vibrate said sticks.

2. The combination, substantially as shown and described, of a hot-water supply, a plank, means to reciprocate such plank longitudinally, beater-up sticks arranged upon a rod and provided with heads, and a shaft having a number of tappets equal in number to the number of the sticks to act upon such heads to vibrate the sticks.

3. The combination, substantially as shown and described, of a tank to hold hot water, a plank above the same, suitably supported beater-up sticks overlying such plank, a shaft provided with tappets to vibrate said sticks, a crank-shaft to reciprocate said plank, and a pump to supply hot water from the tank to the plank.



4. The combination, substantially as shown and described, of the beater-up sticks loosely pivoted upon a rod, with a rail upon which they may be rested in order to gain access to the plank.

5. The fenders arranged longitudinally of, between, and alongside the beater-up sticks, substantially as shown and described, to enable the workman to obtain access to all portions of the plank while protected from the splash.

6. The plank supported upon a fixed bed and adapted to receive a longitudinal reciprocating motion therefrom, substantially as shown and described.

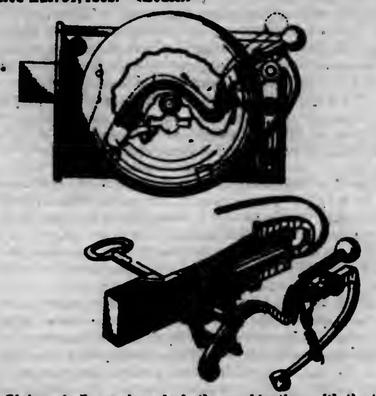
7. The beater-up sticks loosely pivoted upon a rod and operated by tappets acting upon them in the rear of their pivots, combined with means to aid their fall, substantially as and for the purpose described.

258,478. HOPA-HEDSTEAD. HARRY SAMUELS, New York, N. Y. Filed Apr. 18, 1882. (No model.)

Claim.—1. The combination, with the main frame A, having the attached head-piece B, back C, and stationary bottom frame, D, of the frame F, arranged to slide horizontally over the stationary bottom frame, and the seat G, hinged to the outer edge of the sliding frame, and means for retaining the hinged seat in a vertical or a horizontal position, substantially as described.

2. The combination of the main frame, having grooves *h*, attached head-piece B, back C, and bottom frame, D, the horizontal sliding frame F, having end pins engaging the said grooves, the seat G, hinged to the sliding frame and provided with pivoted legs *g*, to support the seat in an extended horizontal position, and the head-board H, provided with means for retaining the seat in a vertical position, substantially as described.

258,479. WITHDRAWN.

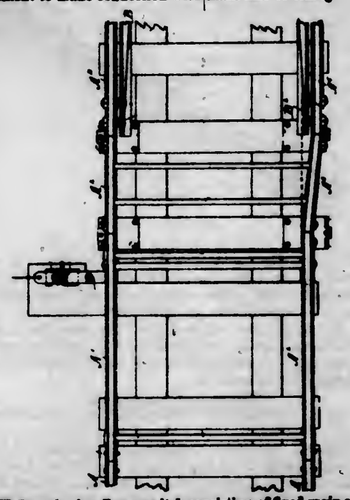


258,480. COLLAR OR CUFF OF CELLULOID OR OTHER PYROXYLINE MATERIAL. ALBERT A. SANBORN, Newark, N. J., assignor, by direct and mesne assignments, to the Celluloid Manufacturing Company, New York, N. Y. Filed Sept. 18, 1881. (Model.)

Claim.—1. The process of manufacturing collars and cuffs of celluloid or other pyroxyline material, consisting in making up the body and tab separately, and then uniting them with cement, &c., substantially as and for the purpose specified.

2. The collars and cuffs of celluloid or other pyroxyline material, constructed substantially as specified, and for the purpose set forth.

258,481. ALARM-LOCK. REINHARD SCHADE, New York, N. Y. Filed Mar. 31, 1882. (Model.)



Claim.—1. In an alarm-lock, the combination, with the tumbler of the lock and an alarm mechanism having a vibratory hammer-arm arranged to strike a gong, of a swinging tripping-lever operated solely by the movement of the tumbler and acted directly on the hammer-arm which sounds the gong.

2. In an alarm-lock, the combination of the tumbler provided with a laterally-projecting pin, a tripping-lever normally resting on said pin, a hammer-arm operated by the end of the tripping-lever when the latter is raised by the pin on the tumbler, and a gong which is sounded by the hammer-arm.

3. The combination, with a lock-case inclosing a sliding bolt and a vertically-movable tumbler, of a pin on said tumbler projecting laterally through the lock-case, and an alarm mechanism having its hammer operated by the vertical movement of the pin on the tumbler through the medium of a hammer-tripping lever.

258,482. RAILWAY-SWITCH. FRANZ S. SCHEFFLER, Richmond, Quebec, Canada. Filed Feb. 3, 1882. (No model.)

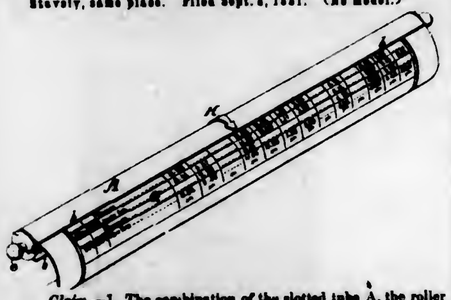
Brief.—The switch-rails are constructed each of two rail-sections having their outer ends pivoted to fixed portions of the track, and so jointed at their inner ends that they are capable of a lateral movement to make connection with main line or siding.

Claim.—1. A railway-switch consisting of fixed main and siding rails, one of each being pointed and all having their ends on substantially the same line, in combination with switch-rails fixed at one end so as to connect with the main rails and free at the other, the free ends being connected to one of the sliding and one of the main rails by interposed movable pieces.

2. In a railway-switch, the combination of the main-line rails A A, the siding-rail A', and the main-line rail A², (the said rails A being permanently connected to said rails A' A² by spring-rails A' A' and short movable rails A² A²,) and the pointed main and siding rails B B', the parts being so constructed and arranged that the movement of the spring-rails A' A' and short rails A² A² operates the switch without breaking the connecting-joints.

3. In a railway-switch, the combination of main-line rail A' A, arranged to move laterally, adjustable rails A² A², forming continuous junctions therewith and with rigid rails A¹ A¹ and pointed rails B B', all substantially as described.

258,483. PROCESS OF OBTAINING SUGAR FROM MOLASSES AND SIRUPS. CARL SCHEIBLER, Berlin, Germany. Filed Feb. 23, 1882. (No specimens.) Patented in Germany July 24, 1880, No. 15,385; in France Oct. 22, 1880, No. 139,256; in Belgium Oct. 22, 1880, No. 52,341; in Austria-Hungary Dec. 11, 1880, Nos. 34,683 and 35,324, and in England Jan. 25, 1881, No. 331.

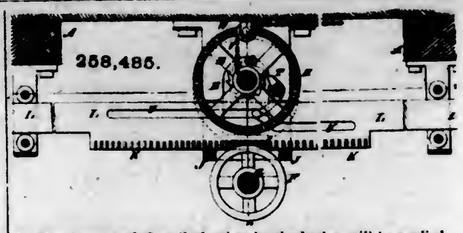


Claim.—1. The method herein described for obtaining strontium saccharates, which consists in treating saccharine solutions with caustic strontium or hydroxide of strontium, and separating the strontium saccharate by boiling, substantially as described.

2. The method herein described for obtaining sugar from saccharine solutions, which consists in treating the solution with a caustic strontium or hydroxide of strontium in excess, separating the strontium saccharate from the non-sugary lye, and finally separating the sugar from the strontium by means of carbonic acid, substantially as described.

3. In the treatment of saccharine solutions by means of caustic strontium or hydroxide of strontium in excess, the method herein described for removing in part the strontium, which consists in treating the over basic saccharate with water at low temperature to crystallize a portion of the strontium, substantially as and for the purpose specified.

4. The method herein described of obtaining sugar from saccharine solutions, which consists in treating such solutions with caustic strontium or hydroxide of strontium in excess, to obtain a strontium saccharate, then eliminating a part of the strontium from the over basic saccharate by treating with water at low temperatures, and finally removing the strontium from the basic saccharate by means of carbonic acid, substantially as herein described, and for the purpose specified.



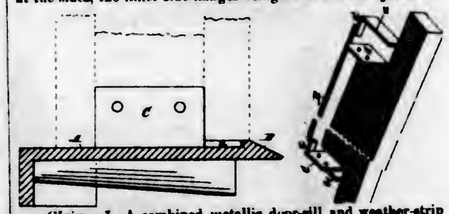
258,484. RAILWAY TIME-INDICATOR. JOHN S. SCHNIBELL, Philadelphia, Pa., assignor of three-fourths to J. Thomas Stavely, same place. Filed Sept. 8, 1881. (No model.)

Claim.—1. The combination of the slotted tube A, the roller D, journaled in bearings in the end of the tube, and a time-table attached to the roller, with a pointer constructed for longitudinal adjustment on the said tube, all substantially as set forth.

2. The combination of the slotted tube, containing a roller journaled in bearings on the tube, and having ribs *b b*, one on each edge of the slot, and with the adjustable duplex pointer H on the tube, substantially as set forth.

258,485. CAR-BRAKE. WILLIAM C. SCHULTEN, Marengo, Iowa. Filed Mar. 31, 1882. (No model.)

Claim.—1. A car-brake constructed substantially as herein shown and described, and consisting of the friction-wheels E F, the gear-wheels H I, the slide-bars L, having rack-bars K and grooves Q U, the sliding bearing-blocks C, and ratchet-wheels and pawls S T, as set forth.



2. In a car-brake, the combination, with the axle G, the car A, and the brake-chain V, of the sliding bearing-blocks C, the friction-wheels E F, the gear-wheels H I, and the slide-bars L provided with rack-bars K, and having grooves Q, substantially as herein shown and described, whereby the brakes will be applied by the advance of the cars, as set forth.

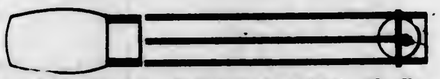
3. In a car-brake, the combination, with the shaft D, carrying the friction-wheel E and brake-chain V, and the slide-bars L, having grooves U, of the ratchet-wheels S, and the pawls T, substantially as herein shown and described, whereby the said shaft and brake-chain are held in place when the friction-wheels are thrown out of contact, as set forth.

4. In a car-brake, the combination, with the slide-bars L and the car A, of the chain *d*, the guide-pulleys *h*, the spring *e*, the piston *f*, and the cylinder *g*, substantially as herein shown and described, whereby the said slide-bars are drawn back to a central position when released, as set forth.

258,486. COMBINED WEATHER-STRIP AND DOOR-SILL. JOSEPH SIMONS, Wayne, Ind. Filed Dec. 13, 1881. (No model.)

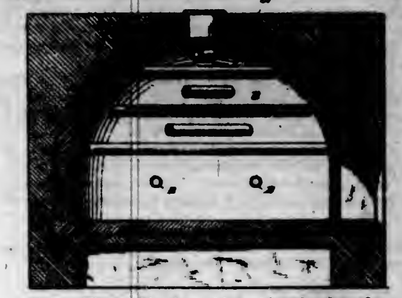
Brief.—A metallic door-sill formed in a single piece and with front and side flanges inclosing a gutter in front and the door-jambs at the sides, the inner side flanges being secured to the jambs.

Claim.—1. A combined metallic door-sill and weather-strip for wooden buildings cast in a single piece and constructed, as specified, with the raised portions B *a' a*, whereby rain is prevented from entering the house or reaching any wooden portion below said sill, substantially as specified.



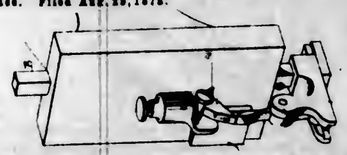
2. A combined metallic door-sill and weather-strip having the foot portion A, the weather strip or ridge B, the projecting portions C, to which the wooden frame is attached, and the flanges *a a'*, against which the back sides of the frame parts rest, all cast in a single piece, substantially as shown and described, and for the purposes specified.

258,487. SUSPENDER-END. JOSEPH WILLIAM SMITH, Boston, Mass. Filed Nov. 21, 1881. (No model.)



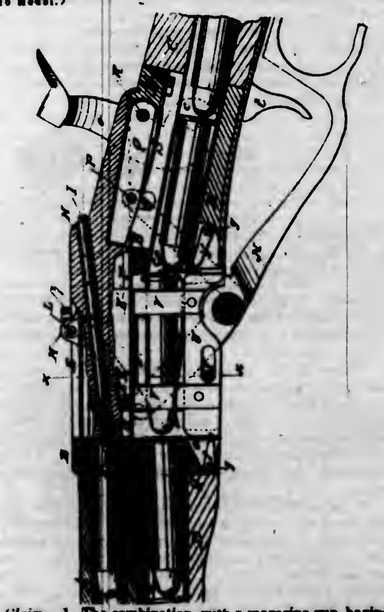
Claim.—The improved suspender-end above described, consisting of the button-strap A, circular in cross-section at and near its middle, the flexible strip B, looped around it, as shown, and with its ends laid together and secured by the metal clasp D, all as set forth.

258,488. GRAIN-SAMPLER. LEWIS C. SMITH, Berlin, Wis. Filed Apr. 5, 1882. (No model.)



Claim.—A grain-sampling tube having an interior valve diametrically pivoted at or near one end thereof, a handle having a short stem portion or guide in the other end thereof, a shoulder or stop on the handle, and an interior rod connecting the handle to the valve eccentrically, substantially as specified.

258,489. COKE-OVEN. WILLIAM B. SMITH, Anniston, Ala. Filed Nov. 3, 1881. (No model.)



Claim.—The combination, with a coking-chamber, of a series of perforated horizontal tubes, B, traversing said chamber at different elevations or planes, and crossing each other, for conveying water for vaporizing purposes through the mass of burning coal contained in said chamber, as and for the purpose set forth.

258,490. SEWING-MACHINE ATTACHMENT. JAMES F. SPENCER, Philadelphia, Pa., assignor to John C. Love, same place. Filed Aug. 29, 1878.

Claim.—A sewing-machine attachment in which a pivoted spring-lever, *c*, having three arms, as described, is combined with a needle-carrying slide and an arm or lever for acting on and being acted on by the said lever *c*, as set forth.

258,491. MAGAZINE FIRE-ARM. GEORGE N. SPENCER, New York, N. Y., assignor of one-half to Dion C. Goldsborough and Obadiah Osborn, Walla Walla, Wash. Filed Dec. 28, 1881. (No model.)

Claim.—1. The combination, with a magazine-gun having a magazine arranged to feed in the usual manner, placed under the barrel, and a similar magazine in the stock, of an open-ended carrier arranged, as described, in line with both magazines, and mechanism, substantially as described, for shutting off one magazine while permitting the other to feed to the carrier, as set forth.

2. The combination, with the lever N, of the bars O, pivoted on pin I', connected to the locking-block by a pin at each side thereof, the recessed breech-frame B, having concaved shoulder, the hinged locking-block Q, having convexed rear end bearing on said shoulder, and the spring S, bearing on the locking-block, as shown and described.

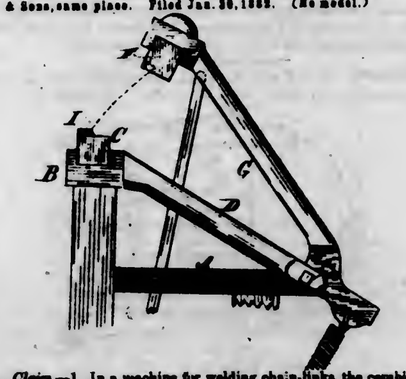
3. In a magazine-gun, the combination, with the carrier U and the magazines *c d*, of the gates *e*, the levers *f g h*, and the connecting-bar *i*, substantially as herein shown and described, whereby the inner ends of the magazines, either or both, can be opened and closed, as set forth.

4. In a gun, the combination, with the carrier U, the forked lever N, and the connecting-bars K, of the three-armed lever Z and the triangular lever *a*, substantially as herein shown and described, whereby the said carrier will be raised and lowered by the movements of the said forked lever, as set forth.

5. The combination, with the sliding breech-block E, the levers N K, the carrier U, and the grooved breech-frame B, of the angular spring *b*, having the end of its lower arm pivoted to and its upper arm sliding in a groove of said frame, and provided with a projection, *b'*, as shown and described.

6. The combination, with the carrier U and three-armed lever Z, of a spring, *b*, having a beveled angle or bend arranged to rest against the end of said lever, whereby the said carrier can be forced down, as and for the purpose specified.

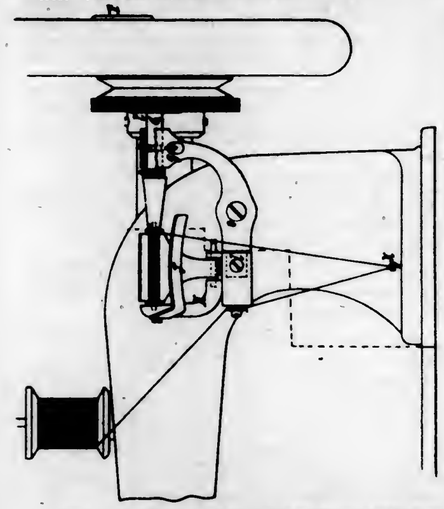
7. The combination, with the removable magazine-tube *c*, having plug *k* and lugs *l l*, of the recessed stock C, the lever *m*, pivoted to and between said lugs, and the slotted plate *n*, as and for the purpose specified.



8. The combination, with the trigger *i*, the lever N, and the plate *o*, of the bent lever *u*, pivoted at the angle to said plate, having a shoulder upon its upper arm and having its lower arm made heavier than its upper one, as and for the purpose described.

258,492. DUST-CAP FOR AXLES. THOMAS W. SQUIRES, Beacon Falls, N. Y. Filed Jan. 18, 1882. (Model.)

Claim.—The improved dust-cap for journal-boxes or axle-boxes, consisting of the metal nut or cap B', provided with the flange D and with lugs C, and the rubber or other envelope, A', embracing closely the exterior of said nut, and having the projection E at the base of same, all constructed and combined substantially as described and shown, for the purpose set forth.

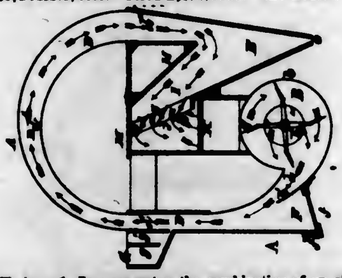


258,493. DEVICE FOR WELDING LINKS. PHILANDER H. STANDISH, Cincinnati, Ohio, assignor of one-half to P. Wilson & Sons, same place. Filed Jan. 30, 1882. (No model.)

Claim.—1. In a machine for welding chain-links, the combination, substantially as hereinbefore described, of a stationary anvil, B, provided with an attached die, C, having the projection I, with the hammer-arm G, pivoted below the plane of the anvil, as described, and provided with the die F, having the recess K, as and for the purpose set forth.

2. In a machine for welding chain-links, the combination, substantially as hereinbefore described, of a base, A, a stationary anvil, B, carrying the die C, the inclined brace D, connected with the anvil and base, the hammer-arm G, pivoted below the plane of the anvil, and provided with a hammer-head carrying the die F, essentially as and for the purpose set forth.

258,494. BOBBIN-WINDER. ROBERT STRIEGL, Gratz, Austria. Filed Oct. 12, 1881. (No model.)



Claim.—1. The combination, substantially as herein before set forth, with the machine-shaft, of the fixed fly-wheel on such shaft, having an elongated hub, the loose pulley and its driving cog-wheel, arranged on such elongated hub, the collar fixed to the hub next to the loose pulley, the set-screw arranged in the fly-wheel to engage the pulley, and the bobbin-winding mechanism adapted to gear with the driving cog-wheel.

2. The combination, substantially as hereinbefore set forth, with the pulley and its driving cog-wheel, of the transversely-grooved bobbin-holding spindle capable of longitudinal movement, the fixed pinion of the spindle, adapted to gear with the driving cog-wheel, the spring bating on the sliding spindle with a tendency to throw its pinion out of gear with the driving cog-wheel, and the catch-pin arranged in the spindle-bearing for engaging the groove of the spindle, and thereby retaining the pinion in gear with the driving cog-wheel.

3. The combination, substantially as hereinbefore set forth, of the bobbin-holding spindle having the inner portion thereof tapered for the reception of a grindstone or other similar device, the fixed spindle-bearing, and the swiveled bobbin-holding arm.

258,495. GRAIN AND MINERAL SEPARATOR. JAY STRESSBERG, Boulder, Colo. Filed Apr. 3, 1881. (No model.)

Claim.—1. In a separator, the combination of an air-shaft simulating a horseshoe, a chamber connecting the ends thereof, a fan located in said chamber, and a feed-hopper placed on one arm of said shaft and arranged to deliver the material in the flue of the blast, the ends of the shaft forming hoppers for the reception of the separated material, as set forth.

2. In a separator, the combination of a fan located in a chamber at the bottom of the machine, an air-shaft, D, leading from and to the chamber, and having upwardly-inclined portions d I, vertical portions d' d''', arched portion d'', and hopper portions E F, and a feed-hopper, G, located on one side of the vertical portion d', as set forth.

3. The combination of fan C, chamber B, formed with inlet-openings b^2, shaft D, receptacles E F, provided with outlets e f, projection H, channel I, forming part of air-passage, opening J, deflector K, and air-chambers A^2, as set forth.

4. The combination of fan C, chamber B, provided with inlet-openings b^2, shaft D, receptacles F and E, provided with outlets f and e, projection H, channel I, forming part of air-passage, opening J, having valves f' f' f', deflector K, and air-chambers A^2, as set forth.

258,496. WIND-ENGINE. HARRY R. STEVENS, Los Angeles, Cal. Filed Jan. 30, 1882. (No model.)

Claim.—1. In a windmill, the combination, with the revolving upright B, having horizontal bracket L, of the bar M, hinged to said bracket, and having horizontal vane N, and mechanism for operating the same, substantially as set forth.

2. The combination of the revolving upright B, having bracket L, the bar M, hinged to the latter, and having horizontal vane N, the bracket O, hinged horizontally to upright B and having adjustable vertical vane P, and the pivoted connecting-rods S, all arranged and operating substantially as set forth.

3. In a wind-engine, the hinged bracket O, having slot R and vane P, adjustable by means of a set-screw, Q, working in said slot, as set forth.

258,497. NUT-LOCK. JOHN L. STEVENS, Chicago, Ill., assignor, by direct and mesne assignments, of three-fourths to George A. Smith and Edward Hempstead, same place. Filed Jan. 21, 1882. (No model.)

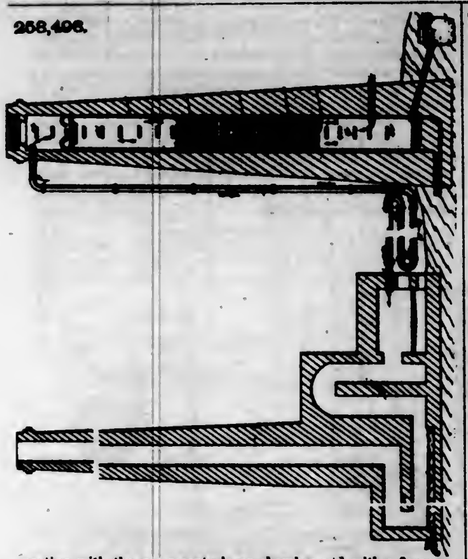
Claim.—The herein-described nut-lock, consisting of an oval ring of metal provided with projections on the inside and adapted to be slipped upon the bolt and secured thereon by compression, causing the projections to bite the threads, or the projections and threads to mutually bite, substantially as set forth.

258,498. COMBINED FURNACE AND STACK FOR DESTROYING NOXIOUS OR POISONOUS GASES. OSCAR A. STEVENS and EDMUND L. DU BARRY, Washington, D. C. Filed July 28, 1881. (No model.)

Claim.—1. The herein-described method of treating noxious gases by first passing the gases in an upwardly-ascending current over moist retarding-surfaces and upward through a descending spray of water, so as to cool and wash the gases, and then burning them in their washed and cooled condition at an intense heat by forcing them into intimate contact with incandescent or ignited combustible and inflammable substances, substantially as described.

2. In combination with the gas-reservoir, the tower provided with means for retarding the currents of gases and subjecting them to the action of a current of water for the purpose of washing and cooling the same preparatory to burning, and the injector arranged to force a current of steam or air directly into the tower, thereby inducing a current of the gases and forcing the same into and up through the tower and thence to the furnace, substantially as specified.

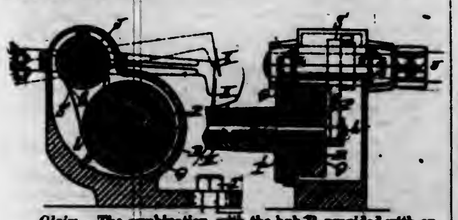
3. In an apparatus for destroying noxious gases, the tower connecting with the gas receptacle or chamber and with a furnace, the said tower being provided with a course of loosely-arranged bricks and a course of broken terra-cotta or similar material, and with an overflow-vessel and water-pipes, whereby the gas on its upward passage may be thoroughly washed and cooled, substantially as described.



4. In combination with the tower and furnace and the connecting-pipes, the series of pipes and return-bends, provided with a suitable cock, whereby any condensed vapor carried over may be collected, substantially as described.

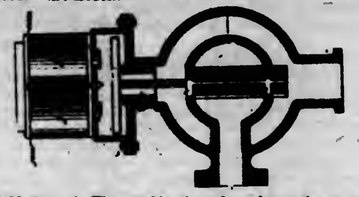
5. In combination with the tower, the herein-described furnace, connected therewith by means of a suitable pipe, whereby the washed and cooled gases and vapors are subjected to the action of intense heat and destroyed, substantially as specified.

6. In combination with the furnace and its vertical flue, the horizontal flue, and the receptacle at the bottom of said flue for holding water, whereby the solid products of combustion arising from the burning gases and fuel are arrested and prevented from escaping into the atmosphere, substantially as specified.



7. The combination, in an apparatus for destroying noxious gases, of the gas-chamber and connections, the tower provided with devices for retarding the gas and for washing and cooling it, the pipe and return pipe and bends and the furnace and flues leading to the chimney, arranged and adapted to operate substantially in the manner specified.

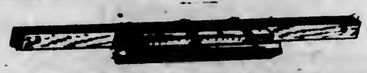
258,498.



258,499. MECHANISM FOR OPERATING DOFFER-COMBS OF CARDING-MACHINES. HARLEY STONE and HARLEY A. STONE, Worcester, Mass. Filed Nov. 14, 1881. (No model.)

Brief.—Upon the inner end of the driving-shaft is secured a hub provided with a circular groove eccentric with the center thereof, said groove receiving a ring, upon which is fastened a pin for engaging with a crank-lever, whereby the operation of the comb-blade is effected.

Claim.—The combination, with the hub P, provided with an eccentric groove, Q, of the circular ring R, inserted therein as described, and provided with pivot-pin A, the doffer-comb blade K, its shaft J, and crank-lever S, said parts being constructed and arranged in relation to each other substantially as shown and described.

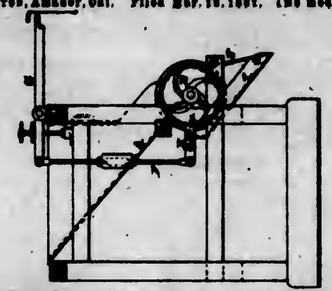


258,500. BALANCED VALVE AND OPERATING MECHANISM. GEORGE W. STORER, Philadelphia, Pa. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination of a valve-casing, a valve, or valve and stem, contained wholly within said casing, and presenting to pressure, when either closed or open, opposite faces of the same area, and an electro-magnet adapted to actuate the valve, all substantially as set forth.

2. The combination of the valve-casing, the valve contained wholly within the casing, and presenting to pressure, when either closed or open, opposite faces of the same area, and an electro-magnet having a pole or poles projecting through the casing and adapted to act upon the valve or upon an armature connected thereto, as set forth.

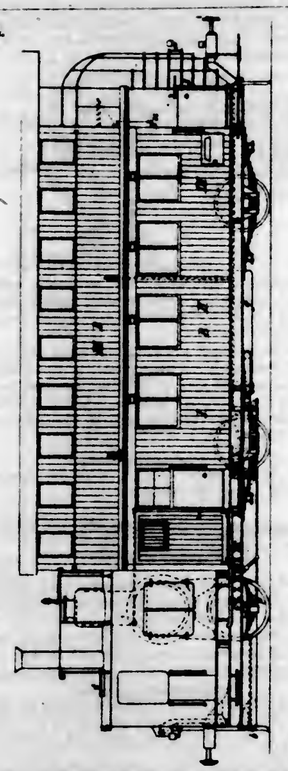
258,501. WIRE FENCE. JAMES F. STRONG, Detroit, Mich. Filed Jan. 20, 1882. (No model.)



Claim.—The method herein described of packing a fence for transportation, consisting in first separating the rails from the posts, leaving the wires attached, placing the rails and one of the posts together, and winding the wires around said rails and posts, thus bringing both of the posts and both of the rails in close proximity and securely holding the whole together, substantially as described.

258,502. MANUFACTURE OF BUTTONS FROM PLASTIC MATERIAL. PHILIP L. SYLVESTER, Auburn, N. Y., assignor of one-half to Woodruff Bros., same place. Filed Mar. 14, 1882. (Specimens.)

Claim.—The method of ornamenting the faces of buttons or other articles by first impressing or indenting the desired figure within the surface of a sheet of plastic material from which the same are made, then sprinkling into such indentations or impressions powdered stock having a different color or shade, and finally subjecting said material to the action of heat, substantially as and for the purpose specified.

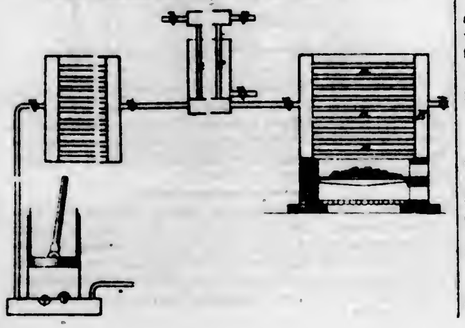


258,503. ORE-FEEDER FOR STAMP-MILLS. ISAAC N. THEPLETON, Amador, Cal. Filed Mar. 18, 1881. (No model.)

Claim.—The combination, in an ore-feeding device, of the chute or hopper A, having the inclined bottom, and front or gate A', with a smooth-surfaced cylinder, B, which extends across the end of the chute and outside the front A', lever G, the tappet upon the stamp-stem, adjustable connecting-rod F, clutch E, and pulley D, substantially as herein described.

258,504. RAILWAY ROLLING STOCK. OSCAR THOMAS, Hayence, Germany. Filed Oct. 14, 1880. (No model.) Patented in Germany Mar. 10, 1880, No. 13,035; in France Sept. 14, 1880, No. 133,033; in Italy Sept. 17, 1880, XIV, 18,185 and XXIV, 205; in Belgium Sept. 15, 1880, No. 53,533; in England Sept. 24, 1880, No. 3,573, and in Austria-Hungary Nov. 7, 1880, Nos. 23,080 and 23,094.

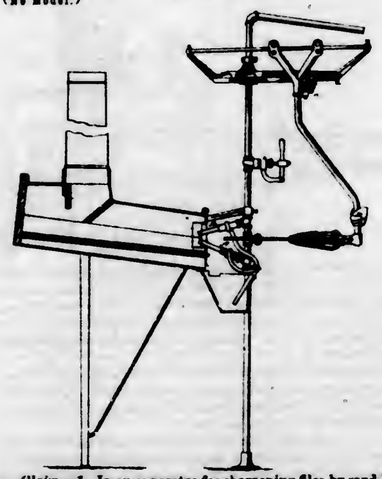
258,504.



Claim.—1. In a railroad-locomotive having two axles, the combination of a fixed driving-axle, a removable reserve axle, removable buffers, and removable traction-hook for the purpose of rendering the locomotive applicable either as an independent vehicle, with the removable axle, traction-hook, and buffers attached, or as part of a steam-carriage by detaching the movable axle, the removable buffers, and traction-book, and attaching the under frame to the under frame of a carriage, substantially as described.

2. In a railroad-locomotive having two axles, the combination of a fixed driving-axle with a removable reserve axle and a horizontal boiler placed over the driving-axle and parallel with the same, substantially as described.

3. In a railroad-vehicle consisting of a carriage proper and a detachable locomotive part, the combination of a feed-water tank carried by the locomotive part with an independent feed-water reservoir, *g*, placed under the carriage part, and lateral cisterns *i i*, provided with feed-openings R, substantially as and for the purpose described.



258,505. APPARATUS FOR COOLING AND HEATING. JOEL TIFFANY, Hinsdale, Ill. Filed Oct. 12, 1881. (No model.)

Claim.—1. The combination of a radiator, a steam-superheater, a pipe directly connecting the heater with the radiator, a refrigerator, a pipe directly connecting the refrigerator and the radiator, stop-cocks in said pipes, an air-forcing apparatus, and a pipe connecting said air-forcing apparatus with the refrigerator, all substantially as described.

2. The combination of a tank, a radiator therein, a steam-heater, a pipe directly connecting the heater with the radiator, a refrigerator, a pipe directly connecting the refrigerator and the radiator, stop-cocks in said pipes, an air-forcing apparatus, and a pipe connecting said air-forcing apparatus with the refrigerator, all substantially as described.

258,506. SAND-BLAST FILE-SHARPENING APPARATUS. EDWARD N. TRUMP, SAMUEL N. TRUMP, CHARLES N. TRUMP, and CHRISTIAN FREDERICK, Wilmington, Del. Filed Mar. 3, 1882. (No model.)

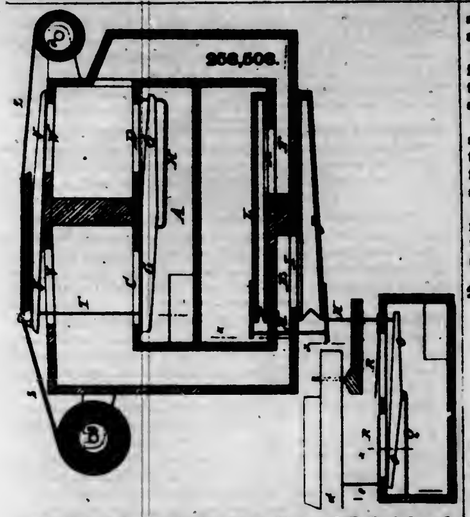
Claim.—1. In an apparatus for sharpening files by sand-blast, the combination of one or more guns with an overhead train or carriage moving upon a round bar attached to a suitable support and carrying the file-holder, substantially as described.

2. In a sand-blast file-sharpening apparatus, an overhead train or carriage with grooved rollers moving upon a round bar, thus permitting a lateral movement, and provided with an adjustable stop for limiting and regulating said lateral movement, substantially as described.

3. In a sand-blast file-sharpening apparatus, a file-holder consisting of supporting-piece, a pair of jaws closed by a cam, and provided with a central pin free to move in line with the file and recessed at end to receive the tang of the file, substantially as shown and described.

4. In a sand-blast file-sharpening apparatus, the combination of one or more guns with an iron box or case, having its upper section farthest from the guns considerably enlarged and furnished with deflecting-boards for collecting sand and water and uptake for waste steam, and with mouth-piece extending into the box in the form of a pipe surrounding the jets or blast, substantially as described.

5. In a sand-blast file-sharpening apparatus, a head-piece for single or double sand-tubes, provided with a pivoted plate air-valve, whereby the sand and water may be readily cut off and the file cleaned by the dry steam, substantially as described.

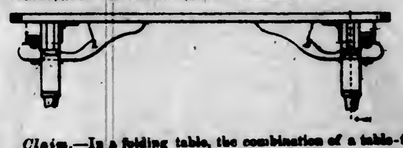


258,507. INSECTICIDE. GEORGE W. TUCKER, Milwaukee, Wis., assignor to Clarence S. Brown, same place. Filed Oct. 25, 1881. (No specimens.)

Claim.—1. In a compound for exterminating vermin, the combination of honey, phosphorus, and rye-flour, as set forth.

2. In a compound for exterminating vermin, the combination of honey, phosphorus, rye-flour, and a substance for keeping the compound in a moist and plastic condition, as set forth

258,508. MECHANICAL MUSICAL INSTRUMENT. GEORGE W. VAN DUSEN, Brooklyn, N. Y. Filed Mar. 9, 1881. (No model.)



Claim.—1. A mechanical musical instrument constructed substantially as herein shown and described, and consisting of the

double balanced valves U G, connected by a rod, T, the balanced bellows J I, connected by a rod, M, the reed-valve O, connecting-rod N, the reeds R, the air-chambers A P, and the air-passages E F, as set forth.

2. In a mechanical musical instrument, the combination, with the perforated music-sheet Z and the reed-valve O, of the balanced double valves U G and the balanced bellows J I, substantially as herein shown and described, whereby the valves are operated by the pressure of the said perforated music-sheet and by air-pressure, as set forth.

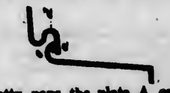
258,509. FOLDING TABLE. CHARLES A. VAN DUSEN, Governeur, N. Y. Filed Jan. 3, 1882. (Model.)

Claim.—In a folding table, the combination of a table-top having on its under side, adjacent to each end, a transverse batten, the hinged legs, connected at their upper ends by cross-bars, a spring-latch attached to each of said cross-bars at or near its center, the yokes attached at their ends, respectively, to the under side of the table-top and to the battens, and provided at their opposite end portions with depressions or notches to engage the spring-latches on the cross-bars of the hinged legs in both the folded and unfolded positions of said legs, substantially as described.

258,510. SPRING-HINGE. CORNELIUS S. VAN WAGONER, Brooklyn, assignor to Van Wagoner & Williams, New York, N. Y. Filed Nov. 23, 1881. (Model.)

Brief.—The novelty consists in the minutiæ of construction of the details.

Claim.—1. The combination, in an adjustable spring-hinge, of the radially-recessed spring-leg, a hinge-ear having a vertical open slot, and a swinging latch or bolt which engages with the spring-leg through the slot in the hinge-ear, substantially as described.

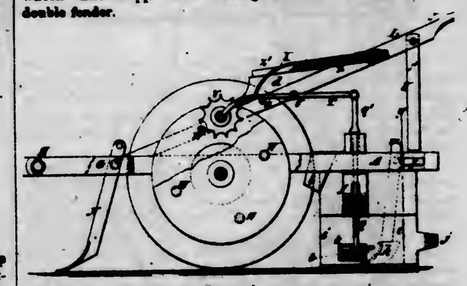


2. The combination, with the hinge-leaves and a spiral spring between the upper and lower hinge-joints, of a non-adjustable spring-leg, which is between the end of said spring and a coincident ear of the hinge, has a bearing against one leaf of the hinge, and is locked thereto against independent rotation, substantially as described.

3. The combination, with the spring and the adjustable rotating tension-leg in a spring-hinge, of a stop which limits the rotation of the leg, and thereby limits the tension of the spring, substantially as described.

4. A detachable spring-leg provided with a neck for entering a spiral spring and centering it, and an abutting stud parallel with the axis of the leg and affording a space between the stud and neck for the reception of the terminal coil of a spring, and a bearing-surface for the inner face of a hinge-ear, substantially as described.

5. A tension-leg for adjustable spring-hinges, provided with radial recesses open at the top of the leg and its edge, in combination with a hinge-ear which closes said recesses at one side thereof, substantially as described.



258,511. PATTY-PAN. AIMÉ VUILLEUM, Portland, Conn., assignor to John E. Ingersoll, same place. Filed Mar. 30, 1882. (No model.)

Claim.—In patty-pans, the plate A, constructed with the edge openings turned downward, outward, and re-turned to form a groove, *d*, combined with the pan constructed with the projecting edge *e*, introduced and closed into said groove, substantially as described.

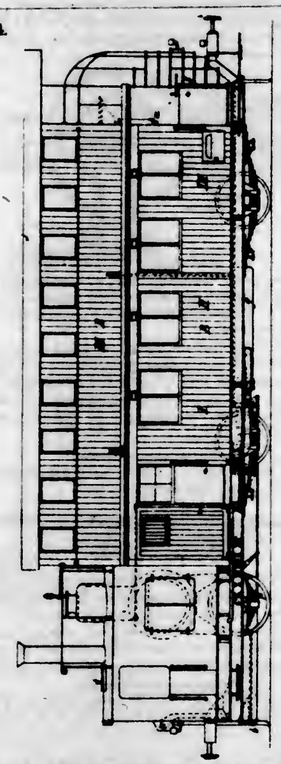
258,512. COTTON-CHOPPER. JOHN H. WALKER, Fort Valley, Ga. Filed Mar. 18, 1882. (Model.)

Brief.—The chopper has intermittent motion, caused by being hung upon a crank-lever pivoted at its angle, and connected to a pinion that is struck at intervals by the pins in a double disk-wheel. The chopper works through one of the side plates of a double fender.

Claim.—1. In a cotton-chopper, the combination, with choppers P and scrapers *h*, of the guards *i*, having rear curved extensions, *j*, higher in the lower edge than said guards, as and for the purpose described.

2. In a cotton-chopper, the combination, with the frame-blocks *g* and choppers P Q, of the guard *i*, extended forward of the chopper and having slot *k*, as and for the purpose specified.

3. The combination of the spur-wheel V, wheel F, having bar-tappets W, working-lever T, and the spring X, with the elbow-lever Q and chopper P, substantially as specified.

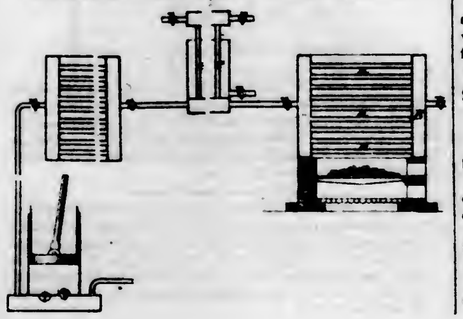


258,513. FORM FOR MAKING INDIA-RUBBER BOOTS AND SHOES. WILLIAM C. WATKINS, New Haven, Conn. Filed Apr. 24, 1882. (No model.)

Claim.—1. As an article of manufacture, a form for making india-rubber boots or shoes, constructed from papier-maché made hollow, substantially as described.

2. A boot-form for making india-rubber boots, the leg and foot sections, the foot-section, pro-

258,504.



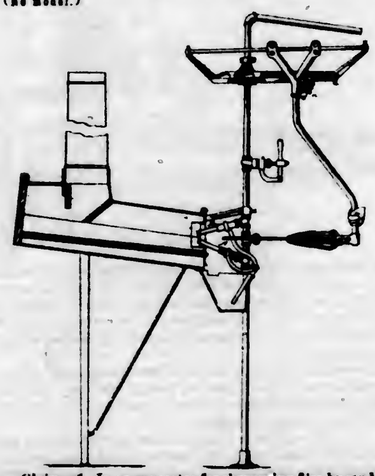
Claim.—1. The combination of a railroad-locomotive having two axles, the combination of a fixed driving-axle, a removable reserve axle, removable buffers, and removable traction-hook for the purpose of rendering the locomotive applicable either as an independent vehicle, with the removable axle, traction-hook, and buffers attached, or as part of a steam-carriage by detaching the movable axle, the removable buffers, and traction-hook, and attaching the under frame to the under frame of a carriage, substantially as described.

2. In a railroad-locomotive having two axles, the combination of a fixed driving-axle with a removable reserve axle and a horizontal boiler placed over the driving-axle and parallel with the same, substantially as described.

3. In a railroad-vehicle consisting of a carriage proper and a detachable locomotive part, the combination of a feed-water tank carried by the locomotive part with an independent feed-water reservoir, *g*, placed under the carriage part, and lateral cisterns *i i*, provided with feed-openings H, substantially as and for the purpose described.

258,505. APPARATUS FOR COOLING AND HEATING. JOEL TIFFANY, Hinsdale, Ill. Filed Oct. 13, 1881. (No model.)

Claim.—1. In an apparatus for sharpening files by sand-blast, the combination of one or more guns with an overhead train or carriage moving upon a round bar attached to a suitable support and carrying the file-holder, substantially as described.



2. In a sand-blast file-sharpening apparatus, an overhead train or carriage with grooved rollers moving upon a round bar, thus permitting a lateral movement, and provided with an adjustable stop for limiting and regulating said lateral movement, substantially as described.

3. In a sand-blast file-sharpening apparatus, a file-holder consisting of supporting-piece, a pair of jaws closed by a cam, and provided with a central pin free to move in line with the file and recessed at end to receive the tang of the file, substantially as shown and described.

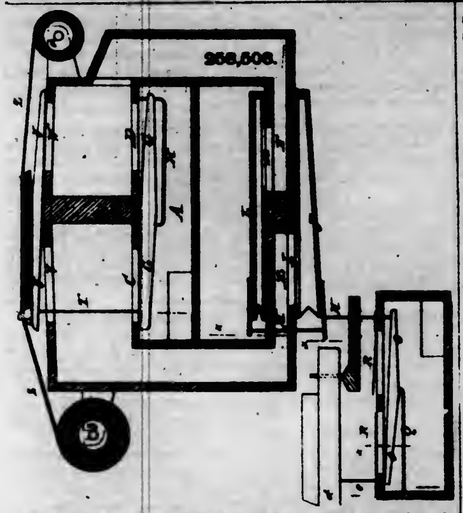
4. In a sand-blast file-sharpening apparatus, the combination of one or more guns with an iron box or case, having its upper section farthest from the guns considerably enlarged and furnished with deflecting-boards for collecting sand and water and uptake for waste steam, and with mouth-piece extending into the box in the form of a pipe surrounding the jets or blast, substantially as described.

5. In a sand-blast file-sharpening apparatus, a head-piece for single or double sand-tubes, provided with a pivoted plate air-valve, whereby the sand and water may be readily cut off and the file cleaned by the dry steam, substantially as described.

258,506. SAND-BLAST FILE-SHARPENING APPARATUS. EDWARD N. TRUMP, SAMUEL N. TRUMP, CHARLES N. TRUMP, and CHRISTIAN-FREDERICK, Wilmington, Del. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination of a radiator, a steam-superheater, a pipe directly connecting the heater with the radiator, a refrigerator, a pipe directly connecting the refrigerator and the radiator, stop-cocks in said pipes, an air-forcing apparatus, and a pipe connecting said air-forcing apparatus with the refrigerator, all substantially as described.

2. The combination of a tank, a radiator therein, a steam-heater, a pipe directly connecting the heater with the radiator, a refrigerator, a pipe directly connecting the refrigerator and the radiator, stop-cocks in said pipe, an air-forcing apparatus, and a pipe connecting said air-forcing apparatus with the refrigerator, all substantially as described.

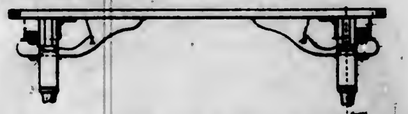


258,507. INSECTICIDE. GEORGE W. TUCKER, Milwaukee, Wis., assignor to Clarence S. Brown, same place. Filed Oct. 25, 1881. (No specimens.)

Claim.—1. In a compound for exterminating vermin, the combination of honey, phosphorus, and rye-flour, as set forth.

2. In a compound for exterminating vermin, the combination of honey, phosphorus, rye-flour, and a substance for keeping the compound in a moist and plastic condition, as set forth

258,508. MECHANICAL MUSICAL INSTRUMENT. GEORGE W. VAN DUSEN, Brooklyn, N. Y. Filed Mar. 9, 1882. (No model.)



Claim.—1. A mechanical musical instrument constructed substantially as herein shown and described, and consisting of the

double balanced valves U G, connected by a rod, T, the balanced bellows J L, connected by a rod, M, the reed-valve O, connecting-rod N, the reeds R, the air-chambers A P, and the air-passages E F, as set forth.

2. In a mechanical musical instrument, the combination, with the perforated music-sheet E and the reed-valve O, of the balanced double valves U G and the balanced bellows J L, substantially as herein shown and described, whereby the valves are operated by the pressure of the said perforated music-sheet and by air-pressure, as set forth.

258,509. FOLDING TABLE. CHARLES A. VAN DUSEN, Governeur, N. Y. Filed Jan. 3, 1882. (Model.)

Claim.—In a folding table, the combination of a table-top having on its under side, adjacent to each end, a transverse batten, the hinged legs, connected at their upper ends by cross-bars, a spring-latch attached to each of said cross-bars at or near its center, the yokes attached at their ends, respectively, to the under side of the table-top and to the battens, and provided at their opposite end portions with depressions or notches to engage the spring-latches on the cross-bars of the hinged legs in both the folded and unfolded positions of said legs, substantially as described.

258,510. SPRING-HINGE. CORNELIUS S. VAN WAGENEN, Brooklyn, assignor to Van Wagenen & Williams, New York, N. Y. Filed Nov. 23, 1881. (Model.)

Brief.—The novelty consists in the minutiæ of construction of the details.

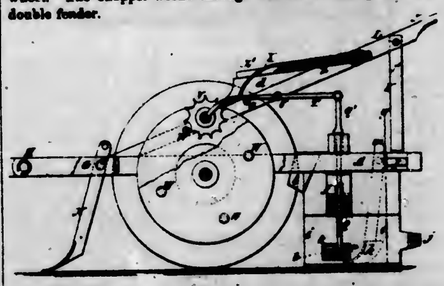
Claim.—1. The combination, in an adjustable spring-hinge, of the radially-recessed spring-leg, a hinge-ear having a vertical open slot, and a swinging latch or bolt which engages with the spring-leg through the slot in the hinge-ear, substantially as described.

2. The combination, with the hinge-leaves and a spiral spring between the upper and lower hinge-joints, of a non-adjustable spring-leg, which is between the end of said spring and a coincident ear of the hinge, has a bearing against one leaf of the hinge, and is locked thereto against independent rotation, substantially as described.

3. The combination, with the spring and the adjustable rotating tension-leg in a spring-hinge, of a stop which limits the rotation of the leg, and thereby limits the tension of the spring, substantially as described.

4. A detachable spring-leg provided with a neck for entering a spiral spring and centering it, and an abutting steel parallel with the axis of the leg and affording a space between the steel and neck for the reception of the terminal coil of a spring, and a bearing-surface for the inner face of a hinge-ear, substantially as described.

5. A tension-leg for adjustable spring-hinges, provided with radial recesses open at the top of the leg and its edge, in combination with a hinge-ear which closes said recesses at one side thereof, substantially as described.

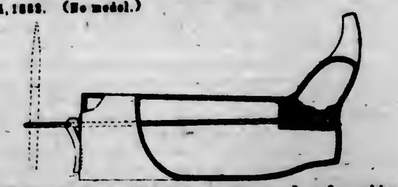


258,511. PATTY-PAN. AUGUSTUS VEILLEUX, Portland, Conn., assignor to John E. Ingersoll, same place. Filed Mar. 30, 1882. (No model.)

Claim.—In patty-pans, the plate A, constructed with the edge openings turned downward, outward, and re-turned to form a groove, *d*, combined with the pan constructed with the projecting edge *e*, introduced and closed into said groove, substantially as described.

258,512. COTTON-CHOPPER. JOHN H. WALDEN, Fort Valley, Ga. Filed Mar. 18, 1882. (Model.)

Brief.—The chopper has intermittent motion, caused by being hung upon a crank-lever pivoted at its angle, and connected to a pinion that is struck at intervals by the pins in a double disk-wheel. The chopper works through one of the side plates of a double fender.



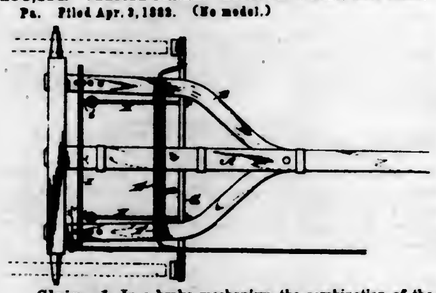
Claim.—1. In a cotton-chopper, the combination, with choppers P and scrapers A, of the guards *i*, having rear curved extensions, *j*, higher in the lower edge than said guards, as and for the purpose described.

2. In a cotton-chopper, the combination, with the frame-blocks *g* and choppers P Q, of the guard *i*, extended forward of the chopper and having slot *h*, as and for the purpose specified.

3. The combination of the spur-wheel V, wheel F, having bar-tappets W, working-lever T, and the spring X, with the elbow-lever Q and chopper P, substantially as specified.

258,513. FORM FOR MAKING INDIA-RUBBER BOOTS AND SHOES. WILLIAM C. WATKINS, New Haven, Conn. Filed Apr. 24, 1882. (No model.)

Claim.—1. As an article of manufacture, a form for making india-rubber boots or shoes, constructed from papier-maché and made hollow, substantially as described.

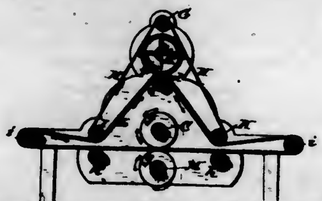


2. A boot-form for making india-rubber boots, consisting of the leg and foot sections, the foot-portion, provided with the socket

O and the rod a, constructed with the T-shaped end, to pass through the socket in the foot, the rod extending up through the leg to form the loop, combined with a cam-lever hung to the said rod, whereby the leg is clamped to the foot portion or detached therefrom, substantially as described.

3. A boot-form for making india-rubber boots, consisting of the leg and foot sections, the foot-section provided with the socket C, the rod a, constructed with the T-shaped end, to pass through the socket in the boot, the rod extending up through the leg to form the loop, combined with a cam-lever hung to the said rod, whereby the leg is clamped to the foot portion or detached therefrom; and the top of the form constructed with a recess, A, in which the arm will lie when the parts are clamped together, substantially as and for the purpose described.

4. A rod for clamping the leg to the foot portion of a boot-form for making india-rubber boots, provided with a loop at its upper end, constructed with shoulders a a, that part of the loop above the shoulder corresponding in shape to the transverse section of the pin upon which the form is to be suspended, substantially as described.



258,514. VEHICLE-BRAKE. BARGUM R. WELCH, Wolf Creek, Pa. Filed Apr. 3, 1882. (No model.)

Claim.—1. In a brake mechanism, the combination of the cross-bar D, swinging bail E, supported thereby and having downward-bent ends, the brake-bar suspended from the bent ends of the bail, the cranked rock-bar I, a draw-bar connecting the crank of the rock-bar with the brake-bar, and a brake-rod for rocking the rock-bar, substantially as described.

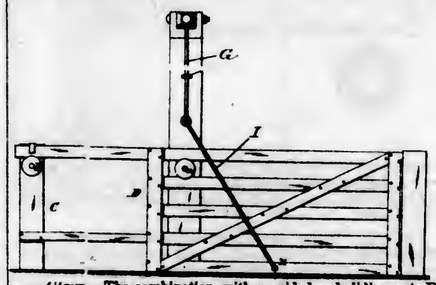
2. The combination, in a brake for vehicles, of the grooved cross-bar D, secured to the hounds, with the rocking bail E, arranged within the groove of said bar, and retained therein by eye-bolts securing the grooved bar to the hounds, the brake-bar G, carrying the brake-shoes and connected with the crank-shaped ends of the bail, the draw-rods rigidly secured to the brake-bar, and also connected to arms upon a rock-bar that has its bearings upon the hounds, and the rod connected with an arm upon the rock-bar, and also connected with the operating-lever, substantially as described.

258,515. COTTON-GIN. PETER V. WESTFALL, Kalamazoo, Mich., assignor of one-half to William Nelson, same place. Filed Apr. 6, 1882. (No model.)

Claim.—1. In a cotton-cleaner, the combination, with a hollow cylinder having an elongated opening and a spiral comb, of an endless rotating apron for feeding the cotton to the comb, and endless rotating wires working on grooved rollers for holding the cotton on the apron, substantially as shown and described.

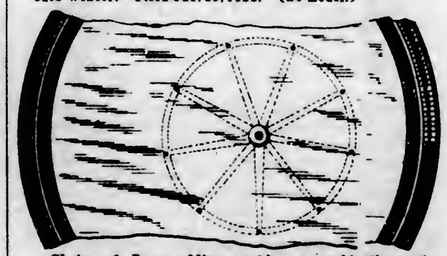
2. In a cotton-cleaner, the combination, with the cylinder F, having elongated opening d, of the revolving spiral comb E, having one of its faces serrated and the other plain, substantially as and for the purpose set forth.

3. In a cotton-cleaner, the spiral comb E, endless apron L, friction-wheels *f g*, and rollers *e h i*, in combination with grooved rollers G I K, rotating wires H, said wires and apron being elevated to an acute angle, the main shaft, driving gear-wheel, and a smaller gear-wheel upon one of the journals of the comb, substantially as and for the purpose specified.



4. In a cotton-cleaner, the hollow slotted cylinder F, revolving spiral comb E, grooved rollers G I K, wires H, rollers *e h i*, main shaft C, counter-shaft M, and friction-wheels *f g*, all arranged to operate substantially as described.

258,516. MANUFACTURE OF STRAINER-PLATE. DAVID H WESTON, Boston, Mass. Filed Feb. 20, 1882. (No model.)



Claim.—The herein-described method of producing metal strainer-plate, it comprehending punching through the plate a series of elongated slots, and then further elongating and contracting the width of the said slots by rolling the said plate, substantially as described.

258,517. SLIDING GATE. WILLIAM R. WHITE, Neoga, Ill. Filed Apr. 7, 1882. (No model.)

Claim.—The combination, with a guided and sliding gate D, of a vertically-guided rod, G, levers E E, connected thereto, and a pitman, I, jointed to the lower end of the rod and to the gate centrally near the lower part, substantially as set forth.

258,518. ADDING-MACHINE. MARY E. WINTER, Galesburg, and CHESMAN W. CRARY, Chicago, Ill.; said Crary assignor to said Winter. Filed Jan. 25, 1882. (No model.)

Claim.—1. In an adding-machine, in combination with a ratchet-wheel, operating-keys, and pawl-carrying arms, the bent pawls hinged to their carrying-arms, and pawl-trippers hinged or pivoted to said carrying-arms and adapted to swing the pawls to release them from the ratchet-wheel, substantially as and for the purpose specified.

2. In an adding-machine, in combination with a ratchet-wheel, swinging pawl-carrying arms, and pawls hinged thereto, pawl-trippers, also hinged to said pawl-carrying arms, and adapted to swing the parts into and out of gear with the ratchet-wheel, substantially as and for the purpose specified.

3. In an adding-machine, in combination with a ratchet-wheel, swinging pawl-carrying arms, and slotted pawls hinged to said arms, pawl-trippers, also hinged to said arms, and adapted to swing the pawls, substantially as and for the purpose specified.

4. In an adding-machine, in combination with the ratchet-wheel, swinging pawl-carrying arms, swinging pawls, and pawl-tripping arms, springs connected, the one with the pawl-carrying arm and the other with the pawl-tripper arm, substantially as and for the purpose specified.

5. In an adding-machine, in combination with the ratchet-wheel, swinging pawl-carrying arms, swinging pawls, pawl-tripping arms, and springs adapted to move both the pawl-carrying arms and the pawl-tripper arms, rods connected with the pawl-tripper arms and the operating-keys, whereby the tripper-arm is moved to engage the pawl with the ratchet-wheel before the pawl-carrying arm is moved, substantially as and for the purpose specified.

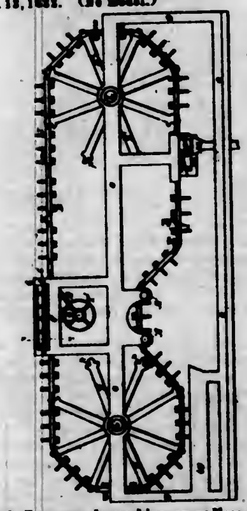
6. In an adding-machine, in combination with the ratchet-wheel and pawl-carrying arms with hinged pawls, an arc-shaped support for the distal end of the pawl-carrying arms, substantially as and for the purpose specified.

7. In an adding-machine, in combination with a ratchet-wheel and pawl-carrying arms, hinged at their outer ends or ends exterior to the ratchet-wheel, actuated by keys and connecting-rods, stops adapted to limit the throw of the pawls, substantially as and for the purpose specified.

8. In an adding-machine, in combination with a ratchet-wheel and swinging arms having pawls hinged to their distal ends, stops adapted to arrest the movement of the pawl-carrying arms by coming in contact with said pawls, and thereby control the extent of movement of the ratchet-wheel, substantially as and for the purpose specified.

9. In an adding-machine, in combination with a ratchet-wheel, arms I, having pawls hinged to their outer ends, and swinging arms adapted to swing said pawls, rods connecting the swinging arms with operating-keys, substantially as and for the purpose specified.

10. The arm F and I, in combination with retracting-springs, actuating rods and keys, ratchet-wheel, and hinged pawls, substantially as and for the purpose specified.



11. In combination with the ratchet-wheel, arms I and F, and hinged pawl, the stops for regulating the throw of the swinging arms, substantially as and for the purpose specified.

12. In combination with the ratchet-wheel and detent M, having its end beveled on one side, the step F', having an inclined side and a vertical side, adapted to permit the ratchet-wheel to rotate in one direction and to arrest its motion when desired when rotated in an opposite direction, substantially as and for the purpose specified.

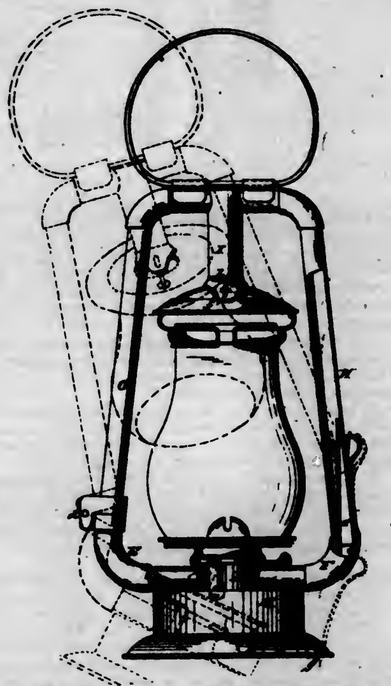
13. In an adding-machine, in combination with a dial-plate, and ratchet-wheel which rotates coincidently therewith, and with swinging arms having pawls hinged to their distal ends, rods connecting said swinging arms with actuating-keys, substantially as and for the purpose specified.

14. In combination with the ratchet-wheel and arms hinged at their outer ends and provided with pawls hinged to their ends next to the ratchet-wheel, actuated by keys and connecting-rods, stops adapted to limit the throw of the pawls, substantially as and for the purpose specified.

258,519. CAPSULE-MACHINE. ALFRED WOOD, Detroit, Mich. Filed Mar. 13, 1882. (No model.)

Claim.—1. In a capsule-machine, an endless chain of plates carrying suitable pins or molds for forming the capsules, as herein shown and described.

2. In a capsule-machine, the combination of a plate carrying suitable pins or molds for forming capsules, one or more friction-rolls engaging with and rotating said pins, and one or more pairs of spring-cutters adapted to bear upon said pins while rotating, as and for the purposes set forth.



2. The combination of the plates D, carrying pins I, and the spring-cutters O O', having straight edges for a portion of their length, and the inclined edge S, as and for the purpose set forth.

4. In a capsule-machine, the combination of the plate D and pins I, carried thereby, with devices for rotating the pins, substantially as and for the purposes described.

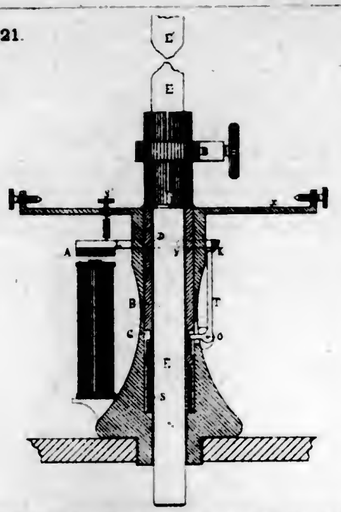
5. In a capsule-machine, the combination of the plate D, pins I, having thereon wheel or pulley B, and friction-roll Q, substantially as herein shown and described.

6. In a capsule-machine, the combination of the endless belt of plates D, the pins I, arranged to freely rotate in said plates, and the stripper R, having an inclined edge arranged to force the capsules from the pins, substantially as and for the purpose described.

258,520. TUBULAR LANTERN. CLARK WOODBURY, FOSTER WOOD, and ALLEN J. SAWYER, Old Town, Me. Filed Mar. 30, 1882. (Model.)

Claim.—1. In a tubular lantern, the combination, with the tube G, hinged at its lower end to the stationary tube-section E, of the tube H and stationary tube-section F, the latter being provided with a fastening device for securely locking the tube H to the tube-section F or releasing it therefrom, substantially as and for the purpose set forth.

2. In a tubular lantern, the combination, with the upright tube I, of the cap K, hinged thereto and carrying the globe L, substantially as and for the purpose specified.



3. In a tubular lantern, the hinged tube G and tube H, in combination with the air-tube sections E F, the latter having a yielding guide-plate, c, and suitable means for fastening or releasing the tube H therefrom, substantially as specified.

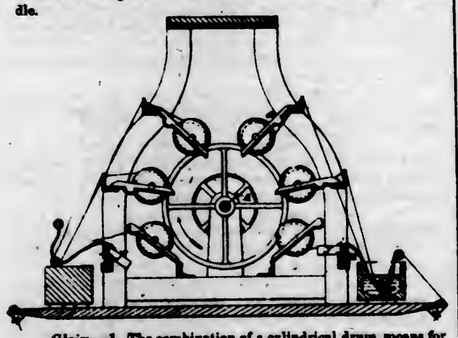
258,521. SAFETY DEVICE FOR ELECTRIC LAMPS. JOHN JOSEPH WRIGHT, Philadelphia, Pa., assignor to George S. Garrett, same place. Filed July 8, 1881. (No model.)

Claim.—1. In combination with an electric-lamp carbon-holder, an automatic safety device consisting substantially of an electro-magnet in a derived circuit around the electrodes, an armature thereafter, a catch or detent in operative combination with said armature, as described, and a spring held compressed by said detent until released by a movement of said armature on an increase in the power of said derived-circuit magnet.

2. In an electric lamp, the combination of a carbon-holder, a

258,521.

spring to elevate the same, a detent to engage the carbon-holder when the same is depressed against the face of the spring, a lever provided with an armature, and a device to hold the detent in engagement with the carbon-holder and a magnet in a shunt-circuit, whereby the carbon-holder may be held in position while the lamp is burning, but will be released and forced against the opposing carbon on an abnormal increase of current in the shunt-circuit, as described.



3. In a safety circuit-preserver, a setting and releasing device consisting of the part B and its groove G, or their equivalents, and of the lever T and lever L, with projection K, or their mechanical equivalents, substantially as described.

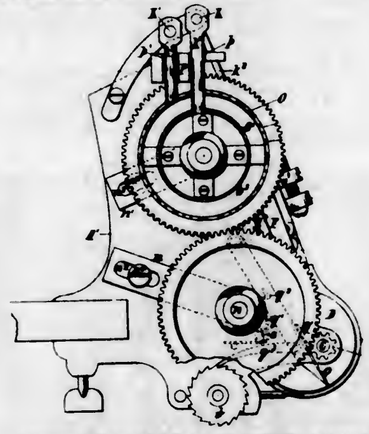
4. In an electric lamp, the combination, with a shunt or derived circuit magnet around the arc of said lamp, of its armature, a lever, L, hook or catch K, and detent-lever T, a carbon-holder, B, and grooved sleeves G, substantially as specified.

5. In combination with a carbon-holder of an electric lamp, a derived-circuit magnet around the arc and armature thereof, and mechanism constructed substantially as set forth, whereby movement is imparted to said carbon-holder by a spring released by said derived-circuit magnet on an abnormal increase in its power.

258,522. MACHINE FOR DOUBLING YARN. ALFRED YATES, Tissington, County of Derby, England. Filed Feb. 4, 1882. (No model.) Patented in England Sept. 19, 1881, No. 3,996.

Brief.—Arms adapted to support the creel-bobbins are so arranged and hung at such an angle around the circumference of the drum that said bobbins will rest upon the surface thereof, so that as the same revolves the yarn will be unwound therefrom and be conducted over guide-rails and through water-troughs to the spindle.

Claim.—1. The combination of a cylindrical drum, means for rotating the drum, a series of downwardly-inclined arms arranged at different heights around the drum, in near proximity thereto, which are adapted to hold a series of bobbins in contact with the periphery thereof, a suitable supporting-frame for the drum and arms, and means for guiding the thread from the bobbins, substantially as described.



2. The combination of a cylindrical drum, means for rotating the drum, a series of downwardly-inclined arms arranged at different heights around the drum, in near proximity thereto, which are adapted to hold a series of bobbins in contact with the periphery thereof, said arms being provided with longitudinal guide-ribs, a suitable supporting-frame for the drum and arms, and means for guiding the threads from the bobbins, substantially as described.

3. The combination of a cylindrical drum, means for rotating the drum, a series of downwardly-inclined arms arranged at different heights around the drum, in near proximity thereto, which are adapted to hold a series of bobbins in contact with the periphery thereof, said arms being provided with longitudinal guide-ribs and with notches or depressions near their upper ends, a suitable supporting-frame for the drum and arms, and means for guiding the threads from the bobbins, substantially as described.

4. The combination of a cylindrical drum, means for rotating the drum, a series of downwardly-inclined arms arranged at different heights around the drum, in near proximity thereto, which are adapted to hold a series of bobbins in contact with the periphery thereof, a suitable supporting-frame for the drum and arms, means for guiding the threads from the bobbins, tanks at the sides of the drum, and pivoted counterbalanced bent levers provided with suitable thread-guides, substantially as described.

258,523. KNITTING-MACHINE. CHARLES YOUNG, Chicago, Ill., assignor, by mesne assignments, of one-half to Burgess P. Pratt and E. C. Walker, same place. Filed June 23, 1880. (No model.)

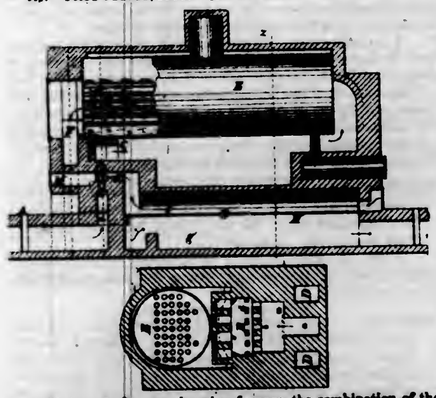
Brief.—This invention is an improvement on applicant's machine covered by Letters Patent No. 209,786. The claims alone will be found to convey quite a full and clear understanding of the construction and operation of the machine.

Claim.—1. The wheel N^3, provided with the indented rims O and O', in combination with mechanism for revolving it, and with the thread-carrier shafts K' and K, provided respectively with the roller-bars k^2 and k^3, for the purpose of communicating to the shafts a motion in the direction of their length, substantially as described.

2. The levers L and L', in combination with mechanism for depressing their lower ends and means for automatically depressing their upper ends, with fixed supports, with shafts or rods arranged in bearings in said supports and having rigidly-affixed rocking arms l^2 and l^3, and with connecting-rods l, l', l^2, and l^3, substantially as and for the purpose described.

3. In a knitting-machine, first, a series of needles provided with hooks at their lower ends; second, mechanism for giving them a longitudinal motion; third, a stitch-varying bar connected with this mechanism, arranged over the hooks and at right angles to the directions of the needles, provided with grooves parallel to the needles large enough to allow the hooks to pass through, and whose number is a divisor of the number of needles; and, fourth, mechanism operated by the same power which moves the needles, for giving to the bar a motion in the direction of its length, all in combination, substantially as and for the purpose described.

4. The combination of the main shaft, the cam a', rigidly affixed thereto, the lever I, the rocking arm j, and the loop-hook shaft J, provided with the loop-hooks j', substantially as and for the purpose described.



5. The combination of the grooved plate B, the needles b, the needle-bars E and G, the catch-bar b^1, the loop-hooks j', thread-carriers k^2 and k^3, and take-up rollers T with mechanism for communicating to needles, loop-hooks, thread-carriers, and take-up rollers concordant motions from a single driving-shaft, substantially as and for the purpose described.

6. The combination of the grooved plate B, the needles b, catch-bar b^1, loop-hooks j', thread-carriers k^2 and k^3, and take-up rollers T with mechanism for communicating to needles, loop-hooks, thread-carriers, and take-up rollers concordant motions from a common driving-shaft, substantially as and for the purpose described.

258,524. FERTILIZER-BAG. ROBERT B. ELLS, Baltimore, Md. Filed Mar. 9, 1882. (No specimens.)

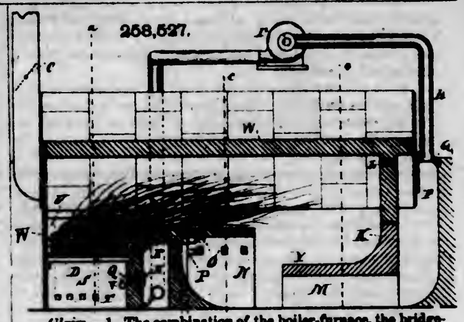
Claim.—An acid-proof bag for holding fertilizers, which consists of bagging treated with an aqueous solution of rosin-soap, alum, asbestus, and gelatine, in the proportions substantially as specified.

258,525. BOILER GAS-FURNACE. JOHN ELLWOOD, Chicago, Ill. Filed Jan. 12, 1882. (No model.)

Claim.—1. In a gas-burning furnace, the combination of the vertical escape-flue F, the bottom flue connecting therewith, and the partitioned recuperator H, having upper air-heating chamber, g, and bottom chamber, g', for the outgoing products of combustion, and a burner located at the front end of the air-heating chamber, substantially as and for the purpose set forth.

2. In a gas-burning furnace, the combination of the horizontal firing-hole M and vertical escape F, surrounding the same, with the burner B, arranged at the rear of the firing-hole, as and for the purpose set forth.

3. In a gas-burning furnace, the combination of the burner B, having a contracted outlet, e, for the flame, gas-inlet openings b, and air-supply openings d, and the superposed deflector c, with gas-supply flue A, and hot-air flue g, as and for the purpose set forth.



258,526. GLASS OR EARTHENWARE PITCHER OR JUG. WM. ZIMMER, Bellaire, Ohio. Filed Feb. 18, 1882. (No model.)

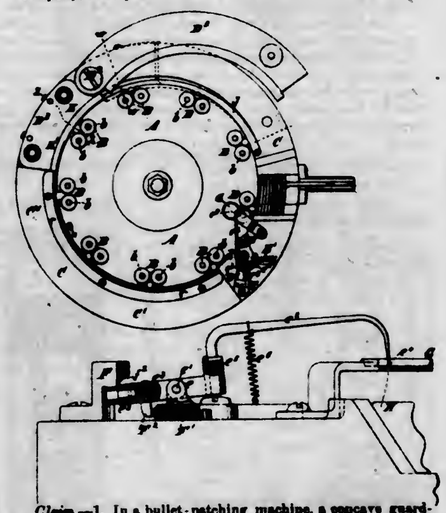
Claim.—As a new article of merchandise, a glass pitcher having a handle adapted for tilting and a separate handle adapted for carrying the same, substantially as described.

258,527. BOILER-FURNACE. GEORGE BLACKBURN, Columbus, assignor of three-fourths to Lemuel E. Hartmann, Cincinnati, Ohio. Filed Feb. 23, 1882. (No model.)

258,527.

Claim.—1. The combination of the boiler-furnace, the bridge-wall, the arch N, extending rearwardly from the bridge-wall and having parallel rows of perforations O, and the jet-pipes P, arranged to issue under the arch along said rows of perforations.

2. The combination of the boiler-furnace, the dead-wall K, opening M under wall K Y, perforated arch N, and air-pipes P.



3. The combination of the boiler-furnace, the dead-wall K, opening M thereunder, roof Y, extending forward therefrom, and perforated arch N, with air-pipes P.

4. The combination of the boiler-furnace, perforated arch N, air-pipes P, dead-wall K, opening M thereunder, and top openings, L, in said dead-wall.

5. The combination of the boiler-furnace, perforated arch N, air-pipe P, dead-wall K, opening M, top openings, L, and roof Y.

6. The combination of the boiler-furnace, the hollow bridge-wall E, slitted openings Q in the front of the bridge-wall, jetted pipe V below the openings Q, fan I', and pipe H.

258,528. BULLET-PATCHING MACHINE. HUGO BORCHARDT, Bridgeport, Conn., assignor to the Union Metallic Cartridge Company, same place. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a bullet-patching machine, a concave guard-rail, in which is inserted a magazine of patches, in combination with a rotating disk provided with friction-rollers arranged in pairs near the periphery of the disk, and having their axes of rotation parallel with the axis of the disk, for the purpose of preserving the bullets in vertical positions while they are being rolled across the guard-rail and magazine, substantially as set forth.

2. A concave guard-rail, in which is inserted a magazine of patches, and a rotating disk provided with friction-rollers arranged in pairs near the periphery of the disk, and having their axes of rotation parallel with the axis of the disk, in combination with means for effecting the positive rotation of the friction-rollers in directions opposite to the direction of rotation of the rotating disk at a prescribed rate of speed, and thereby imparting to the bullet a slightly more rapid speed of rotation upon its own longitudinal

axis than that which would be caused by the progressive rolling of the bullet across the concave face of the guard-rail, for the purpose of causing the bullet to draw the patch tight around its body, substantially as set forth.

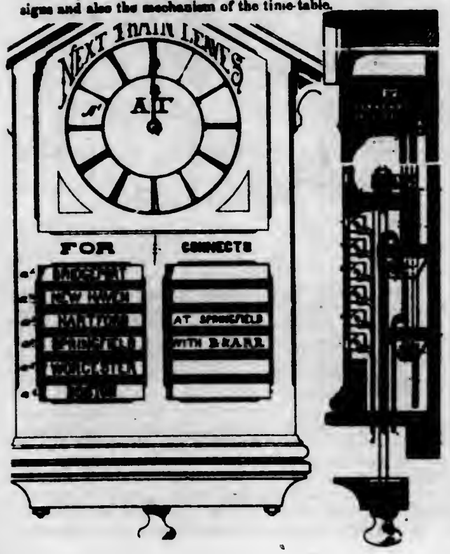
3. In combination with bullet-patching mechanism substantially such as described, a mucilage-reservoir and a mucilage-distributer, consisting of a jointed arm operated as described, and having both a vertical and a horizontal axis of oscillation, for depositing mucilage upon the patches successively at the parts of their surfaces with which the bullets respectively first acquire contact.

4. The oscillating plate E and means for effecting the oscillation thereof upon its vertical axis, and the longitudinal rock-shaft d', supported upon the oscillating plate E, carrying the mucilage-distributing arm d^3, and provided with the arm d^5, in combination with the cam F, for the purpose of imparting to the mucilage-distributing arm d^3 and finger d^4 the resultant motions due to the oscillation of the plate E upon a vertical axis and the oscillation of the rock-shaft d' upon a horizontal axis, substantially as described.

5. In combination with bullet-patching mechanism substantially such as described, the mucilage-distributing arm d^3, connected with the rock-shaft d' by the hinged joint d^6, in combination with the spring d^7, as and for the purpose set forth.

6. In combination with bullet-patching mechanism substantially such as described, the oscillating plate E, provided with the retracting-spring E', and having its free end projecting over the space between the guard-rail D and the rotating disk A, provided with the pairs of rollers B, for the purpose of having the oscillation of the plate E effected by the bullets, successively, as they are rolled along the face of the guard-rail.

7. In combination with bullet-patching mechanism substantially such as described, the crimping-rail J, provided with a spring, J', substantially as shown, and for the purpose set forth.



8. In combination with bullet-patching mechanism substantially such as described, the crimping-rail J, provided with the serrated concave edge j, as shown.

9. In combination with the rotating disk of a bullet-patching machine substantially such as described, the movable segment D' of the guard-rail, having a range of movement sufficient to carry it out of its operative position, as and for the purpose set forth.

10. In combination with the rotating disk of a bullet-patching machine substantially such as described, an adjustable gage provided with an offset, and so arranged relatively to the disk that suitably-patched bullets are discharged from the narrower space between the disk and gage, while bullets which have been too thickly patched are held by friction and rolled along and discharged from the wider space between the disk and gage, as set forth.

258,529. INFORMATION-TABLET. EDWARD S. BOYNTON, Bridgeport, Conn. Filed Jan. 26, 1882. (No model.)

Brief.—A key automatically displays a definite selection of signs and also the mechanism of the time-table.

Claim.—1. In an information-tablet, the combination, substantially as before set forth, of a number of signs and a key for automatically displaying a determinate selection thereof.

2. In an information-tablet, the combination, substantially as before set forth, of a number of signs, a time-indicator, and a key or keys for automatically displaying a determinate selection of signs and setting the hands of the time-indicator.

3. The combination, substantially as before set forth, of the signs and a removable Jacquard key for automatically displaying a determinate selection thereof.

4. The combination, substantially as before set forth, of the signs, the sign-tumblers, and a removable Jacquard key.

5. The combination, substantially as before set forth, of the dial and hour and minute hands, the spring-actuated rack-bars and pinions, the locking-cylinders, the time-tumblers, and a removable Jacquard key.

6. The combination, substantially as before set forth, of the signs, the sign-tumblers, the removable Jacquard key, and the movable key-holder.

7. The combination, substantially as before set forth, of the dial and hour and minute hands, the spring-actuated rack-bars and pinions, the locking-cylinders, the time-tumblers, a removable Jacquard key, and the movable key-holder.

8. The combination, substantially as before set forth, of the spring-actuated rack-bars and pinions and the bellows or governors for governing the resilient action of the springs.

9. An imperforate Jacquard key-blank, (from which Jacquard keys for operating information-tablets of above description may be prepared by perforating the blank at determinable points,) consisting of a strip of card-board or other stiff material provided with marks of a definite number and arrangement, each such mark being designated by a word or letter or numeral (one or more of each) corresponding to the information that may be displayed on the particular tablet for which the blank is designed.

258,530. MANUFACTURE OF ANTHRACENE-BLUE. HEINRICH BRUNCK, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Nov. 2, 1881. (Specimens.)

Claim.—As a new article of manufacture, the blue coloring-matter termed "anthracene-blue," having the characteristics hereinbefore stated.

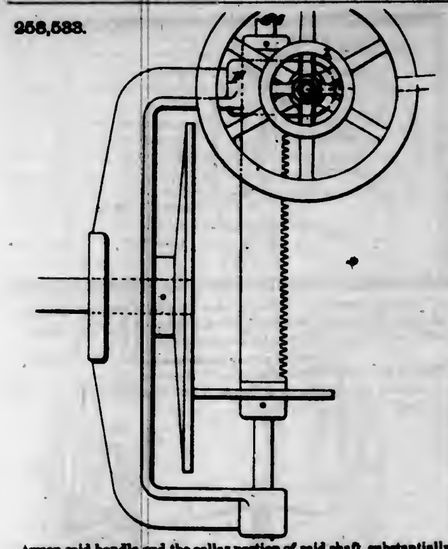
258,531. THE PRODUCTION OF BLUE COLORS UPON TEXTILE FABRICS. HEINRICH BRUNCK, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Nov. 2, 1881. (Specimens.)

Claim.—1. The within-described process for developing a blue color in or upon a textile fiber, yarn, or cloth, whether knit or woven, by impregnating said fiber, yarn, or cloth with an aqueous solution of the anthracene-blue hereinbefore described, and then exposing the same to heat, substantially as set forth.

2. The within-described process for developing a blue color in or upon a textile fiber, yarn, or cloth, whether knit or woven, by impregnating said fiber, yarn, or cloth with a solution of acetic acid or tartaric acid, or the hereinbefore-named salts of said acids, and with an aqueous solution of the anthracene-blue hereinbefore described, and then exposing the same to heat, substantially as set forth.

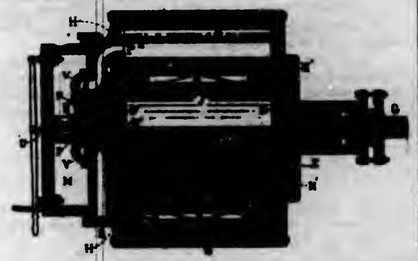
3. As a new article of manufacture, textile fiber, yarn, or cloth, whether knit or woven, having a blue color developed within or upon the same by impregnating it with an aqueous solution of the anthracene-blue hereinbefore described, and then exposing it to heat, or by any other means which will produce the same result.

258,532. BLANK FOR LACING-STUDS. LOUIS GODDU, Winchester, assignor of one-half to Albert Van Wagenen, Boston, Mass. Filed Apr. 1, 1881. (No model.)



Claim.—The sheet-metal eyelet-blank a, having the hook 2 and pronged part to form the upper flanged rim of the eyelet, substantially as described.

258,533. ADJUSTING-GEARING. ALEXANDER GORDON, Cincinnati, and SPENCER T. RIDER, Hamilton, assignors to the Niles Tool Works, Hamilton, Ohio. Filed Apr. 3, 1882. (No model.)



Claim.—1. The combination, with a rack or gear to be moved by a pinion, of a pinion, a collared pinion-shaft, a divided pinion-shaft bearing adapted to clamp the rack or gear, a handle fitted to slide on the pinion-shaft, and a nut screwing on the pinion-shaft to cause said divided bearing and rack or gear to be pinched between said handle and the collar portion of said shaft, substantially as and for the purpose set forth.

258,533.

2. The combination, with a rack or gear to be moved by a pinion, of a pinion, a collared pinion-shaft, pinion-shaft bearing, a handle fitted to slide on the pinion-shaft, and a nut screwing on the pinion-shaft, whereby friction is created at the ends of the bearing, and the shaft thus locked against rotation, substantially as and for the purpose set forth.

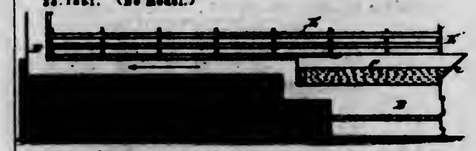
258,534. ORBITAL ROTARY ENGINE. DEXTER D. HARDY, Havana, Ill. Filed Aug. 29, 1881. (No model.)

Claim.—1. As a valve for rotary engines, the rod U, swiveled to the pin R, the eccentric F, having a slotted collar, the valve V, having upon one side an annular groove, and the slotted shaft Z', rotated by the disk D', in combination with the head H, having ports P and an annular groove with a discharge-pipe leading therefrom, as set forth.

2. The combination of the stationary internally-toothed cylinder B, having two or more lugs, T, the heads H' and H, having ports P and fastened to said cylinder B, the spur-gear wheel A, having recesses to admit said lugs T, the crescent C, and disks D' and D, bolted to said crescent C, with shaft G and crank-pin Z, as and for the purpose specified.

3. The rod U, pin R, eccentric F, valve V, shaft Z', and disk D', in combination with the head H, having ports P, head H', disk D, internally-toothed cylinder B, crescent C, spur-wheel A, and crank-pin Z, as and for the purpose specified.

258,535. ROTARY PUMP AND MOTOR. MOSES W. KIDDER, Boston, assignor to Person Hoyes, Lowell, Mass. Filed Oct. 15, 1881. (No model.)



Brief.—Diagonal grooves J J extend from the induction-port B to the eduction-port C, forming channels for the removal of any sand or other matter which may find its way between the pistons and the concave ends of the casing. The grooves are formed in the interior surfaces of the casing.

Claim.—The combination of the casing having the induction and eduction ports with the rotating pistons and the grooves or passages, adapted to receive sand, &c., from the induction-passage and to discharge it into the eduction-passage, thereby preventing the wear of pistons and casing, substantially as described.

258,535.

258,536. STEAM VEGETABLE AND FRUIT EVAPORATOR. RUTH W. LOWELL, Nunda, N. Y., assignor of two-thirds to Frank S. Belcher and John B. Belcher, Charlotte, Mich. Filed Nov. 23, 1881. (No model.)

Claim.—The combination of the furnace B, boiler C, lower steam-pipe E, and the smoke-flue, all arranged and operating as shown and described.

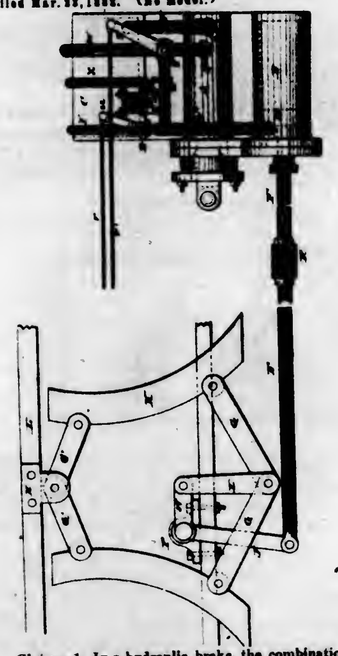
258,537. ELECTRICAL ANNUNCIATOR. ADAM LOWENY, New York, N. Y. Filed Sept. 7, 1881. (Model.)

Claim.—1. The combination, with an annunciator-magnet and its drop or tag, of an armature or armature-pawl having a part projecting into the path of motion of the tag or drop, with the tag or drop arranged to strike the said armature in its fall, and thereby retract it from the magnet, substantially as herein set forth.

2. The combination, with an annunciator-magnet and its tag, of an armature-pawl having one arm arranged to be attracted by the magnet and to engage the tag, and the opposite arm or foot of the pawl bent or directed across the path of the tag in its direction of drop, whereby the tag, when released, falls upon the foot of the pawl, and is thereby stopped in its motion, and at the same time retracts the pawl from the magnet, substantially as herein shown and described.

3. An annunciator constructed with a magnet-supporting shelf, in combination with magnets supported in holders affixed to said shelves, and armatures or armature-pawls pivoted on the said holders and depending before the edge of the shelf, whereby the said edge forms the stop to limit the retraction of the pawl, substantially as herein set forth.

4. In an annunciator, the screen-plate r, arranged before the magnets and armatures and behind the reading opening or window of the case, with tags arranged to project over in front of said screen when released, whereby the screen serves to conceal the general mechanism of the instrument, and affords a contrasting background, against which a fallen tag will conspicuously show, substantially as herein shown and described.



5. A pivoted annunciator-tag having a long arm formed with a tag-plate at one side of the pivoted axis, and a short arm at the opposite side of the axis, provided with counter-weights w, so proportioned as to dispose the center of gravity in the long arm near the axis, substantially as and for the purpose set forth.

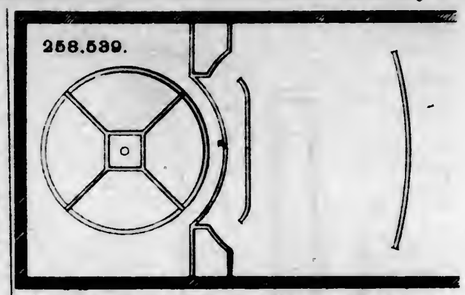
6. An annunciator constructed with a longitudinal shelf or bar and with magnet-holders, each carrying a magnet and its pawl-armature mounted in transverse rotation with said bar, with the pawls depending against the edge thereof, and with a means of fastening said holders in fixed position with an adjustment back and forth transverse to said bar, substantially as and for the purpose set forth.

7. A tag raising and setting device for annunciators, consisting of levers *s s*, pivoted at opposite ends of a series or row of tags, and a longitudinal bar, *x*, overlying or commanding said row, and fixed at each end to said levers, with projections on the pivotal arms of said tags disposed in the arc of motion of said bar, and with a manipulating device to sway one of the levers, *s*, and thereby sweep said bar toward the tags, substantially as and for the purpose set forth.

8. The combination, with two or more rows of annunciator magnets and tags, of a multiple raising and setting device consisting of levers *s s*, and bars *x x*, arranged substantially as set forth, and duplicated in each row with the coupling-links *v v*, connecting the succeeding series of bars and levers with the preceding, and with a common manipulating device to sway the first series, and thereby operate the whole, substantially as herein shown and described.

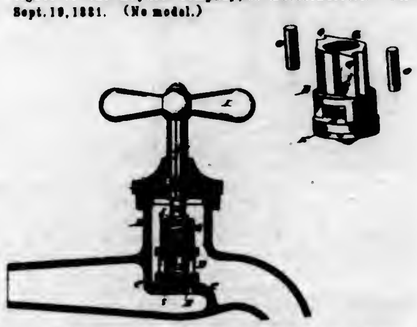
258,538. HYDRAULIC BRAKE. WILLIAM A. HYNDS, Scranton, Pa., assignor of one-half to S. N. Stetler, same place. Filed Mar. 23, 1882. (No model.)

Claim.—1. In a hydraulic brake, the combination, with the pump A, cylinder B, and tank C, of the pipes V, W, W', and Y, the valves Q, Q', and *z*, the safety-valve *e*, and its return-pipe *x*, the eccentric on the axle of the engine, the piston E, rod F, the toggles G and G', brake-shoes K, and the lever, arm, and link J N I, substantially as and for the purposes set forth.



2. In a hydraulic brake, the combination of the brake-shoes K, the toggles G', secured to the frame L by the hangers H, the toggles G, the angle-levers J, having rock-shafts or journals on the engine-frame, the arms N, links I, and rods F, and mechanism for operating them, substantially as specified.

3. In a hydraulic brake, the combination, with the pump A, cylinder B, and tank C, of the pipes V, W, W', and Y, the valves Q, Q', and *z*, the safety-valve *e*, and its return-pipe *x*, and the eccentric on the axle of the engine operating the pump, substantially as specified.

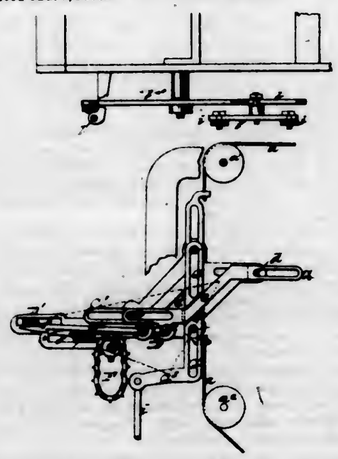


258,539. THEATER-STAGE. CHARLES A. NEEDHAM, New York, N. Y., assignor to himself and Elias P. Needham, same place. Filed Feb. 24, 1882. (No model.)

Claim.—1. The combination, with the proscenium of a theater, of a multiple stage provided with a vertical axis and arranged opposite the center of the proscenium, and adapted to be turned or rotated to bring different portions adjacent to the proscenium, substantially as described.

2. The combination, with the proscenium of a theater, of a multiple stage provided with a vertical axis and with radial vertical partitions arranged opposite the center of the proscenium, and adapted to be turned or rotated to bring different portions adjacent to the proscenium, substantially as described.

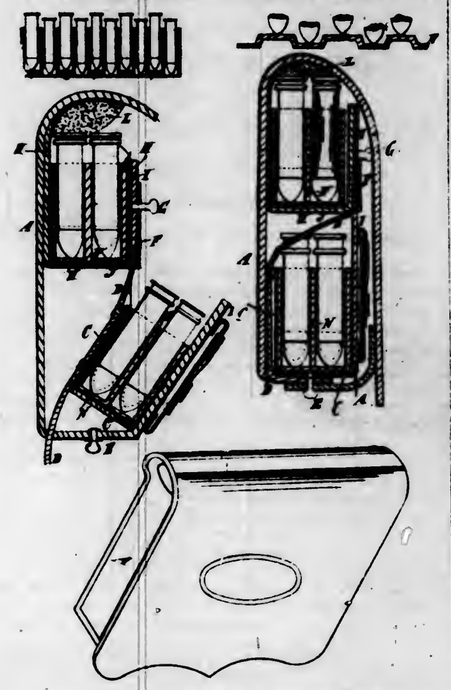
258,540. FAUCET. ARTHUR H. WHITING, Boston, Mass., assignor to the Hayden Company, of Massachusetts. Filed Sept. 19, 1881. (No model.)



Claim.—1. A faucet provided with casing B, having grooves P, in combination with a valve, D, having grooves Q and rods O, substantially as and for the purpose specified.

2. A faucet provided with a casing, B, having grooves P in its sides, in combination with a valve, D, having grooves Q and nut G, rods O, and spindle provided on the bottom with a screw-thread and adapted to reciprocate said valve without rotating it, substantially as and for the purpose specified.

REISSUES.

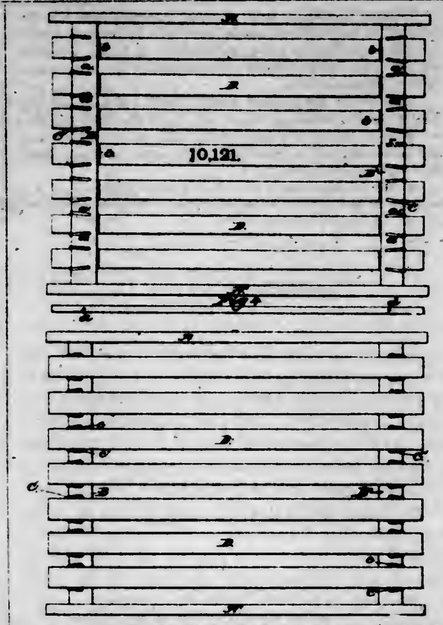


10,119. SHUTTLE-BOX MOTION FOR LOOMS. JOHN BARNES, Whittenton, Mass. Filed June 6, 1879. Original No. 211,126, dated Jan. 7, 1879.

Claim.—1. The combination of the vertically-sliding bars G, provided with angular arms G², the horizontally-sliding bars G', having the jacks G³ jointed thereto, and their actuating mechanism, the lever *i'*, and connecting-rods *i*, with the end-slotted lever *l*, the pivot-link, swiveled clamp-nut, and the shuttle-box rod *l'*, as and for the purpose specified.

2. The combination, with the vertically-sliding bars G, provided with angular arms G², and having inclined recesses midway of their length, and formed with seats *e'*, of the horizontally-sliding bars G', having the inclined middle portions, *e*, the jacks G³, jointed to said bars G', and operating mechanism, substantially as and for the purposes set forth.

10,120. CARTRIDGE-BOX. FELIX GRILLENWORTH, New Haven, Conn., assignor to Andrew H. Leslie, Chicago, Ill. Filed Sept. 28, 1881. Original No. 91,419, dated June 15, 1869.



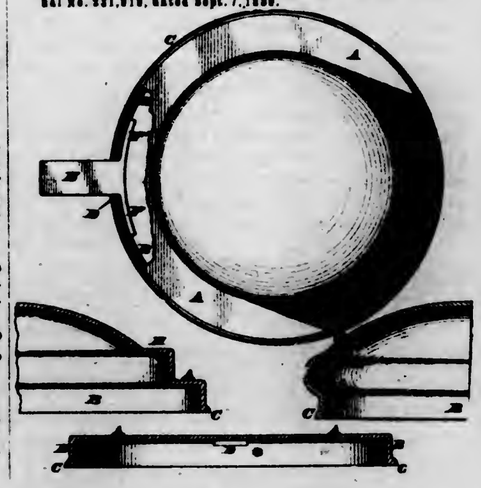
Claim.—1. A cartridge-box comprising the combination of a box or case which may be opened at the front, an upper compartment, and a lower compartment adapted to be tilted forward just beyond the upper compartment to facilitate the extraction of cartridges therefrom without endangering their falling out and while both compartments are in said box or case, substantially as specified.

2. A cartridge-box comprising the combination of an upper compartment, a lower compartment adapted to be tilted forward just beyond the upper compartment to facilitate the extraction of cartridges therefrom without endangering their falling out, and means for limiting the forward tilting movement of said lower compartment and supporting it in its tilted position, substantially as specified.

3. A cartridge-box having two compartments, C and H, one above the other, the lower one of which is hinged at A and operated by means of the strap D, all constructed and operating substantially as herein described and set forth.

4. A cartridge-box containing the compartments C and H, the lower being hinged at A, the strap D, buttons E G, flap-lining L, and openings for said strap D.

10,121. SPRING BED-BOTTOM. OTIS HOWE, Cambridgeport, Mass., assignee of Tyler Howe and of Lovinda Fulton, Administratrix of said Tyler Howe, deceased. Filed Mar. 1, 1882. Original No. 160,408, dated Mar. 1, 1870.



Claim.—1. The described spring bed-bottom, composed of the frame or rails A A, the two cross-bars B B', the two series of springs C C, formed as described, and the series of slats C', arranged and applied together substantially as hereinbefore specified.

2. In a spring bed-bottom, the rails A and cross-bars B B', and slats D, provided with holes or sockets *d* at each side near their ends, combined with a series of slat-supporting springs having journals or supports *c c'* at their ends or extremities, and adapted to be sprung into the holes or sockets in the sides of and support the said slats, substantially as and for the purpose described.

3. The slat-supporting springs bent to embrace and be held in place by the cross-bars, and having their ends or extremities turned toward each other to form journals or supports to be sprung into sockets in the edges of and support the slats, substantially as described.

10,122. FLYING TARGET. GEORGE LIGOWSKY, Cincinnati, Ohio, assignor, by mesne assignments, to Ligowsky & Co., same place; said Ligowsky & Co. assignors to the Ligowsky Clay Pigeon Company, same place. Filed Aug. 16, 1881. Original No. 231,818, dated Sept. 7, 1880.

Claim.—1. A flying target concave in general form, and provided with a flat peripheral tongue, wherewith the device is applied to the jaw or clamp of a trap, substantially as herein described, said flat tongue being separate and distinct from the target proper, for the purpose set forth.

2. A fragile flying target concave in general form and provided with a flat peripheral tongue, wherewith the device is applied to the jaw or clamp of a trap, substantially as herein described, said flat tongue being separate and distinct from the target proper, for the purpose set forth.

3. The combination of the slotted concave flying target A B D and flat detachable tongue E F F', as and for the purpose described.

4. A concave or dish-shaped flying target composed of a suitable fragile material, and slotted at its periphery to receive a flat tongue, said target having a strengthening-rim, C, at the margin of its flange B, as and for the purpose herein described.

5. A flat tongue projecting from the periphery of a flying target, for the purpose of enabling the latter to be thrown in the manner herein described, said flat tongue being separate and distinct from the target proper, as set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

LINDSAY *v.* STEIN.

Decided February 24, 1882.

1. PATENT NO. 202,735—SLEEVE-SUPPORTERS—PATENTABILITY—DOUBLE USE.

The invention described in Letters Patent No. 202,735, for an improvement in sleeve-supporters, which consists of two of the clasps described in No. 156,439, one being at each end of a connecting web or strap, is not merely a duplication of the clasp or a new application thereof. As a structure the two clasps with the uniting-strap will do what one clasp, or one clasp with an attached webbing, cannot do, and involved invention beyond what the clasp alone indicated.

2. SECTION 4894 REVISED STATUTES—APPLICATION, NOT INVENTION, ABANDONED.

Section 4894 Revised Statutes, which provides that upon failure to prosecute an application within two years after action is had thereon by the Patent Office it shall be regarded as abandoned, refers to the application, not the invention, and does not prevent a subsequent application for the same invention.

3. SAME—SAME—SECOND APPLICATION INDEPENDENT.

Such second application when made can derive no aid as to time from the prior abandoned application, and the applicant must stand as to defences in suits on the patent as if the new application were the first application.

Messrs. Munson & Philipp for the plaintiff.
Mr. J. B. Staples for the defendant.

BLATCHFORD, *J.*:

This suit is brought on Letters Patent No. 202,735, granted to the plaintiff April 23, 1878, for an improvement in sleeve-supporters.

Some time in 1873 the plaintiff invented a clasp. He applied for a patent for it on the 31st of August, 1874, and obtained a patent for it, No. 156,439, November 3, 1874. The specification of that patent speaks of the clasp as one "for stocking-supporters or various other articles of wearing-apparel." The clasp is composed of two jawed levers pivoted together and a spring arranged between them. The tail of each jaw-lever is made concavo-convex in transverse section, the lower lever with its jaw being extended within the upper lever and its jaw. At the place of connection of the two levers the lower one is punched inward on its flanks, so as to form two concavo-convex teats or projections. The spring is shaped or made of wire, and has an eye which is slipped upon the two teats, after which the upper jaw-lever is arranged with respect to the spring and the lower jaw-lever in proper position, and then is punched inward on its flanks, so as to enter the two teats, and thus the two levers are connected and pivoted together. The levers cover and protect the spring, and, as the specification says, prevent it "from being caught in the stocking or clothing" and from moving laterally or getting out of place. The specification says that each of the jaws may be notched or provided with teeth in its opposite edges, and that, by having the jaws of the lower lever close into the concavity of the jaw of the upper lever, a much better hold of the "material or stocking" will be secured than when the jaws abut together at their edges. The tail of the upper lever has a slotted head, which is projected from the tail in such manner that its flanks, in case the clasp is pressed "against the leg of the wearer, may bring up against it in a manner to prevent" the tail of the lower jaw from being accidentally moved inward, so as to open the jaws sufficiently to cause them to let go their hold "on the stocking;" and "the slotted head is also to enable the clasp to be attached to a strap of a stocking-supporter."

The claim of No. 156,439 is this:

The clasp composed of the levers provided with the operative spring, pivoted together by means of the indentations as described, and made with concave-convex jaws and tails, and with the one jaw to close within the concavity of the other, all substantially as specified.

In January or February, 1874, the plaintiff invented the sleeve-supporter afterward patented by No. 202,735. It consisted of two of the clasps described in No. 156,439, one being at each end of a connection, either elastic or non-elastic. No. 202,735 describes the supporter as one "for the sleeves of shirts and other garments." It is applied to the sleeves in a direction longitudinal with the arm, "thereby avoiding the compression and consequent interference with the free circulation of the blood incident to that class of supporters which partially or entirely encircle the arm." One clasp grasps a fold of the lower part of the sleeve to be supported, while the other clasp grasps a fold of the upper or supporting portion of the sleeve, the lower portion of the sleeve being drawn up to the desired distance before attaching the second clasp, the intermediate portion between the two clasps being drawn up into folds by that operation. The specification disclaims—

A garment-supporter consisting of an elastic strap and two tongued plates attached to its ends, the tongues being made to enter holes in the garments and being afterward clinched down thereon.

It also says:

My improved supporter simply grasps the sleeve, and does not go into or through it, and consequently, in detaching the supporter therefrom it does not require to be pulled lengthwise, and thereby causes undue strain, which tends to tear the sleeve. Nor does my supporter require cuts or holes to be made in the sleeve to receive it, as is usually the case with garment-supporters.

The claims of No. 202,735 are two, as follows:

1. The improved method of supporting or shortening the sleeves of shirts and other garments without compression, to avoid interference of the free circulation of the blood of the wearer incidental to the use of constricting bands, by means of a holder, consisting, essentially, of a short piece of elastic or non-elastic webbing, provided at each end with an automatic clasping device applied to the sleeve in the direction of its length, substantially as described and shown.

2. As a new article of manufacture, a sleeve-supporter consisting of the strip B, provided at its ends with the clasping-jaws A A, all combined and adapted for use substantially as described.

The plaintiff, after making one of these supporters in January or February, 1874, showed it to other persons, and illustrated its use at that time, and used it himself satisfactorily in March or April, 1874. He made a second supporter of the same structure in September, 1874, as a model for an application for a patent. His application was filed in the Patent Office complete October 28, 1874. The specification was sworn to October 20, 1874. The drawings were substantially the same as those in No. 202,735, and the description was to the same effect. The claim was substantially like claim 2 of No. 202,735. The spring closes the jaws, and they are opened by pushing the tails of the jaws toward each other against the action of the spring, the tail of the lower jaw projecting downward. This application was rejected November 9, 1874, on the ground that it did not involve invention in view of No. 156,429 and of a patent to Langford and one to Boughton. On December 26, 1874, amendments were filed. One, to obviate the Boughton patent, disclaimed a supporter consisting of an elastic strap and two hooked plates fixed to its ends, the hooks "being to enter a garment." Another disclaimed either of the clasps separate from the strap. The amendments were considered, and on January 2, 1875, the application was again rejected in view of the same references. Nothing more was done till April, 1878. On the 9th of April, 1878, a new application was filed complete with a new petition, oath, specification, drawing and model, and a new fee. The oath was made April 5, 1878. On the 11th of April, 1878, the application was rejected, as being "found to be lacking in patentable novelty, in view of the state of the art," because the clasp was old, as seen in No. 156,429, and because—

Suspending-straps composed of an elastic band with a clasp, buckle, or other adjusting device on each end are also old, and therefore in the present instance the alleged invention is but the mere substitution of one old clasp in the place of another upon the ends of the strap, and is not deemed an invention.

Reference was made in the letter of rejection to Patent No. 88,984 to Robbins; and to patents to Gibbons, Church, and Eames, and Philbrook. On the 11th of April, 1878, after said rejection, amendments were made, making the specification and claims exactly as they are in No. 202,735.

The application was rejected again, on the 13th of April, 1878, on the same references and on a patent to Sanford; but on the same day the patent was ordered to be issued.

It is contended for the defendant that No. 156,429 contains everything that is found in No. 202,735; that there was no invention involved in passing from the clasp to the structure with one of the clasps at each end of it, and that the case is one of mere duplication or double use, or, at least, of merely a new application of the clasp. It is quite apparent from the evidence that the clasp was applicable and was applied for use by being attached to one end of a piece of elastic and then fastened to a stocking to hold it up, the other end of the elastic being fastened by a button or other device to another garment above. Large numbers of the clasps were made and sold and used in that way. The plaintiff, almost simultaneously with his invention of the clasp, capable of such separate use, invented the supporter consisting of the two clasps and the connecting-strap. The latter invention was completed before he applied for the patent for the former. In that application he might have covered the supporter and also claimed the clasp separately, and one patent might have embraced both. The supporter is not merely a new application of the clasp; it is something more. As a structure the two clasps with the uniting-strap will do what one clasp or one clasp with an attached webbing cannot do. It is an article complete in itself, capable of use at any place without any appliance except what it contains, and of being moved from one place to another without any previous special preparation of the garment to receive it. It involved invention beyond what the clasp alone indicated.

The specification of No. 202,735 is criticised as being obscure and as not pointing out what invention is claimed. The first claim is properly to be construed as a claim to using the structure described, consisting of material with the clasp described, or its substantial equivalent, at each end, when such structure is applied to the sleeve in the direction of its length. There is no valid objection to this claim. The article can be used otherwise than lengthwise of the sleeve. The second claim is for the article irrespective of the manner in which it is used. The first claim may be unnecessary, and there may be little practical difference between the two claims; but the claims sufficiently point out the inventions, and they are patentable.

By section 12 of the act of March 2, 1861, (12 U. S. Stats. at Large, 248,) it was enacted as follows:

All applications for patents shall be completed and prepared for examination within two years after the filing of the petition, and in default thereof they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable.

By section 32 of the act of July 8, 1870, (16 Id., 202,) it was enacted as follows:

All applications for patents shall be completed and prepared for examination within two years after the filing of the petition, and in default thereof or upon failure of the applicant to present the same within two years after any action therein, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner that such delay was unavoidable.

This section is substantially re-enacted in section 4894 of the Revised Statutes, approved June 22, 1874, the only change being that the words "the filing of the petition" in section 32 are altered to the words "the filing of the application" in section 4894.

On comparing section 32 of the act of 1870 with section 12 of the act of 1861 it is seen that a material change was made by the addition in section 32 of the words "or upon failure of the applicant to prosecute the same within two years after any action therein." The effect of the addition was that when an applicant for a patent should make an application and complete it for examination, and the Patent Office should take action upon it and reject it and notify him of such action, and he should fail to prosecute it within two years after such rejection, it should be regarded as abandoned, so that it could not be resumed and prosecuted further after the lapse of such two years, unless it should be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable. It is not the invention which should be regarded as abandoned, but the application. In the present case the application of October 28, 1874, was rejected a second time, January 2, 1875. That application was never prosecuted at all after that. More than two years elapsed, and in December, 1877, the plaintiff employed new attorneys and

gave them a power of attorney, and revoked the power of attorney given to his former attorney. A paper to that effect was filed in the Patent Office December 17, 1877, in the files of the first application. The new attorneys, with the whole matter before them, advised the plaintiff that he had better make a new application. They did this unquestionably because they saw that they could not show to the satisfaction of the Commissioner that the delay beyond two years from January 2, 1875, was unavoidable. The new application was made complete April 9, 1878.

The defendant contends that the effect of the act of 1870 is that when an application is under section 32 to be regarded as abandoned no new application for a patent for the same thing can be subsequently made. There is nothing to prevent a subsequent application. When made it can derive no aid as to time from the prior abandoned application, and the applicant must stand as to defenses in suits on the patent as if the new application were the first application. Therefore, as applied to the present case, the words "two years prior to his application" in section 4886 of the Revised Statutes, and the words "two years before his application for a patent" in section 4920, must mean two years before April 9, 1878, so that No. 202,735 will be invalid if the inventions covered by it were in public use or on sale in this country for more than two years before April 9, 1878. The decisions of the courts under the statutory provisions before that in section 32 of the act of 1870 in regard to the continuity of an application once made can have no application to a case like the present, in view of the express provision of section 32. An application which is to be "regarded as abandoned" must be regarded as abandoned by the Commissioner and the courts, and if it is to be regarded as abandoned it cannot be regarded as subsisting for the purposes of sections 4886 and 4920. The cases of *Singer* v. *Braunsdorf*, (7 Blatchf. C. C. R., 521;) *Blandy* v. *Griffith*, (3 Fisher's Pat. Cases, 609;) *Howes* v. *McNeal*, (15 Blatchf. C. C. R., 103;) *Godfrey* v. *Eames*, (1 Wallace, 317,) and *Smith* v. *Goodyear Dental Vulcanite Company*, (3 Otto, 486,) arose under statutory provisions enacted before the act of 1870, and can have no application to the present case.

It is argued for the plaintiff that as No. 202,735 was granted on the second application for the same invention that was claimed in the first application, it must be presumed that the Commissioner had before him evidence showing that the delay in prosecuting the first application was unavoidable. This would be so if in fact the Commissioner had allowed the first application to be prosecuted further. But he did not. It was the application of April 9, 1878, that was rejected April 11, 1878, and granted April 23, 1878, and No. 202,735 was issued on that application, as appears on its face and by the records of the Patent Office.

The defenses of want of novelty and of public use and sale of the invention for more than two years before the application for the patent are urged by the defendant. The latter defense is not set up in the answer, but the plaintiff appears desirous of having it considered under the proofs.

There is no satisfactory evidence that the plaintiff, either by himself or by his agents, allowed his sleeve-supporter to be in public use or on sale at any time prior to two years before April 9, 1878, or that a structure substantially like his was in public use or sale at any time prior to two years before April 9, 1878. The date of any sale by Taylor Brothers cannot be fixed earlier than January, 1877. There was no sale by Shelby before the last part of 1876. The Thomas transaction was in May, 1876. The evidence as to sales by Rollins does not show beyond a reasonable doubt that such sales were made before April 10, 1876.

Defendant's Exhibits Nos. 1 and 2 are arranged to penetrate or pass through at one end one portion of the article to be supported, while at the other end are loops or hooks to pass over or around buttons or some other previously-arranged attaching means formed upon the garment. Defendant's Exhibits Nos. 3 and 16 have no hinged jaws, and require a further shortening of the garment to allow of attaching or disengaging the wires, and the device is liable to lose its hold, and cannot seize the margin of a garment. Defendant's Exhibit No. 21 is the patent to Robbins, No. 88,984, and Defendant's Exhibit No. 5 is a garter made according to that patent in part. They show devices the structure of which is such as to necessitate the penetration of the garment at each end of the webbing by the devices.

The Robbins patent is the only one of the prior patents referred to by the Patent Office (except No. 156,429) which has been put in evidence by the defendant. It shows two like devices at each end of a piece of webbing. It is of the date of 1869. But the existence in it of identity between the fastening devices at each end of it does not, in view of the evidence as to the invention by the plaintiff of the clasp and of the supporter and of the characteristic features of the supporter, show a want of patentability in the invention of the supporter. The Ellis patent, No. 137,539, requires a button at one end of the device. The Core patent, No. 55,064, has no clamping-jaws and no webbing with holding means at each end of it. The Kendall or Vail patent, No. 61,011, has no clamping-jaws on each end of a strap of webbing.

Defendant's Exhibit No. 22, the *Demorest* book, is not proved as to its date of publication and is not set up in the answer. Independently of this it is not clear what the thing shown in it is or how such thing is to be used. From what can be made out it is liable to the same objections as Defendant's Exhibit No. 3, requiring the fabric to be forced into a narrow opening and requiring increased shortening to free the fabric, and having no clamping-jaws. As to the exhibits Furness and Furness No. 3, no original article actually made more than two years before April 9, 1878, is produced. The question as to the time when any sleeve-supporters of the kind were made and sold rests wholly on the unaided memory of Mr. Furness, and in view of all the evidence it must be held that the defense as to the Furness sleeve-supporter is not established. Irrespective of this it is not at all clear that the Furness exhibits embrace the plaintiff's invention or will practically accomplish the results which the plaintiff's supporter will accomplish. None of the prior articles or patents anticipate the invention of the plaintiff, and none of the defenses considered are established.

It appears that the patented article is one of great utility, and has found a ready market as compared with any prior structures. Under the plaintiff's authority from eight hundred and fifty thousand to one million one hundred and fifty thousand pairs of his

supporters have been sold during 1878, 1879, and 1880, and there have been infringements. The article combines these points of advantage: it does not compress the arm; it does not require adjustment of length for arms of different sizes; it does not require previous preparation of the garment by putting on buttons or making eyelet-holes at either end; it can be used to support cuffs and stiff articles on their edges; it can be applied by one hand; it is secured without perforating the garment; it is not pulled off by a slight strain; it does not require to be pulled lengthwise to release its hold; it has superseded older articles and is largely recognized by the public and licensees as a useful invention. All these matters are very persuasive in favor of its patentability. (*Smith* v. *Goodyear Dental Vulcanite Company*, 3 Otto, 486, 495.)

The defendant has sold two structures, No. 1 and No. 2. No. 2 is identical with the plaintiff's in all substantial particulars. It is a sleeve-supporter formed of a short piece of elastic webbing with a clasp at each end. Each clasp is composed of two jawed levers pivoted together, with a spring between them, which closes the jaws automatically, and the jaws are opened by pressing together the tails of the levers. Each jaw has across its end teeth or projections which take into corresponding indentations in the end of the other jaw. This construction is an equivalent construction for the closing of the lower jaw within the upper jaw, as shown in No. 156,429 and in the drawings of No. 202,735. The bending of the fabric, in the one case transversely and in the other case longitudinally, assists in holding it, though it by no means follows that No. 202,735 would not be infringed if the clasps had flush meeting edges in the jaws with a spring or means of holding them together sufficiently powerful. No. 1 is a sleeve-supporter having at each end of a piece of elastic webbing a clasp made of two jaws of springy metal, the end of each of which is a lip projecting toward the other jaw, one lip shutting inside of the other and the ends of the lips not meeting. There is a slide inclosing the shanks of the two jaws, and the bite is made by sliding the slide toward the lips, which forces the lips together. Sliding the slide in the reverse direction allows the jaws to open, which they do by their springy action, they being set to stand open unless made to shut. They shut against the action of the spring, while in the plaintiff's form the clasp opens against the action of the spring.

The form of clasp in No. 1 is substantially the clasp shown in the Ellis patent, No. 137,539, granted April 8, 1873. But that patent shows that Ellis contemplated the use of only one clasp, and that at the top of a stocking, while above the supporter was to be attached by a button to a waistband. No. 1 has all the points of advantage of the plaintiff's structure. It has an automatic clasping device at each end, consisting of clamping-jaws, and the structure as a whole and in its parts, and in their co-operation to effect the result produced by the whole, is the equivalent of the plaintiff's structure. The change in the springy action, to hold open instead of to hold shut, is immaterial in regard to the action of the structure as a whole. There was nothing in the Ellis clasp by itself to indicate the plaintiff's supporter, or No. 1, any more than there was anything in the plaintiff's clasp by itself to indicate the plaintiff's supporter, or No. 2.

On the foregoing considerations it must be held that both No. 1 and No. 2 infringe the second claim of No. 202,735, and there must be a decree to that effect and for an account of profits and damages with a perpetual injunction and costs to the plaintiff.

Supreme Court of the United States.

MELLON *et al. v.* THE DELAWARE, LACKAWANNA, AND WESTERN RAILROAD COMPANY.

Decided April 3, 1882.

LICENSE ALLEGED TO HAVE BEEN DELIVERED AS AN ESCROW—BURDEN OF PROOF.

Where a license executed by the complainant is in the possession of the defendant and is produced by it on the trial, and on its face is absolute and without any limitation or condition, the burden of proof is upon the complainant to show that it was delivered as an escrow.

APPEAL from the Circuit Court of the United States for the Western District of Pennsylvania.

Mr. Furman Shepard and *Mr. H. T. Fenton* for the appellants.

Mr. Justice WOODS delivered the opinion of the Court.

The bill charged infringement of letters patent dated October 2, 1866, granted to Edward Mellon, one of the complainants, for an improvement in the mode of attaching tires to wheels of locomotives. Mellon had assigned a one-half interest in his letters patent to William Matthews, and they two were joined as complainants.

The defendant pleaded that while Mellon was the sole owner of the patent, to wit, on May 15, 1867, he had, for a valuable consideration, granted a license in writing to the defendant for the full term of the patent to use the improvement described therein upon all its locomotives, locomotive-tires, and wheels. The complainants took issue on this plea. The circuit court heard the cause upon the pleadings and evidence and dismissed the bill. The appeal of the complainants has brought up the case for our consideration. To support the issue on its part the defendant produced a license in writing, signed and sealed by Mellon, dated May 15, 1867, which, its execution being admitted by Mellon, proved every allegation of the plea. The appellants asserted, however, that the license had been delivered as an escrow to John Brisbin, the president of the appellee, in order that he might present it at the next meeting of the board of directors of the company, and if the board consented to pay and did pay thirty-five hundred dollars for the license, it was to take effect, otherwise not; and that nothing whatever had been paid for it. The appellee denied this, and asserted that the delivery was upon a valuable consideration received by Mellon, was absolute, and without condition or reference to any future contingency.

As the license is in the possession of appellee and is produced by it on the trial, and on its face is absolute and without any limitation or condition, the burden of proof is upon the appellants to show that it was delivered as an escrow. The only evidence to maintain their side of the controversy is the deposition of Mellon. On the part of the appellee is the testimony of Brisbin, its president, to whom the license was delivered. His deposition contains a direct and explicit denial of the testimony of Mellon in reference to the delivery of the license, and he is corroborated by the evidence of another witness, who was superintendent of the rolling stock of the appellee at the time the license was delivered.

The case turns upon a single question of fact. The burden of proving that fact is on the appellants, but the weight of the evidence is with the appellee.

The decree of the circuit court dismissing the bill was right, and must be affirmed.

9,424.—PLUG AND TWIST TOBACCO, SMOKING-TOBACCO, CIGARS, AND CIGARETTES.—*Thomas C. Williams & Co.*, Richmond, Va. Application filed May 3, 1882.

"The words 'LUCY HINTON.'"

9,425.—CIGARETTES.—*S. Jacoby & Co.*, New York, N. Y. Application filed April 14, 1882.

"The representation of the two hands, the one box, the cigarette, and the flame, in the order described."

9,426.—PERIODICAL.—*James Lefel & Co.*, Springfield, Ohio, and New York, N. Y. Application filed February 4, 1882.

"The words 'MECHANICAL NEWS.'"

9,427.—SHIRTS.—*The Morley Manufacturing Company*, Newark, N. J. Application filed May 4, 1882.

"The word 'ENIGMA.'"

9,428.—VANILLA-CHOCOLATE.—*Henry L. Pierce*, Boston, Mass. Application filed April 19, 1882.

"The words 'W. BAKER & Co.'s,' together with the figures of the cupids supporting wreaths, the bust, and the medals, as shown and described."

9,429.—ILLUMINATING-OIL.—*Scofield, Shurmer & Teagle*, Cleveland, Ohio. Application filed May 1, 1882.

"The word 'PALACINE.'"

9,430.—OILED CLOTHING.—*Abner J. Tower*, Boston, Mass. Application filed May 3, 1882.

"The representation of a fish."

LABELS.

2,685.—Title: "CONDENSED MILK ANGLO-SWISS CONDENSED MILK CO. CHAM, SWITZERLAND. PREPARED IN AMERICA."—*Anglo-Swiss Condensed Milk Co.*, Middletown and New York, N. Y. Application filed May 8, 1882.

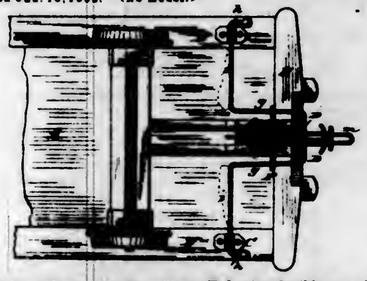
2,686.—Title: "DR. BRACK'S TOILET AND LAUNDRY SOAPS."—*M. W. Brack*, Hardin Springs, Ky. Application filed April 27, 1882.

2,687.—Title: "THE WORLD'S CATARRH CURE."—*James C. Davidson* and *Calvin C. Davidson*, Denver, Colo. Application filed April 13, 1882.

2,688.—Title: "PHENOL MOUTH WASH."—*Owens & Minor*, Richmond, Va. Application filed April 17, 1882.

2,689.—Title: "POWELL'S LOOSE MATCH AND SQUIB, FOR MINERS USE."—*John R. Powell*, Plymouth, Pa. Application filed May 1, 1882.

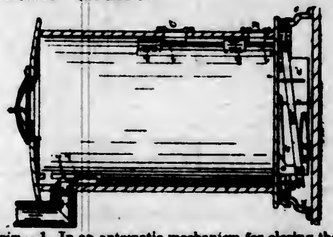
2,690.—Title: "BEEF, IRON & RYE."—*Thomas Scott*, Brooklyn, N. Y. Application filed April 21, 1882.



2,691.—Title: "BAKING POWDER."—*John A. Tolman & Co.*, Chicago, Ill. Application filed February 27, 1882.

2,692.—Title: "ORIGINAL TEXAS TOLU CHEWING GUM."—*Benjamin Ward*, Mobile, Ala. Application filed May 8, 1882.

PATENTS

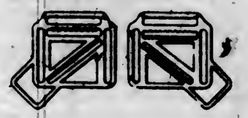


GRANTED MAY 30, 1882.

258,541. CAR-COUPLING. JAMES H. BAILEY, Pittsburg, Pa. Filed Jan. 18, 1882. (No model.)

Claim.—The combination of lever D, having flexible arms d d, and weighted arms b b, and lifting-point b, pivot c, yoke F, and buffer-head of railway-car, substantially as herein described.

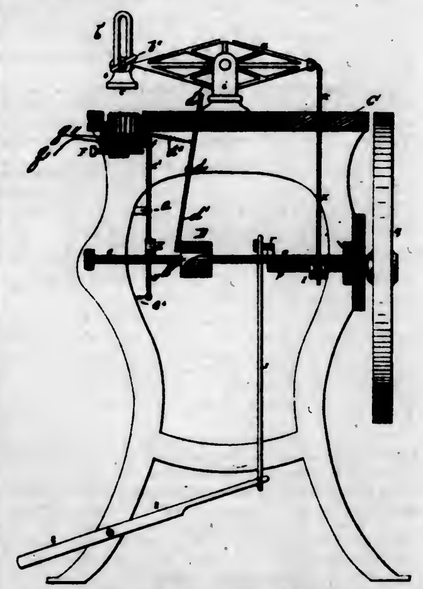
258,542. CAR-STOVE. WILLIAM H. BALDWIN, Chicago, Ill., assignor of one-half to Henry C. Whitney, same place. Filed Apr. 10, 1882. (No model.)



Claim.—1. In an automatic mechanism for closing the apertures in a railway heating-stove, the combination of the frame a', the bar I, the rods e, the slides d, the latch i, the spring G, the lever F, and the chain or rod f, attached to the staple e, arranged in the manner and operating substantially as set forth.

2. The bar I, attached to the frame a', held in position by the lever F, in combination with the rods e e, and the slides d d, and the latch i, and corresponding catch on the lid, substantially as set forth and described.

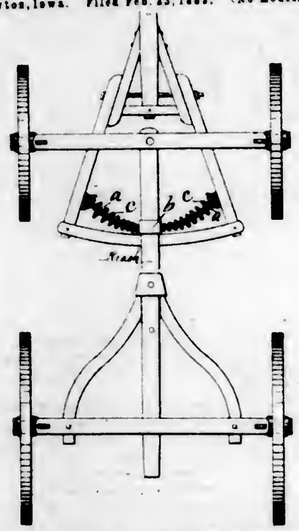
3. The slides d d, and the latch i, operated by the spring G, the rod or chain f, attached to the fixed staple e, the lever F, and the bar I, arranged and operating in the manner substantially as set forth.



258,543. HALTER. EDWARD BARNARD, Rome, N. Y., assignor of one-half to Henry C. Maxwell, same place. Filed Feb. 11, 1882. (No model.)

Claim.—1. In a halter, corner-pieces provided with vertical end slots, horizontal slots, and an inclined slot, provided with a biting-edge to retain the halter-strap, substantially as and for the purpose set forth.

2. In a halter, a corner-piece provided with a vertical slot at each end, an outer and an inner horizontal slot, the latter being provided with a biting-edge, and a diagonal slot arranged between the said vertical slots, substantially as and for the purpose set forth.

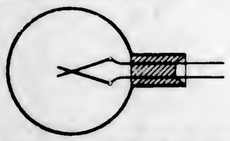


258,544. ADDRESSING-MACHINE. WILLARD W. W. BELKNAPP and GEORGE H. ROSILLARD, Brighton, N. Y. Filed June 16, 1881. (No model.)

Claim.—1. In an addressing-machine, the combination of the main shaft c, provided with the crank l, cam D, and eccentric E, with rod K, walking-beam a, adjustable impression-block b, delivery-lever d', spring d'', feed-lever e', spring e'', and galley-bed f', and ratchet f, substantially as shown and described.

2. In an addressing-machine, the combination of the main shaft c, provided with the roll D, having the peripheral groove d''', straight upon one side and curved upon the other, as shown, with the pivoted lever d', the lower end of which is spring-pressed against the end of roll D and into the groove d''', and the upper end of which lever is extended through and above the table C, whereby said upper end of said lever is at each revolution of the shaft c, by the action of the spring, caused to suddenly remove the printed wrapped paper, as shown and described.

258,545. RUNNING-GEAR FOR WAGONS. ISAAC E. BASSETT, Newton, Iowa. Filed Feb. 23, 1882. (No model.)

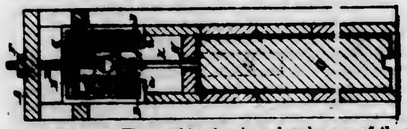


Claim.—1. A governing attachment for wagons, consisting of a curved bar, a spring or springs, and a loop or fastening device for connecting the complete device to a wagon-reach, arranged and combined relative to each other and the running-gear of a wagon, substantially as shown and described, to operate in the manner set forth, for the purposes specified.

2. The combination of springs with the bounds of the front carriage of a wagon and a reach fixed to the rear carriage, and pivoted to the axle of the front carriage, substantially as shown and described, to operate in the manner set forth, for the purposes specified.

3. The combination of the bar *a a*, fixed to the bounds of the front carriage of a wagon, the loop *b*, the springs *c c*, and a wagon-reach, substantially as shown and described, for the purposes specified.

258,546. ELECTRIC INCANDESCENT LAMP. EMILE BERLINER, Boston, Mass. Filed Mar. 31, 1882. (No model.)



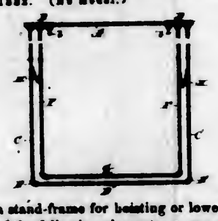
Claim.—1. An electric lamp consisting of two electric carbons in loose contact with one another and inclosed in a transparent or semi-transparent vacuous chamber.

2. An electric lamp consisting of two conductors overlapping and in loose contact with one another and inclosed in a vacuum.

3. In an electric lamp, a vacuous chamber containing a conductor consisting of elastic carbon, as described, and in loose contact with another conductor, substantially as described.

258,547. DOOR-HANGER. WILBUR F. BERRY, Martinsburg, W. Va. Filed Dec. 7, 1881. (Model.)

Claim.—1. The combination, in a door-hanger, of the vertically-adjustable box B, having an open bottom, the rails D D, rigidly applied to the inner sides of the said box, the double sheaves G G, mounted on the said rails, the hanger-rods, and the door-plates, substantially as and for the purposes specified.



2. The combination, in a door-hanger, of the two flanged sheaves G G, each having beveled or inclined perimeters, and the correspondingly-beveled rails D D, substantially as and for the purposes specified.

3. The combination, in a door-hanger, of the headed-screw bolts E E, the plates or irons C C, the hollow box B, having an open bottom, the rails D D, and the nuts F F, substantially as and for the purposes specified.

4. The combination, in a door-hanger, of the hollow block H, having spindles on its sides and a circular opening, *b*, the sheaves G G, mounted on the said spindles, the hanger-rod K, and a semi-circular nut, J, run upon the said rod and arranged in the opening *b*, substantially as and for the purposes specified.

5. The combination, in a door-hanger, of the right and left screw-threaded hanger-rods K K, the plates L and L', adapted for attachment to the outside of the door, and having therein screw-holes to receive the lower ends of the said rods, and the sheaves G G, adjustably connected to the upper ends of the said rods by means of male and female screws working oppositely from those at the lower end thereof, whereby a simple turn of the said rod will adjust the door vertically to an extent greater than if the screw-threads on the said rods both run in the same direction, substantially as specified.

258,548. STAND-FRAME FOR HOISTING. WILLIAM S. BLUNT, New York, N. Y., assignor to Catharine S. Blunt, same place. Filed Apr. 28, 1882. (No model.)

Claim.—In a stand-frame for hoisting or lowering purposes, the combination of the following elements: a screw-threaded rod, A, the T's B, the upright rods C and F, the right-hand and left-hand elbows E, and the bottom rods, D and G, the same being constructed and operating substantially as and for the purposes set forth.

258,549. INSULATING MATERIAL FOR ELECTRICAL CONDUCTORS. FRANÇOIS BOREL, Cortaillod, Switzerland, assignor to the Société Anonyme de Câbles Électriques, (Système Berthoud, Borel & Cie.,) Paris, France. Filed Apr. 15, 1882. (No specimens.) Patented in France Mar. 4, 1882, in Germany Mar. 15, 1882, and in England Mar. 29, 1882.

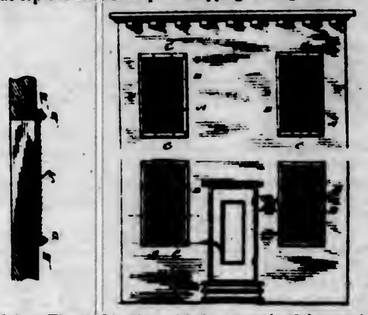
Claim.—1. As an insulating material or ingredient in insulating compounds, siccative oil—such as linseed-oil—transformed by heat into a solid body, substantially as described.

2. The combination, with siccative oil—such as linseed-oil—transformed into a solid by heat, of a resinous matter—such as colophony—substantially as described.

258,550. CAR-COUPLING. PATRICK H. BRACKLIN, Davenport, Iowa. Filed Nov. 26, 1881. (Model.)

Claim.—1. The recessed draw-head having the fulcrum-lips *c*, enlarged link-recess E, pin-passage G, extending vertically through the front portion of the link-recess, the recess H, for the dog in rear, and the bridge or partition *a*, separating said passage from the lower portion of the latter recess, substantially as specified.

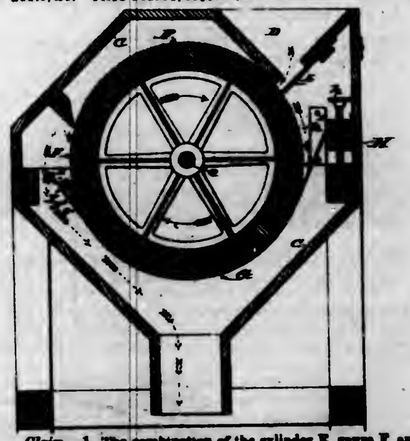
2. The combination, with the draw-head A, having the fulcrum-lips *c*, enlarged link-recess E, and the bridge or rest *a*, of the gravitating dog having the rear pivot, *l*, lateral arms *z*, and angular head R, substantially as specified.



3. In a draw-head, the combination, with the fulcrum-lips *c*, pin-passage G, and the recesses for the link and dog, of the pivoted dog, its top rest, *r'*, face *e*, short under lip, *t*, and handles *z*, substantially as specified.

4. In a recessed draw-head, the pivoted gravitating dog having the pin-rest *r*, the face *e*, and the short under lip, *t*, at right angles, or nearly so, with said face.

5. The combination, with the fulcrum-lips *c* of the draw-head and the dog K, having the short under lip, *t*, of the pin V and link W, substantially as specified.



258,551. PERMANENT WINDOW-SCREEN. JOHN H. BRADFORD, Belleville, Kans. Filed Mar. 23, 1882. (No model.)

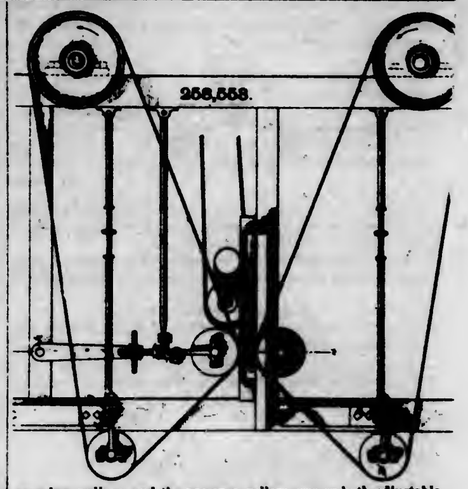
Brief.—The edges of the netting are held by metallic U-shaped strips, the top and bottom strips overlapping the edges of the side strips.

Claim.—The combination, with the screen A, of the securing-strips B B C C, bent around the edges of the screen, the latter strips being also bent over the edges of the former, as and for the purpose set forth.

258,552. RIDDLINGS-DETACHER. CHARLES BROWN, St. Louis, Mo. Filed Feb. 25, 1882. (No model.)

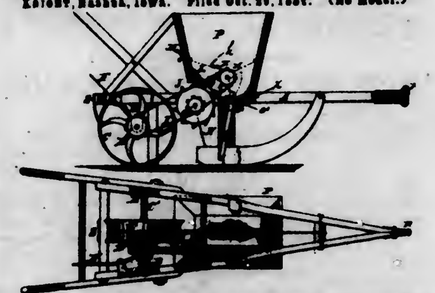
Claim.—1. The combination of the cylinder E, gauze F, and concave G, substantially as described.

2. The combination of the cylinder E, the gauze F, the concave G, and means for adjusting relatively the gauze and concave.



3. The combination of the cylinder E, the gauze F, the concave G, the rod I, and the adjustable clamp H, substantially as described.

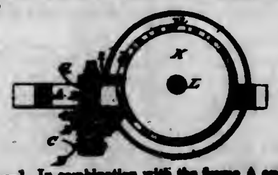
4. The combination of the casing C, the hopper D, the cylinder E, the gauze F, and the concave G, substantially as described.



258,553. MACHINE FOR SANDPAPERING WHEEL RIMS OR FELLIES AND OTHER ARTICLES. GEORGE A. BROWN and BENJAMIN HOLT, Concord, N. H., assignors of one-third to Amos F. Holt, same place. Filed Jan. 17, 1882. (No model.)

Claim.—1. The combination, with the bed or table and a guide or guides and feed mechanism for the material to be operated on, of the sandpapering-belt, the carrying-pulleys, and the pressure-rollers adjustable to and from the table and adapted to be canted or tilted in the direction of its length, under the arrangement and for operation substantially as hereinbefore set forth.

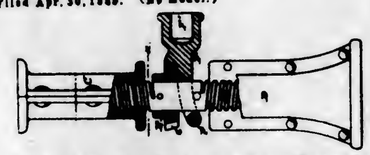
2. The combination, with the bed or table and a guide or guides and feed mechanism for the material to be operated on, of the two sandpapering-belts, one above and the other below the table, the carrying-pulleys, and the pressure-rollers adjustable to and from the table and adapted to be canted or tilted in the direction of their length, substantially as and for the purposes hereinbefore set forth.



258,554. PLANTER. SAMUEL W. BYERS and HENRY W. KEIGHT, Nashua, Iowa. Filed Oct. 29, 1881. (No model.)

Claim.—1. The combination of the adjustable covering-wheel shaft C', wheel C, feed-wheel J, and slotted seed-box P, provided with the agitator K, having the curved spoken *k*, the parts being arranged and operating substantially as shown and described.

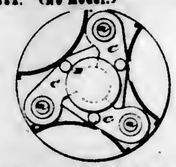
2. The combination of seed-box P, having the slanted slotted side L, the perforated bottom, the adjustable slides X M, and the feed-wheel J and agitators K *k*, substantially as shown and described.



258,555. MOWING-MACHINE. CHARLES W. CHENEY, Athol, Mass., assignor of a part to C. Walter Knowlton and William C. Bowers, both of Brooklyn, N. Y. Filed July 13, 1881. (No model.)

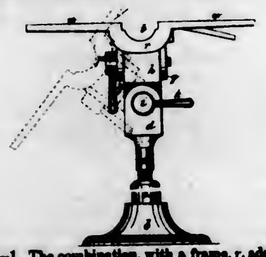
Claim.—1. In combination with the frame A and main axle L, the two disconnected cam-wheels K K', made adjustable relative to each other, the shaft G, provided with the three arms *q*, the pivoted bar H, the pitmen E F, and the two cutters C D, the whole constructed and arranged to operate substantially as and for the purpose set forth.

2. In combination with the cutters C D and pitmen E F, the shaft G, provided with the arms *x y* and the adjustable and removable arm *z*, and means for imparting to said shaft a rotary oscillating motion, substantially as described.



258,556. LIFTING-JACK. JAMES CHURCH, St. Louis, Mo. Filed Apr. 30, 1869. (No model.)

Claim. 1. The operating-screw provided with gear-wheel E, in combination with a tilting sleeve or lever, F, having one or more teeth, *f*, as and for the purpose set forth.



2. The combination of operating-screws A B, parts C D, gear-wheel E, tilting sleeve F, and teeth *f*, as and for the purpose set forth.

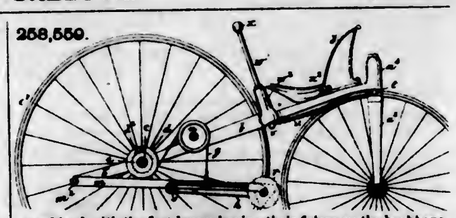
258,557. HUB-FASTENER. NORMAN CLARK, Sterling, Ill. Filed Mar. 23, 1882. (No model.)

Claim.—The latches C C C, pivoted near one end, and used in groups of not less than three, and having their inner faces recessed circularly, so that each recessed face, in the aggregate, encircle the axle A at the recess B therein, whereby each recess is completely filled, and at the same time less space and action are required to withdraw each latches from said recess B, substantially as shown, and for the purpose specified.

258,558. CARRIAGE-PAINTER'S JACK. EUGENE COOK, Nashville, Mich. Filed Nov. 3, 1881. (No model.)

Claim.—1. The combination, with a frame, *r*, adapted to support and be secured to a vehicle-body, of a threaded shaft, *c*, engaging in an interiorly-threaded socket or tube, *a*, and connected with the frame *r* by a universal joint, substantially as described, and for the purpose set forth.

2. The combination, with the socket or tube *a*, interiorly threaded near its upper end, and shaft *c*, provided with a bifurcated head, *d*, and threaded near its lower end and fitting in said socket, of the tenoned block A, frame *r*, provided with the lugs *q q*, and clamping-bolts *i p*, substantially as described, and for the purpose set forth.



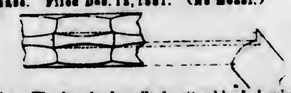
3. The combination of the socket or tube *a*, interiorly threaded near its upper end, shaft *c*, provided with a bifurcated head, *d*, and fitting in said socket, tenoned block A, clamping-bolt *i*, and coupling *m*, substantially as described, and for the purpose set forth.

4. The frame *r*, composed of the parallel longitudinal pieces *s*, with a slot, *t*, between them, perforated lugs *q q*, hollowed end pieces, *u u*, and cam-levers *v v*, substantially as described, and for the purpose set forth.

258,559. BICYCLE. HOSEA G. CHASE, Newton, Mass. Filed Oct. 6, 1881. (No model.)

Claim.—1. In a bicycle, the front wheel, the pawl-carrying drums and actuating-levers therefor, and backbone provided with a seat back of the front wheel, combined with the rear wheel, and its fork adapted to swivel in the backbone to steer the bicycle, substantially as described.

2. The front wheel, c^2, its shaft and rigid bearings therefor in the backbone, and the loose pawl-carrying drums and the ratchets,



combined with the foot-levers having their fulcra on the backbone, and with belts to connect the said levers and pawl-carrying drums, and with means, substantially as described, to vary the point of connection of the said straps with the said levers, substantially as set forth.

3. The front wheel, c^2, its shaft and rigid bearings located near the front of the backbone, and the fixed ratchets and loose pawl-carriers and pawls, combined with straps and foot-levers having their fulcra on the backbone, whereby the said levers are made to move the drums in one direction, while a spring moves them in the opposite direction, substantially as described.

4. The front wheel, c^2, its ratchets, and shaft having bearings fixed to the backbone, and the pawl-carriers and straps, combined with the intermediate pulleys or sheaves, having their axes fixed to the said backbone near the shaft of the front wheel, and with the levers, and means, substantially as described, attached to the levers to change the effective points of connection of the said straps and levers, substantially as set forth.

5. In a bicycle, a backbone, a front wheel in fixed bearings thereon, ratchets, and pawl-carrying drums and straps, combined with foot-actuated levers having their fulcra on the backbone, in front of the bearings for the front wheel and with strap-supporting sheaves located on the backbone at the rear of the axle of the front wheel, substantially as described.

258,560. MILLING CUTTER-BLANK. MOSES G. CRANE, Newton, Mass. Filed Dec. 13, 1881. (No model.)

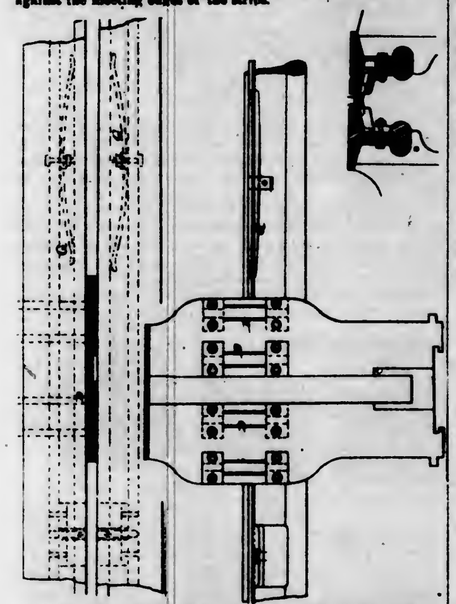
Claim.—The herein-described cutter-blank, having its periphery provided with a series of concavities sunk laterally, or in a direction parallel with its axis of rotation, whereby the side edges of the teeth subsequently formed therein by notching are properly beveled, substantially as described.

258,561. ELECTRIC SWITCH BOARD AND PLUG. DUNCAN DUNBAR, Indianapolis, Ind. Filed Oct. 3, 1881. (No model.)

Brief.—The invention in the switch-board consists essentially in so arranging the conducting-bars with relation to the grain of the wood of the frame as to prevent the inconvenient effects of warping. The construction of the switch-plug is set forth in the claims.

Claim.—1. The combination, in an electric switch-board, with the base-board, the electric conducting-bars thereon, and the upper conducting-bars, of the coupling-saddles secured individually to the base-board in electric contact with the conducting-bars thereon, and separated at each end from the upper bars by spaces or recesses fitted to receive switch-plugs, substantially as described.

2. The combination, with the handle and the central rigid bar, of the two bow-shaped springs united to the bar near the handle, substantially as described.



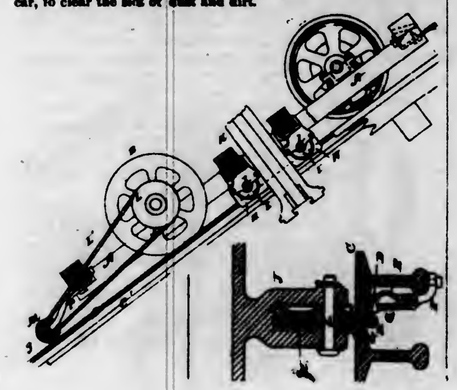
3. The switch-plug having a central rigid bar and a spring or springs, and a stem formed by a union of the springs and said bar, substantially as described.

4. A spring switch-plug embodying a threaded stem comprising the ends of the spring or springs, which are united by soft cast metal, substantially as described.

5. The switch-plug having springs composed of a doubled piece of spring metal, and a central bar united at one end with the ends of the spring by means of threaded soft metal to provide a stem for entering a handle, substantially as described.

258,562. GUIDE-RAIL FOR ROPE-RAILWAY CLUTCHES. CHARLES S. DRAKE, San Francisco, Cal. Filed Oct. 19, 1881. (No model.)

Brief.—Consists of inverted T-shaped rails having a slot between them, and having at their under sides continuous elastic closing-strips actuated by bow-springs and guided in brackets secured to the rails. A shank secured to the car is provided with gripping-wheels and vertical anti-friction rollers arranged to roll against the meeting edges of the strips.



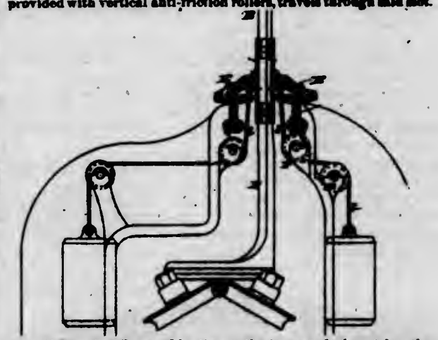
Claim.—1. The combination of the inverted T-shaped rails, the continuous elastic closing-strips, the guides therefor, and the bow-springs applied behind the said strips, substantially as described.

2. The combination of the anti-friction rollers, arranged as described, with the shank, substantially as and for the purpose explained.

258,563. ATTACHMENT FOR WIRE-ROPE RAILWAYS. CHARLES S. DRAKE, San Francisco, Cal. Filed Oct. 24, 1881. (No model.)

Brief.—The closing-strip has a convex top and is supported upon a bow-spring provided with a supplemental spring. The whole is hinged to a bracket and applied from below to the slot of a tube or tunnel. An opening device consisting of a shank or bracket provided with opening-wheels and guards is attached to the car and crowds the closing-strip to one side in advance of the grip. To the front of said car is secured a rotary brush, which is operated by an endless chain and pulley secured to the axle of the car, to clear the slot of dust and dirt.

Claim.—1. The combination, with the shank which is attached to the car, of opening-wheels and guards and a closing-strip, substantially as described.

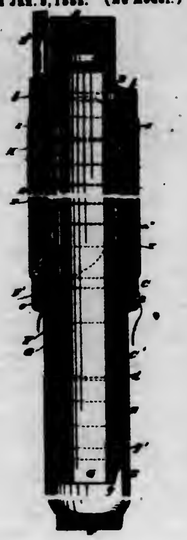


2. The combination of the bracket J, the wheel, the guard, and a closing-strip applied to the slot or space between the guide-rails, substantially as described.

3. The combination of one or more rotary brushes, the guard or guide rails, the closing-strip for the groove between the rails, and means for opening and closing said strip, substantially as described.

4. In combination with the inverted T-rails, the closing-strip D, convex on top, the bow-spring E, the bracket F, and the supplemental spring G, substantially as described.

258,564. APPARATUS FOR COVERING SLOTS IN CABLE RAILWAYS. CHARLES S. DRAKE, San Francisco, Cal. Filed Oct. 24, 1881. (No model.)



Brief.—Hinged and beveled closing-strips are riveted to inverted T-rails, which are arranged to form a slot, which is kept closed by means of weights connected by wires passing partly around grooved pulleys to said closing-strip. A shank of the grip, provided with vertical anti-friction rollers, travels through said slot.

Claim.—1. The combination of the hinged closing-strips, the inverted T-rails, the hinges E, and weights or their equivalents, for keeping said strips closed, substantially as described.

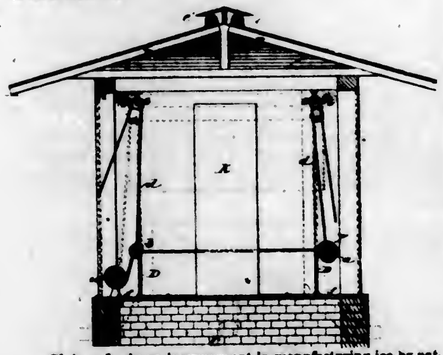
2. The combination of the shank B, the anti-friction rollers thereon, the guide-rails arranged with a slot between them, the hinged and beveled closing-strips, and the means, substantially as described, for keeping these strips closed, all substantially as described.

258,565. OIL-WELL PACKER. SOLOMON R. DRESSER, Bradford, Pa. Filed Jan. 9, 1882. (No model.)

Claim.—1. In an oil-well packer wherein is a rubber annulus arranged between two compressing-flanges which are attached to sections of tubing which telescope together, the combination therewith of chambers within said flanges, and a slotted tube connected with one of said flanges and communicating between said chambers, substantially as and for the purposes mentioned.

2. The combination within an oil-well packer of the following elements: a rubber annulus arranged between two chambered flanges, a tube within said annulus communicating between said chambers and containing a tube which forms part of the eduction-tube, and which is sufficiently smaller to form an annular space between said tubes, which space is closed at its lower end by packing upon a shoulder on the inner tube, substantially as and for the purposes set forth.

3. In an oil-well packer, the combination of the following elements: the rubber annulus A, flanges B and C, with chambers *b* and *c*, tube F, with slot F', tube G, with shoulder *g* and packing *g'*, extension C' of flange C, coupler D, packing *d*, and reducer E, substantially as shown.



4. In combination with the rubber annulus of an oil-well packer, a shoulder-lining ring, H, having radial dovetail lugs *h*, which ring is embedded in the rubber annulus at the time of its formation.

5. In an oil-well packer, a rubber annulus provided with a series of indentations of different depth arranged in the order shown upon the inner wall of said annulus, for the purposes mentioned.

6. In the rubber annulus of an oil-well packer, the shoulder-lining ring H, and a strip of duck cloth or other fabric within the material back of said ring, substantially as and for the purposes mentioned.

258,566. MANUFACTURE OF ICE. WILLIAM W. DUDENBURY, Brooklyn, N.Y. Filed Oct. 13, 1881. (No model.)

Brief.—Uses curtains of felt or other heavy fabric to inclose ice frozen by natural cold to protect the ice from warm outside air, and lowers the curtain-walls to expose water to cold outside air to form more ice.

Claim.—1. As an improvement in manufacturing ice by natural cold, an inclosure formed by walls composed of continuous pieces or sections arranged to be extended from the floor upward, and to be lowered for the purpose of exposing the interior to the air, and to shut in and to protect the ice when formed, substantially as described.

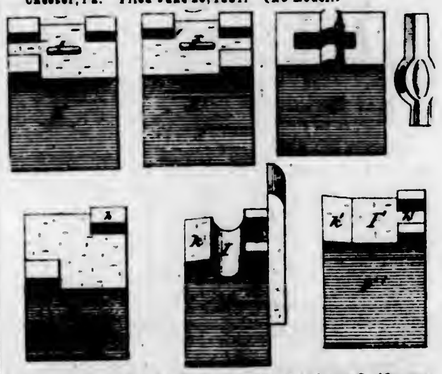
2. Walls for an inclosure in which to manufacture and store ice, made of a flexible material or structure, and adapted to be raised to inclose the ice-space for the purpose of preserving the ice and lowered to expose the same and admit cold exterior air, substantially as described.

3. The walls D, having their lower edges attached to the floor of the structure, in combination with suitable devices for raising and lowering the same, substantially as described.

4. The combination of the cold-air shaft K, arranged to be surrounded by the ice, the openings *f* in the floor of the structure, between the inner and outer walls, and a refrigerating-chamber communicating with the shaft K and openings *f*, substantially as described.

5. The walls D, adapted to be raised to inclose the sides of the ice and to be laid over the top of the same to protect and preserve it, substantially as described.

258,567. BOBBIN-HOLDER FOR SPOOLING-MACHINES. THEO. C. ENTWISTLE, Lowell, Mass., assignor to the Phœnix Machine Company, same place. Filed Jan. 26, 1882. (No model.)



Brief.—The bobbin lies loose without other bearings in the holder, which consists of a trough closed at both ends and provided with a cap hinged thereto to rest upon the bobbin, and thereby retain the bobbin in place and supply requisite friction, and provided also with an adjustable weight to vary the tension.

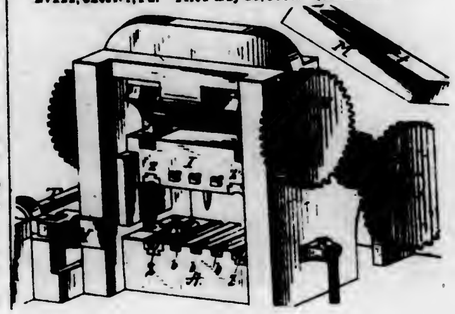
Claim.—1. The bobbin-containing trough A, adapted to receive and support without other bearings a bobbin loose within it, in combination with the cap D, these parts being united by a hinge-connection and adapted for joint operation, as hereinbefore set forth.

2. The bobbin-containing trough A, adapted to receive and support without other bearings a bobbin loose within it, in combination with the cap D, united therewith by a hinge-connection, and the adjustable weight E, as hereinbefore set forth.

258,568. DIE FOR MAKING HATCHETS. WILLIAM EVANS, Chester, Pa. Filed June 20, 1881. (No model.)

Claim.—1. The die C, formed with the slot and ridges arranged on opposite sides of the slot, substantially as shown and described.

2. The pair of dies E E, for fullering the metal, substantially as shown and described.

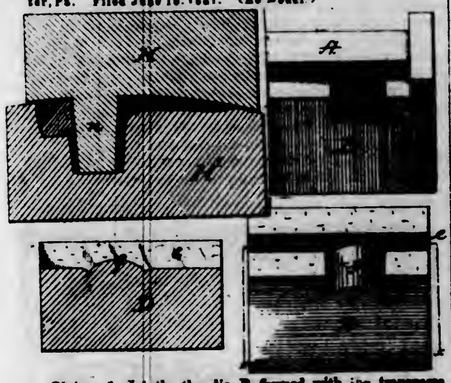


3. The pair of dies F F', the die F being formed with an inclined surface, K', horizontal surface I', and depression *h'*, and the other die, F, being formed with the incline surface *k*, concave surface I, depression *h*, for the purpose of setting down the metal on the upper portion of the eye-socket and inclosing the bit portion, substantially as set forth.

4. The pair of dies H H' of the construction substantially as seen in Figs. 13 and 14, for the purpose stated.

5. The pair of dies K K of the construction substantially as seen in Figs. 17 and 18, for the purpose stated.

6. The series of dies hereinbefore described for manufacturing hatchets in progressive steps.



258,569. MACHINE FOR FORGING HAMMERS. WILLIAM EVANS, Chester, Pa. Filed May 26, 1881. (No model.)

Claim.—1. In a machine for forging hammers, the combination, with the upper and lower sections of a hammer-die, of the movable side section or plunger, M, means for advancing the said side section, and a spring for retracting the same, substantially as described.

2. In a machine for forging hammers, the combination of the bed-block A, having dies, and the side sections or plungers, M, with slots *f*, and the follower I, with dies, and tapering arms J', with means for operating the follower, substantially as described.

258,570. DIE FOR MAKING ADZES. WILLIAM EVANS, Chester, Pa. Filed June 15, 1881. (No model.)

Claim.—1. Jointly, the die B, formed with the transverse groove *a* and flange *b*, and die C, with a plain surface for breaking down the metal, substantially as described.

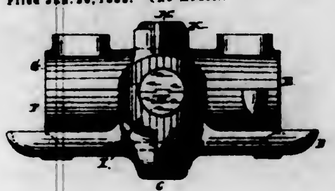
2. Jointly, the dies D, each constructed with the longitudinal groove *e* and the transverse convex surface *f*, said groove and surface being arranged as shown, for the purpose of fullering the metal.

3. The die E, substantially of the construction seen in Fig. 7, for the purpose stated.

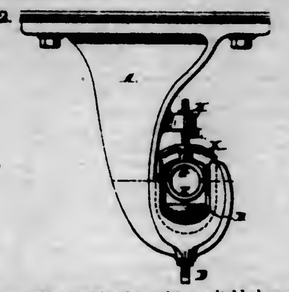
4. The pair of dies F F'—the former or lower one formed with square opening, shoulder *h*, and cavities *i k*, and the latter or upper one provided with a punch, *m*, substantially as and for the purpose set forth.

5. The pair of dies H H', substantially of the construction seen in Fig. 10, for finally shaping the adz.

6. The series of dies hereinbefore described for manufacturing adzes in progressive steps.



258,571. LAMP-STAND. TEMPLE GARCHAU, Boston, Mass. Filed Mar. 8, 1882. (No model.)

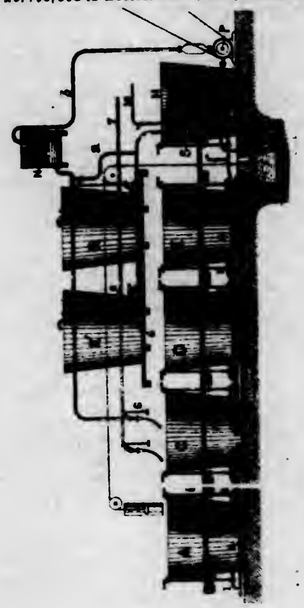


Claim.—1. A lamp-stand to rest on the floor, having a weighted base, *a*, a stem, *b*, and a lamp-holder, *c*, separably connected together, so that the stem *b* may be dispensed with and the base *a* and holder *c* be united to make a lamp-stand of the ordinary height for table use, substantially as set forth.

2. In combination with a lamp-stand composed of sections adapted to be fastened to each other, a table-top or similar article secured between two of the sections, substantially as and for the purposes specified.

258,572. SHAFT-HANGER. EVERETT S. GIBSON, Providence, R.I. Filed Jan. 20, 1882. (No model.)

258,572.

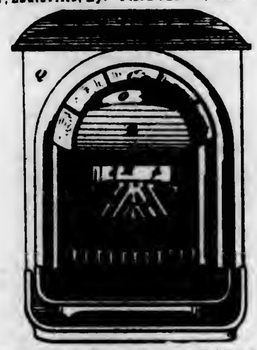


Claim.—The combination, with a suitable hanger, A, having arm M, and securing devices D L, of the sleeve E, having lugs H, drip-pan B, having ears I and socket C, and the cap K, having socket N, the cap extending over the sleeve and covering the lugs with the ears, so as to form a bearing, and the sockets receiving the ends of the securing devices, as set forth.

258,573. PROCESS OF MANUFACTURING TANNIN EXTRACTS. PAUL GONDOLO, Paris, France, assignor to the Gondolo Tannin Company, Huntingdon, Pa. Filed Dec. 10, 1881. (No specimens.) Patented in France Mar. 13, 1879, No. 128,541; in England Mar. 18, 1879, No. 1,076; in Belgium Mar. 19, 1879, No. 47,694; in Germany Apr. 2, 1879, No. 7,864; in Italy Apr. 9, 1879, No. 19,837; in Austria Apr. 7, 1879, No. 1,076, and in Spain July 28, 1879, No. 385.

Claim.—The hereinbefore-described improvement in the process of manufacturing tannin extracts, which consists in the maceration of the vegetable matters in a slightly-acidulated bath, the addition thereto of a coagulant or absorbent, the subsequent addition of an alkali or alkaline salt and of a further quantity of coagulant or absorbent, and the final precipitation by means of an acid, substantially as set forth.

258,574. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF TANNIN EXTRACTS. PAUL GONDOLO, Paris, France, assignor to the Gondolo Tannin Company, Huntingdon, Pa. Filed Dec. 16, 1881. (No model.) Patented in Germany Apr. 2, 1880, No. 7,864; in France Apr. 10, 1880, No. 128,865; in Belgium Apr. 14, 1880, No. 51,139; in England Apr. 16, 1880, No. 1,668; in Italy Apr. 19, 1880, No. 11,781; in Spain July 1, 1880, No. 795, and in Austria Oct. 4, 1880, No. 24,918.

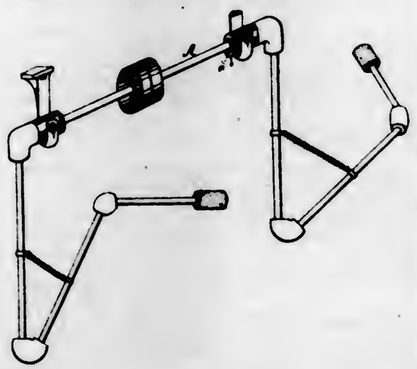


Claim.—1. The hereinbefore-described improvement in the manufacture of tannin extracts, which consists in first macerating the substances containing the tannin in a bath containing a salt of sulphurous acid, and then treating the resulting solution by the addition of sulphuric acid, substantially as set forth.

2. The hereinbefore-described improvement in the manufacture of tannin extracts, which consists in first macerating the substances containing the tannin in a bath containing a salt of sulphurous acid, and then treating the resulting solution by the addition of sulphuric acid, and finally clarifying the liquor by the admixture and coagulation of blood or other coagulant, substantially as set forth.

3. The combination of the steeping-vats, the reservoirs N R R', and the clarifying-vat H, provided with the cooling coiled pipe and the heater S', substantially as and for the purposes described.

258,575. FRANKLIN STOVE AND FIRE-GRATE. ALFRED GREENAWAY, Louisville, Ky. Filed Jan. 20, 1881. (No model.)



Claim.—1. A basket, E, and the surrounding frame Q, having its opening extended about the basket, as shown and described, to secure a large heat-outlet, combined with the tile L, the cap N, and the smoke-flue between the two, and the mica-filled hood C, placed about the opening of said frame to insure a perfect draft and prevent smoking, all constructed and arranged to operate substantially as set forth.

2. The tile L, as shown and described, cemented in place, combined with the grate, the grate-frame Q, with its enlarged opening and hood, and the cap N, substantially as shown and described, whereby an enlarged heat-opening is obtained and a perfect draft insured.

3. In a grate, the front portion, E, made with grate-bars, combined with the back F, having projections *a b*, to interlock with the front portion, E, to hold said back at, or about at, an angle of forty-five degrees to the horizontal, substantially as described.

4. The air-conduit H, the air-chamber G, the grate E, its back F, the fines I, the tile L, and the chamber P, combined and arranged as shown and described, and for the purpose specified.

258,576. UNIVERSAL JOINT. JOHN JAMES GREENOUGH, Syracuse, N. Y. Filed Apr. 18, 1882. (No model.)

Claim.—1. The manner of suspending the shaft of the upper arm coupled with the main or driving shaft by means of the coupling-joint, in which the main shaft A turns, resting in and being supported by the hanger independent of the main shaft, as and for the purposes specified.

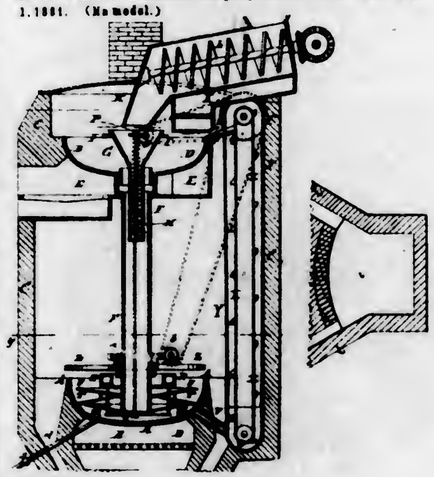
2. The combination of the upper arm and forearm connected by a spring, *s*, as herein specified, to assist in holding up the forearm at the wrist-joint.

3. The combination of the swiveling shoulder and wrist-joint with the non-swiveling elbow-joint, as and for the purposes specified.

4. The bearings rigidly affixed in the tubes surrounding and forming the boxes in which the shafts turn and in which they are supported independent of the couplings, as herein described.

5. The bevel-gear arranged and combined as herein specified, in combination with the couplings forming a universal joint, in the manner and for the purposes specified.

6. The combination of two pendent shafts with the shaft A, one at each end thereof, so as to cause the brush or other tool to rotate in opposite directions, as and for the purposes specified.

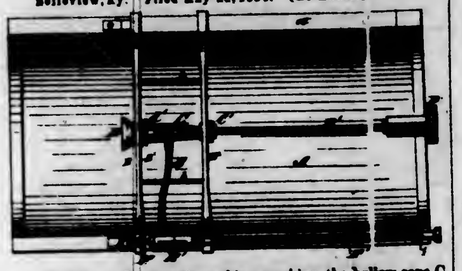


258,577. FIRE AND BURGLAR PROOF SAFE. HENRY GROSS, Tiffin, Ohio. Filed July 11, 1881. (No model.)

Claim.—1. In a fire-proof safe, the door-frame B' B' and the door-jamb frame C C, constructed in sections and provided with lugs *b' b'* and *c' c'*, respectively, to receive the connecting bolts or rivets, and acting as braces to stiffen the connection of the sections, substantially as and for the purpose specified.

2. In a fire and burglar proof safe, the burglar-proof plates L and *l'*, composed of continuous pieces of welded iron and steel or steel-plate, the plate L extending continuously through the body of cement filling in the safe-body and the plate *l'* extending through the cement filling in the door-frame, said plates having their ends connected respectively with the interior of the door-jamb and door-frame, substantially as and for the purpose described.

258,578. APPARATUS FOR AMALGAMATING GOLD AND SILVER ORES. WALTER HAMILTON, New York, N. Y., assignor to the Hamilton Reduction Company, of New York. Filed Apr. 1, 1881. (No model.)



Claim.—1. In a gold and silver ore amalgamator, the combination of the upper and lower basins, D A, the funnel G, having a feed-screw within its tube H, the pipe or tube F, surrounding tube H and communicating at the top with the basin D, and the valve Q, connecting with float R, as and for the purpose described.

2. In an apparatus for amalgamating gold and silver ores, the combination, with the lower basin, A, the upper basin, D, the connecting-pipe F, the elevator or pump X, and the funnel G H, of the furnace C, substantially as herein shown and described, whereby the amalgamating substance is kept molten, as set forth.

3. The combination, with the pipe F and basin A, of the revolving arms Z and a receptacle connecting with the top of said basin by a passage around the fire-chamber B, as shown and described.

4. In an apparatus for amalgamating gold and silver ores, the combination, with the pipe F, connecting the upper basin, D, and the lower basin, A, of the valve Q, substantially as herein shown and described, whereby the passage through the said pipe of the amalgamating substance and the ore is regulated, as set forth.

258,579. BOTTLE-WASHING MACHINE. KONRAD HOFMANN, Cincinnati, Ohio, assignor of one-half to Albert V. Fuhrmann, Bellevieu, Ky. Filed May 28, 1881. (No model.)

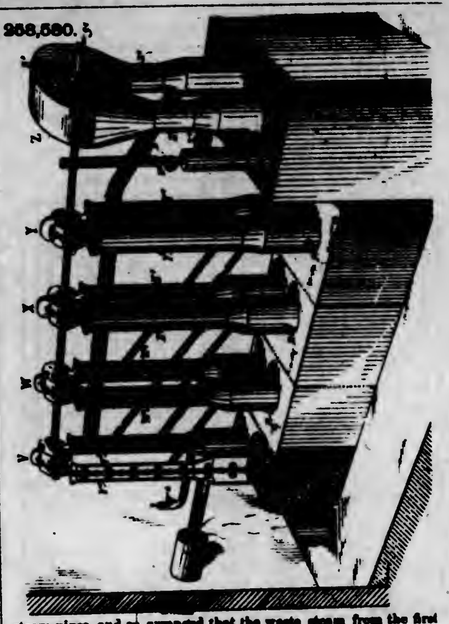
Claim.—In a bottle-washing machine, the hollow cone C and funnel D, the latter consisting of an enlarged portion lined by an elastic lining, J, and a neck, which latter is screwed into the end of the cone C and the loose bushing or sleeve K, in combination with a revolving brush or scraper and a device for automatically supplying water to the interior of the bottle, substantially as and for the purposes specified.

2. The combination of the cone C, constructed substantially as described, and the valve-box E', connected to said cone by the pipe E, said valve-box being attached to the slide *e*, which slides on the way *a*, and having in its interior the valve-seat *e'* and valve *e'*, the latter being attached to the rod *e²*, supported by the post F on the frame B, substantially as and for the purposes specified.

3. The combination of the frame B, sliding on ways *a*, and provided with post F, the valve-box E', having in its interior the valve-seat *e'* and valve *e'*, the latter being attached to rod *e²* and supported by said post F, and the supply-pipe F', substantially as and for the purposes specified.

4. In combination with the cone C, funnel D, and loose bushing K, and means for automatically supplying water to said cone C, a revolving cleaning device consisting of a hollow casing, 1, provided with the two levers 3, pivoted to one end of said casing, and adapted to be separated by the spring 8, contained within said casing, substantially as and for the purposes specified.

5. The herein-described cleaning device, consisting of the hollow casing 1, provided with shank 2 and levers 3, the latter being pivoted to one end of the casing and provided with flexible strip 10, said levers being caused to separate by the spring 8 and sliding plunger 6, substantially as and for the purposes specified.



6. The combination of the casing 1, the arms 4, pivoted to said casing, and the felt strips 10, secured to said arms by means of the clamping-plate 11, and a suitable spring and plunger to cause said arms to separate when in the bottle, substantially as described.

7. The combination of the cleaning-device holder and the valve-box E', connected thereto by a suitable conduit, said valve-box being attached to the slide *e*, which slides on the way *a*, and having in its interior the valve-seat *e'* and valve *e'*, and connecting and operating mechanism for enabling the latter to automatically supply water to the cleaning device, all substantially as and for the purposes specified.

258,580. STEAM-MOTOR. SAMUEL W. HUSSEY, Hudsondale, Pa. Filed Dec. 16, 1881. (No model.)

Claim.—1. The combination of two or more distinct and independent motors, substantially such as described, connected by

258,580.

steam-pipes, and so arranged that the waste steam from the first motor serves to operate the other motor or motors, as set forth.

2. The combination of the motors V W X Y, their connecting steam-pipes, the motor Z, and the steam-pipe E, substantially as set forth.

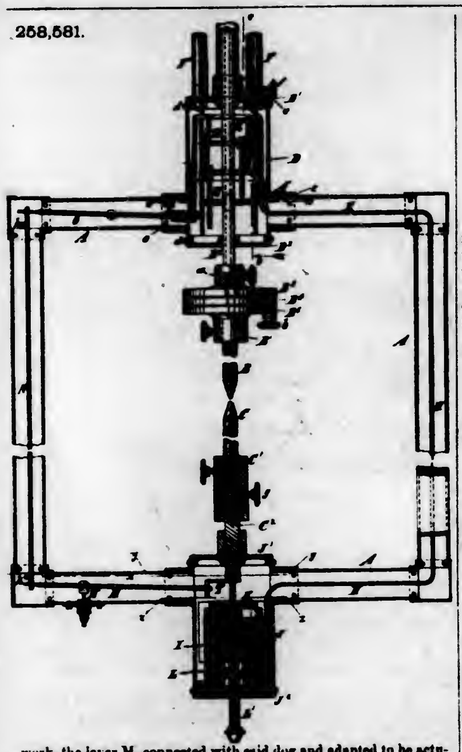
3. The combination of the several independent motors, their sprockets S', the connecting steam-pipes, and the common shaft S', substantially as set forth.

4. The combination of the motors V W X Y, having steam-cylinders and air-compressing tubes, their connecting steam-pipes, and their connecting air-pipes, substantially as set forth.

5. The combination of the steam-cylinder, the air-compressing tube, the endless chain, piston-heads, and sprockets, a fluid seal, and a closed or sealed tank, substantially as set forth.

6. The combination of the steam-cylinder, the air-compressing tube, the endless chain, the cup-shaped piston-heads, sprocket-pulleys, and a fluid seal, substantially as set forth.

7. The combination of the steam-cylinder, the sprocket-pulleys, the elongated piston-heads, having comparatively small spaces between them, the endless chain or connecting-links, and a fluid seal, substantially as set forth.



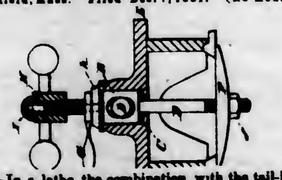
258,581. ELECTRIC-ARC LAMP. CHARLES A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed May 25, 1881. (No model.)

Claim.—1. In an electric lamp, the combination of a single electric circuit, an electro-magnet or solenoid in said circuit, an armature for said electro-magnet or solenoid directly connected with the lower carbon, a train of wheel-work for controlling the feed of the upper carbon, a dog for controlling said wheel-work, a lever adapted to be actuated by said armature, but arranged so that the armature may have a given range of movement before acting upon the lever, and means for transmitting motion from said lever to said dog to effect the disengagement of said dog from said wheel-work and permit the feed of the upper carbon, substantially as specified.

2. In an electric lamp, the combination of a single electric circuit, an electro-magnet or solenoid, I, and an armature, K, therefor, contained in a case, J, the lower carbon, C, connected with said armature, the upper carbon, B, the train of wheel-work E, for controlling the feed of the upper carbon, and the device Q Q', for regulating the operation of said wheel-work, contained in a case, D, a hollow frame, A, connecting the cases D and J, and the lever M, rod N, and lever O, arranged within said hollow frame, substantially as specified.

3. In an electric lamp, the combination of a single electric circuit, the electro-magnet or solenoid I and its armature K, the lower carbon, C, directly connected with said armature, the upper carbon, B, the wheel-work E, the dog Q', controlling said wheel-

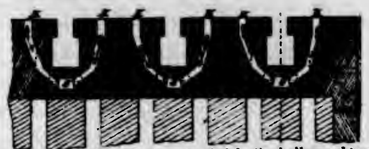
258,581.



work, the lever M, connected with said dog and adapted to be actuated by said armature, but arranged so that the armature has a given range of movement before acting upon it, and the fulcrum M', adapted to be adjusted to suit currents of different potentials, substantially as specified.

4. In an electric lamp, the combination, with a carbon-holder and its supporting-rod, of two or more plates connecting said holder and rod, and a pivot or pivots connecting said plates eccentrically to said holder and rod, so that the plates may be swung laterally relatively to each other to adjust said carbon-holder into line with the opposite carbon-holder, substantially as specified.

5. In an electric lamp, the combination, with a carbon-holder and its supporting-rod, of two or more plates connecting said holder and rod, and a screw or screws pivoting said plates together eccentrically to said holder and rod, so that the plates may be swung laterally relatively to each other, and also serving to clamp the plates together after such lateral adjustment, substantially as specified.

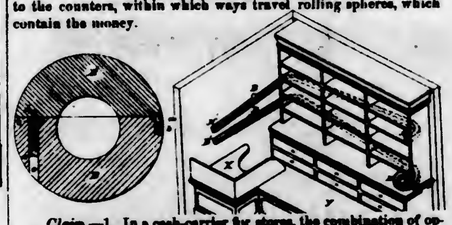


6. The combination of the case D, containing a train of wheel-work, E, the removable cap D', insulating-bushing *a*, suspending-rod F, wire or conductor H, and set-screw *f*, substantially as specified.

258,582. TAIL-STOCK FOR TURNING-LATHES. ANDREW HYDE, Hatfield, Mass. Filed Dec. 7, 1881. (No model.)

Claim.—In a lathe, the combination, with the tail-block and with the spindle *b*, of the clamp-rod D, having the perforated slide B, hollow end, and rod I, washer A, or equivalent bearing-surface, handle-nut G, solid top nut, H, and clamp-plate F, arranged to effect the clamping of tail-block and spindle upon a common axis in a vertical line with the axis of the spindle, substantially as shown and described.

258,583. KILN FOR BURNING BRICK. JAMES JOHNSON, Bay View, assignor of one-half to Martin Darelaar, Milwaukee, Wis. Filed Mar. 3, 1882. (No model.)



Claim.—1. In kilns for burning brick, the hollow column I, formed in rear of the combustion-chamber, provided with one or more cold-air passages, K, communicating from said hollow space with the exterior air, substantially as and for the purpose specified.

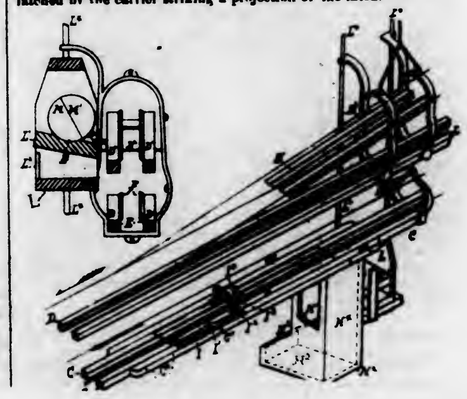
2. In kilns for burning brick, the column I, provided with open space J, inlet air-passages K, and outlet-passages L, substantially as and for the purpose specified.

258,584. AUTOMATIC CASH-CARRIER. WILLIAM S. LAMSON, Lowell, assignor to the Lamson Cash Carrier Company, Boston, Mass. Filed Dec. 5, 1879.

Brief.—Reversely-inclined ways extend from cashier's desk to the counters, within which ways travel rolling spheres, which contain the money.

Claim.—1. In a cash-carrier for stores, the combination of oppositely-inclined ways N N' D' D, and a rolling cash holder or box, B B', substantially as and for the purpose specified.

2. In a cash-carrier for stores, the combination of oppositely-inclined ways N N' D' D, adapted to the cashier's desk *x* and counter *y* of a store, and hollow rolling balls B B', adapted to receive and carry cash on said ways, as and for the purpose specified.



3. The combination, with the counters *y* and desk *x* of a store, of two ways, N N' D' D, connecting the same, each way consisting of a trough, substantially as set forth.

4. The combination of the box B and the cover B', turning one upon the other, as specified, the pin *a* and spring *b*, as and for the purpose specified.

5. The combination of the box B, the cover B', the spring *b*, and the pin *a*, beveled on the top, as and for the purpose specified.

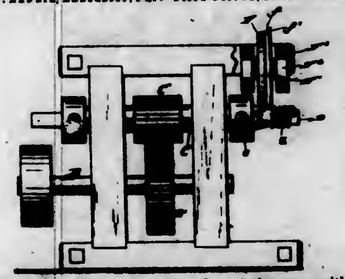
258,585. AUTOMATIC CASH-CARRIER. WILLIAM S. LAMSON, Lowell, assignor to the Lamson Cash Carrier Company, Boston, Mass. Filed Aug. 29, 1881. (No model.)

Brief.—The carrier or ball rests in a depression in a shelf in the elevator. The shelf is tilted by its contact with a projection on a bridge pivoted above the way and tilted toward the way by the weight of the carrier. The carrier is transferred to a receptacle beneath the way by means of a tilting section of the way unlatched by the carrier striking a projection of the latch.

Claim.—1. The elevator provided with a tilting shelf, L', having a depression, L'', as and for the purpose specified.

2. The elevator L, provided with a pivoted shelf, L', having a depression, L'', in combination with means for tilting said shelf, as and for the purpose specified.

3. In combination with the way D, the pivoted bridge D', and a carrier, M M', adapted to travel on said bridge and to tilt the same, as and for the purpose described.



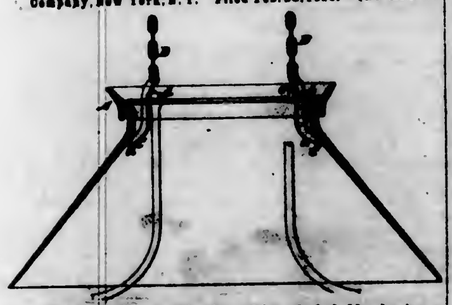
4. In combination with the pivoted bridge D', provided with a catch, D'', the elevator L, provided with the tilting shelf L', as and for the purpose described.

5. In combination with the way C, the pivoted bridge D', and a carrier, M M', adapted to travel on said bridge and to tilt the same, as and for the purpose specified.

6. The way C, provided with switches R and means for allowing said switches to be opened by carriers M M', traveling thereon, in combination with said carriers, as and for the purpose described.

7. The combination of the switch R and the box H', provided with an opening, H'', as and for the purpose specified.

258,586. MACHINE FOR MAKING SPRINGS AND RINGS. E. F. LAUBIN, Lancaster, Pa. Filed Oct. 13, 1881. (No model.)



Claim.—1. The combination of a rotating cone with a bar sliding through the same, but rotating therewith, said bar being adapted to the attachment of wire, substantially as set forth.

2. A rotating cone and a pressure-wheel arranged to bear against the ends of wire on said cone, in combination with a sliding bar that turns with said cone, and to which the wire is attached, substantially as set forth.

3. Pressure-wheel F, having groove *f* and guide-flange *f'*, in combination with rotating cone E and bar D, turning with said cone, but sliding endwise therein, substantially as set forth.

4. Tubular shaft C, recessed at one end, in combination with cone E, having extension E', which sets into said recess, a detachable fastening therefor, and a bar to which the wire is attached, and which slides in said parts C E, but turns with them, substantially as set forth.

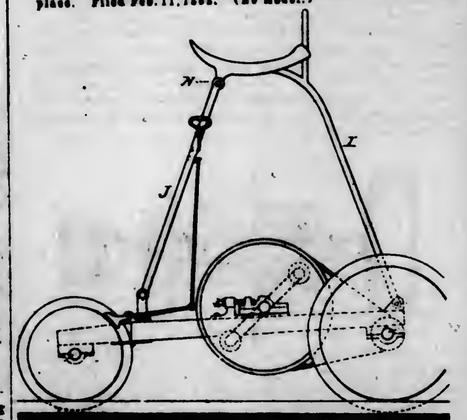
258,587. SHADE-HOLDER. CHARLES HASCHBURGH, Bridgeport, Conn., assignor to the Craighead & Hiwell Manufacturing Company, New York, N. Y. Filed Feb. 24, 1882. (No model.)

Claim.—1. The combination, with a shade-holder having a rim or flange for bearing against one side of a shade, of fingers or fastenings adapted to bear on the other side, and chains or other means for suspending the shade, connected directly with said fingers or fastenings, substantially as specified.

2. The combination, with the shade-holder A, of the fingers C, having hook-shaped lower ends, and attached to the chains D or like devices, substantially as specified.

3. The combination, with the shade-holder A, of the fingers C, made polygonal, fitting in corresponding bearings, having hook-shaped lower ends, and attached to chains D or like devices, substantially as specified.

4. The combination, with the shade-holder A, of the fingers C, having hook-shaped lower ends and reversely-bent upper ends, the bearings *a*, the guides *b*, and the chains or like devices, substantially as specified.



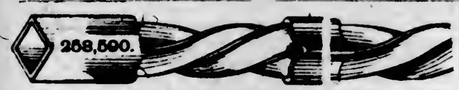
258,588. SAFETY-VALVE. JOSEPH R. MITCHELL, New Brighton, Pa. Filed Jan. 13, 1882. (No model.)

Claim.—1. A hollow valve, B, resting upon two seats, with radial adjusted holes for the escape of the steam in the proper proportion from the central hollow part, for the purpose as shown and set forth.

2. In a safety-valve arranged as described, the hollow stem and valve with regulating-holes and resting upon two seats, in combination with the adjusting pin-valve X, substantially as and for the purpose shown.

258,589. RAILWAY-VELOCIPEDE. GEORGE A. HOSMER, Troy, N. Y., assignor of one-half to Nelson Davenport, same place. Filed Feb. 11, 1882. (No model.)

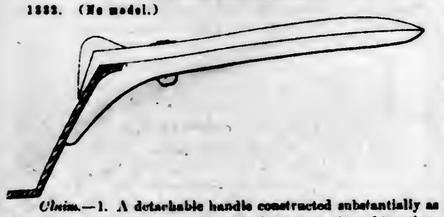
Claim.—1. In a railway-velocipede, and in combination, a seat or saddle, a detachable seat-support, I, hinged supports J, and connecting-joints N, substantially as described, and for the purposes set forth.



2. In a railway-car, a car-frame made in two sections, each section being provided with two track-wheels, one upon each end of the same axle, in combination with sliding or folding joints which connect said sections together in such a way that said axles will be and remain parallel to each other in every position assumed by said sections, for the purpose of varying the length of said car and enabling the same to run upon a railway-track in a folded as well as extended position, substantially as described.

3. In a railway-velocipede, a double-crank shaft provided with sliding bearings adapted to be moved backward or forward relatively to a superimposed seat or saddle, in combination with said seat or saddle, substantially as described, and for the purposes set forth.

258,590. COUPLING FOR LIGHTNING-RODS. WILLIAM H. MUNN, Collingswood, N. J. Filed Feb. 1, 1882. (No model.)

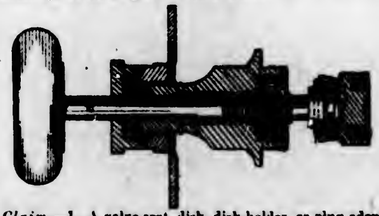


Claim.—1. A coupling for spiral lightning-rod sections, consisting of a cast-metal box hollow from end to end, and adapted to be secured to the sections by compression in the manner set forth.

2. A section of spiral lightning-rod with one or both of its ends provided with a cast-metal coupling-box hollow from end to

end, secured in place by compression, and adapted to receive the end of an adjacent section, substantially as and for the purpose set forth.

258,591. DETACHABLE HANDLE FOR UTENSILS. FRED A. MEINER and GEORGE GASSMANN, Augusta, Ky. Filed Feb. 28, 1882. (No model.)



Claim.—1. A detachable handle constructed substantially as described—that is to say, constructed of two parts pivoted together, and provided with jaws arranged to move in closing in planes substantially parallel to their faces, as set forth.

2. The combination, to form a detachable handle for utensils, of the two parts pivoted together and provided with jaws to grasp the utensil, arranged to move in closing in planes substantially parallel to their faces, and one part arranged to close within a pocket in the other when the two are brought together, substantially as set forth.

258,592. VALVE. JEREMIAH O'HARA, New York, N. Y. Filed Jan. 27, 1882. (No model.)

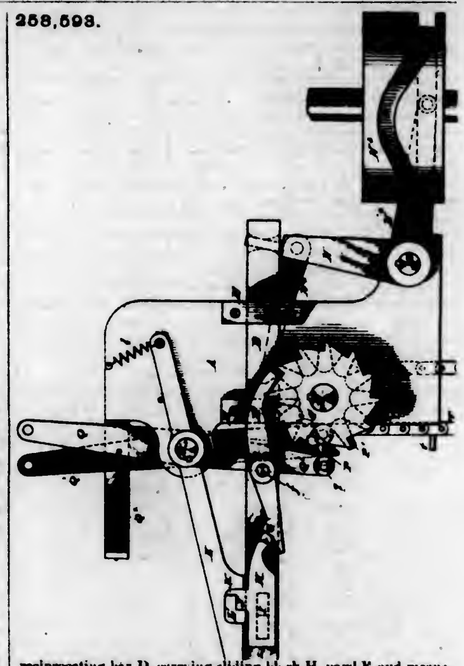
Brief.—The valve-disk is provided with a grooved projection adapted to be loosely slipped on the end of a stem and held thereupon with freedom of motion, so as to become self-adjusting, by means of an annular cap inclosing said grooved projection, and locked down thereupon by a pin. The threaded wrench *o*, having a handle, *p*, is placed below the divided box to hold it against displacement by the sticking of the stem therein.

Claim.—1. A valve-seat, disk, disk-holder, or plug adapted to be loosely connected to a stem or spindle, combined with a loose superposed cap and independent means to hold said cap in place, substantially as described.

2. A valve-stem having a collar on its end, a disk, or its described equivalent, having an undercut grooved projection to fit over such collar, a cap on said stem provided with a flange to embrace such projection to prevent its lateral displacement, and a pin secured in the stem above the cap to hold said cap against vertical displacement and down upon the projection of the disk, substantially as shown and specified.

3. A valve-stem provided with a collar on its end, a disk, or its described equivalents, provided with parallel lips to embrace such collar, an annular cap on the stem having a flange to inclose said lips and collar, and means to prevent the vertical displacement of such cap, substantially as shown and specified.

4. A threaded wrench provided with a handle and applied to the threaded bonnet of a valve below the box or gland thereon to hold such box or gland against being backed or run off by the turning of the valve-stem, substantially as shown and described.



5. The combination, with a threaded bonnet and a box thereupon, of a handled wrench applied below such box on the bonnet, substantially as and for the purpose described.

6. The handled wrench *o*, combined with an independently-movable stuffing-box or gland to hold such box or gland against accidental displacement, substantially as specified.

258,593. MECHANICAL MOVEMENT. JOHN H. OSBORNE, Philadelphia, Pa. Filed Apr. 18, 1882. (No model.)

Claim.—1. The combination of ratchet-wheel C, sliding or

258,593.

reciprocating bar D, carrying sliding block H, pawl F, and means to arrest the movement of the sliding block in either direction after it has traveled some distance.

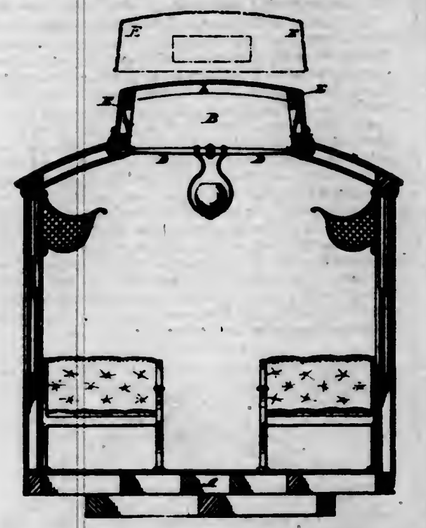
2. The combination of ratchet-wheel C, sliding or reciprocating bar D, carrying sliding block H, furnished with lug J, pawl F, means on said block to raise said pawl free of the teeth of said ratchet-wheel, and lever L, or its equivalent, provided with slot L', substantially as described.

3. The combination, with ratchet-wheel C, of reciprocating bar D, carrying pawl F and sliding block H, furnished with projection J and arm A, lever L, having slot L', and pattern mechanism to automatically raise or lower said lever at stated intervals, substantially as specified.

4. The combination, with ratchet-wheel C, of reciprocating bar D, carrying pawl F, having cam-projection G, and sliding block having projection J and arm A, lever L, shaft M, arm M', chain-wheel B', and chain T, provided with pins *t*, substantially as described.

5. The combination of sliding or reciprocating bar D, carrying pawl F, provided with a cam-projection, G, sliding block provided with arm A, and means to arrest the movement of the sliding block as it is carried in either direction by the reciprocating bar, substantially as set forth.

6. The combination of shaft B, having secured thereon one or more cam-wheels and a ratchet-wheel, C, reciprocating bar D, carrying a pawl, F, provided with cam-projection G, and sliding block H carrying arm A, and means to arrest the movement of the sliding block as it is carried in either direction by the reciprocating bar, substantially as set forth.



7. The combination of shaft B, having secured thereon one or more cam-wheels and a ratchet-wheel, C, reciprocating bar D, carrying pawl F and sliding block H, lever L, having slot L', shaft M, arm M', and chain mechanism to actuate said arm, substantially as set forth.

8. The combination of shaft B, having secured thereon one or more cam-wheels and ratchet-wheel C, reciprocating bar D, carrying pawl F and sliding block H, lever L, shaft M, arm M', chain-wheel B', having ratchet-wheel R, chain T, having pins *t*, rock-shaft O, arms N N', pawl M', arm N², and cam N², substantially as described.

9. The combination of shaft B, having secured thereon one or more cam-wheels, P P', and ratchet-wheel C, reciprocating bar D, pawl F, pivoted thereto, sliding block H, means to arrest the movement of said sliding block in either direction after it has moved some distance, and one or more levers, Q Q', with springs Q², substantially as described.

10. The combination of the ratchet-wheel with the reciprocating bar carrying a pawl and automatic pattern mechanism to raise said pawl up clear of said ratchet-wheel except at stated intervals, substantially as set forth.

258,594. RAILWAY-CAR. JAMES PATTERSON, Washington, D. C. Filed May 23, 1882. (No model.)

Claim.—1. In passenger-cars, a removable roof or cover, E, having sides and ends fitting over the elevated part B of a car, substantially as set forth.

2. In cars, a removable roof or cover, E, having inclined sides and ends fitting over the inclined elevated part B of the car, substantially as specified.

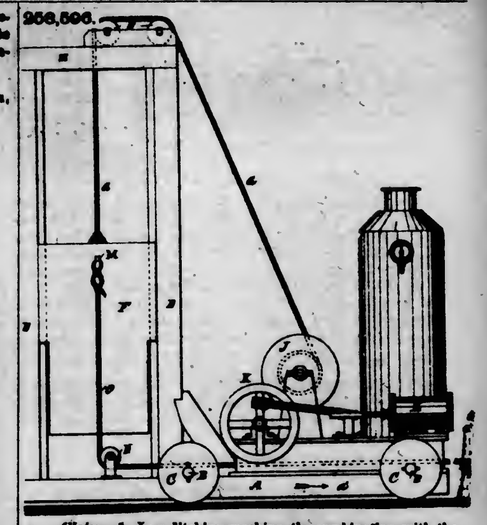
3. In cars, a removable roof or cover, E, having sides and ends fitting over the elevated part B of the car, and provided with packing *i*, substantially as described.

4. In cars, a removable roof or cover, E, having sides and ends fitting over the elevated part B of the car and secured by hooks A or other suitable fastenings, substantially as set forth.

5. In cars, a removable roof or cover, E, having sides and ends fitting over the elevated part B, and having braces D, to strengthen the upper part of the car, substantially as shown, and for the purpose specified.

6. The combination of a car-body with the elevated part B, removable cover E, a series of braces, D, and joints *h*, all arranged substantially as set forth.

258,595. SPRING BED-BOTTOM. WILLIAM L. PHILLIPS, Brooklyn, N. Y., assignor to Alice B. Phillips, same place. Filed Sept. 7, 1881. (No model.)



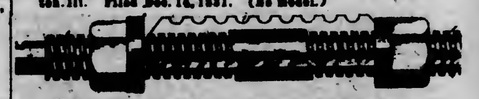
Claim.—The construction of a woven-wire bate having a rigid frame made in one or more parts with spiral springs mounted thereon and secured thereto, substantially as described.

258,596. DITCHING-MACHINE. FRANCIS PIDGEON, Saugerties, N. Y., assignor to H. H. Pidgeon, same place. Filed Sept. 2, 1881. (No model.)

Brief.—To move the machine forward the hauling-rope is attached to the knife when down, and as the knife is elevated the machine is correspondingly advanced.

258,596.

Claim.—1. In a ditching-machine, the combination, with the platform A, of the uprights D, the drop-knife F, the rope G, the windlass E, the rope O, the pulley N, and the cleat M, substantially as herein shown and described, and for the purpose set forth.



2. The method, substantially as herein shown and described, of propelling the platform A, carrying a drop-knife, consisting in attaching the end of the rope O, passing through a pulley, N, to the knife F, when the same is lowered, and then raising this knife, as set forth.

258,597. DOOR-HANGER AND PULLEY. CHAS. W. PIERCE, Oak Hill, N. Y. Filed May 23, 1881. (Model.)

Claim.—The block or frame of a door-hanger or sheave-pulley, consisting of the main bar A and its attachments, lateral branches G, and connecting-bar H, all arranged as described, and cast or otherwise formed in one solid piece, and provided with bearing-holes B for the pivots of the roller or sheave, and channels L for the entry of said pivots to said bearing-holes by springing the frame apart for said entry and closing thereafter to secure the pulley, substantially as described.

258,598. EXPANDING MANDREL. JOHN G. POPE, Bloomington, Ill. Filed Dec. 14, 1881. (No model.)

Claim.—1. An expanding mandrel provided with sliding boys or plates held in place upon the arbor by nuts at the ends of the boys, the boys or plates being provided upon their outer edges with a series of inward curves or scallops, substantially as and for the purpose set forth.

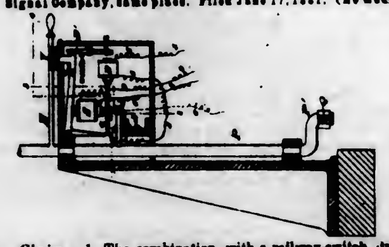
2. A mandrel boy or plate provided upon its outer edge with a series of inward curves or scallops, substantially as and for the purpose set forth.

258,599. PISTON. JAMES PRESTON, New York, N. Y., assignor of one-half to S. A. Burns and G. A. Cooke, same place. Filed Aug. 8, 1881. (No model.)

Claim.—1. In a piston, the combination, with a valve-cage having a beveled flange and attached to a rod, of a beveled ring attached to the lower end of a tube surrounding the rod, and of a packing-strip wound spirally around the valve-cage and held between the beveled flange and beveled ring, substantially as herein shown and described, and for the purpose set forth.

258,599.

2. In a piston, the combination, with the short cylinder A, fastened to a rod, C, by a transverse bar, B, of the apertured bottom D, forming a beveled flange, F, of the beveled ring H, attached to the fork J at the lower end of the tube K, and of a packing-strip, L, wound spirally around the short cylinder A, substantially as herein shown and described, and for the purpose set forth.



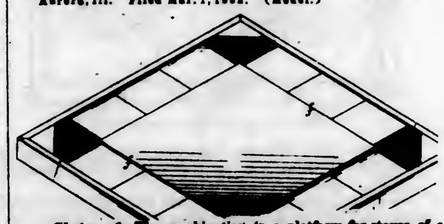
3. The piston-rod C, constructed, substantially as herein shown and described, with a valve-cage formed of the short cylinder A, the transverse bar B, and the apertured bottom D, with projecting beveled edges at its lower end, as and for the purpose set forth.

258,600. ELECTRIC RAILWAY-SIGNAL. THEODORE A. B. PUTNAM, New York, N. Y., assignor, by mesne assignments, to the Railway Cab Electric Signal Company, same place. Filed June 28, 1881. (No model.)

Claim.—A locomotive bearing a partial-closed electric circuit, including a generator and alarm, and terminating, on the one hand, in a pair of wheels of the locomotive, and, on the other hand, in a truck or pair of wheels of the locomotive, tender, or some car of the train, said wheels being insulated from those first named, in combination with a railway-track having insulated spaces or breaks in both the right-hand and left-hand rails thereof, the insulations of one rail being opposite those of the other, substantially as set forth.

258,601. ELECTRIC SAFETY APPLIANCE FOR RAILWAY-SWITCHES, &c. THEODORE A. B. PUTNAM, New York, N. Y., assignor, by mesne assignments, to the Railway Cab Electric Signal Company, same place. Filed June 17, 1881. (No model.)

Claim.—1. The combination, with a railway-switch, draw-bridge, or similar structure or provision, of a visual signal disk or plate arranged adjacent to the operating-handle, and tending to move into the way thereof, an electro-magnetic detent arranged to normally restrain said signal, a partial electric circuit including said magnet extending to a distant signaling-point and there terminating in two adjacent and successive track-rails insulated from each other, and a circuit-breaking device, also included in said partial circuit, and so arranged in connection with the switch, bridge, &c., that the said partial circuit remains closed when said switch or bridge is properly set, and is broken when the latter is set to "danger," substantially as set forth.



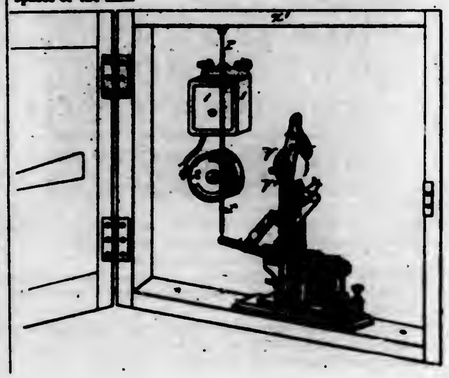
2. A switch or draw-bridge locking device consisting of the combination of a partial circuit terminating in distant insulated rails H J, an electro-magnet, D, included in said circuit, a detent-lever, D', bearing the armature of said magnet, a lever, S', bearing a locking device, V, tending to thrust the latter into engagement with the operating-handle, and normally restrained by said detent-lever, whereby an instantaneous electrical impulse through said circuit will cause the locking of the switch or bridge, and the latter will thereupon remain locked until the locking device is otherwise withdrawn, with automatic means for withdrawing said lock upon the passage of a train past a point on the track adjacent thereto, substantially as set forth.

3. The combination of operating-handle E, disk V, armature-lever S', magnet S, a partial circuit including said magnet and terminating in two successive track-rails at a point adjacent thereto, the said rails insulated from each other, a withholding detent-lever, D', bearing an armature, an electro-magnet, D, a partial circuit including said magnet extending to a remote point on the track, and there terminating in two successive track-rails, and the said rails insulated from each other, all constructed and arranged to operate substantially as set forth.

4. A railway-switch, draw-bridge, or other structure provided with an electro-magnetically-applied lock, in combination with a mechanical or spring latch adapted to always engage the operative mechanism when the structure is in the position of "safety," and to strongly resist any effort to move it out of that position, thereby relieving the electrical lock of more or less strain, substantially as set forth.

5. A railway-switch provided with an electro-magnetically-applied lock adapted to engage the operative mechanism when the switch is set to "safety," in combination with an automatic mechanical locking device consisting of a locking-lever, T, having a central recess near its fulcrum adapted to engage a moving part, *b* or *b'*, on the switch-shifting mechanism when the switch is set in its "safety" position, and having an arm or arms extended laterally of said socket for engagement with said part in its movement toward or from said socket, in combination with said part and with a spring or springs, *d*, arranged to cause the lever to resist the tilting movement necessary to the escape of said part from its socket, substantially as set forth.

258,602. TILE STOVE-PLATFORM. EDWIN W. L. RICE, Aurora, Ill. Filed Mar. 1, 1882. (Model.)



Claim.—1. The combination, in a platform for stoves, of a wooden base or bed, a central metal plate, and a set of inlaid tiles.

2. In a platform for stoves, the combination, with a set or system of tiles, of a flanged exterior band or binding and a flanged metallic center piece, the band and center piece serving to hold the tiles in place.

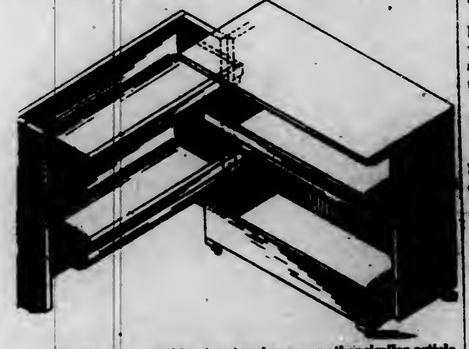
3. In a platform for stoves, the base-board constructed with a raised center piece or block, combined with a metal cap secured thereto, and having a flange projecting beyond such block, as and for the purposes described.

258,603. ELECTRIC TIME-DETECTOR. JAMES E. RICHARDS, Cedar Keys, Fla. Filed Oct. 20, 1881. (No model.)

Brief.—An alarm located in a locked box in the room to be visited is sounded on the completion of the circuit by the automatic make and break wheel, and a disk is rotated one space behind the door of the said locked box. Through a slot in the said door the watchman records the exact time of his visits on the white spaces of the disk.

Claim.—1. The combination of a battery, a continuously-moving make and break circuit device, as constructed that the times when the circuit will be made and broken may be varied at will, and one or more locked station-boxes, through a slot in the lid of which the dial may be seen, and in each of which is the following apparatus—*i. e.*, electro-magnets provided with the usual armature and fittings, a lever connecting the lever of the armature with mechanism for revolving a dial, and a bell, all combined and operating substantially as and for the purposes set forth.

2. The combination of a battery, a continuously-moving make and break circuit device, as constructed that the times when the circuit will be made and broken may be varied at will, and one or more station-boxes, in each of which is the following apparatus—*i. e.*, electro-magnets provided with the usual armature and fittings, a dial caused to rotate at stated times by the movement of the armature, upon which dial the watchman may register his rounds, and a bell, all combined and operating substantially as and for the purposes set forth.

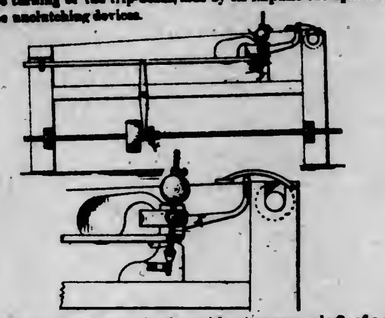


3. The combination of an automatic make and break circuit apparatus on an electric circuit and one or more station-boxes, in each of which is the following apparatus—*i. e.*, electro-magnets provided with the usual armature and fittings, a shaft upon which is a dial, which shaft is caused to rotate at stated times by the movement of the armature-lever, and upon which dial the watchman can register his rounds, and a bell, the said station-boxes being placed on a local circuit, the relay of which is actuated by the current sent through another circuit by the automatic make and break circuit apparatus.

4. The combination of the wheel A, provided with the teeth E, the tipping lever A, having on one end thereof the insulating-plate *i*, and one or more station-boxes containing electro-magnets provided with the usual armature and fittings, and a movable dial operated by the movement of the armature-lever, all combined substantially as and for the purposes set forth.

5. The tipping lever A, having on one end thereof the insulating-plate *i*, placed near the end thereof, and an automatically-moving metallic surface, portions of which at stated times come in contact with, first, the insulating-plate, and, secondly, the metal of the tipping lever, all combined and arranged to give good and instant contact between the metal surfaces, substantially as and for the purposes set forth.

6. The combination, in an electric time-detector, of an automatic make and break circuit apparatus provided with its battery, alarm, and dial-registering devices at one or more station-boxes, a double-contact button placed in the main line, and an alarm-bell, the bell being operated by a current from a separate battery passing through the double-contact button, all combined and arranged substantially as and for the purposes set forth.



258,604. BUREAU, &c. GEORGE F. RICHARDSON, Montague, Mass. Filed Dec. 16, 1881. (No model.)

Claim.—The combination, in a bureau or other similar article of case-work, of receptacles or compartments arranged alternately on opposite sides, so that when opened the contents of each receptacle will be readily accessible, and when closed the spaces between each receptacle will be filled by the opposite receptacles, substantially as specified.

258,605. WARP-STOP MECHANISM FOR LOOMS. TIMOTHY R. RIDER, Pitch Bay, Quebec, Canada. Filed June 16, 1881. (No model.)

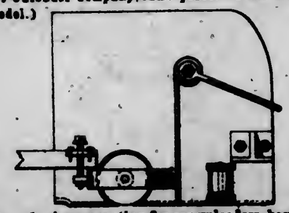
Brief.—A series of forked detector-levers is pivoted upon a shaft placed transversely in the loom-frame below the line of warp-threads, and a trip-beam, also mounted on said shaft, is formed with a sleeve, to which are attached an upright weighted arm resting normally a slight distance to one side of a vertical line passing through said sleeve and a dependent arm connected with the unclutching devices. An adjustable stop engaging a lever which is pivoted to the dependent arm, and which may be thrown up to permit movement of the trip-beam by hand, regulates the position of the weighted arm. The latter, when carried past the vertical line by the turning of the trip-beam, aids by its impulse the operation of the unclutching devices.

Claim.—1. The combination, with a transverse shaft, of a series of weighted levers provided with slots or eyes to receive the warp-threads, a trip-beam having its ends bent and pivoted on said shaft, and arranged to be operated by said levers, and an arm provided with an adjustable weight, substantially as described.

2. The combination, with a transverse shaft, of a series of weighted levers, constructed and arranged, as described, to admit of the contact of the threads therewith, a trip-beam arranged relative to said levers, an arm provided with an adjustable weight, a dependent arm, a lever connected to said dependent arm, and a stop for preventing backward tilting of the weighted arm, substantially as described.

3. The combination, with the transverse shaft, of a series of levers, a trip-beam provided with a weighted arm, and an adjustable stop for preventing undue backward motion of said arm, substantially as described.

4. The combination, with the transverse shaft, of a series of levers and a trip-beam provided at one end with a sleeve having the arm provided with an adjustable weight, substantially as described.



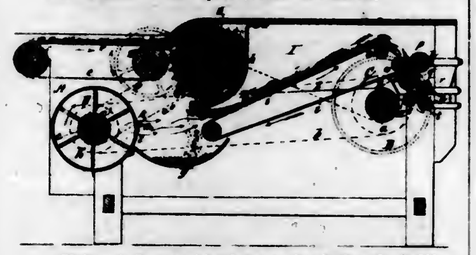
5. The combination, with a transverse shaft, of a series of levers, a trip-beam having its ends bent at right angles for connection to said shaft, a sleeve, an upright arm secured to said sleeve, a dependent arm, and shipping or unclutching devices, substantially as described.

6. The combination, with the transverse shaft, of a series of levers, a trip-beam arranged relative to said levers, a sleeve, a weighted arm secured to the latter, a dependent arm provided with a stud, a lever pivoted to the dependent arm, and an adjustable stop, substantially as described.

7. The combination, with the trip-beam having a weighted arm and a dependent arm with its lever, of the adjustable stop, as and for the purpose set forth.

8. The combination, with the series of levers, and the trip-beam having a weighted arm and dependent arm with its lever, of the adjustable stop, as and for the purpose set forth.

258,606. NOSE-CASTING FOR CAR-UNLOADERS. GEORGE W. ROLFE, Toledo, Ohio, assignor to the American Rail Road Ballast Unloader Company, same place. Filed Mar. 28, 1882. (No model.)



Claim.—1. A nose-casting for car-unloaders, having upon its inner side a bracket of suitable construction, to which is pivoted or otherwise adjustably connected an anti-friction roller adapted to bear upon the car-platform, substantially as and for the purpose set forth.

2. In a car-unloader, the nose-casting at the extreme forward end thereof, having pivoted to its inner side a suitable frame, carrying an anti-friction roller, in combination with means, substantially as shown, for raising and lowering said frame, for the purpose set forth.

3. In a car-unloader, the combination, with the nose-casting thereof, of an anti-friction roller connected to the forward end of said nose-casting and adapted to bear against the guide-rail of the car-platform, substantially as and for the purpose specified.

4. A nose-casting provided with a bracket on the inner side of its forward end to rest over and above the guide-rail of the car-platform, substantially as and for the purpose described.

258,607. APPARATUS FOR PREPARING FEATHERS FOR BEDDING, &c. GEORGE A. SANBORN and GEORGE W. SANBORN, Boston, Mass. Filed Sept. 27, 1881. (No model.)

Claim.—1. In a machine for preparing feathers for bedding, &c., a series of corrugated or fluted rolls, in combination with means for producing an air-blast and a picker, H, constructed to operate substantially as described.

2. An endless apron, *i*, having an upwardly-inclined portion and a downwardly-inclined portion, traveling within a closed passage, I, in combination with a series of corrugated or fluted rolls, mechanism for producing an air-blast, and a picker, as set forth.

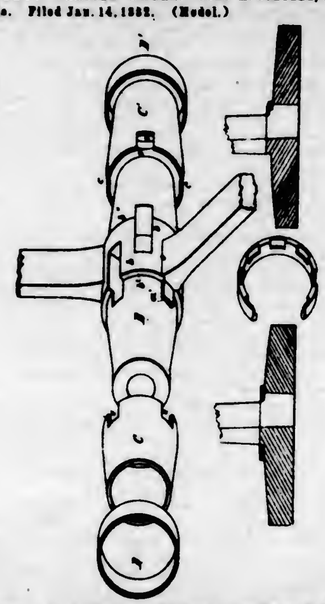
3. The combination of the endless feed-apron *e*, the angular endless apron *i*, located in a closed passage, I, a series of corrugated or fluted rolls, a picker, and mechanism for producing an air-blast, as and for the purpose specified.

4. A slotted frame, K, a series of corrugated or fluted rolls having bearings in said slotted frame, as described, in combination with a series of levers, L P, and links for connecting the same, one of the said levers being weighted to allow of the adjustment of the rolls, for the purpose set forth.

258,608. ROPE-CLAMP. THOMAS SAMSON, Egg Harbor Township, Atlantic County, N. J., assignor of one-half to Wm. B. Rose, same place. Filed Feb. 14, 1882. (Model.)

Claim.—The block A, having the oblong opening B and transverse slot C, in combination with the shaft D, journaled therein, and carrying the reversible crescent-shaped clamping-block E and handle F, all constructed and arranged substantially as described.

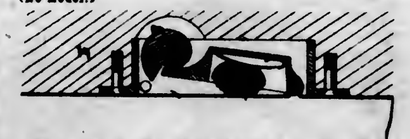
258,609. CLOCK-BELL. GEORGE W. SANFORD and AARON C. SANFORD, Winsted, Conn. Filed Mar. 3, 1882. (No model.)



Claim.—1. A clock-bell consisting of a bell-wire fastened to a sounding-disk and a wire fastened to the sounding-disk and crossed beneath the same, the ends of the wire being perforated for the insertion of fastening-screws, substantially as set forth.

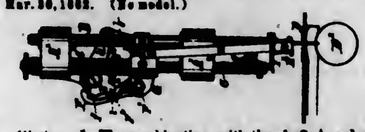
2. A clock-bell consisting of a bell-wire fastened to a sounding-disk and a supporting-wire on which the sounding-disk is cast, substantially as set forth.

3. The combination, with the sounding-disk, bell-wire, and supporting-wire, of the rubber washers interposed between the ends of the supporting-wire and clock-case, substantially as set forth.



258,610. VEHICLE-WHEEL. JOHN A. SCHULER, Hillville, Ohio. Filed Jan. 14, 1882. (Model.)

Claim.—1. A vehicle-wheel having a wooden hub, B, in combination with wooden spokes whose tenons A are widened beyond the spoke-face and extend radially upward along such face beyond the hub's periphery, as at *a'*, and are driven and glued fast in the hub-mortices; one or more metallic shells, C C', indented on their inner edges to receive said tenon-extensions and flush therewith; lastly, bands or hoops D D', embracing said tenon-extensions and the notched portions of the shells and supporting the outer faces of the spokes, substantially as set forth.



2. In the described combination with wooden hub B, spokes A, and covering-bands D D', the shells C C', indented on their inner edges and having the interior fin or burr, *c''*, to prevent their accidental displacement, as set forth.

258,611. SASH-HOLDER. HENRY A. STORR, Brooklyn, N. Y., assignor to Andrew Randell, same place. Filed Oct. 17, 1881. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the pivoted self-retracting friction-stop, the revolving cam acting on such stop, and the rocking spring-sustained double eccentric forming the working-face of the stop, for the purpose specified.

258,612. AUTOMATIC PRESSER-FOOT LIFTER FOR SEWING-MACHINES. CHARLES G. STRATTON, Worcester, Mass. Filed Mar. 30, 1882. (No model.)

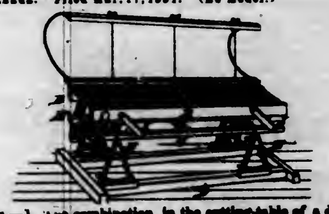
Claim.—1. The combination, with the shaft A and presser-bar C, of the oscillating head-piece E, having the offset *f* and trip *l*, and the latch-piece F, adapted for automatically effecting the

elevation of said presser-bar, substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore described, of the presser-bar C, the auxiliary movable bar H, carrying the presser-foot H', the drop block or hub G, fixed to said presser-bar, the guide I, the latch-piece F, the oscillating head E, fixed to the shaft A and provided with offsets or lugs *f l*, and the springs F' and K, for the purposes set forth.

3. The combination, with the auxiliary swinging bar H, carrying the foot H', and the presser-bar C, with its spring C', of the drop block or hub G, having a lip, G', extending over the end of said swing-bar and forming a pressure-socket therefor, substantially as shown and described.

4. The combination, with the shaft A, provided with arm *a*, and presser-bar C, provided with the catch-piece F, of the head-piece E, having offset or lug *f*, and projections *l m*, the adjusting-screw M, and trip-screw L, as and for the purposes set forth.



258,613. BED-BOTTOM FRAME. JOHN A. THOMPSON and ELIAS WELLS, Pittsburg, Pa. Filed Apr. 19, 1882. (No model.)

Claim.—1. A woven-wire-mattress frame consisting of screw-threaded metallic side rails, threaded metallic corner-pieces, having sockets for the end and side rails, in combination with set-screws which pass through the corner-pieces and bear against the threaded portion of the side rails, substantially as and for the purposes specified.

2. A mattress-frame having adjustable side rails, provided with a set screw or screws extending through the sockets and biting on the rail fitting therein, substantially as and for the purposes described.

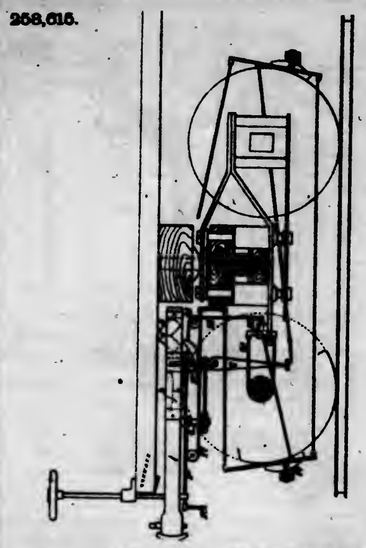
258,614. DRAIN-TILE MACHINE. GEORGE S. TIFFANY, London, Canada. Filed Mar. 17, 1881. (No model.)

Claim.—1. The combination, in the cutting-table of a drain-tile machine, of the hinges or hinged supports I I I I and frame C, substantially as and for the purpose herein set forth.

2. The combination of the slotted bars H H, binding-rod K, crank-nut L, and frame C with the cutting-table of a machine for making drain-tiles, substantially as and for the purpose herein specified.

258,615. AUTOMATIC CAR-BRAKE. DOLPHUS TORREY, New York, N. Y. Filed Oct. 18, 1881. (No model.)

Claim.—1. In a double-acting draw-bar brake apparatus, the combination, with the draw-bar and brake-lever, of duplicated blocks or toggles, arranged for alternative use to transmit motion from the draw-bar to the brake-lever in one or the other direction.

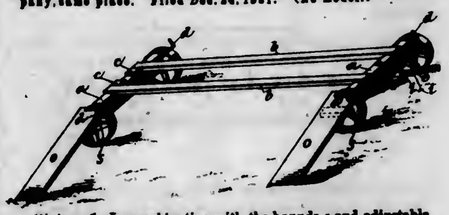


2. In an automatic draw-bar brake apparatus, the combination, with the draw-bar and brake-lever, of duplicated blocks or toggles for transmitting motion from the former to the latter in one or the other direction, and a reversible tripping device for unsetting one or the other of said transmitting-blocks or toggles.

3. The combination, with the draw-bar, the brake-lever, and a transmitting device for communicating motion from one to the other, of a cam-drum, mounted on the brake-lever and carrying a tripping device for unsetting the transmitting device, substantially as described.

4. The combination, with the draw-bar, the brake-lever, and one or more blocks or toggles for transmitting motion from the draw-bar to the brake-lever, of the cam-drum and the oblique cam or eccentric carried thereby, for tripping the transmitting-block or toggle, substantially as described.

5. The automatic adjustment device 20 22, placed in active position by the movement of the brake-beam and actuated by the rotation of the axle, substantially as described.



258,616.

6. The reversible yoke, in combination with the transmitting-shaft and chain or cord, for setting said chain or cord on either side of the shaft for direction adjustment, as explained.

7. The combination of the draw-bar or transmitting-bar connected therewith, the brake-lever, one or more interposed blocks or toggles, the cam-drum, and the transmitting chain or cord actuating said cam-drum for automatic adjustment, substantially as described.

258,616. TRUCK FOR MOVING HARVESTERS. WILLIAM H. TURNER, Indianapolis, Ind., assignor to the Turner Truck Company, same place. Filed Dec. 24, 1881. (No model.)

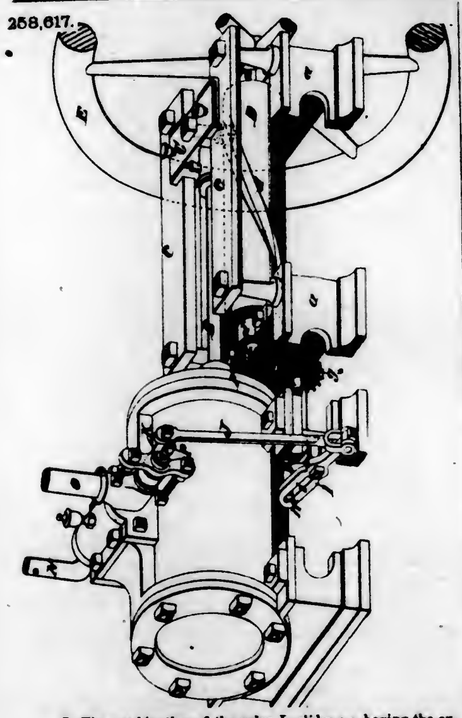
Claim.—1. In combination with the bounds *c* and adjustable blocks *i i*, a truck having bolsters *a a*, reaches *b b*, blocks *e e*, and hooks *d*, all constructed and arranged in the manner described.

2. A skid, *e*, having one end cut to fit the curve of the wheel-rim, as described, the block *s*, and the wheel of a truck, combined in the manner described and shown, and for the purpose set forth.

258,617. STEAM-ENGINE. ALBERT F. VALLOTTON and HENRY LUBWAY, St. Louis, Mo. Filed Aug. 26, 1876. Renewed Sept. 26, 1881. (Model.)

Claim.—1. The cylinder D, having the center d^3 and the adjustable parts d^4 d^5, as and for the purpose described.

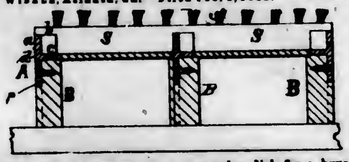
2. The combination of the slides *e e*, the cross-head C, stud *c'*, and the cylinder D, having the adjustable parts d^4 d^5, substantially as described.



3. The combination of the slides *e e*, having the extended bearings e^3 e^3, the cross-head C, stud *c'*, and the cylinder D, having the groove *d*, the said parts being relatively adjusted as and for the purpose set forth.

4. The combination of the slides *e e*, having the extended bearings e^3 e^3, and the cross-head C, having the rollers c^2 c^2 and the stud *c'*, and the cylinder D, substantially as described.

5. The combination of the cylinder D, pinion F, gear *g*, shaft G, pin g^2, crank H, pin h^2, slotted lever I, rod J, arm K, and valve L, substantially as described.

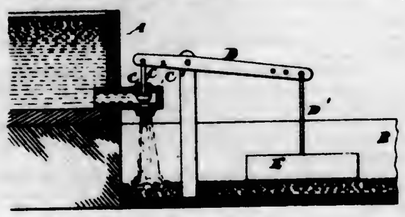


6. The combination of the shaft G, crank H, having the shoulders *h h'* and pin h^2, and the slotted lever I, as and for the purpose set forth.

258,617.

7. The combination of the valve L, slides *c c*, having the extended bearings *c' c'*, seat M, stem *l*, and screw P, substantially as described.

258,618. BRUSH-CYLINDER FOR COTTON-GINS. EDWARD VAN WINKLE, Atlanta, Ga. Filed Feb. 8, 1882. (No model.)

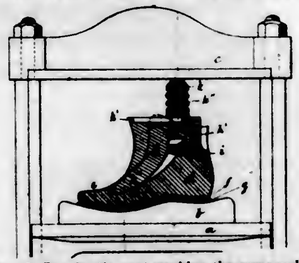


Claim.—1. A metallic ring or annular disk for a brush-cylinder of a cotton-gin, composed of the vertical wall *d*, horizontal flange *e*, and the dovetailed or trapezoidal slots, substantially as described.

2. A metallic ring or annular disk, A, for a brush-cylinder of a cotton-gin, having converging walls *b b* and the walls *a*, substantially as described.

3. The improved brush-cylinder for a cotton-gin, consisting essentially of a shaft, wooden disks B, the annular rings formed with the trapezoidal or dovetailed slots, and the brush-slats S, formed of a trapezoidal shape, substantially as shown and described.

258,619. WATERING ANIMALS. ISAAC WELTY, Olney, Ill. Filed Oct. 5, 1881. (No model.)



Claim.—1. An automatically-operating apparatus for watering stock, the combination of the reservoirs A and B, the pipe C, having a horizontal opening communicating with the reservoir A, and a vertical opening for the discharge of water into the reservoir B, said vertical opening being provided with a valve-seat for the automatically-operating valve to close upon, the float E, the graduated lever D, the valve C', and the connecting-rod D', the parts being constructed and arranged as shown and described.

258,620. TOP-FLAT OF CARDING-MACHINES. WILLIAM E. WHITEHEAD, Lowell, Mass., assignor to the Whitehead & Atherton Machine Company, same place. Filed Mar. 23, 1882. (No model.)

Claim.—A molded fibrous pulp top-flat for carding-machines, substantially as hereinbefore set forth.

258,621. DEVICE FOR BEATING OUT SHOE-SOLES. SIDNEY W. WINSLOW, Salem, Mass. Filed Oct. 10, 1881. (No model.)

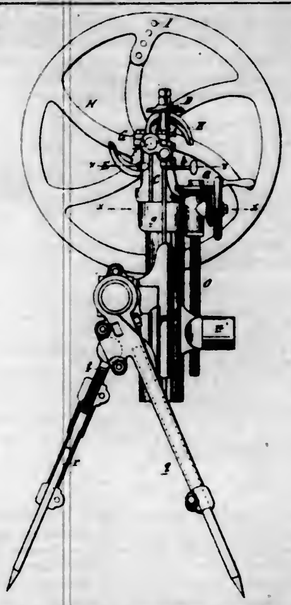
Claim.—1. In a beating-out machine, the pressure-block *h*, in combination with the adjustable swivel heel-piece *i* and last *d*, as and for the purpose set forth.

2. In a beating-out machine, the pressure-block *h*, in combination with the laterally-adjustable screw and nut *k k'* and last *d*, as and for the purpose set forth.

3. In a beating-out machine, the last *d*, the pressure-block *h*, with its swivel heel-piece *i*, and laterally-adjustable screw and nut *k k'*, as and for the purpose set forth.

258,622. CORSET. WILLIAM S. ALLEN, Hillsdale, assignor to Charles W. Higby, Jackson, Mich. Filed Aug. 25, 1881. (No model.)

Claim.—1. In a corset provided with side openings to entirely disclose the hip of the wearer, as described, an adjusting-strap provided with a flexible shield of substantially the shape shown at its point of attachment to the corset, said shield being adapted to prevent the flesh of the wearer from unduly protruding through the hip-opening, and prevent undue pressure on the same, as and for the purpose specified.



2. In combination with a corset having hip-openings to entirely disclose the hip of the wearer, as described, adjusting-straps provided with flexible shields or enlargements, and adapted to close the rear half only of said hip-openings, and having the lower and vertical sides at right angles, or nearly so, with each other, and having curved sides at their point of attachment to the corset, substantially as and for the purpose specified.

3. In combination with a corset having side openings to entirely disclose the hip of the wearer, the flexible quadrant-shaped shield B and the strap *b*, both made in a single piece, substantially as described.

258,623. ROCK-DRILL. ERWIN A. ARMSTRONG, Detroit, Mich. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a rock-drill, the frame C, in combination with

258,623.

the drill-stock A, the spring J, adapted to give said drill-stock its downward movement, the ratchet-wheels K Q, screw O, driving-shaft F, and connections, substantially as described, between the driving-shaft and the ratchet-wheels, as and for the purpose specified.

2. In a rock-drilling machine, the main shaft F and cam M', rotating with said shaft, in combination with the pawl and lever L N and the ratchet-wheel K and the drill-stock, for the purpose of automatically and intermittently rotating said drill-stock, substantially as described.

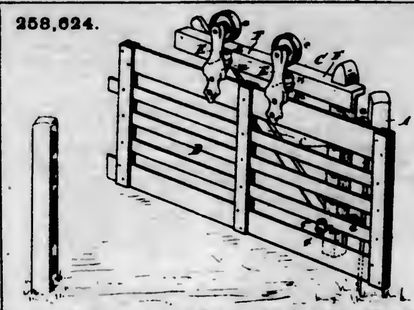
3. In a rock-drilling machine, the main shaft F and cam M, rotating with said shaft, in combination with the pawl-lever E, the ratchet-wheel Q, and the screw O, for the purpose of automatically and intermittently advancing the frame supporting the operating parts, substantially as described.

4. In a rock-drill, a tripod-head provided with trunnions *n n'*, in combination with the secondary trunnions *o*, adapted to be clamped upon either of the trunnions *n n'*, and the adjustable legs *q r*, substantially as described.

5. In a rock-drill, a tripod-head provided with two trunnions, *n n'*, each having an end socket, *s*, in combination with the leg *r*, having an adjustable ball-head, *t*, whereby the tripod-head can be clamped in a horizontal position, substantially as and for the purpose specified.

6. In a rock-drill, the case C, supported on the trunnions *n n'* and legs *q r*, and the drill-stock A and spring J, operating in said case, in combination with the head D, the cams E M M', arms R N, pawls *k* L, ratchet-wheels K Q, and the screw O, as and for the purpose specified.

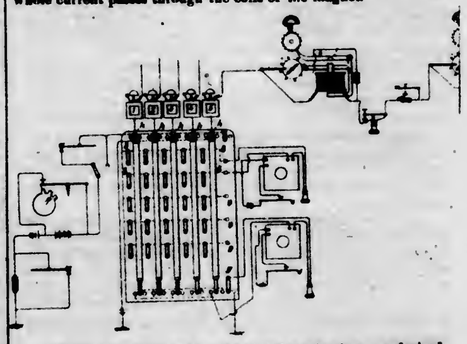
7. In a rock-drill, the shaft F, provided with the cam E, for retracting the drill-stock, and with cams M M', for feeding and rotating said drill-stock, in combination with intermediate mechanism, substantially as described, between the cams and the drill-stock and drill-frame, as set forth.



258,624. FARM-GATE. GEORGE I. BLYTH, Memphis, Mich. Filed Feb. 4, 1882. (No model.)

Claim.—1. In a sliding hinged gate, the gate-body suspended from two brackets arranged equidistant from and upon each side of its center, said brackets carrying rollers arranged at right angles to each other, and the whole combined with a hinged frame, as set forth.

2. A hinged frame the horizontal arm of which forms an angle-bar, as shown, combined with sets of rollers, each set arranged at right angles to the other, and adapted to traverse the angle-arm both upon the upper and side surfaces, and with a gate suspended therefrom, as specified.



3. The combination of the post A, the hinged frame C, having arm *d*, roller *e*, and track F, the gate D, the brackets E, and the rollers *e n*, at right angles to each other, all constructed and arranged substantially as and for the purpose specified.

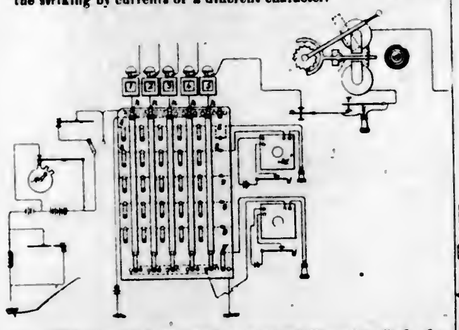
258,624.

258,625. ELECTRIC INDIVIDUAL SIGNALING APPARATUS. CHARLES E. BUELL, New Haven, Conn., assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed July 6, 1881. (No model.)

Brief.—A single magnet is employed to operate step-by-step mechanism and to unlock the signaling mechanism. The escapement-wheel of the step-by-step mechanism is provided with an insulating-tooth and forms part of a shunt which is normally closed around the magnet. A polarized armature which vibrates by the currents sent to line while the shunt is closed operates or controls the escapement. The signal mechanism is unlocked by a neutral armature, which is not affected till the shunt is broken and the whole current passes through the coils of the magnet.

Claim.—1. In a step-by-step signal mechanism, a polarized electro-magnetic receiving-instrument controlling step-by-step circuit-breaking devices, and provided with a supplemental neutral armature controlling the bell.

2. In combination with bell devices and step-by-step mechanism which serves to throw the bell devices into and out of operative electrical condition, a polarized electro-magnetic receiving-instrument provided with a supplemental neutral armature.



3. The combination, substantially as described, in an individual signaling apparatus, of a metal escapement-wheel connected to the main electric circuit on one side of said apparatus, and provided with an insulated tooth, and an escapement-lever having conducting-pallets electrically connected with the circuit upon the other side of the apparatus.

4. The combination, of an electro-magnetic receiver provided with a polarized and a supplemental neutral armature, a circuit closer and breaker normally closing a branch circuit around the electro-magnet, devices controlled by the polarized armature serving to operate the circuit-closer so as to break the branch circuit at a predetermined point in its movement, and bell-ringing devices operated by the supplemental armature, substantially as described.

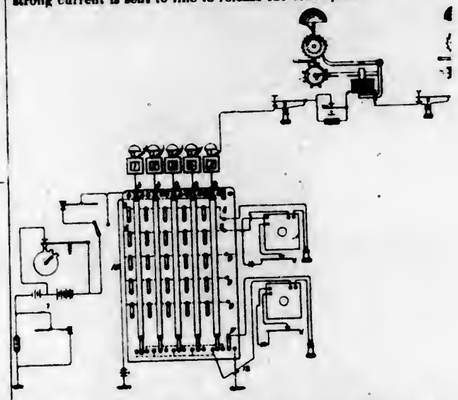
5. The combination of step-by-step mechanism, an electro-magnet in the main-line circuit controlling said mechanism, a derived circuit around said magnet controlled by the step-by-step mechanism, and containing a resistance and a supplemental armature for said electro-magnet controlling the bell-ringing devices, and adjusted above the tension of the line-currents used in operating the step-by-step mechanism.

258,626. INDIVIDUAL SIGNALING APPARATUS FOR TELEPHONE SYSTEMS. CHARLES E. BUELL, New Haven, Conn., assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed July 8, 1881. (No model.)

Brief.—The bell-hammer or bell is rotated by a step-by-step device, so that the hammer can only strike the bell in a given position, this position being different for the several stations on a line. The rotation is effected by currents of one kind or strength and the striking by currents of a different character.

Claim.—1. The combination, substantially as described, of a bell-hammer and a bell, movable with relation to one another into and out of position where the bell-hammer, when operated, will strike the bell, mechanism controlled by an electro-magnet adjusted to be operated by currents of one kind or strength for producing the desired relative movement, and devices adapted to be operated by an electro-magnet and currents of another kind or strength for causing the bell-hammer to strike the bell.

2. The combination, substantially as described, of a bell-hammer and a bell, movable with relation to one another into and out of position where the bell may be struck, devices controlled by a polarized electro-magnet adapted to be operated by reversals of current for producing the desired relative movement, and a neutral armature carried by or attached to the bell-hammer for causing the hammer to strike the bell, and adapted to be operated by a current of either polarity, but differing in strength from the reversed currents.



3. The combination, substantially as described, of step-by-step mechanism controlled by a polarized electro-magnetic receiving-instrument, a bell-hammer lever operated by said step-by-step mechanism and carried into and out of position where it may strike a bell, an armature attached to or carried by the bell-hammer, and a retractor for said bell-hammer lever and armature, adjusted above the tension of the currents used for controlling the step-by-step mechanism.

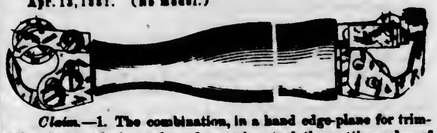
4. The combination, substantially as described, of an electro-magnet provided with a polarized and a neutral armature, step-by-step mechanism controlled by the polarized armature, and carrying a bell-hammer lever to which is attached the neutral armature, and a stationary bell arranged to be struck by the hammer when the latter is operated at the proper point in its movement with relation thereto.

5. The combination, upon the same main line, of a series of polarized electro-magnetic receiving-instruments, each provided with a supplemental neutral armature-lever carrying a bell-hammer, a stationary bell arranged to be struck by the hammer when it is in position for that purpose, and step-by-step mechanisms controlled by reversals of current and carrying the bell-hammer, but arranged to place the bell-hammer at the various stations into position where they may strike the bell at a time different for the various mechanisms.

258,627. ELECTRIC INDIVIDUAL SIGNAL APPARATUS. CHARLES E. BUELL, New Haven, Conn., assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed July 6, 1881. (No model.)

Brief.—Each station is provided with a mechanical signaling apparatus which is normally held from operation by two locking-pawls. One of these pawls is held in engagement with the signaling mechanism by a disk having a notch at one point, into which the pawl may fall at a certain point in the rotation of the disk. The other pawl is attached to the lever of an armature of an electro-magnet. This magnet has a polarized armature, by which the rotation of the disk is effected, and a neutral locking-armature for the signal apparatus. The neutral armature is adjusted to require stronger currents than the polarized armature. The disk is first rotated by reversed currents till one pawl is released, and then a strong current is sent to line to release the other pawl.

Claim.—1. At two or more stations on a telephone or telegraph line, the combination of step-by-step mechanism operated by an electro-magnet in the main-line circuit, mechanism controlled by the step-by-step devices, serving to unlock the bell-ringing devices from operation at a point in the movement of the step-by-step devices different for the different stations, and a second armature for operating the bell-ringing devices, actuated by a current differing from that used in operating the step-by-step mechanism, substantially as described.

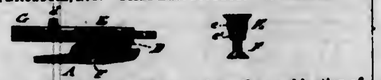


2. In a step-by-step signal mechanism, a polarized electro-magnetic receiving-instrument, which controls through the step-by-step devices mechanism for the bell devices, in combination with a neutral armature adjusted above the tension of the current used for operating the step-by-step mechanism, and serving, when operated, to ring the bell.

3. In combination with bell devices and step-by-step mechanism which locks the bell devices from operation excepting at a predetermined point, a polarized electro-magnet provided with a supplemental neutral armature.

4. The combination, with step-by-step mechanism controlled by a polarized electro-magnetic receiving-instrument and reversals of current, of locking mechanism for locking the bell-ringing devices from operation, and a second neutral armature controlled by the electro-magnet, and adapted to be operated by an increased current for ringing the bell after the step-by-step mechanism and the locking mechanism have been placed in the proper position, substantially as described.

5. The combination of the escapement-wheel and its notched flange, the locking-toe resting upon the flange, and the bell-ringing devices.

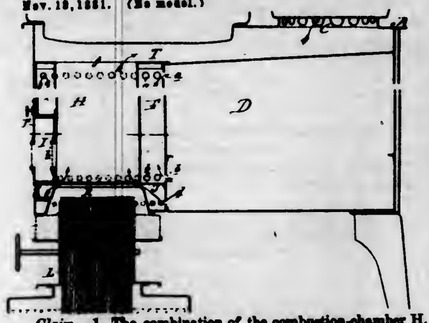


258,628. EDGE-PLANE. LUTHER D. RUSSELL, Boston, Mass., assignor of one-half to James E. Russell, same place. Filed Apr. 13, 1881. (No model.)

Claim.—1. The combination, in a hand edge-plane for trimming boot and shoe soles, of a cutting-tool the cutting-edge of which is shaped to cut away portions of the thickness of the sole to a greater depth than other portions, and a gage-roll of equal diameter throughout, arranged to bear upon the sole in front of said cutting-edge and form between it and said cutting-edge a throat of varying width, whereby a chip of varying thickness in cross-section may be cut from the sole-edge, and thus reduce it to the desired form at one operation, substantially as described.

2. In an edge-plane for trimming boot and shoe soles by hand, the combination of a cutting-tool adapted to trim and shape the edge of the sole, a revolving gage-roll adapted to bear upon the edge of the sole in advance of the cutter, and a revolving guide-roll adapted to bear against the tread-surface of the sole, substantially as described.

258,629. HOT AND COLD AIR REGISTER. RICHARD S. T. CISSEL, Elizabeth, N. J. Filed Mar. 27, 1882. (No model.)



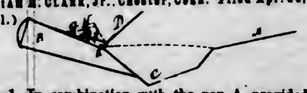
Claim.—1. In a hot and cold air register, the combination of frame A, having top and bottom bars, C and D, valves B, governing-rod B', operating-lever G, female screw E, and male screw F, substantially as set forth.

2. In a hot and cold air register, the combination of the frame A, having a bottom bar, D, and the valve-operating lever G, with a female screw, E, and a male fastening-screw, F, said female screw having a partly-cylindrical and partly-square shank to serve as a pivot for the lever and as a fastening for the bottom bar, substantially as set forth.

3. In a hot and cold air register, the combination of a frame, A, bottom bar, D, operating-lever G, female screw E, having a cylindrical shank portion, *c*, below its head, and a square end portion, *c'*, and a male fastening-screw, F, which is inserted through the frame A into the interiorly-threaded shank of the female screw, substantially as specified.

258,630. OIL-STOVE. ORSON E. CLARK, Detroit, Mich. Filed Nov. 19, 1881. (No model.)

Claim.—1. The combination of the combustion-chamber H, the flue F, surrounding said chamber, and the oven D, partly surrounding the flue F, said flue being provided with openings *a* at its upper end and with openings *b* near its lower end, whereby a constant circulation of air in the oven and flue is insured, substantially as shown, and for the purpose specified.



2. In an oil-stove, the combination of the outer casing having a series of holes, the flue F, having holes *a b*, the cones R, the slotted plates J and T, the flues H and E, and the oven D, substantially as shown and described.

3. In an oil-stove, the combination, with the oven D and the chimney H, of the flue F, provided with an upper series of holes, *a*, and two lower series of holes, *b* and *d*, and the chimney-base J, supported between the lower two series of holes, and forming two distinct chambers in the flue F, substantially as set forth.

4. The combination, with the outer casing and the flue F and chimney H within said outer casing, of the double-walled or chambered door I', constructed to close and fill a passage, I, leading into the chimney H through the flue F, substantially as and for the purpose specified.

5. In a lamp-stove, the flue F, fitting within the outer casing thereof, and provided with a bottom composed of a bottom plate, the cones R, and passages Q, leading to said cones, in combination with the slotted plate J and the chimney H, fitting within said flue above the cones, and a lamp having wick-tubes projecting into the latter, substantially as and for the purpose specified.

258,631. DUST-PAN. WILLIAM H. CLARK, JAMES B. CLARK, and WILLIAM H. CLARK, Jr., Chester, Conn. Filed Apr. 24, 1882. (No model.)

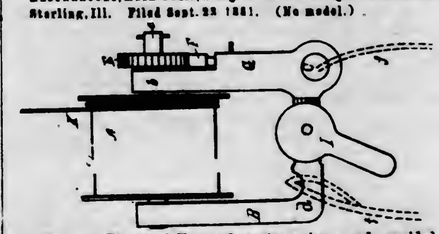
Claim.—1. In combination with the pan A, provided with the receptacle C and the handle B, the hinged cover D, provided with the thumb-piece F, extending back toward the handle, substantially as described.

2. In combination with the pan A and the handle B, the hinged cover D, the thumb-piece F, attached to said cover, the spring G, and the latch H, substantially as described.

258,632. PROCESS OF ADMINISTERING ANÆSTHETICS. SHERMAN COOPER, Westfield, N. J., and EDWARD DENNIS, Sing Sing, N. Y.; said Dennis assignor to Charles Hilbert, Sing Sing, N. Y. Filed Jan. 21, 1882. (No model.)

Claim.—1. That improvement in the art of administering anæsthetics which consists, first, in inclosing material saturated with the anæsthetic in a close vessel, so as to prevent waste or escape thereof; second, opening such inclosed anæsthetic to the admission of air, and, finally, forcing the air by external mechanical means through such anæsthetic, whereby it is laden with the anæsthetic and is forcibly expelled in the form of a dry gas at the point of application.

2. As a means for administering anæsthetics in the form of a dry gas, the cylindrical shell A, its cap B, and plug or valve G, forming an air-tight vessel, the absorbent packing M, means to forcibly drive a current of air through said packing, and means to convey such forced current to the point of application, substantially as shown and described.

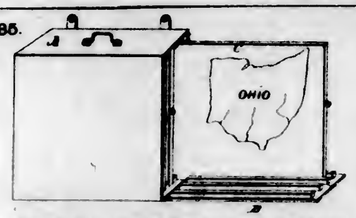


3. The shell A, its tubular cap B, a valve controlling the tubes in such cap, means to confine a packing within such shell, a tube, J, extending through the cap to near the bottom of the shell, an air-forcing apparatus, P Q, and an applying device, R S, substantially as and for the purpose described.

258,633. VAPOR-BURNER. JOHN F. DANIELS, Decatur, Ill. Filed Mar. 25, 1882. (No model.)

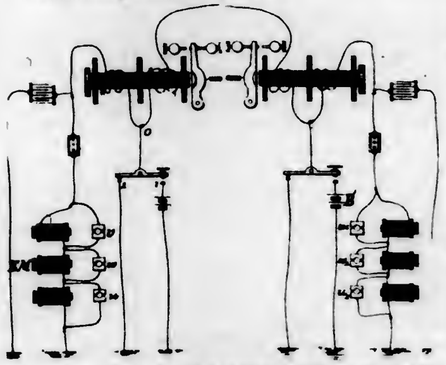
Claim.—The vapor-burner described, consisting of the flat circular generator-chamber *b* and passage *c*, leading downward and opening into the duct *d*, vapor-chamber having funnel-shaped mouth *e e*, and conical tip *e e*, extending down from above and provided with exit-openings *f g*, as set forth.

258,634. WINDLASS FOR WIRE-STRETCHERS. ROLLIN BASTARDOOKS, Rock Falls, assignor to Washington H. Dillon, Sterling, Ill. Filed Sept. 22 1881. (No model.)



Claim.—The pawl F, seated on the spring *e*, and provided with the spur *e*, the spur *g*, the sleeve G, provided with the longitudinal slot *l* and recess *i*, the axle *a*, wheel E, frame B, drum A, and slotted lever H, in combination, whereby the pawl F can be used to engage the wheel E when either side of the frame B is upward, or can be held disengaged from such wheel at the will of the operator, substantially as shown, and for the purpose specified.

258,635. COMBINED BLACKBOARD AND MAP-CASE. ASA C. ELLIOTT, New Jerusalem, Ohio. Filed Sept. 8, 1881. (Model.)

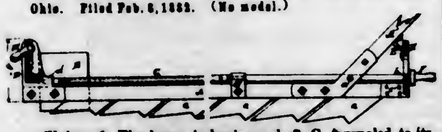


Claim.—1. The combination, with the case having a blackboard-surface and internal grooves adapted to hold a series of maps in a vertical position, of the grooved end hinged to the case and adapted to form a horizontal support for the maps when withdrawn from the case, substantially as described.

258,635.

2. The internally-grooved case A, having the hinged and grooved end B, substantially as described, and for the purpose set forth.

258,636. DUPLEX TELEGRAPH. JOSEPH E. FENN, Elizabeth, N. J. Filed Jan. 5, 1882. (No model.)



Claim.—1. The method of preventing the extra current upon a telegraph-line, set up by receiving-instruments at distant stations, from producing false signals upon the receiving-instrument at the home station in the process of transmitting signals therefrom, which consists in the simultaneous production at the home station of an artificial extra current capable of exerting an effect substantially equal but opposite to that due to the distant instrument set up in the main line upon the receiving-instrument at the home station.

2. In a telegraph system for simultaneous transmission in opposite directions, the combination, at each and both terminal stations, of transmitting devices, duplex receiving-instruments, and an artificial line having a resistance proportional to that of the main line, and electro-magnetic induction apparatus, said resistance being located upon the artificial line between the receiving-instrument and the induction-magnets, as specified.

3. In a telegraph system for simultaneous transmission, the combination, at each station, of duplex receiving-instruments, and an artificial line having an adjustable electro-magnetic device, substantially as specified, and a resistance proportional to that of the main line, situated between the receiving-instruments and the electro-magnetic devices, for the purpose set forth.

258,637. ICE MARKER AND PLOW. JOSEPH B. FISCHER, Hamilton, assignor of two-thirds to Martin Rare, Cincinnati, Ohio. Filed Feb. 6, 1882. (No model.)

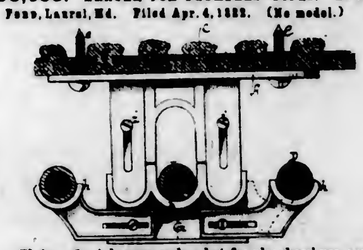
Claim.—1. The beam A, having a shaft, C, journaled to its upper edge, and extending from the front to the rear end of said beam, in combination with the guide-plate B, attached to the shaft C by the adjustable arm B', the rear end of said shaft being provided with means for turning the guide-plate from one side of the beam to the other, substantially as and for the purposes specified.

2. The combination of the shaft C and the guide-plate B, connected to said shaft by the arm B', said arm being constructed in two sections, 1 and 2, one section being capable of sliding on and being secured at the desired point to the other section, substantially as and for the purposes specified.

3. The combination of the beam A and the shaft C, extending from the front to the rear end of said beam, the front end of said shaft being provided with a guide-plate, B, and the rear end with mechanism for rotating said shaft to carry the guide-plate from one side of the beam to the other, substantially as described.

4. The beam A, provided at its front end with the clevis-block D and at the rear end with the bearing-plate *e*, in combination with the shaft C, provided with the guide-plate B, one end of said shaft being journaled in the clevis-block and the other end in the bearing-plate *e*, said shaft being provided with means for causing it to rotate, substantially as and for the purposes specified.

5. The combination of the beam A and the shaft C, the latter provided with a guide-plate, B, and mechanism for rotating said shaft to carry the guide-plate from one side of the beam to the other, and for holding the shaft and guide-plate in the desired positions, substantially as and for the purposes specified.



6. The beam A, provided with plate *e* and semicircular plate E, in combination with the shaft C, provided with the crank F, said crank and semicircular plate being provided with means for causing the crank to be held in the desired position, substantially as and for the purposes specified.

7. The beam A, provided with the clevis-block D and the semicircular plate E, said plate being provided with notches *h*, in combination with the shaft C, provided with the crank F and spring-pawl G, substantially as and for the purposes specified.

8. The beam A, constructed substantially as described, in combination with the shaft C, journaled at each end of the beam, and at or near the center in the clip or box *d'*, substantially as and for the purposes specified.

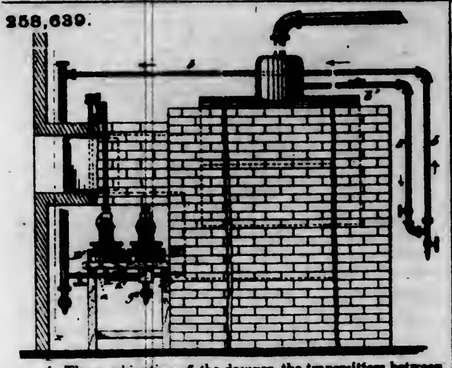
9. The beam A, provided with the semicircular plate E, in combination with the handles A', secured to the beam by the plates *a'* and to the semicircular plate by the angle-irons or braces E', substantially as and for the purposes specified.

258,638. HANGER FOR PLUMBERS' PIPES. EDWARD C. FENN, Laurel, Md. Filed Apr. 4, 1882. (No model.)

Claim.—1. A hanger or bracket for plumbers' use, consisting of a plate, A, with means for attachment to the ceiling, combined with a part, G, and saddles *h*, horizontally adjustable, substantially as set forth.

2. A hanger or bracket for plumbers' use, consisting of a part, A, for attachment to the wall, and a part, G, provided with saddles *h*, combined with slots *f* in the part A, whereby the fastening-screws *e* may have a lateral range of location irrespective of the location of the bracket, as and for the purpose set forth.

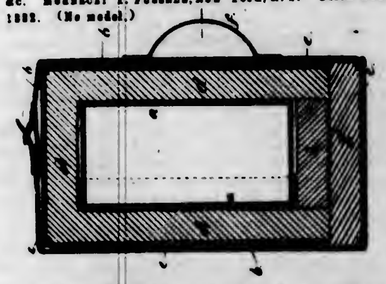
3. A hanger or bracket for plumbers' use, consisting of a plate, A, provided with means for attachment to the ceiling having a range of lateral location irrespective of the location of the bracket, combined with a part, G, and saddles *h h*, which are capable of vertical and horizontal adjustment, substantially as set forth.



258,639. AUTOMATIC DAMPER-REGULATOR. JOHN W. FUNCK, Stapleton, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. The combination of a steam-boiler-furnace damper-regulator, two separate cylinders both having elastic diaphragms, the weighted regulating-levers, a slide-valve actuated by the starting-cylinder, a communication between the said diaphragms, an outlet for the surplus water of condensation from said starting-cylinder, and a stand-pipe communicating with the steam-spaces of the boiler and with the starting-cylinder, substantially in the manner and for the purpose described.

2. The combination of a starting-cylinder having an elastic diaphragm acted on by a weighted lever, a spindle fixed to the diaphragm, a valve applied to guide-recesses of the spindle, the supply and discharge pipes, the second or working cylinder, its diaphragm and loaded lever, and a stand-pipe communicating with the steam-boiler and the first cylinder, substantially as described.



3. The combination of the two cylinders B B', their diaphragms and loaded levers, the receiving and discharge pipes, and a valve applied to the spindle, substantially as described.

258,639.

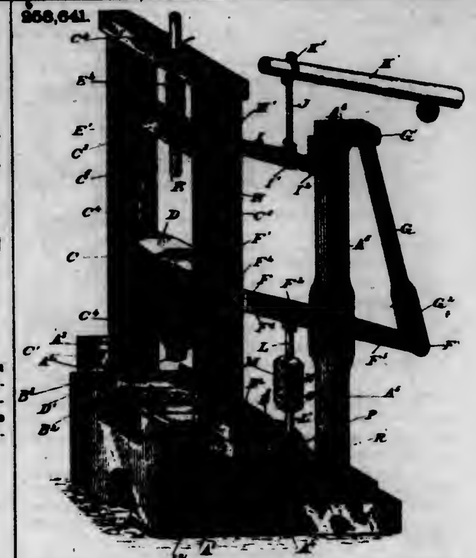
4. The combination of the damper, the transmitters between this damper, a bucket lever, *c'*, the diaphragms in the two communicating cylinders B B', the loaded lever applied to the diaphragm of the cylinder B, the valve applied to the spindle in the latter cylinder, and the stand-pipe communicating with the steam-boiler and with the cylinder, substantially as described.

258,640. NON-CONDUCTING ENVELOPE FOR ICE-CREAM, &c. MORDECAI T. FUSSELL, New York, N. Y. Filed Feb. 13, 1882. (No model.)

Claim.—1. The combination, with the box or package of ice-cream or similar material, of the canvas case *b*, the felt lining *d*, the case *e*, adapted to slip over the case *b*, and the stopper *g*, of felt, fastened into the bottom of the case *e*, substantially as set forth.

2. The combination, in an envelope for packages of ice-cream, of the canvas case *b*, the felt lining *d*, the case *e*, felt stopper *g*, plug *h*, and handle, substantially as set forth.

258,641. MACHINE FOR FORGING CARRIAGE-BOLTS. GEO. GELCHER and JOS. T. GELCHER, Reading, Pa. Filed July 11, 1881. (No model.)



Claim.—1. In a carriage-bolt-forging machine, the combination of the following elements: an anvil, A, provided with die-recess B, guide-standards C, back post, A^1, vertical drop-hammer D, spring cushion or buffer E^1, mounted on spindle E, having collar E^1, helve F, suspension-link G, and suspension-rods H and J, intermediate or compound lever, I, with fulcrum-plate I', clips F^1 and K', connecting-rod L L^1, provided with swivel-link, M, nut N, and spring O, all arranged to be operated by suitable mechanism through the crank-pin P on the disk R, substantially as shown, and for the purpose described.

2. A vertically-guided hammer, D, in combination with a reciprocating helve, F, suspension-link G, links H and J, lever I, fulcrum-plate I', and spring-pole K, substantially as shown, and for the purpose set forth.

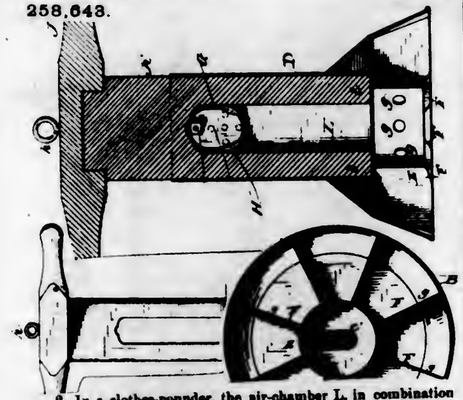
3. The compound lever I and its fulcrum-plate I', in combination with the hammer D, suspension-link G, crank-pin P, spring-pole K, the links J H, helve F, connecting-rod L L^1, and fulcrum-pin F^1, substantially as shown, and for the purpose specified.

4. The suspension-link G, having a bifurcated end, provided with a series of holes, G^1, and suspended from the back post, A^1, by the arm A^2, in combination with the hammer D, crank-pin P, spring-pole K, fulcrum-pin F^1, helve F, connecting-rod L L^1, links H and J, and lever I, substantially as shown, and for the purpose set forth.

258,641.

258,642. RULING-MACHINE. SIDNEY A. GRANT, Springfield, Mass. Filed Feb. 7, 1882. (No model.)

Claim.—1. In a machine for ruling two sides of a strip of paper simultaneously, the combination, with two sets of ruling devices, of the rolls *o* o^3 and adjustable pressure-rollers *n n*, to receive and bear upon the paper as it passes between said rolls *o* o^3 and said rollers *n n*, substantially as set forth.

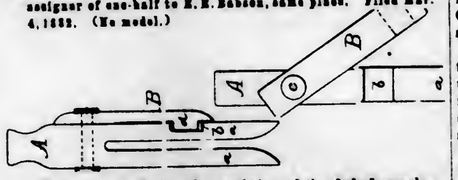


2. In a paper-ruling machine, the combination of two pairs of rods, *o* o', two tension-springs, *c*, two sets of suitable ruling devices, the rolls *o* o^3, and two pressure-rollers, *n n*, to bear upon each of said rolls *o* o^3, substantially as set forth.

3. The within-described improvement in the method of feeding a strip of paper from a roll, B, thereof to the ruling devices of a paper-ruling machine, which consists in seizing the end of said strip, which leads directly from said roll between revolving pressure-rollers, then passing said end loosely around said roll, then between a suitable tension device and under ruling devices, and again between said revolving pressure-rollers, substantially as set forth.

258,643. CLOTHES-POUNDER. CHARLES HANSHAW and THOMAS HANSHAW, Holden, Mo. Filed Mar. 8, 1882. (Model.)

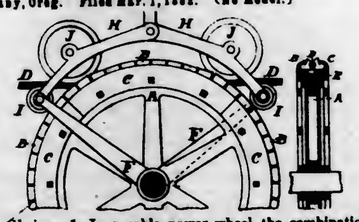
Claim.—1. A clothes-pounder provided with an air-chamber, in combination with the valve located in and on one side of said chamber, and the forked center piece extending into said chamber and around said valve, substantially as described.



258,643.

2. In a clothes-pounder, the air-chamber L, in combination with the valve G, located in and on one side of said chamber, and the metallic cup H, inclosing the lower portion of said valve, substantially as described.

3. In a clothes-pounder, the inner rim or ring, E, provided with holes *g*, in combination with a diaphragm having a central opening, the radial vanes F, with rounded inner edges, the funnel-shaped body A, and flaring lower rim, B, substantially as described.



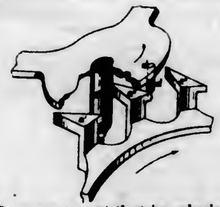
258,644. CLOTHES-PIN. JOSEPH T. HASKINS, Rockport, Mass., assignor of one-half to E. E. Babson, same place. Filed Mar. 4, 1882. (No model.)

Claim.—1. A clothes-pin consisting of the forked member having the notch through one of its sides and the swinging holder pivoted thereto, and having the projection for entering said notch, substantially as described, and for the purpose specified.

2. A clothes-pin consisting of the head A, legs *a a*, one of which has the notch *b*, the holder B, having projection *d*, and the pin *c*, passing through the holder B and head A, all substantially as described, and for the purpose specified.

258,645. CABLE-POWER WHEEL. ROBERT D. HAVEN, Albany, Oreg. Filed Mar. 1, 1882. (No model.)

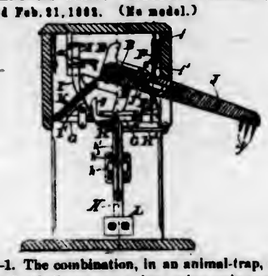
Claim.—1. In a cable-power wheel, the combination of a series of eccentric grips, B B, adapted to the cable D, with the ball-and-socket joints K K, substantially as described.



2. In a cable-power wheel, the endless spiral spring E, resting in a groove adapted to said spring, and extending entirely around said wheel, substantially as described, for the purpose specified.

3. The cap-segments C C, having the sockets *h h* and the recesses *e e*, and being secured to the wheel A, substantially as shown, for the purpose specified.

4. In connection with a cable-power wheel, the combination of the arms F F with the levers H H, carrying the sheaves I I and J J, adapted to said cable D, all substantially as set forth, for the purpose specified.



258,646. WATCH-ESCAPEMENT. ALBERT HENSELS, Ueberlingen, Germany. Filed Jan. 12, 1882. (No model.)

258,646.

Claim.—In an escapement, the triangular impulse and escapement teeth elevated above the surface of the escapement-wheel, in combination with the balance having a grooved arbor, and the impulse-pin *d*, substantially as specified.

258,647. ANIMAL-TRAP. CHARLES S. HENSLEY, Lawrence, Ind. Filed Feb. 21, 1882. (No model.)

Claim.—1. The combination, in an animal-trap, of the bait-lever H, pivoted at h, the transversely-moving spring-actuated slide G, the detent F, the ratchet-wheel E, the shaft B, and the striking-arm, substantially as set forth.

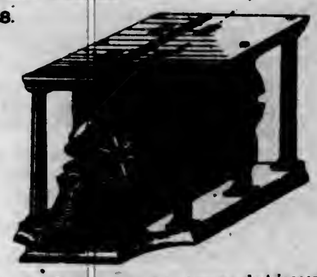
2. The combination, in an animal-trap, of a spring-driven rotating shaft, a striking-arm loosely mounted thereon, but adapted to be driven thereby by a releasable catch mechanism, said catch mechanism, an intermittently-actuated ratchet-wheel on the said shaft, a detent for said wheel, and means for operating the same, substantially as set forth.

3. The combination, in an animal-trap, with the bait-lever thereto and a long-toothed ratchet-wheel on the shaft of the trap, of a slide, I, connected to said bait-lever by a cord, I', and adapted to be operated by said ratchet-wheel, whereby said bait-lever is returned to engagement with the springing mechanism and the trap is thereby automatically reset, substantially as set forth.

4. The combination, with spring-slide G, of the bait-lever H, having pivoted catch part H' and spring h^3, whereby an elasticity is imparted to the catch part and a more certain engagement effected, substantially as set forth.

5. The combination, in an animal-trap, of a shaft, a loosely-mounted striking-arm thereon, and a rigidly-mounted ratchet-wheel on said shaft, said arm having a sliding catch, with which said wheel will engage, and, when engaged and the trap mechanism is operated, force said arm forward, but which is adapted to slide down beyond the point of engagement, and thus permit said arm to return to its normal position, substantially as specified.

6. The combination, in an animal-trap, of the arm J, having sliding catch or cross-bar J' and an inclined spring, a^3, to force said catch to the upper end of its slide when said arm is raised, all substantially as set forth.



7. The combination, in an animal-trap, of the shaft B, striking-arm J, mechanism consisting of a spring, a ratchet, and a detent, and means for engaging and releasing the same for operating said striking-arm, and a spring, K, for forcing said arm back into position, substantially as set forth.

258,648. DYNAMO-ELECTRIC MACHINE. EDWIN J. HOUSTON, Philadelphia, Pa., assignor to the American Electric Company, New Britain, Conn. Filed Oct. 21, 1881. (No model.)

Brief.—The invention relates to the construction of armatures for dynamo-electric machines, and consists in so forming the carriers for the coils that the armature-cores shall be both mechanically and magnetically separated from each other. Free spaces between the ends of adjacent cores permit the passage of air for cooling the armature. The field-magnets are made hollow for purpose of ventilation.

Claim.—1. A cylindrical armature for a dynamo-electric machine, constructed in separate and distinct sections, as described, separated from one another by free-air spaces parallel to the axis of rotation of the armature.

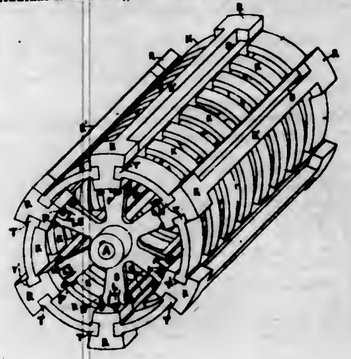
258,648.

2. A cylindrical armature for a dynamo-electric machine, constructed in separate and distinct sections, each of which is separated from adjoining sections by free-air spaces, and is provided with distinct and independent means for securing it in place, all constructed as set forth, whereby each section is magnetically independent of the others, and may be removed without disturbing the adjoining sections.

3. The combination, substantially as described, of a spider-frame of brass or other non-magnetic material, the curved armature-sections provided with the lugs P P, and screws or equivalent fastening means for each section, whereby the lugs P P and the connected section may be fastened to the spider-frame independently of the other sections.

4. In a dynamo-electric machine, a cylindrical armature-core constructed in sections, suitably mounted upon the shaft of the machine, said sections being separated from one another by free longitudinal slots extending in a direction parallel to the axis of rotation, for the purpose of ventilating the armature and insuring a more rapid change in the magnetic polarity thereof.

5. In a dynamo-electric machine, an armature-section consisting of a curved plate provided with slots extending in a direction parallel to the line of rotation and included within the edges of the plate, said plate being wound with coils of insulated wire parallel to the axis of rotation.



6. The combination, with a cylinder-armature constructed in independent sections separated from one another by air-spaces parallel to the axis of rotation, of compound field-magnets constructed, as described, so as to provide air-spaces between the cores and pole-pieces of the individual magnets, said spaces being parallel to those upon the armature, so as to aid in ventilation of the armature.

7. The combination, with the field-magnet plate provided with openings, as described, of hollow field-magnet cores bolted to said plates over the openings, substantially as and for the purpose described.

8. The combination, with the field-magnet plate, of two separate field-magnet cores bolted to the plate on opposite sides of a slot or perforation therein coinciding with the space between the two cores and their pole-pieces.

258,649. DYNAMO-ELECTRIC MACHINE. EDWIN J. HOUSTON, Philadelphia, Pa., assignor to the American Electric Company, New Britain, Conn. Filed Dec. 10, 1881. (No model.)

Brief.—The armature-cores are supported in longitudinal ribs, which are secured to spider-arms. These ribs are provided with lateral grooves, into which the ends of the sections of the armature-cores are seated. Space for ventilation is provided by means of longitudinal slots through the ribs or at the sides thereof.

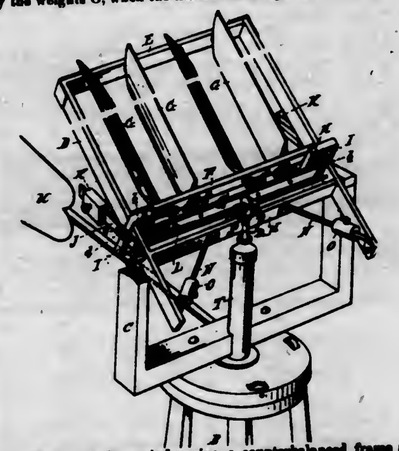
Claim.—1. A supporting-frame for a sectional armature, constructed, substantially as described, of a spider-frame connected to the armature-shaft and longitudinal grooved supporting-ribs for the armature-sections attached to said spider-frame.

2. A supporting-frame for a sectional armature, constructed, substantially as described, of a spider-frame attached to the armature-shaft and longitudinal ribs attached to said spider-frame and shaped so as to form portions of a cylindrical outline.

3. A supporting-frame for a sectional armature, constructed, substantially as described, of supporting disks or spiders and longitudinal supporting-ribs provided with side grooves, in combination with separately-detachable armature-sections having supporting tongues or projections which enter the side grooves, and by which said sections are supported.

4. The combination, in a ring-armature, of a supporting armature-frame constructed substantially as described, and separately-detachable armature-sections supported at each end upon the armature-frame by tongues and grooves formed in or upon the armature-frame and in or upon the ends of the separate sections.

5. A supporting-frame for a sectional armature, constructed of a spider-frame and longitudinal stiffening or supporting ribs slotted or perforated, so as to provide openings for ventilation and to prevent circulation of induced currents.



6. In an armature-core for dynamo-electric machines, the central longitudinal rib, R R, provided with a longitudinal slot or groove extending along the entire length of its upper face, and with central openings, O O, &c., and side grooves or slots, T T, substantially as and for the purpose set forth.

7. The combination, with the separately-detachable sections in a ring-armature, of longitudinal supporting-ribs provided with side grooves and central openings or slots for ventilation.

8. In an armature-core for dynamo-electric machines, the supporting-rings M M and the longitudinal ribs R R, cast in one piece with the rings and furnished with slots or grooves for the insertion of the separate detachable sections, substantially as and for the purpose set forth.

258,650. WIND-ENGINE. EPHRAIM HOWLAND, Pontiac, Mich. Filed Dec. 1, 1881. (No model.)

Brief.—The frame D is normally inclined toward the wind, the blades G being closed. When the frame D is blown back the blades G are automatically opened, whereby the wind is allowed to pass through. The frame is returned to the original position by the weights O, when the movement is repeated.

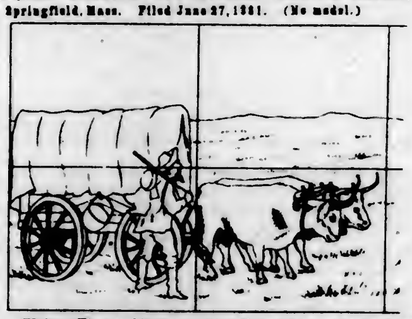
Claim.—1. In a wind-engine, a counterbalanced frame supported on journals upon the turn-table, and provided with a series of pivoted wings adapted to be opened or closed by the downward or upward movement of the frame, substantially as described.

2. The pivoted and counterbalanced frame D, provided with a series of pivoted sails or wings, G, in combination with the pivoted weight-arm J, and connections, substantially as described, between said weight-arm and the sails, whereby the movement of the frame and the weight-arm opens and closes the sails, as and for the purpose specified.

3. In a wind-engine, substantially as described, the pivoted frame D, brace-rods N, and adjustable counter-weights O, as and for the purpose specified.

4. In combination with the pivoted and counterbalanced frame

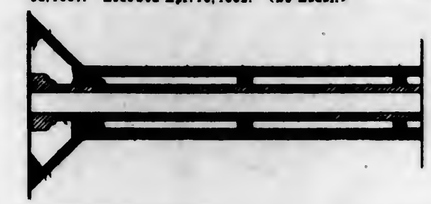
D, the pivoted sails G, provided with links *a*, the sliding bar G', provided with pins *c*, and the pivoted weight-arms J, substantially as described.



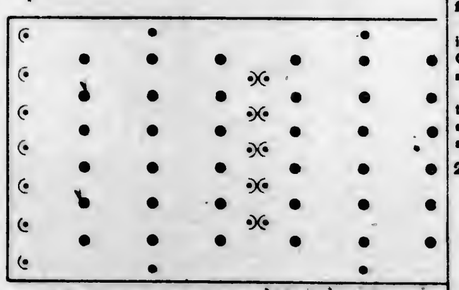
5. In combination with the pivoted and counterbalanced frame D, the pivoted sails G, and means, substantially as described, for turning said sails by the upward and downward movement of the frame, the bifurcated arm P, secured to the frame D, the rod R, and the side projections, S, on said rod, as and for the purpose specified.

6. In combination with the frame D, carrying the sails G, the sliding bar G', weight-lever J, and connections, substantially as described, between the bar G' and sails, as set forth.

7. The pivoted and counterbalanced frame D, carrying the sails G, in combination with the links *a* of said sails, the sliding bar G', the yokes I, and the pins *c* and *d* on said bar, the guides *b*, and the slotted and weighted lever J, substantially as and for the purpose specified.



8. In combination with the frame D, provided with guides *b*, and the sliding bar G, the weight-arms J, and the rod L, rigidly connecting said weighted arms, whereby the bar G is caused to move exactly the same at both ends, substantially as described.



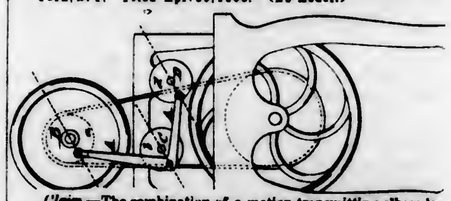
258,651. DISSECTED TOY PICTURE. GEORGE H. INGLAND, Springfield, Mass. Filed June 27, 1881. (No model.)

Claim.—The combination, with a dissected toy picture, of one or more substitute sections to be introduced into the said toy picture to convey something additional to the original dissected toy picture, substantially as set forth.

258,652. REFLECTOR. CHARLES W. JUDD, Boston, assignor of one-half to H. Baker Welch, Cambridge, Mass. Filed Apr. 23, 1881. Renewed Apr. 18, 1882. (No model.)

Claim.—1. The reflectors described, consisting of detachable frames bearing the reflective material, in combination with the columns and with one or more electric lights arranged to diffuse and distribute the light, as herein specified.

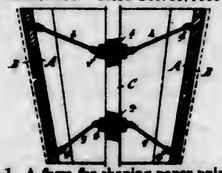
2. The combination, with extended reflective surfaces mounted upon the ceiling and walls of a room receiving the light from one or more lamps, and with pillars provided with a removable frame having a reflective coating, of said lamps, substantially as set forth.



3. The system of electric lamps herein described, consisting of two rows of end lamps having their reflectors arranged at angles so as to throw the rays toward the center of the room, and the double row of lamps in the mid-length of the room, having their reflectors back to back, so as to distribute the light between the several pillars, substantially as set forth.

4. The reflectors described, for use upon columns, consisting of a circular or polygonal sheath encompassing the greater part of the column, and an inverted conical reflector mounted above it, substantially as set forth.

5. The reflector described, formed in two parts and afterward placed around the column, as set forth.

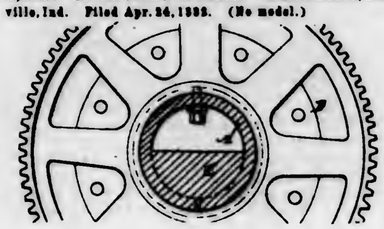


6. A room having columns provided with removable frames bearing a coating of sulphide of calcium or analogous material, so as to reflect and diffuse light while it is received, and to continue it after the extinguishment of the lamps or other lighting means, in combination with said lamps or lighting means, substantially as set forth.

258,653. MECHANICAL MOVEMENT. JOSEPH A. JONES, New York, N. Y. Filed Apr. 29, 1881. (No model.)

Claim.—The combination of a motion-transmitting elbow-lever, A, with crank-disks of a primary shaft, B, an intermediate shaft, C, and an auxiliary shaft, D, to which the elbow-lever is pivoted equidistantly from the centers of the shaft, at its ends, and at the apex of its angle, substantially as and for the purpose set forth.

258,654. FORM FOR MAKING PAPER-PULP PAILS. DAVID C. JONES, Detroit, Mich. Filed Dec. 26, 1881. (No model.)



Claim.—1. A form for shaping paper-pulp pails, consisting of expansible and contractible staves permanently secured at their adjoining edges to elastic connecting-pieces, substantially as and for the purpose specified.

2. A form for the purposes specified, consisting of the rabbeted staves, elastic connecting-pieces, and means for expanding and contracting the staves from a fixed center, substantially as and for the purposes set forth.

3. In combination with the staves A, secured at their adjoining edges to elastic connecting-strips B, the screw-threaded shaft C, the nuts *e f*, and the rods *e*, substantially as and for the purpose specified.

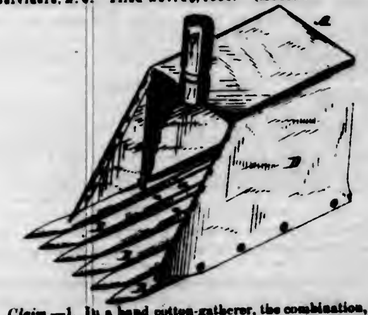
4. In combination with the staves A, the elastic strips B, for the purpose of connecting said staves and permitting them to be expanded without exposing openings between them, substantially as set forth.

258,655. LUBRICATING-JOURNAL. GEORGE KRAPS, Evansville, Ind. Filed Apr. 24, 1882. (No model.)

Claim.—The combination, with a suitable spur or gear wheel and the side plate of a boiler, of, the journal A, formed with oil-cup C, having feed-holes *b*, and the annular flange D, for securing it to the side plate, substantially as and for the purpose set forth.

258,656. MECHANISM FOR OPERATING DOFFER-COMBS OF CARDING-ENGINES. PERLEY LAPLIN, Warren, assignor to George Draper & Sons, Hopedale, Mass. Filed Feb. 28, 1882. (No model.)

Brief.—The comb-shaft is mounted upon a bearing within a fixed sleeve and vibrated about said bearing by means of a pin fixed eccentrically upon a plate attached to a pulley revolving upon the sleeve, the extent of each vibration depending upon the degree of eccentricity of the said pin. The arms which carry the doffer-comb are grooved at their rear ends and provided with pins which are inserted in holes made in the rock-shaft, the friction of said pins holding the arms firmly.

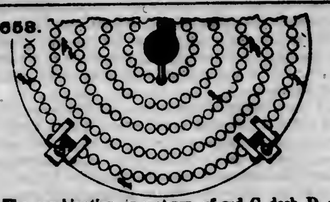


Claim.—1. The tubular fixed sleeve *a* and its bearings d^3, and the comb rock-shaft supported upon the said bearings at one side of its center, and provided at its end with a slot, *e*, combined with a driving-pulley, *c*, having a pin mounted eccentrically thereon and entered directly within said slot, the rotation of the pulley causing its pin within the said slot to vibrate the rock-shaft, substantially as described.

2. The tubular fixed sleeve *a* and the bearings d^3, the pulley *c*, mounted on said sleeve, and its eccentrically-placed pin c^2, combined with the comb rock-shaft supported at one side of its center by the bearings d^1, and provided at one end with a slot to be entered by the pin c^2, whereby by the rotation of the said pulley its stud or pin is caused to rock the rock-shaft, substantially as described.

3. The tubular fixed sleeve *a*, provided with slot 10, bearings d^1, and the cylindrical bearing 2 for the pulley, and the pulley *c* and its eccentrically-placed pin c^2, and the comb rock-shaft *d*, sustained by the bearings d^1 at one side of its center, and provided with the slot *e*, to receive the said pin c^2, combined with the comb *i* and its arms *h*, connected, substantially as described, with the comb rock-shaft, as and for the purpose set forth.

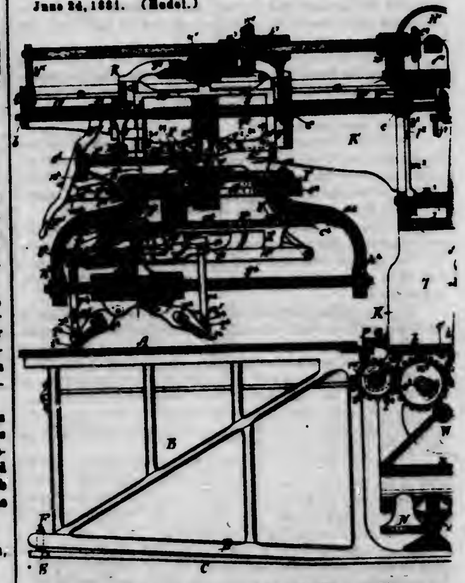
258,657. HAND COTTON-GATHERER. BENJAMIN F. LAND, Belvidere, N. C. Filed Nov. 21, 1881. (Model.)



Claim.—1. In a hand cotton-gatherer, the combination, with a suitable receptacle, A, provided with handle C, of the fingers B, having shanks *a*, which, when together, form one of the sides of the receptacle, substantially as and for the purpose set forth.

2. In a hand cotton-gatherer, the fingers B, having shanks *a*, in combination with the frame composed of the wires *c d e f g* h, bent as shown, and having the handle C, said frame being covered with a suitable material, substantially as and for the purpose specified.

258,658. CHURN. WILLIAM D. LEAVITT, Cincinnati, Ohio, assignor of one-half to George B. Moore, same place. Filed Sept. 13, 1881. (No model.)



Claim.—1. The perforated disk F *f*, attached to the pierced dash-rod C *c* by pins E E, whose heads *e e* snap into said perforations *f*, as and for the purpose described.

258,658.

2. The combination, in a churn, of rod C, dash D, and adjustable perforated disk F *f*, which latter carries the guiding-rollers G, for the purpose stated.

258,659. MACHINE FOR SCOURING, SETTING, OR GLAZING LEATHER. FREDERIC A. LOCKWOOD, Boston, Mass. Filed June 24, 1881. (Model.)

Claim.—1. In a machine for dressing leather, a table or support for the skin and the truck and beam, combined with a carriage composed of a trundle-frame and a vertically-adjustable head therein, adapted to support the guide-rod for the tool-carrier, substantially as and for the purposes described.

2. The truck and its beam, the trundle-frame of the carriage, movable thereon, and the vertically-adjustable head mounted in the trundle-frame, combined with the yoke, its guide-rod, the tool-carrier, and with means to reciprocate the tool-carrier upon its guide-rod while the yoke and guide-rod are locked or held in position.

3. In a leather-dressing machine, the combination of a screw-shaft with and to operate the carriage transversely of the table to effect the traverse of the dressing-tools and their operative devices transversely of the table.

4. The truck and its beam, provided with guides or ways and the carriage fitted thereto, combined with the screw-shaft and means to rotate it, whereby the carriage is moved positively.

5. The skin-supporting table and the truck, combined with a nut and screw to move the truck positively longitudinally of the table, substantially as and for the purposes described.

6. The skin-supporting table, the truck, and nut and screw to move the truck longitudinally of the table, combined with the carriage and a screw to move the carriage transversely of the table, substantially as described.

7. A leather-dressing machine containing the following instrumentalities, viz: a skin-supporting table, a truck, means to move the truck longitudinally of the table, an independently-movable carriage which, by its change of position, places the dressing-tools in the desired position with relation to the table, means to move the said carriage transversely of the table, and a single guide-lever and connections between it and the devices which directly con-

trol the movements of the truck and carriage, whereby the said single guide-lever, by moving it more or less in one or the other direction, insures the separate or joint movement of the truck and carriage in either of their directions, substantially as and for the purposes described.

8. In a leather-dressing machine, the skin-supporting table, the truck and the carriage movable thereon, and the shaft J' of the carriage, adapted to impart reciprocating movements to the tool-carrier and dressing-tools, combined with the shaft X and shaft s^2, and intermediate gearing to directly and positively drive the said shaft J' in all the positions of the truck and carriage and dressing-tools with relation to the table, substantially as described.

9. In a leather-dressing machine, the trundle-frame of the carriage, combined with the vertically-adjustable head therein, adapted to support the shaft J', and also the yoke and guide-rod for the tool-carrier, substantially as described.

10. In a leather-dressing machine, the truck, the trundle-frame of the carriage, and the vertically-adjustable head therein, combined with the axially-movable yoke and its guide-rod, substantially as described.

11. The skin-supporting table, the truck, the trundle-frame movable on the truck, and the head fitted to move in the trundle-frame, combined with the shaft n^2 and intermediate mechanism to adjust the head vertically in the trundle-frame, substantially as and for the purpose described.

12. In a machine for dressing leather, the head of the carriage, the sectoral toothed plates or levers pivoted thereon and connected at their outer ends with the trundle-frame, and the toothed racks n^2, combined with the toothed bell-crank levers and means to operate them simultaneously, substantially as described.

13. The rock-shafts G' W', extended through the beam B', combined with the guide-lever and with connecting mechanism between the said lever and rock-shafts to enable the said lever to turn them in the proper directions to ship the belts, substantially as described.

14. The guide-lever and the rock-shaft G', actuated by it, combined with the belt-shipper s^3 and intermediate mechanism, whereby the belt s^3 may be shifted to control the movements of the truck in one or the other direction, substantially as described.

15. The guide-lever and the rock-shaft W', actuated by it, combined with the belt-shipper and intermediate mechanism, whereby the belt y may be shifted to control the movement of the carriage transversely of the skin-supporting table, substantially as and for the purpose described.

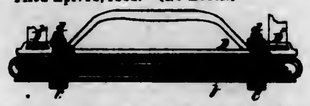
16. The combination, in a leather-dressing machine, of the beam of the truck, the carriage thereon, the screw-shaft S, to move it on the beam, the belt y, belt-shipper d', and the fast and loose pulleys with which the said belt co-operates to effect the rotation of the said screw, substantially as described.

17. In a leather-dressing machine, shafts X and s^2, located at right angles to each other, combined with intermediate gearing, the reciprocating dressing-tools, the traveling carriage and the pulleys, the truck having beam B', and table, said truck, carriage, and tools being operated by the rotation of the said shafts, substantially as described.

18. In a leather-dressing machine, the pulleys A' B' V b^2 s^3 f', the belts y and s^3, the stop-rod d', and shipper-arm s^3, the latter guiding the belt s^3 and being secured to and moving with the rod, substantially as described.

19. In combination, the rod d', shipper-arms d' s^3, toothed bars f' b^2, and rock-shafts W' G', with suitable intermediate mechanism, whereby the rocking of either shaft tends to move the shipper-arms in one or the other direction, substantially as described.

20. The combination, in a leather-dressing machine, of the truck and beam, the carriage, and driving-shaft X, pulleys W and H', the rock-shafts G' W', and suitable intermediate mechanism, whereby the continuous rotation of the said pulleys in one direction effects the rotation in either direction of the devices which engage and move the truck on its rails and the carriage on the truck, substantially as described.



21. The combination of the rock-shaft W' and screw-shaft S, the truck, its beam, and the trundle-frame of the carriage, combined with intermediate mechanism, whereby the said screw-shaft is rotated to move the trundle-frame upon the truck, and the rock-shaft is enabled to control the rotations of the said screw-shaft, substantially as described.

22. In combination, the truck and its beam, the carriage, the rock-shafts G' W', the screw-shaft S, and screw-rod s^3, nut r^3, the guide-lever F', and suitable connecting mechanism, whereby said guide-lever controls the rotation of the shaft S and nut r^3, and of the movements of the truck and of the carriage on the truck, substantially as described.

23. The rock-shaft W' and connected lever E', and the carriage, combined with the shipper-rod p^2, connected with the said lever, whereby as the rod p^2 is moved in the carriage as the latter reaches its extreme positions the belt-shipper d' is moved to ship the belt y upon the loose pulley B' and stop the movement of the carriage, substantially as described.

24. In a leather-dressing machine, the truck, the loosely-held stop-motion rod d', and its connected arm s^3, whereby as the rod d' is moved on the truck as the latter reaches its extreme positions the said arm s^3 moves the belt s^3 upon the idle-pulley b^2 and stops the movement of the truck, substantially as described.

258,660. PACKAGE-COVERING. JOHN W. MARSH, Oxford, Mass. Filed Apr. 12, 1882. (No model.)

Claim.—1. The combination of the sheet of water-proof fabric A and inclosing-case B, provided with straps d, or means for its temporary attachment to a shawl-strap bar or handle, substantially as and for the purpose set forth.

2. The combination, with the shawl-strap handle D, of the sheet of fabric A and the case B, for containing said fabric when folded, substantially as set forth.

3. The combination, with the handle-bar D, having straps D' D', of a case or receptacle, B, and a sheet of fabric, A, adapted for covering hand-packages and capable of being folded and inclosed within said case when not required for use, substantially as hereinbefore set forth.

258,661. FIRE-BRICK COMPOUND. EDWARD A. MARTIN, Virginia City, Nev. Filed Apr. 1, 1882. (No specimens.)

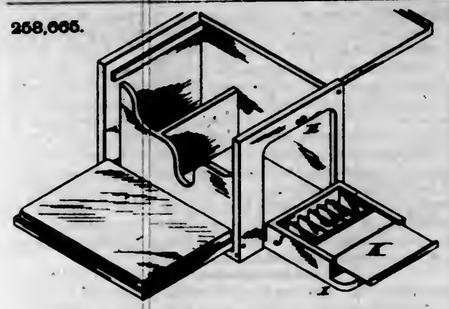
Claim.—The herein-described composition of matter suitable for and forming fire-brick, consisting of silica, potash, or soda and lime, in substantially the proportions specified.

258,662. METHOD OF FORMING WAVED HAIR-FRONTS. JOHN B. MCCARTHY, Philadelphia, Pa. Filed Mar. 25, 1882. (No model.)

Claim.—The method of forming hair-waves hereinbefore described, which consists, first, in stretching or straightening natural or artificial curly hair over a block, and in securing said hair upon said block in a straightened or stretched condition by means of strings, cords, or kindred devices passed over said straightened hair and secured to said block; second, in drawing, working, or otherwise manipulating said straightened hair forward and backward upon said block, between and under said strings or cords, in order to form the desired wave therein; third, in treating the wave so formed with moisture by means of a wet towel or other moisture-containing article applied thereto; and, finally, in drying said wave upon said block.

258,663. PAINT COMPOUND. WILLIAM JAY MCDONALD, Gainesville, Ga.* Filed Feb. 28, 1882. (No specimens.)

Claim.—A paint composition consisting of gas-tar, asphaltum varnish, Venetian red, yellow ocher, gum-shellac, salt, sal-soda, spirits of turpentine, alcohol, carbolic acid, and water, in the proportions substantially as herein set forth and described.



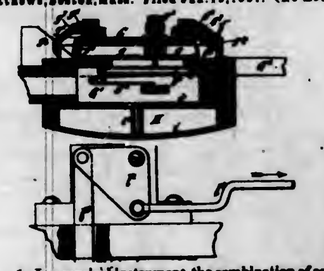
258,664. PROCESS OF MAKING BREWERS' YEAST. FRIEDRICH MEYER, Wilmington, Del. Filed Feb. 28, 1882. (No specimens.)

Claim.—The herein-described process of making a present-use yeast, consisting in, first, making a first yeast from hops, malt, and water in the proportions and at the temperatures described, then a second yeast from hops, malt, and water and the first yeast, as described, then making a third yeast from malt, hops, and water and the second yeast, as described, and compounding this third or stock yeast with malt, hops, and water to produce the fourth or present-use yeast, substantially as described.

258,665. RUBBER-STAMP CABINET. JAMES HUDNOCK, Jr., Cincinnati, Ohio. Filed Mar. 24, 1882. (No model.)

Claim.—The rubber-stamp cabinet having a folding top and front, the opening H in the end of the cabinet, the door I, pivoted in said end, the tray J, fixed to said door, and the sliding lid K of said tray, all combined substantially as and for the purpose set forth.

258,665.



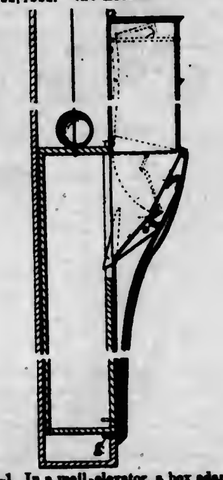
258,666. HAND-STAMP. JAMES HUDNOCK, Jr., Cincinnati, Ohio. Filed Mar. 24, 1882. (No model.)

Claim.—The die-plate B, having threaded boss H and cavity E, handle C, threaded ferrule D, fixed on the handle and projecting therefrom, and the disk F, having screw K and notches J, all combined substantially as and for the purpose set forth.

258,667. MECHANICAL MUSICAL INSTRUMENT. ORWELL H. NEWMAN, New York, N. Y., assignor, by mesne assignments, to John Michel, same place, James Morgan, Brooklyn, N. Y., and Jane Matthews, Boston, Mass. Filed Jan. 13, 1881. (No model.)

Claim.—1. In a musical instrument, the combination of sound-producing devices, a rest provided with ducts for the passage of air to operate said sound-producing devices and with ports extending from said ducts to the side of the rest, a traveling music-sheet for controlling the passage of air through said ducts, and a cheek-piece adjustably secured to the side of said rest, and constructed with ports ranging with the ports in said rest, whereby the sound-producing devices of one octave may be coupled with sound-producing devices of corresponding notes in another octave, substantially as specified.

2. In a musical instrument, the combination of sound-producing devices, a rest provided with ducts for the passage of air to operate said sound-producing devices and with ports leading from said ducts alternately to opposite sides of the rest, a traveling music-sheet controlling the passage of air through said ducts, and cheek-pieces adjustably secured to opposite sides of said rest, and constructed with ports ranging with the ports in said rest, one of said cheek-pieces serving to couple alternate sound-producing devices and the other the intermediate sound-producing devices in one octave with devices of corresponding notes in another octave, substantially as specified.



3. The combination, with the rest C', of a cheek-piece adjustably secured upon the side thereof, and a link, F, lever F, and rod or stop-draw $\bar{f}$, for adjusting the position of said cheek-piece, substantially as specified.

4. The combination, with the rest C', of cheek-pieces J J', a bridge, $\bar{l}$, connecting said cheek-pieces, and a link, F, lever F, and rod or stop-draw $\bar{f}$, connected with one of said cheek-pieces, substantially as specified.

5. In a wind musical instrument, the combination of a set of sound-producing devices, an exhaust chest or chamber with which they communicate, a hollow sound-board, also communicating with said chest or chamber, and means for exhausting air from said chest or chamber and also from said sound-board, for applying tension to said sound-board, substantially as specified.

6. The combination of the reeds g, the valves g', the exhaust chest or chamber G', the sound-board composed of the boards $\bar{i}$ $\bar{i}'$, the latter of which is provided with openings, and the posts $\bar{i}^2$, and the bellows $\bar{G}^2$, for exhausting air from said chest or chamber to cause the outer board, $\bar{i}$, to be bulged inward by atmospheric pressure, and tension to be applied to the board $\bar{i}'$ through the posts $\bar{i}^2$, substantially as specified.

258,668. MAIL-ELEVATOR. JOHN W. PAINE, Baltimore, Md. Filed Apr. 22, 1882. (No model.)

Claim.—1. In a mail-elevator, a box adapted to receive the mail and discharge the same into a suitable car, in combination with a hoisting device and means for lowering the car to a position to receive the contents of the box.

2. In a mail-elevator, a box adapted to receive the mail, a car provided with suitable hoisting and lowering mechanism, and means for retaining mail-matter placed in the box until the car is lowered into position to receive it, as set forth.

3. In a mail-elevator, a receiving-box, a hoisting-car, suitable elevating and lowering mechanism, and a slide or bottom which normally closes the bottom of the receiving-box, and is automatically operated to open by the descent of the car, as set forth.

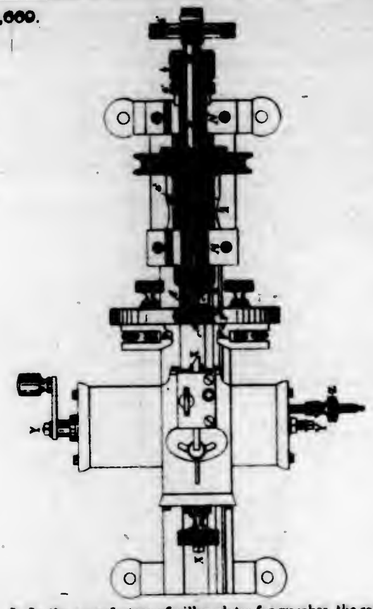
4. In a mail-elevator, a receiving-box, a hoisting-car, suitable elevating and lowering mechanism, a latch for securing the car in position to receive mail-matter placed in the box, and a cover for the bottom of the box which automatically closes as the car rises and opens as it descends, as set forth.

5. In combination with the receiving-box and hoisting-car, a latch for securing the car concealed when the box is closed, and an automatically-operating delivery-chute, as set forth.

6. In combination with the receiving-box and hoisting-car, the swinging bottom and supplemental chute automatically operated, as set forth.

7. In combination with the receiving-box and shaft, the hoisting-car and automatically-operating delivery chute and bottom, and mechanism at the top of the shaft for sounding an alarm on the arrival of the car and for lowering the same, as set forth.

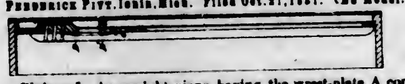
258,669. WATCH-MAKER'S LATHE. DAVID L. PETITPIERRE, Couvet, Neufchatel, Switzerland. Filed Jan. 26, 1882. (No model.) Patented in France Dec. 13, 1881.



Claim.—1. In a watch-maker's lathe, the tubular shaft A, plate P, and pin C, in combination with the pin B, disk B', and nuts a' $\bar{b}$, substantially as and for the purpose specified.

2. The plate P', in combination with the cap r', secured thereto, the pins a' $\bar{b}'$ in the cap, and the dogs q' upon the plate P', substantially as and for the purpose specified.

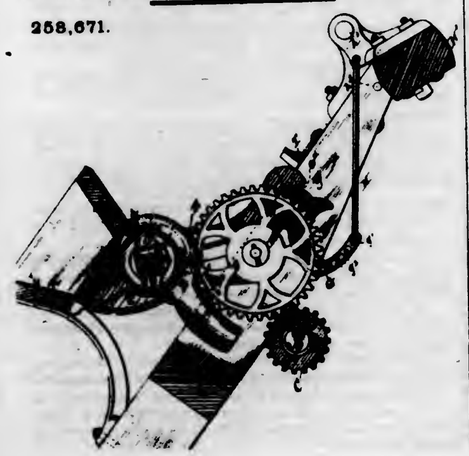
3. The plate P', in combination with the cap r', pins a' $\bar{b}'$, dogs q', and push-pieces $\bar{s}'$, substantially as and for the purpose specified.



4. The strap U, support T, spindle W, and boring or sinking tool, in combination with the screw R, passing through such support, and the shoe S upon the strap U, substantially as and for the purpose specified.

258,669.

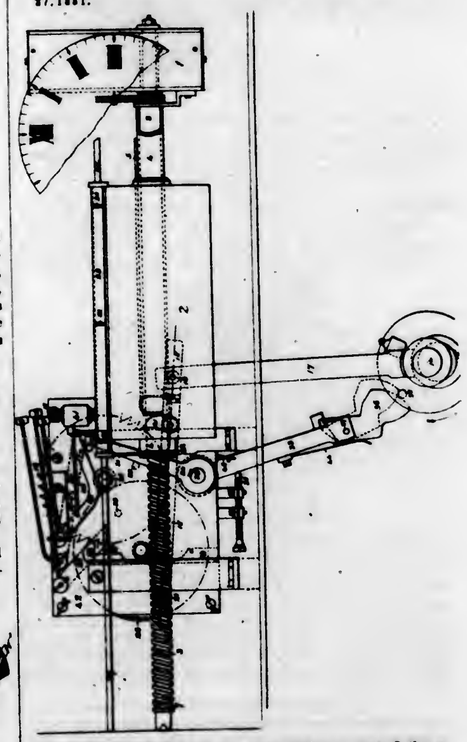
5. In the manufacture of pillar-plates for watches, the several plates P' P^{a} P^{a}, &c., adapted to hold the pillar-plate during the several operations, each provided with a cap to receive the pillar-plate, pins to position the pillar-plate, and dogs to hold it within the cap, the caps and pins so placed that the pillar-plate is brought to its proper position successively upon the respective plates to bring the center to be bored central with the axle of the plate to which it is held, as specified.



258,670. SOUNDING-BOARD FOR UPRIGHT PIANO-FORTES. FREDERICK PITT, Ionia, Mich. Filed Oct. 21, 1881. (No model.)

Claim.—1. An upright piano having the wrest-plate A constructed in one piece with the frame B, or rigidly attached thereto, in combination with an undivided sound-board extended above and beyond the range of the tuning-pins, substantially as described.

2. An upright piano-forte having an undivided sound-board extended above or beyond the range of the tuning-pins, in the manner and for the purpose substantially as specified.

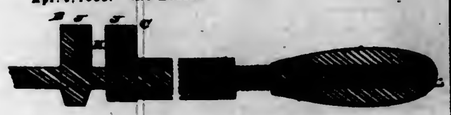


258,671.

258,671. SEED-PLANTER. LUTHER E. PRESTON, St. Cloud Minn., assignor of one-half to the Rosenberger Manufacturing Company, same place. Filed Oct. 15, 1881. (No model.)

Claim.—As an improvement in seed-planters, the combination of the gear-wheel C on the main axle B, the swinging bracket E, carrying the gear-wheel D, and having a hooked or semicircular recess, e', at its upper end, by which it is hooked or hung upon the axle e of the seeding-cylinder, and a semicircular recess, e^3, in its free lower end, the lifting-pawl G, pivoted at the side of the frame, the upper arm of which, g, engages the recess e^3 of bracket E, and having its lower arm, g', provided with a series of perforations, g^3, and the lifting-rod H, the lower end of which engages the perforations g^3 while its upper end is adjusted in a casting, h, on the eccentric-shaft H', all arranged and operating substantially as and for the purpose specified.

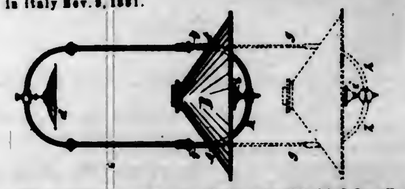
258,672. RECORDER FOR LOCOMOTIVES. ALEXANDRE LOUIS POUGET, Montpellier, France. Filed Nov. 5, 1881. (No model.) Patented in France July 8, 1880, No. 137,637, and June 25, 1881; in Belgium Oct. 14, 1880, No. 53,776, and Aug. 8, 1881; in England (provisional patent) July 23, 1881, and in Italy Aug. 27, 1881.



Claim.—1. The combination of the stationary screw 3, the rotating cylinder 2, provided with the keyway, the sliding key 6, and the rotating tube 4, provided with the feather 5, whereby a rotative, and at the same time a progressive, motion is imparted to the cylinders, while at any time the progressive motion may be arrested by raising the sliding key out of the screw, and whereby when such disconnection is effected the cylinder can be freely moved by hand longitudinally on the tube for the purpose of setting it at any particular point, when progressive motion can be again established by reinserting the key in the thread of the screw, substantially as described.

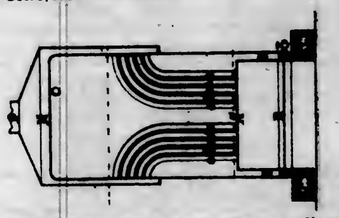
2. In a mechanism for marking the fractions of kilometers (or other measures of distance traveled by a locomotive) on a recording-sheet, the combination, with the shaft 14, rotated by a road-wheel running on one of the locomotive-wheels, and provided with the eccentric 15, of the eccentric-rod 17, lever 18, pawl 21, ratchet-wheel 16, carrying studs 23, lever 24, hammer 8, and punch or marker 10, substantially as described.

3. In a mechanism for marking on a recording-sheet units of distance traveled by a locomotive, the combination, with the shaft 14, rotated by a road-wheel running in contact with one of the wheels of a locomotive, and provided with the eccentric 15, of the eccentric-rod 17, lever 18, pawl 21, ratchet-wheel 16, pinion 26, gear 26, provided with stud 27, lever 28, hammer 13, and punch or marker 12, substantially as described.



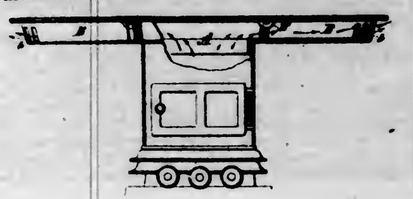
4. The mechanism for marking the retrograde travel of a locomotive on a recording-sheet, consisting of the shaft 14, rotated by a road-wheel running in contact with one of the wheels of a locomotive, which road-wheel is provided with a disk carrying the pin 38, the double lever 33 34, spindle 30, pawl 36, provided with spring 44, bent lever 60, spring 43, hammer 9, and punch or marker 11, substantially as described.

258,673. WRENCH. JOHN E. PRESTON, Brunswick, Mo. Filed Apr. 6, 1882. (No model.)



Claim.—In a wrench, the jaws B C, having V-shaped recesses J, with convex inner sides, K, as and for the purpose set forth.

258,674. LAMP-SUPPORT. HEINRICH RAUPP, Heilbronn, Wurtemberg, Germany. Filed Mar. 1, 1882. (No model.) Patented in Italy Nov. 9, 1881.



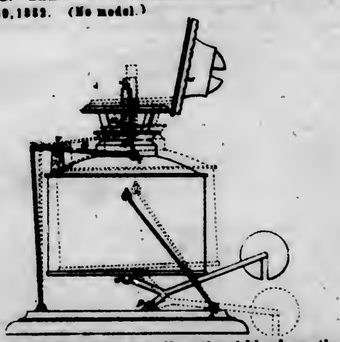
Claim.—In a lamp-support of the extensible kind described, the combination of the fixed and extensible tubes a g, the stuffing-boxes provided with clamping-screws, the transverse tube h, connecting the lower ends of the tubes g, the chain B, the supports A A therefor on said tube h, and the burner i between said supports, all substantially as and for the purposes described.

258,675. FIRE-TUBE STEAM-BOILER. DAVID RUSHAW, Gohasset, assignor of one-half to Harvey T. Litchfield, Hull, Mass. Filed Dec. 1, 1880. (No model.)

Claim.—In a vertical steam-generator, the group of heat tubes extending from the crown-sheet to and through the entire body of water and approaching all sides of the shell, in combination with a hood constructed in such manner that the space between the hood and the shell of the boiler is less in area than the combined area of all the tubes, for the purpose set forth and described.

258,676. PETROLEUM COOKING-STOVE. CHRISTOPHER RISBERG, New York, N. Y. Filed Mar. 11, 1882. (No model.)

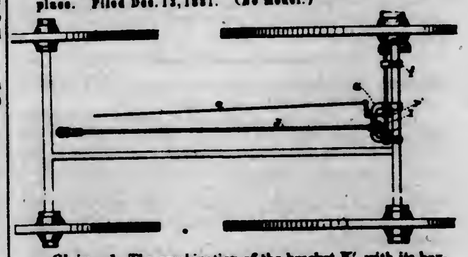
Claim.—1. In a petroleum or other cooking-stove, a hollow extension-top flue provided at its outer end with a series of openings for the escape of gas, and an open inner end, in combination with a horizontal flue-section into which the main stove, a semi-circular hook attached to the hollow extension-flue, and the socket in the top A, by which the two flues are locked together, substantially as described.



2. In a petroleum or other cooking-stove, the top part, A, having a series of draft-openings, a, in combination with an extension, detachable flue with an open end adjoining said top part and a series of exit-openings, b, in its outer end, and with the locking devices B' A', substantially as described.

258,677. HORSE-COLLAR FASTENING. ALFRED B. ROBINSON, Lebanon, Mo. Filed Mar. 27, 1882. (No model.)

Claim.—In a horse-collar, the combination, with the end A, having shouldered tongues a, of the end B, having recesses b, caps c, formed with elongated openings d, and the rod C, having curved end e, and constructed to operate substantially as and for the purpose set forth.

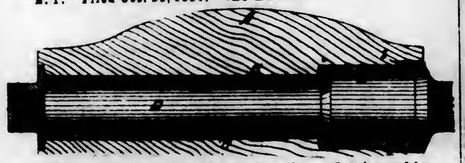


258,678. LAMP. WALTER SCOTT, Hoosick Falls, N. Y. Filed Mar. 30, 1882. (No model.)

Claim.—1. In an automatically-extinguishing lamp, the combination of an oil-receptacle with a counterpoise-weight or its equivalent connected by mechanism to the extinguisher near the flame, whereby the movement of receptacle after a certain amount of illuminating material has been consumed actuates the extinguisher and quenches the light or flame, substantially as and for the purpose set forth.

2. In an automatically-extinguishing lamp, a receptacle for the illuminating material, supported on a pivot and connected by suitable mechanism to an extinguishing device, combined with a counterpoise or balance adjustable at will, whereby the time at which the extinguisher shall quench the flame may be predetermined.

258,679. REIN-HOLDER. RICHARD E. SHARPER, San Francisco, Cal., assignor of one-half to Adolph T. F. Obermeyer, same place. Filed Dec. 13, 1881. (No model.)

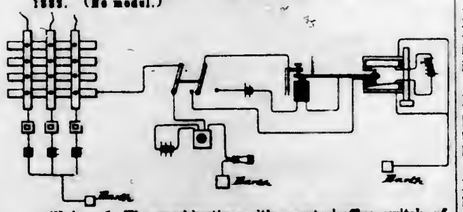


Claim.—1. The combination of the bracket K', with its boxing K, divided sleeve S, with its curved slots s, having shoulders c, and the shaft J, with its spring b, lugs a, and pawls T, having

shoulders *d'*, and the loose pinion L, with its ratchet-hub *l* and groove *i*, substantially as and for the purpose herein described.

2. The combination and arrangement of the shaft J, with its feathered pinion I and its spring *b*, lugs *a*, and pawls T, with their shoulders *c'*, sleeve S, with its curved slots *s*, having shoulders *e*, loose pinion L, with its ratchet-hub *l* and groove *i*, bracket K', with its box K, pinion M, and rod N, with its forked head *n*, substantially as and for the purpose herein described.

3. The dash-board O, having the spools *o o* upon its side, in combination with the winding-shaft N, substantially as and for the purpose herein described.



258,680. CARRIAGE-AXLE. ALFRED E. SMITH, Bronxville, N.Y. Filed Oct. 20, 1881. (No model.)

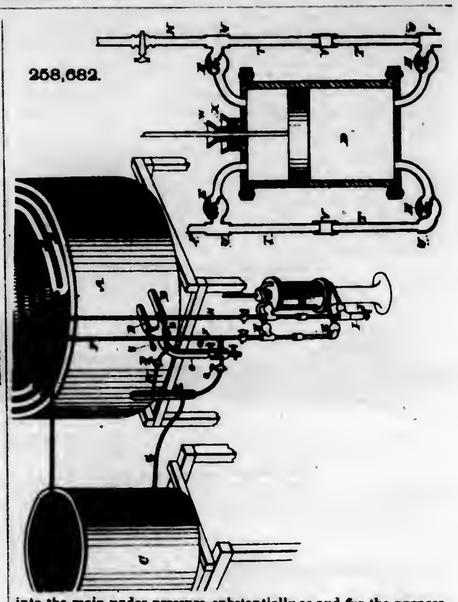
Claim.—1. An axle with an enlarged tapering journal-bearing at its rear end, up which a detachable and adjustable flanged sand-band or collar is pressed or driven until it is placed beyond the inner end of the axle-box.

2. A detachable flanged sand-band or collar which is driven up on the taper of the enlarged bearing at the rear end of the axle until it is beyond the rear end of the axle-box when said box is properly fitted to its axle, and its inner end revolves within the cup formed by the flange projecting toward the front end of the axle-box or against the collar which it may abut.

258,681. SIGNALING APPARATUS FOR TELEPHONE-EXCHANGES. JAMES G. SMITH, Hackensack, N.J. Filed Mar. 23, 1882. (No model.)

Claim.—1. The combination, with a central-office switch, of devices for connecting a subscriber's line to the signaling apparatus and auxiliary switch devices for completing the connection of the local battery by which the signaling apparatus is operated, combined as set forth, so that the act of connecting any line to the signaling apparatus simultaneously and by the same operation completes the circuit of the local battery or batteries by which the signaling apparatus is controlled or operated.

2. The combination, with a central-office switch, of apparatus for producing reversed electric impulses, a local battery or batteries and electro-magnet for operating said apparatus, a switch device for connecting any subscriber's line to the reversed-current apparatus, and auxiliary switch devices for simultaneously and by the same operation completing the circuit of the local battery.



3. The combination, substantially as described, of a pole-changer, a local battery and operating electro-magnet for said pole-changer, a switch for completing the circuit from said pole-changer to line, and auxiliary switch devices for completing simultaneously and by the same operation the circuit of the local battery and operating electro-magnet.

258,682. ICE-MACHINE. GEORGE W. STEVENS, San Francisco, Cal. Filed Dec. 30, 1881. (No model.)

Claim.—1. In an ice-machine, and in combination the freezing and condensing tanks, the vertical chamber L, with closed extension at the top, and having the supply-pipe G, leading into the lower part from the condenser, and the pipe N, leading from the upper part into the distributing-main O, in combination with the trap M and cocks, as shown, connected with both chamber and main, so that any heavy liquid will gravitate into it, substantially as herein described.

2. In an ice-machine, the main O, having the small supply-pipe N, opening into it from the pressure-chamber L, and in the direction of its length, so that the liquid may be blowed through

258,682.

into the main under pressure, substantially as and for the purpose herein described.

3. In an ice-machine, and in combination with the chamber L, pipe N, with its cock P, and the main O, the small branch pipes B, leading from the main through the freezing-tank A, and having the wire-gauze or equivalent distributing material compressed into them, substantially as herein described.

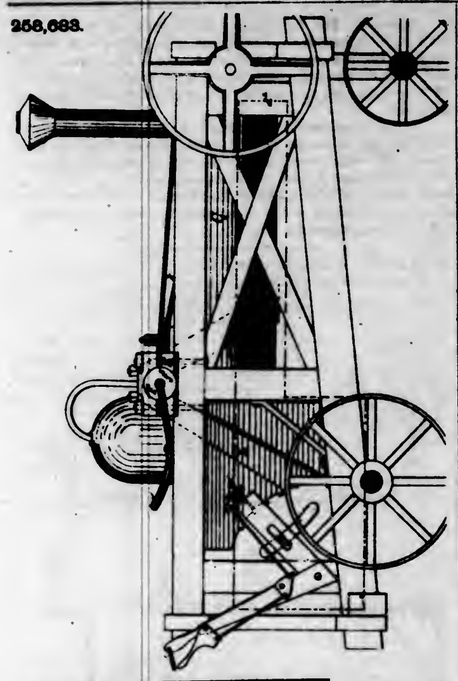
4. In an ice-machine, and in combination with the chamber L, pipe N, with its cock P, the distributing-main O, and the branch pipes B, the pipes S, secured centrally within the pipes B, to spread the liquid into thin sheets within the outer pipes, substantially as herein described.

5. In an ice-machine, and in combination with the chamber L, pipe N, cock P, distributing-main O, and branch pipes B, the hollow pipes S, extending into the pipes B, and having their interior ends closed and their outer ends fitted with couplings, whereby steam or hot water may be introduced, substantially as and for the purpose herein described.

6. The pump D, having the valve-chambers E above and below, as shown, and the connecting-pipes F H, formed with screw-threads at opposite ends to connect with the couplings U, in combination with the leaden connecting-sleeve V, inclosing the meeting ends of the pipes, and soldered to them after they are secured in place, to form a joint, substantially as herein described.

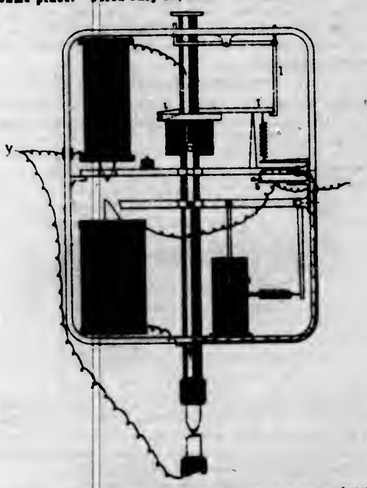
258,683. TRACTION-ENGINE. EDWARD J. TAYLOR, Frankfort, W. Va. Filed Apr. 7, 1882. (No model.)

Claim.—1. A traction-engine having a frame provided with journal-boxes at the top, in combination with a boiler suspended within such frame below the level of the boxes, and a rock-shaft secured to the boiler and resting in said boxes, as set forth.



2. A traction-engine having a frame provided with journal-boxes, in combination with a self-adjusting boiler suspended within the frame, and a rock-shaft, bored as described, and provided with connections for the steam and water supply and the exhaust, as set forth.

3. In a traction-engine, a self-adjusting boiler, in combination with means, substantially as described, for locking it at any desired point after it is leveled, as set forth.



4. In a traction-engine, the shield or apron located at the sides and beneath the boiler, as and for the purpose set forth.

5. A traction-engine provided with a frame having the journal-boxes, as described, in combination with a self-adjusting boiler suspended within the frame, and a rock-shaft secured to the boiler, resting in the boxes, and provided at its ends outside of the boxes with the collars, whereby, in the event of one side of the engine being higher than the other, the greater part of the weight of the boiler will be sustained by the upper side of the frame, as set forth.

258,683.

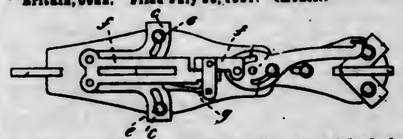
258,684. ELECTRIC-ARC LAMP. ELIHU THOMSON, New Britain, Conn., assignor to the American Electric Company, same place. Filed July 11, 1881. (No model.)

Claim.—1. The combination, with the clamp or clutch in an electric lamp, a feed-operating electro-magnet normally out of circuit, and a retractor acting in opposition to said electro-magnet for holding the clamp in position, where it will engage with and prevent the carbon rod from feeding, of a derived-circuit electro-magnet, a circuit closer and breaker operated thereby, and circuit-connections arranged in the manner described, whereby when the derived-circuit magnet is strengthened, owing to an increase in the length of arc, an electric current is admitted to the feed-operating electro-magnet and energizes the same for the purpose of producing a feed of the carbon.

2. The combination, with the feed-regulating mechanism in an electric lamp, an electro-magnet for releasing said feed mechanism, and a retractor acting in opposition to said electro-magnet to hold the feed mechanism out of action, of a derived-circuit electro-magnet, a circuit-closer, and connections, substantially as described, whereby when the power of the derived-circuit electro-magnet is increased an electric current may be admitted to the electro-magnet of the feed-regulating mechanism, so as to energize the same and cause the feeding of the electrode.

3. The combination, with the carbon rod or carrier in an electric lamp, of a clutch or clamp and spring for normally holding said clamp in engagement with the rod or carrier, an electro-magnet for releasing the clutch from the rod or carrier, a derived-circuit electro-magnet, and a circuit-closer, and connections, as described, for admitting an electric current to the releasing electro-magnet when the power of the derived-circuit electro-magnet increases.

4. The combination, with the feed-regulating clutch or clamp for the carbon rod or carrier, of means for releasing the clamp, and a lug, toe, or projection upon the carbon rod, arranged as described, to come into contact with and actuate the releasing devices.



5. The combination, substantially as described, with the spring-actuated clamping-toe, of mechanism engaging with the toe so as to disengage it from the carbon-carrier, and a lug or projection upon the carbon-carrier.

6. The combination, with the carbon-support and its lug F, of lever L, stop *l*, and clamp-jaw *t t'*, substantially as and for the purpose described.

7. The combination, with an electric lamp, of a dash-pot having division G placed with its opening immediately above the piston, so that the latter acts as a valve when the cup is inverted.

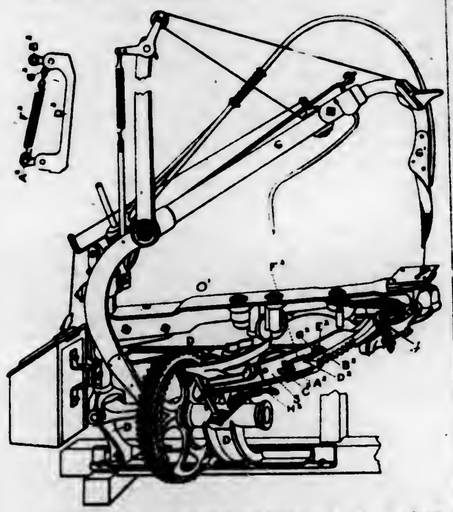
8. The combination, with an electric lamp, of a dash-pot having a division, G, and curved cup J, combined, in the manner shown and described, with the piston H, rod *r*, and inverted cup I.

258,685. SKATE. THOMAS TRACY and CHARLES E. HART, New Britain, Conn. Filed July 26, 1881. (Model.)

Claim.—1. In a skate, the movable sole and heel clamps, combined with and operated by the longitudinally-movable double eccentric disk, all substantially as described.

2. In a skate, the combination of the longitudinally-movable eccentric disk *j*, sole-clamps *o c*, heel-clamp *i*, serrated connection-rod parts *f f'*, and the cam *g*, all substantially as described.

258,686. FRICTION-CLUTCH. OSCAR E. WAIT, Woonsocket, R. I., assignor of two-thirds to Philetus W. Gould, Pittsfield, Mass., and Franklin E. Darrow, Bristol, Conn.; Amelia W. Darrow and Elbert E. Thorpe, Bristol, Conn., Administrators of Franklin E. Darrow, deceased. Filed May 3, 1880. (Model.)



Claim.—1. The combination of the ordinary pulley C, having the ordinary central bore which constitutes its axial bearing and which embraces the clutch mechanism, the hub B, having the part outside the shoulder of its flange substantially equal in length to that of the axial bore of the pulley, the divided ring *h*, secured to the hub B and fitted to the smallest axial bore of said pulley, and the shipper-wedge *d*, substantially as described, and for the purpose specified.

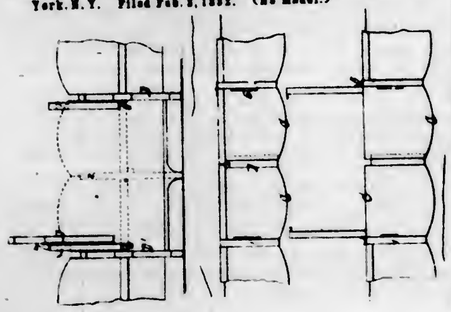
2. The combination of the hub B, divided ring *h*, pulley C, shipper-ring D, having the wedge *d* secured thereto, and the set-screw *k*, inserted in the hub B and acting as an adjustable stop to limit the motion of the shipper-ring toward the hub B, substantially as described, and for the purpose specified.

3. The combination of the shaft A, a friction-clutch mechanism mounted on said shaft, and the pulley C, having its smallest axial bore embracing the clutch mechanism, the whole being so combined, in the manner substantially as hereinbefore described, that when the pulley is revolving and the shaft is stationary the pulley takes all of its bearing axially upon the clutch mechanism instead of upon the shaft.

258,687. GRAIN-BINDER. CALVIN YOUNG, Auburn, N. Y. Filed July 18, 1881. (Model.)

Claim.—1. In a grain-binder, the horizontally-vibrating knotting devices, in combination with a switch and rack frame provided with a track or cam suspended from said frame by swinging links adapting it to rise and fall bodily.

2. The combination, in a grain-binder, of a switch-frame, a pendent swinging track or cam suspended therefrom, a fixed lower track or cam, and mechanism for actuating the knotter-shaft.

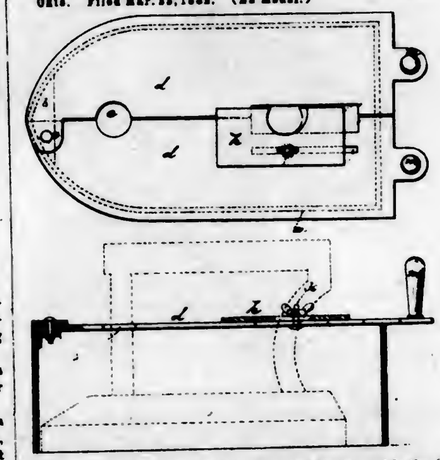


3. The combination, in a grain-binder, of a switch-frame, a movable track or cam connected with said frame by swinging links, a fixed lower track or cam, a horizontally-vibrating knotter-shaft and mechanism for actuating said shaft.

4. The combination, in a grain-binder, of a switch-frame, a horizontally-vibrating arm moving over said frame and carrying the knotting devices, mechanism for actuating the knotter-shaft, a movable track or cam suspended from the switch-frame by swinging links, and a fixed lower track or cam operating in connection with the swinging track or cam for actuating the knotter-hook.

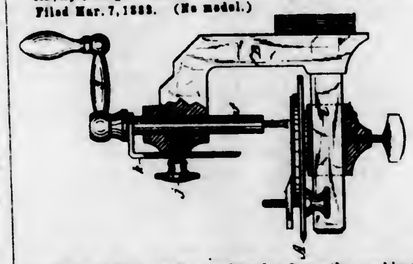
5. The swinging track or cam plate, suspended in a vertical slot in the switch-frame by means of parallel links, substantially as described, whereby it is adapted to be lifted or swung up out of the way for allowing the knotter-hook to remain closed on the return or backward movement of the knotter-carrying arm, in combination with the spring for throwing said cam-plate into position for acting on said hook on its outward movement, substantially as described.

6. The combination, with the switch and rack frame for actuating the horizontally-oscillating knotting devices, of the swinging track or cam plate D^5, pivoted thereto by the parallel links A^5 and B^5, the spring F^5, and the fixed lower track, H^5, having the inclined ends I^5 and J^5, all arranged and operating substantially as described.



258,688. FOLDING OPERA-CHAIR. ALLEN W. ADAMS, New York, N. Y. Filed Feb. 3, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with suitable chair-standards, of the folding back hinged on one of its vertical edges to swing rearward in a horizontal plane and the folding seat hinged on one of its side edges independently of the folding back to swing in a lateral direction, for the purpose specified.

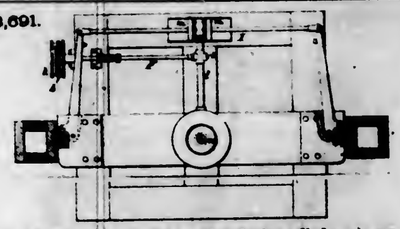


2. The combination, substantially as hereinbefore set forth, with the outer chair-standards, of the two folding backs hinged on one of their vertical edges and the two folding seats hinged on one of their side edges to such standards, independently of the folding back, to form two chairs, and the intermediate or folding standard hinged to the folding seat of either chair to swing upward therewith, for the purpose specified.

258,689. FLAT-IRON HEATER. IRA R. ARNELL, Delphos, Ohio. Filed Mar. 23, 1882. (No model.)

Claim.—In a flat-iron heater, the combination, with the inclosing-case wall *a*, of the notched and pivoted cover-sections *d d*, provided with handles *m m*, and the adjustable notched slide *h*, substantially as specified.

258,690. JEWELING-TOOL. WILLIAM B. ATKINSON, Franklin, Ky., assignor of one-half to William B. Jackson, same place. Filed Mar. 7, 1882. (No model.)



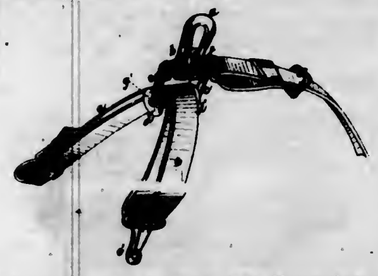
Claim.—In a jeweling-tool for hand use, the combination of the bracket B, the drill-rod *f*, journaled in the bracket, and the slotted and perforated gage *k* and thumb-screw *j*, with a bed-plate, A, adjustably supported on an arm of the bracket and having movable clamps, substantially as shown and described.

258,691. SAFETY APPARATUS FOR ELEVATORS. CYRUS W. BALDWIN, Chicago, Ill. Filed Apr. 19, 1882. (No model.)

Claim.—1. In a safety apparatus for elevators having brake-levers arranged upon the cage to clamp or clutch the guides, the combination, with such levers, of one or more detents, constructed to retain the levers in the positions to which they are set by the safety appliances, as set forth.

2. The combination, with the brakes of an elevator-cage, of a brake-cylinder, a cylinder communicating with the brake-cylinder, and a piston and connections, as specified, whereby the motion of the piston may be arrested, while that of the cage is continued, as and for the purpose set forth.

258,691.



3. The combination of the brake, brake-cylinder, air-compression cylinder communicating therewith, operating-rope *b*, governor, and appliances, constructed and arranged as described, whereby the brake-cylinder is supplied with air under pressure when the travel of the rope is arrested.

4. The combination of the cage, brake-levers, brake-cylinder, governor, operating-rope *b*, and a cylinder containing the operating-fluid and provided with a piston connected to the rope *b*, substantially as specified.

5. The combination of the brake-levers, governor, and operating-rope *b*, and a shaft, F, connected with the brake-operating appliances and carrying a drum round which the rope *b* is wound, as set forth.

258,692. NECK-YOKE ADJUSTER. JOHN A. BARNES, Laclede, Mo. Filed Apr. 14, 1882. (No model.)

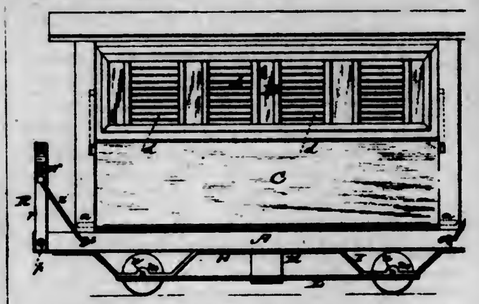
Claim.—1. In a neck-yoke adjuster for double-team harness, the combination, with the T-shank having the forked or slotted hook f' and the arms *c c*, of the tongue *h*, having the rib i' and the projection h', the spring *j*, the flanged roller *d*, and the link *f*, substantially as described, for the purpose specified.

2. In a neck-yoke adjuster, the hooked T-shank having the side and middle arms, *c a b' b'*, the latter formed with the cross-pin b^5, in combination with the tongue *h*, having the eye-forming strap end *i*, the projection h', and the ribbed end i', and the spring *j*, the flanged roller, and the link *f*, substantially as and for the purpose set forth.

3. In a neck-yoke adjuster, the snap-hook frame having the confining-eye *a*, for the side link, formed by the projection a', and the wing c^5, as shown and described.

4. In a neck-yoke adjuster, the flanged roller *d*, having a hollow hub and end shoulders, d' d', in combination with the hook-frame arms *c c*, one of which has screw-threaded hole g' and the screw-bolt *g*, as shown, and for the purpose described.

258,693. ADJUSTABLE ECCENTRIC. JOHN BAPTISTE BARNOUT, Woodhaven, N. Y. Filed Feb. 7, 1882. (No model.)



Claim.—1. The screw collars or rings D, in combination with the two halves of the eccentric C, the latter being correspondingly threaded, as herein specified.

2. The two eccentrics B and C, one within the other, having a series of grooves or splines in the one jointly with a single pawl in the other, adapted to serve as herein specified.

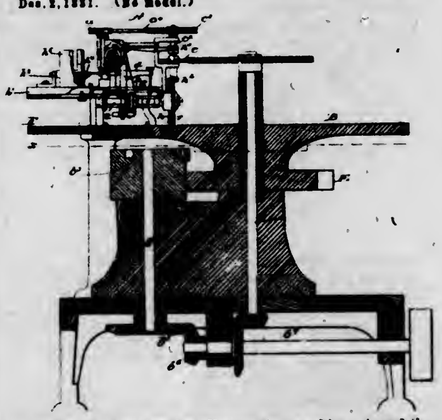
3. The two eccentrics B and C, one within the other, having a series of grooves or splines in the one jointly with a single pawl, K, in the other, and with means F, for urging the pawl into engagement with said grooves, as herein specified.

258,694. CONVERTIBLE CRIB. JOHN W. HARTER, Emporia, Kans. Filed Apr. 1, 1882. (No model.)

Claim.—1. In a crib having the form and gear resembling a car, the combination of the folding side walls, the side sashes, the roof, end railings, and the under gear, substantially as specified.

2. In a crib, the removable roof having its sections connected by hinges, carrying slide-rods *c'*, to engage sockets in the end walls of the crib, substantially as specified.

3. In a crib having folding side walls, the grooves *h* in the end walls engaging the studs *k* of the side walls and the openings *h''* in the outer walls of said grooves, substantially as specified.



4. In a crib, the lower side-wall sections having sockets *g*, and the upper side-wall sections having slide-rods *c*, engaging said sockets, substantially as specified.

5. In a crib, the folding sides, their hinge rods or journals *a*, and the projecting side edges of the bottom, forming brace-ledges *b*, to support the sides when folded down or open, substantially as specified.

6. The reversible railings R, pivoted to the ends of the bottom, and forming, when reversed, rockers, and the braces *s*, securing the railing or rockers in position, substantially as specified.

7. In a crib, the bent straps H, forming, in connection with the tie-straps I, and brace-strap M, the under gearing supporting the crib on the wheel-journals, substantially as specified.

258,695. MECHANISM FOR GROOVING SEWING-MACHINE-NEEDLE BLANKS. PHILO H. BURNS, Bridgeport, Conn. Filed Dec. 2, 1881. (No model.)

Claim.—1. A series of needle-grooving machines, A, and the movable support therefor, combined with the mechanism, substantially as described, to automatically and successively operate the needle-blank-holding jaws of the said machines to grip and hold the blanks to be grooved, substantially as described.

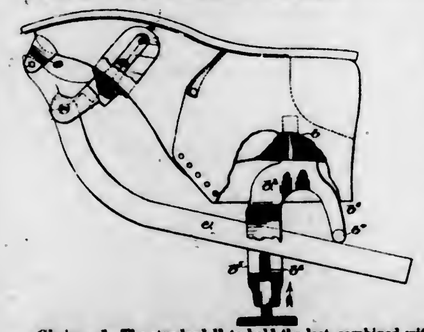
2. A series of needle-grooving machines, A, and intermittingly-rotating support B therefor, bed F, and needle-blank-holding jaws, and cam to automatically close them, combined with the needle-withdrawing mechanism adapted to automatically engage and withdraw a grooved needle-blank from the needle-grooving machine opposite it, substantially as described.

3. A series of needle-grooving machines, A, and intermit-

tingly-rotating support B therefor, bed F, and needle-blank-holding jaws, and the means to automatically close and lock them, as described, combined with a hopper and ejector, and the means, substantially as described, to operate the ejector to automatically transfer a needle-blank from the hopper into position between the jaws to be grasped and held thereby while being grooved, substantially as described.

4. The bed F and hopper and ejector to move a needle-blank into position between the needle-blank-holding jaws and the needle-withdrawing mechanism to automatically seize and withdraw a grooved blank from the needle-blank-holding jaws, combined with a series of needle-grooving machines having needle-blank-holding jaws, and with the intermittingly-rotating support by which the said machines are brought one after the other in the proper order before the hopper and the needle-withdrawing mechanism, substantially as set forth.

5. The hopper h^1, to contain the needle-blanks, slide-plates to remove a blank from the hopper, and an ejector for forcing the blanks into the blank-holding jaws, the bed F, and the carriage-throwing-in mechanism connected therewith, combined with the carriage *h* and the automatically-operated needle-blank-holding jaws mounted thereon, substantially as described.



6. The intermittingly-revolving support B, bed F, and needle-blank-holding jaws, combined with cam d^5, shaft d^6, arm d^7 thereon, and fingers to strike the said arm and actuate the shaft and cam, substantially as described.

7. The needle-withdrawing mechanism composed of the jaws G, the links, the jaw-actuating slide g^1, and slide g^2, to operate substantially as described, and the bed F, combined with the intermittingly-revolving support B, a series of needle-grooving machines, A, and needle-blank-holding jaws thereon, substantially as and for the purposes set forth.

8. The hopper and the loosely-connected slide-plates, 12 16, combined with the adjusting device 34, to insure the correct position of the forward end of the slide 16 with relation to the discharge-passage at the bottom of the hopper, substantially as described.

9. The hopper, the slide-plates, and the lever 38 and its presser 27, to engage and bear upon the needle-blanks, combined with a cam-ledge to give to the said lever and presser the proper movements to enable the presser to press the needle-blanks down in the hopper at the proper times and between the slide-plates, substantially as described.

258,696. BOOT OR SHOE HOLDING JACK. ELI BERTRAND, Boston, Mass. Filed Apr. 6, 1882. (No model.)

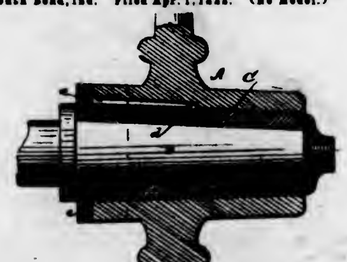
Claim.—1. The standard b^1, to hold the last, combined with the lever *c*, means to move it, and with the spring-clamp to act upon the upper over the top of the last, as shown, between its toe and instep, substantially as described.

2. The standard b^1, to hold the last, the lever *c*, and lever-adjusting device, combined with the block and toe-rest, substantially as described.

3. The standard to hold the last, the lever, the lever-adjusting device, and spring-clamp to fit the upper to the last, combined with the toe-clamp, substantially as and for the purpose described.

4. The lever *b* and projected toe-clamp, combined with the last, standard b^1, lever *c*, and lever-adjusting device, substantially as described.

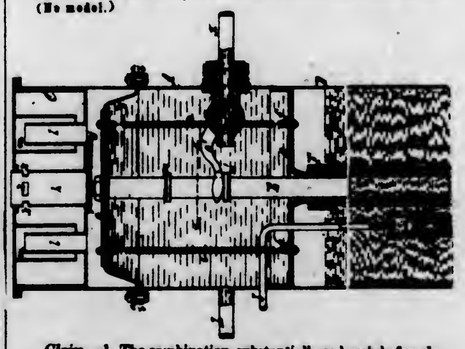
258,697. REVERSIBLE CLOAK. HERMANN F. BIDDELL, New York, N. Y. Filed Apr. 24, 1882. (No model.)



Claim.—1. A reversible cloak composed of a silk covering, an intermediate layer of water-proof material, and of a lining of fur, quilted, or other fabric, said layers or parts being connected at the sides, but the silk covering disconnected from the lining and water-proof material at the upper and lower ends, whereby the cloak may be reversed so as to bring the silk covering or the water-proof material to the outside, substantially as set forth.

2. A reversible cloak consisting of a silk or other covering, an intermediate water-proof layer, and a lining of fur, quilted, or other fabric, which are connected at the sides but open at the upper and lower ends, said ends being provided with means for attaching the silk covering to either side of the connected lining and water-proof layer after reversing the cloak, substantially as set forth.

3. The combination, in a reversible cloak, of a silk covering, an intermediate layer of water-proof material, and a lining of fur, quilted, or other fabric, the layers or parts being connected at the sides but open at the upper and lower edges for being reversed, the parts being provided with a double trimming along the sides, substantially as described.



258,698. WHEEL FOR SULKY-PLOWS. THELUS H. BISSELL, South Bend, Ind. Filed Apr. 1, 1882. (No model.)

Claim.—1. The wheel-hub A, constructed with internal grooves, *a b b*, in combination with the thimble having a lug, *d*, formed on it for the purpose of binding the hub and thimble, substantially as described.

2. The combination of the internally-grooved hub, the thimble having a collar and a lug formed on it externally, and the nut fastening for the axle, substantially as described.

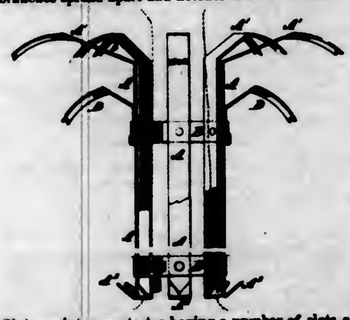
258,699. DISINFECTING APPARATUS FOR WATER-CLOSETS. HENRY BLACKMAN, New York, N. Y. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the vessel A, the diaphragm D, the connections K L, the disinfecting-drum C, the air-tube A, the circulating-pipes *l m*, and the valve *i*.

2. The combination, substantially as hereinbefore described, of the vessel A, the diaphragm B, the plunger E, the collars *a a'*, for actuating the valve *c*, and the connections K L.

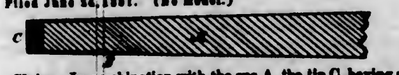
3. The combination, substantially as hereinbefore described, of the vessel A, the diaphragm B, the plunger E, the cylinder G, the valve-chamber H, and the pipe I, leading into the basin of a water-closet.

4. The combination, substantially as hereinbefore described, of the vessel A, the diaphragm B, the connections K L, the disinfecting-drum C, the plunger E, the pump-cylinder G, and the pipe I, leading into the basin of a water-closet.



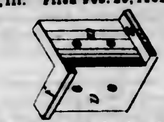
258,700. THILL-COUPLING. ISAAC S. BOWEN, Fremont, Ohio, assignor of one-half to Byron B. Budrow, same place. Filed Mar. 23, 1882. (No model.)

Claim.—In a thill-coupling, the combination of the coupling-iron C C' C^1, constructed as described, and having the thumb-screw D, thill-iron E, having cross-head *e*, bearing-plate F, having concaved shoulders *f f* and transverse rib *g*, elastic block H, having transverse groove or recess *h*, and top plate, G, having end flanges, *e e*, and raised seat *d*, the whole constructed and combined to operate substantially in the manner, and for the purpose herein shown and described.



258,701. TREE-PROTECTOR. THOMAS BOWEN, Waterburg, N. Y. Filed Apr. 1, 1882. (No model.)

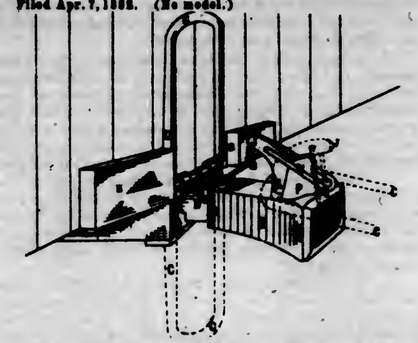
Brief.—Slats set in a circle at a short distance apart, held together by bands, and provided with bent barbed extensions having split branches spread apart and notches at the outer end.



Claim.—A tree-protector having a number of slats arranged at a short distance apart in a circle, held together by the bands B, and provided with the bent barbed extensions A', said extensions being split branches spread apart and notched at the outer ends, as shown and described.

258,702. BILLIARD-CUE. HENRY A. BOWEN, Lexington, Ky. Filed June 24, 1881. (No model.)

Claim.—In combination with the cue A, the tip C, having an elastic ferrule, B, said tip and ferrule being made of one and the same piece, substantially as and for the purposes set forth.

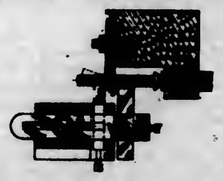


258,703. CAR-FRAME. THORNTON A. BRADY and CALVIN D. HANAIS, Matteson, Ill. Filed Feb. 25, 1882. (No model.)

Claim.—1. The angle-iron D, having the lower edge-flange, E, and at right angles thereto the upper edge-flange, F, whereby the iron may be used as described.

2. In a railroad-car frame, the combination, with the end sills, A, and the side sills, B, of the angle-irons D, having flanges E F, substantially as herein shown and described, whereby the end and side sills are connected firmly and detachably, as set forth.

258,704. CAR-COUPLING. SANFORD BRAY, Boston, Mass. Filed Apr. 7, 1882. (No model.)



Claim.—1. The coupling-links C, hinged to the end of the car-body, and provided with a projection, D, adapted to contact with a projection or shoulder, H, formed upon the draw-bar E, when the said draw-bar is forced inwardly by contact with an opposing draw-bar in the act of coupling, as and for the purposes set forth.

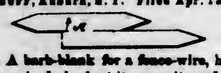
2. The combination, with the draw-bar E, having the horn P and guard or spring G, and provided with the coupling-pin L, having the curved upper end portion, J, provided with the guard-link N, and its lower end provided with a short pin or projection, *r*, and the hinged coupling-link C, provided with the projection D, substantially as described, as and for the purposes set forth.

3. The combination, with the draw-bar E, having the projecting horn P, of the coupling-pin L, having the curved upper end portion, J, provided with the guard-link N, adapted to engage with said horn, as and for the purposes set forth.

4. The combination, with the draw-bar E, having the shoulder H, and provided with the coupling-pin L, having the bent upper portion, J, of the coupling-link C, adapted to be turned down to couple by the horizontal or inward movement of the said draw-bar, substantially as described, as and for the purposes set forth.

258,705. SHEARING ATTACHMENT FOR HEADING-MACHINES. THOMAS J. BRAY, Pittsburg, Pa., assignor to Oliver Bros. & Phillips, same place. Filed Jan. 5, 1882. (No model.)

Claim.—1. The combination, in a metal-shearing machine, of a fixed knife, a movable knife, and a stop movable with the movable knife and arranged with relation to the knives, substantially as specified, to prevent the end portion of the rod from swinging around under the action of the cutting-knife, substantially as and for the purpose set forth.



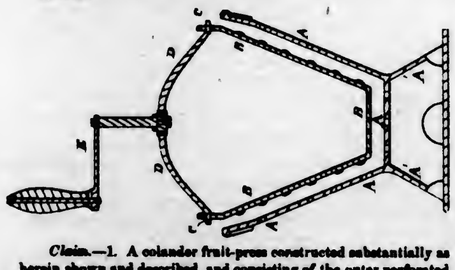
2. The combination, in a metal-shearing machine, of a fixed knife, a movable knife, and a laterally and longitudinally adjustable stop mounted on and adapted to move with the movable knife, substantially as and for the purpose specified.

3. The combination, in a metal-shearing machine, of a fixed knife and a gage mounted therewith, with a movable knife and a bearing-stop movable therewith, substantially as and for the purpose specified.

4. The combination, in a metal-shearing machine, of a fixed knife, a gage mounted with the fixed knife, a movable knife, and a laterally and longitudinally adjustable stop mounted on and adapted to move with the movable knife, substantially as and for the purpose specified.

5. The combination of the cutting-lever with the gripping-lever of the header and an intermediate lever and link, substantially as and for the purposes described.

258,706. BARBED FENCE. JACOB BRINKERHOFF and WARREN H. BRINKERHOFF, Auburn, N. Y. Filed Apr. 13, 1882. (Model.)



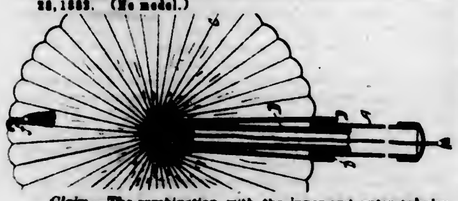
Claim.—1. A barb-blank for a fence-wire, having two barbs at one end, with a single barb at its opposite end substantially in the same line with one of the said two barbs, whereby the barb out of line with the single barb can be passed by the edge of said single barb when bending it upon a fence-wire.

2. A three-pronged sheet-metal barb-blank for wire fences, consisting of a base or body portion having at one of its end corners a single barb, and at its opposite end provided with two barbs of unequal length, whereby when its body portion is bent upon the fence-wire and its longer barb bent thereon, so as to project reversely to the two short barbs, all of said barbs will project to substantially the same extent from the wire, substantially as described.

3. A three-pronged sheet-metal barb-blank comprising a base or body portion, A, provided at one end with the two barbs of unequal length, and at its remaining end provided with one barb and one short lip, said barb-blank being adapted to be clasped upon the fence-wire and its barbs projected therefrom, substantially in the manner described.

4. The combination, with a fence-wire, of the three-pronged barb-blank comprising a body, A, with two barbs of unequal length at one end and one barb and one short lip at its remaining end, the body being adapted to be bent upon the wire so as to bring the two short barbs in diverging planes, and the lip and the long barb being bent upon the wire reversely to the two short barbs, substantially as described.

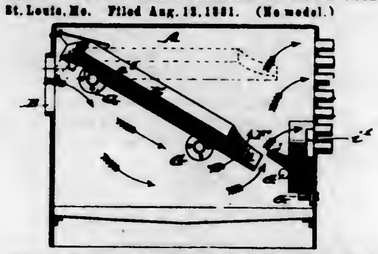
258,707. COLANDER AND FRUIT-PRESS COMBINED. LORETTA BREWSLOW, East Paw Paw, Ill. Filed Mar. 18, 1882. (Model.)



Claim.—1. A colander fruit-press constructed substantially as herein shown and described, and consisting of the outer perforated vessel, A, the similarly-shaped inner vessel, B, having roughened outer surface, the spider and crank D E, and the tongs G, as set forth.

2. In a colander fruit-press, the combination, with the outer perforated vessel, A, of the inner similarly-shaped vessel, B, having a roughened outer surface, substantially as herein shown and described, whereby the fruit can be crushed between the two vessels and pressed and strained through the perforations of the outer vessel, as set forth.

3. In a colander fruit-press, the combination, with the inner vessel, B, of the spider D and crank E, substantially as herein shown and described, whereby the said inner vessel can be readily turned within the outer vessel, as set forth.

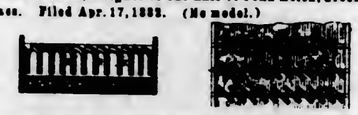


4. In a colander fruit-press, the combination, with the perforated outer vessel, A, of the tongs G, substantially as herein described, whereby the said outer vessel can be held stationary while the inner vessel is being operated, as set forth.

258,708. FAN. GUSTAV BRUNCK, New York, N. Y. Filed Mar. 28, 1882. (No model.)

Claim.—The combination, with the inner and outer tubular sections, A B, of the two tapes D, extending through and around both ends of the inner section, and each tape having its two ends connected with the upper end of the outer section, and the fan C, carried by the inner section, and having its outer or end leaves connected with the tapes, substantially as and for the purpose described.

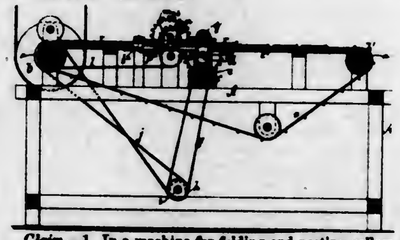
258,709. LOCOMOTIVE-FURNACE. THOMAS A. BUCKLAND, St. Louis, Mo. Filed Aug. 15, 1881. (No model.)



Claim.—1. The combination of the furnace A, the diaphragm E, having the projections *e e*, and the tiling I, having the projection *i*, extending toward and over, but not coming in contact with, the diaphragm, substantially as described.

2. In a locomotive-furnace, the tiling I, having a flue in rear of and extending from the bottom to the top of the tiling, as and for the purpose described.

3. In a furnace, the combination of the supports G G and the diaphragm E, said diaphragm having a series, *e' e'*, of recesses, as and for the purpose described.



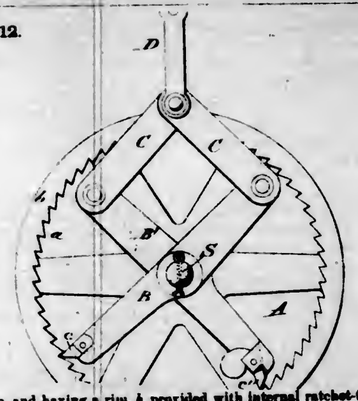
258,710. MANUFACTURE OF PAPER. CHARLES M. BURNETT, Turner's Falls, assignor of one-half to John Keith, Greenfield, Mass. Filed Apr. 17, 1882. (No model.)

Claim.—1. In the manufacture of paper, a series of magnets suspended upon rods with their poles immediately above or within the flowing pulp, as and for the purpose set forth.

2. Two or more series of permanent or electro magnets arranged and suspended in quincunx order above or within the flowing pulp, substantially as and for the purpose set forth.

258,711. MACHINE FOR FOLDING AND PASTING THE ENDS OF PAPER COLLARS. EDGAR GARY, New York, N. Y. Filed Feb. 14, 1882. (No model.)

Claim.—1. In a machine for folding and pasting collars, the combination, substantially as described, of the transverse shaft *m*, provided near each end with a folder-cam, *n*, with the carrying belts or chains moving at right angles to said shaft.

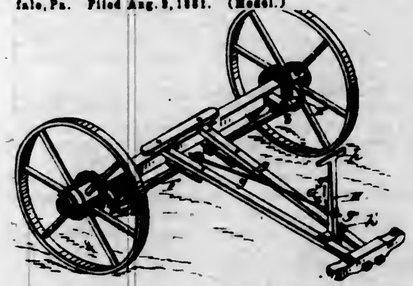


2. In a machine for folding and pasting collars, the combination of the guides *r*, carrying rotary friction-rollers *g*, with the pasting-disks *d*, arranged directly beneath the friction-rollers, the carrying belts or chains, and the transverse shaft *m*, provided near each end with a folder-cam, *n*, substantially as described.

3. The combination of the transverse folder-shaft *m*, carrying near each end a folder-cam, *n*, the transverse shaft *d'*, carrying paste-disks *d* and geared at one end with the folder-shaft, and the friction-rollers *g*, arranged directly above the paste-disks, substantially as described.

258,712. DEVICE FOR CONVERTING RECIPROCATING INTO ROTARY MOTION. JOHN W. CHAMBERLAIN, Pontoon, Ill. Filed Feb. 25, 1882. (No model.)

Claim.—1. The combination of the shaft S, wheel A, secured



258,712.

thereto, and having a rim, *b*, provided with internal ratchet-teeth, *a*, the arms or bars B B', pivoted on said shaft, and having pawls *c c'*, adapted to engage alternately with the ratchet *a*, the connecting-bars C C, pivoted to the bars or arms at their ends opposite to the pawls, and the link D, connected with the connecting-bars, substantially as and for the purpose described.

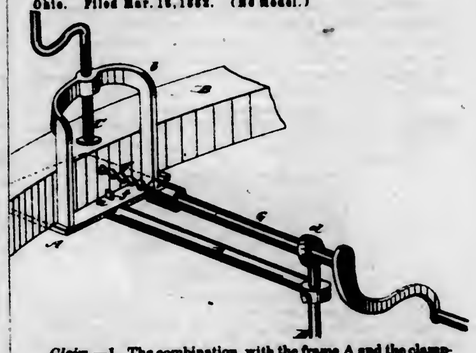
2. The combination of the wheel A, ratchet-teeth *a*, cross-bars B B', pawls *c c'*, connecting-arms C C, link D, and shaft S, substantially as shown and described, and for the purpose set forth.

258,713. VEHICLE-BRAKE. WALLACE CLAYPOOL, North Buffalo, Pa. Filed Aug. 3, 1881. (Model.)

Claim.—The forked rod G, having stem *x* and branches *g g*, in combination with the hand-lever H, brake-levers F F, and the triple sets of nuts *g' g' g'*, whereby is formed a device for operating the brakes in which either or both brakes can be adjusted at will, all as set forth and described.

258,714. CREAMING-CAN. ERWIN B. CLEMENT, Barnet, Vt. Filed Jan. 30, 1882. (No model.)

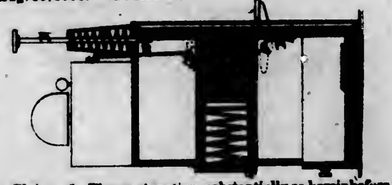
Claim.—As an improvement in creaming-cans, a deep water vat or tank, B, suspended within a light frame composed of uprights A and parallel connecting-bars *a a'* and *b b'*, in combination with one or more deep and narrow cream-cans, C, having ears *c c'* at their ends, by which they are suspended upon the cross-bars *b b* of the frame, out of contact with the water vat or tank B, as shown and set forth.



258,715. BUCKLE. EDWARD A. COOPER, Buffalo, N. Y., assignor of one-fourth to Pratt & Letchworth, same place. Filed Jan. 12, 1882. (No model.)

258,716.

Claim.—A harness-buckle provided with cross-bars *e* and *g*, having fixed tongues *f* and *h*, intermediate cross-bars *i* and *k*, and a snap-hook, B, substantially as set forth.



258,716. BORING-MACHINE. VINCENT COX, New Vienna, Ohio. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination, with the frame A and the clamping-screw C, of the bit or auger holding and operating shaft G, and the supporting-post E, having a rolling bearing-surface, substantially as herein shown and described, whereby the direction of the bit or auger can be varied, as set forth.

2. The combination, with the frame A, provided with a clamping-screw, C, and forwardly-projecting arm D, of the post E, adjustable both longitudinally and axially within and through said arm, and the bit or auger holding and operating shaft G, supported in an eye, *d*, of said post, constructed to form a bearing having a rolling surface, essentially as shown and described.

258,717. CHECK-CASE. JOHN S. OBARR, Cohoes, N. Y. Filed Aug. 23, 1881. (No model.)

Claim.—1. The combination, substantially as herein before described, of the check-magazine, the pusher for forcing the checks successively out of said magazine, the window for displaying the figure which indicates the value of the check, the device for retaining the check during the time the figure is being displayed, and the look-box for receiving the check or tally.

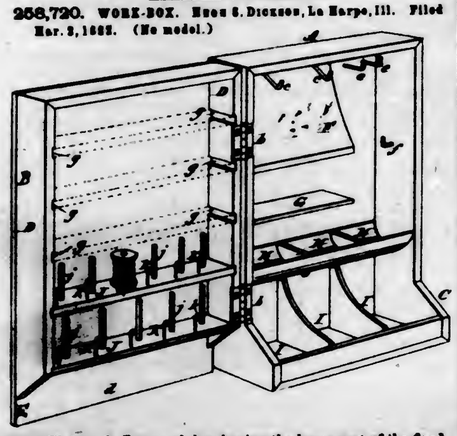
2. The combination, substantially as herein before described, of the check-magazine, the pusher, the window for displaying the figure which indicates the value of the check, the device for retaining the check during the time the figure is being displayed, the alarm-lever, actuated by the pusher, the catch for retaining the alarm-lever, and the handle for releasing the check-retaining device and the catch.

3. The combination, substantially as herein before described, of the check-magazine, the spring acting on the checks in said magazine, the pusher, the window for displaying the figure which indicates the value of the check, the device for retaining the check during the time the figure is being displayed, the alarm-lever actuated by the pusher, the catch for retaining the alarm-lever, the handle for releasing the check-retaining device, and the catch and the look-box.

258,718. CHICKEN-COOP. DAVID E. DAVIS, Marion, Va. Filed Apr. 10, 1882. (No model.)

Brief.—All the parts are separable, there being no hinges.

268,718.



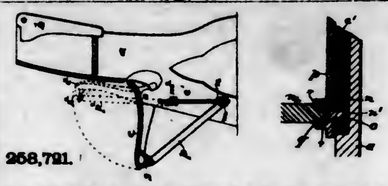
Claim.—In a poultry-coop, the combination of the separable side and end pieces, B B and C C, having hooks *e e f f*, bottom piece, A, having side loops, *b b*, and top piece, D, having the swivel-eyed bands *g g*, provided at their projecting outer ends with loops *h h*, adapted to engage hooks *h h*, affixed to the side pieces, substantially as shown and set forth.

268,719. PROCESS OF PACKING MEAT FOR TRANSPORTATION. CHARLES H. DUNNY, Chicago, Ill. Filed Dec. 22, 1881. (No specimens.)

Claim.—The mode described of packing fresh meat for transportation, the same consisting of applying a limited quantity of dry borax to the meat and wrapping the latter in coarse cloth, as set forth.

268,720. WORK-BOX. HUGH S. DICKSON, La Harpe, Ill. Filed Mar. 2, 1882. (No model.)

Claim.—1. In a work-box having the lower part of the fixed portion extended forward at C, the lower part of the swinging portion, with its side pieces, D, cut away angularly at its lower end, and the outside piece, E, extended down at *d*, as shown and described.



2. The hinged part B, provided with the removable shelves J, having the pins *j* and thread-holders K, substantially as and for the purposes described.

3. The main or back part, A, of the box provided with the hooks *e e* and *f*, cushion F, shelf G, and the recessed trays H and I, substantially as described.

268,721. SCHOOL-DESK. GORDON DIBBRELL, Kirksville, Mo. Filed Feb. 16, 1882. (No model.)

Claim.—1. The combination, with a desk-frame provided with grooves in its sides and a seat hinged to the desk-frame, of a foot-rest sliding in said grooves, and means, substantially as described, for connecting the foot-rest and hinged seat, whereby the foot-rest and seat rise and fall simultaneously, as specified.

2. The combination of the desk-frame *a*, provided with grooves *a'*, foot-rest *m*, hinged seat *o*, rigid arms *p*, secured to the foot-

268,721.

rest at their lower ends and hinged to the seat-frame at their upper ends, substantially as described, and for the purpose set forth.

3. The combination of the desk-frame *a*, provided with vertical grooves *a'*, foot-rest *m*, slides *n*, hinged seat *o*, provided with rigid arms *s*, and rigid arms *p*, secured to the foot-rest at their lower ends and hinged to the lower ends of the arms *s* at their upper ends, substantially as set forth.

4. The combination, with the desk-frame *a*, provided with grooves *a'*, hinged seat *o*, slides *n*, and sliding foot-rest *m*, of the rigid arms *p*, hinged to the seat-frame at their upper ends, and provided with the gudgeons *o o* and mortises *g g* and screws *r r*, substantially as described, and for the purpose set forth.

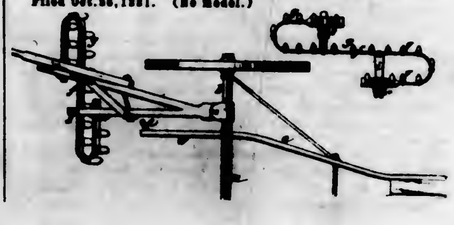
268,722. ATTACHMENT-LINK. JAMES H. DOBSON, Chicago, Ill. Filed Apr. 8, 1882. (Model.)

Claim.—1. An attachment-link for conveyors formed or provided with devices *e e*, or their equivalents, and a bearing-surface, *g*, the said devices being arranged in the proper relationship to the portion *g* of the link, as described, and being properly shaped to permit the employment, in connection with the link, of a metallic flight, *f*, in the manner explained, and to effect the retention of said flight in place through the media of suitable fastening devices, all as set forth.

2. In combination with an attachment-link, A, for conveyors, having a bearing-surface for the flight at *g*, and provided with projecting devices *e e*, or their equivalents, a metallic flight, *f*, cut out at the lower edge to fit over the end of the link and secured to the latter, all substantially as and for the purposes set forth.

268,723. WATCH-CHARM. WILLIAM W. DOBSON, Washington, D. C. Filed Apr. 14, 1882. (No model.)

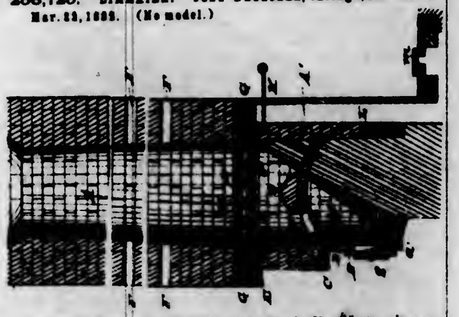
Brief.—The watch-charm contains or is coated with a phosphorescent or luminous compound or substance, whereby it is caused to give light in the dark.



Claim.—1. A charm for watch-chains, &c., charged with luminous matter, substantially such as described, and adapted to be attached to a chain.

2. As a new article of manufacture, a watch-charm containing a transparent body provided on its inside with luminous matter, as explained.

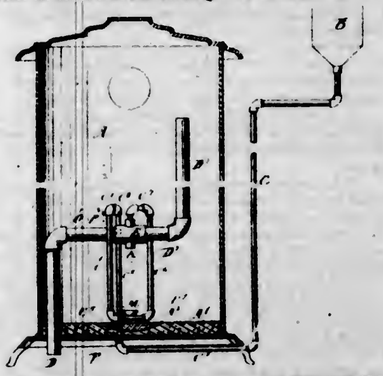
3. The herein-described charm, having the globe B, charged with luminous matter, substantially such as described, and provided with valve C, as and for the purpose explained.



4. In a charm such as described, the globe B, having the inwardly-turned edge *b*, as and for the purpose set forth.

268,724. CULTIVATOR. THOS. C. DODSWORTH, Ottawa, Kans. Filed Oct. 26, 1881. (No model.)

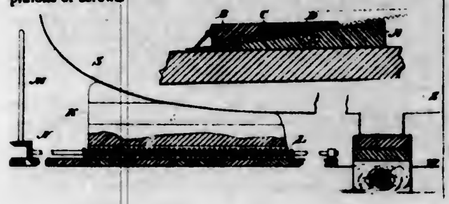
Claim.—In combination, the beams of a straddle-row cultivator, the single-tooth carrying-bar crossing between the beam-standards, having opposite return ends, the braces *i i*, secured to said bar between its return ends and its middle part, and the clips *s*, for securing the ends to said beam-standards, substantially as set forth.



268,725. LIMEKILN. JOHN DEUSCHER, Chicago, Ill. Filed Mar. 23, 1882. (No model.)

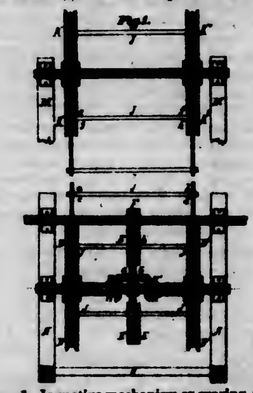
Claim.—In a gas-burning limekiln, the inclined bars *a*, in connection with the front or face wall having the arched offsets *a'*, C, and E, and the bridge or inside arch, N, supporting the saddle O, and spanning the enlarged lower part of the kiln below the gas or burner channel P, between the back wall, A', and front arch, C, said arches N and C being at right angles to one another, substantially as and for the purpose shown and set forth.

268,726. OIL-GAS STOVE. THOMAS E. DUDLEY, Boston, Mass., assignor of one-half to Jett Grant, same place. Filed Dec. 21, 1881. (No model.)



Brief.—The bottom of the stove is covered with ashes, asbestus, or some other non-combustible material, and has a shallow dish in the center for convenience in kindling an initial flame.

Claim.—The combination of the generator C' C' C' C' C' C' C' with the air-chamber E E' E² and orifice *e*, arranged to operate substantially as described, and for the purpose set forth.

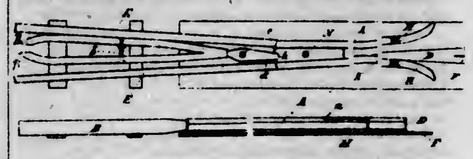


268,727. SHIP-RAILWAY AND DRY-DOCK. JAMES B. EADS, St. Louis, Mo. Filed Jan. 7, 1881. (No model.)

Brief.—Checks and keel-blocks are advanced and retracted by means of positive connections, gearing, shafts, and racks and pinions or screws.

Claim.—The combination, in a ship's cradle or dry-dock, of a system of wedges or inclined checks, and racks and pinions or screws, and positive mechanical means for operating the same for forcing the said wedges or checks up in contact with the ship's bottom, substantially as described.

268,728. MOTIVE MECHANISM OR GEARING. OLIVER H. EATON, New York, N. Y. Filed Sept. 8, 1881. (No model.)



Claim.—1. In motive mechanism or gearing, the arrangement of two actuating or driving pulleys or drums connected together by interposed gearing for the purpose and in the manner substantially as set forth.

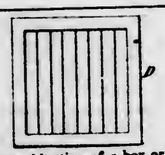
2. In motive mechanism or gearing, the combination of two or more driving or winding pulleys or drums connected by interposed gearing, whereby these motive pulleys or drums are allowed reciprocal movement to compensate for unequal motion.

3. In motive mechanism or gearing, a driving-gear bearing radially gearing suited to communicate motion to and allow reciprocal movement of actuating pulleys or drums on each side.

268,729. RAILROAD-FROG. WILLIAM H. EGGLES, St. Louis, Mo., and JOHN C. O'HELVENY, East St. Louis, Ill. Filed Mar. 3, 1882. (No model.)

Brief.—The frog consists of a base-plate with two pivotal standards, one serving as a pivot for two sections of rails rigidly connected together, having flaring ends cut down to a lower level from the point where they commence to flare, (to meet the flanges, but not the treads of wheels,) and one on which turns a lever for shifting the section-rails, two bowed rails being attached thereto, to be operated by the flanges of the car-wheels. The said bowed rails are adjustable by means of a bolt and suitable nuts.

Claim.—1. In a railroad-frog, the two sections of rails permanently attached together and moving with each other on a pivotal standard, N, being provided with the flaring wings H H at their ends, in combination with the lever *d* and its flange-wings B B, by means of which they are operated automatically by the action of the flanges of the wheels of cars.

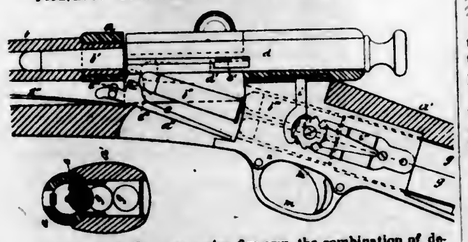


2. In a railroad-frog, the movable section-rails A A, with their flaring ends, in combination with the lever *d*, with its flange-wings B B, and the base-plate F, with its pivotal standards *c* and N, and its frog-point D, substantially as above described.

3. In a railroad-frog, the bolt I, with its adjustable nuts, in combination with the wings B B, as and for the purposes set forth.

4. In a railroad-frog, the flaring wings H H, with their treads cut away, so as not to interfere with tread of the wheel in the operation of the frog.

268,730. APPARATUS FOR SEPARATING THE SKINS FROM THE PULP OF POTATOES. GEORGE H. EDWARDS, Chicago, Ill. Filed June 22, 1881. (No model.)



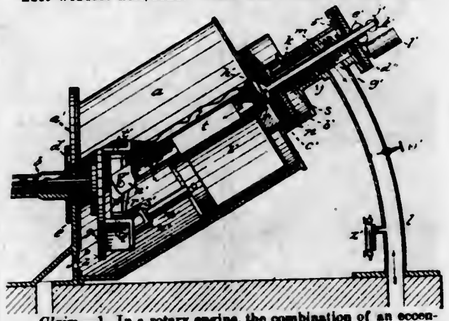
258,730.

Claim.—1. The combination of a box or hopper having an open grating or perforated bottom with a removable lining of one or more sheets of woven wire or frames of parallel wires, or a mixture of such sheets and frames, either being of uniform size of mesh and used together or separately or of a varying size of mesh to suit the quality of the vegetable, for the purpose of removing the skins from cooked potatoes or yams, substantially as set forth.

2. A box or hopper having an open bottom formed of a grating or perforated plate, and a lining of one or more sheets of woven wire or frames of parallel wires, or a mixture of such sheets and frames, with a press used to force the pulp of cooked potatoes or yams through such lining for the purpose of removing the skins from the vegetables, substantially as set forth.

258,731. MAGAZINE FIRE-ARM. WILLIAM H. ELLIOT, New York, N. Y. Filed Feb. 21, 1882. (No model.)

Claim.—1. In a magazine fire-arm, the combination of devices substantially as follows: a bolt which moves in a line with the barrel for closing the chamber, and is provided with groove d', which extends forward through the face of that device for the reception of the stop s when the arm is closed, a stop rigidly fastened to the receiver or to some device supported by the receiver, which projects unyieldingly into the receiving-chamber and touches the body of the cartridge at a point forward of its head to stop its upward or lateral movement, and a carrier which applies its force to the cartridge both in rear and in front of said stop, substantially as specified.



2. In a magazine fire-arm, the combination of devices substantially as follows: a bolt which moves in a line with the barrel for closing the chamber, and is provided with groove d', which extends forward through the face of that device for the reception of the stop and ejector e when the arm is closed, and is also provided with an extractor, e'', a stop and ejector rigidly fastened to the receiver or to some device supported by the receiver, which projects unyieldingly into the receiving-chamber and touches the body of the cartridge at a point forward of its head to stop its upward or lateral movement, and is located at a proper distance from the rear end of the chamber of the barrel to serve as an ejector of the shell, and a carrier which applies its force to the cartridge both in rear and in front of said stop and ejector, whereby this device serves the double purpose of stopping the advancing cartridge before the bolt and of ejecting the empty shell from the arm, substantially as specified.

3. In a magazine fire-arm, a tubular magazine located in the butt-stock, a bolt or breech-block for closing the chamber, which moves in a line with the barrel, and in combination therewith a carrier pivoted to the receiver under, or nearly under, the rear end of the barrel by means of an oblong pivot-bearing, c'', and with spring c''', said bearing being oblong in a vertical direction, so that it yields downward to cushion the force of the advancing column of cartridges or to make room for a cartridge in the receiver between the carrier and the bolt when the arm is closed, substantially as specified.

4. In a magazine fire-arm having a bolt for closing the chamber provided with a handle which terminates under the guard-strap, and in combination therewith, a spring, , provided with the catch v'' and an extension, v''', which projects over the rear end of the trigger, whereby the trigger is only allowed movement enough to trip the hammer when the handle is locked in place, substantially as specified.

5. In a magazine fire-arm having a bolt or breech-block for closing the chamber, which moves in a line with the barrel, and is provided with groove n, for holding the cartridge in a central position, and in combination therewith a carrier which holds the end of the cartridge in said groove, substantially as shown and described.

258,732. ROTARY STEAM-ENGINE. ERASTUS W. ELLSWORTH, East Windsor Hill, Conn. Filed Dec. 2, 1881. (No model.)

Claim.—1. In a rotary engine, the combination of an eccentric adjustable stop-pin, l', with the rotary arm k', communicating through suitable intermediate mechanism with the rotary cut-off plate, substantially as described.

2. In a rotary engine, the combination of an eccentric adjustable stop-pin, l', with the rotary arm o', communicating through suitable mechanism with the rotary valve, substantially as described.

3. In a rotary engine, the combination of the eccentric adjustable stop-pins l' l' with the rotary arms k' and o', communicating, respectively, through suitable intermediate mechanism with the rotary valve, substantially as described.

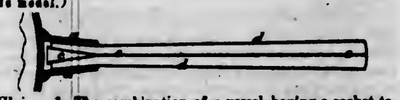
4. In a rotary steam-engine, the combination of the group of cylinders revolving about an axis parallel with the axis of each cylinder, the rotary and plane-surfaced valve-seat on the end of the cylinders, the flat-surfaced valve, and the rotary cut-off, all substantially as described.

5. In a rotary engine, the combination of the laterally-revolving cylinders, the rotary valve-seat upon the end thereof, the valve and its tubular rod, and the rotary cut-off with its rod passing through said tubular rod, all substantially as described.

6. In a rotary engine, the combination of the tubular steam-chest trunnion, the tubular valve-stem, the stuffing-boxes m d', and the spring g', pressing the stuffing of both, all substantially as described.

7. In a rotary steam-engine, the combination of the group of cylinders revolving about an axis parallel with the axis of each cylinder, the rotary and plane-surfaced valve-seat on the end of the cylinders, the plane-surfaced valve, and the semicircular and rotary cut-off plate having an independent movement on the back of the valve, all substantially as described.

8. In a rotary steam-engine, the combination of a group of cylinders revolving about an axis parallel with the axis of each cylinder, the central duct formed by the juxtaposition of the cylinders and running from end to end of the cylinders, the cylinder-ports, and the valve taking the exhaust steam from the cylinders and delivering it into said central duct, all substantially as described.

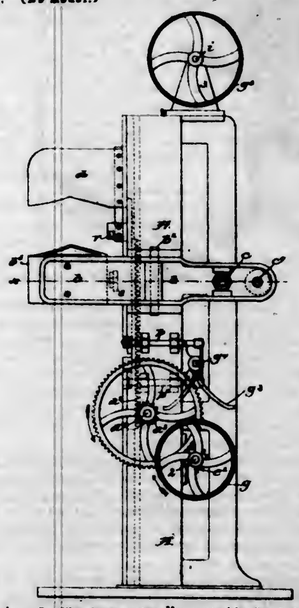


9. In a rotary steam-engine, the combination of a group of cylinders revolving about an axis parallel with the axis of each cylinder, the rotary steam-chest on the end of the cylinders, and the tubular trunnion affording entrance to the live steam, all substantially as described.

10. In a rotary steam-engine, the combination of the pistons, the group of cylinders revolving about an axis parallel with the axis of each cylinder, the steam-ports of the cylinders, the plane-surfaced and rotary valve-seat upon the end of the cylinders, and the plane-surfaced valve having ports so cut and arranged relatively to the cylinder-ports as to put steam-pressure on the pistons just before beginning their outward stroke and to maintain the pressure till just after the completion of such stroke, (to prevent jarring,) all substantially as described.

11. In a rotary engine, the combination of the piston-rods, disk g, arbors f', sleeves p', journal-pins o', springs r', and yokes s', substantially as described.

12. In a rotary engine, the combination of a piston-rod, a disk, g, arbor f', exteriorly threaded, and sleeve p', interiorly threaded, substantially as described.



258,733. HANDLE FOR SAUCEPANS. CHARLES EZARD, Manchester, County of Lancaster, England. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination of a vessel having a socket tapering outward and a wedging device within the socket with a hollow handle adapted to be expanded and secured in the socket by being forced therein, substantially as described.

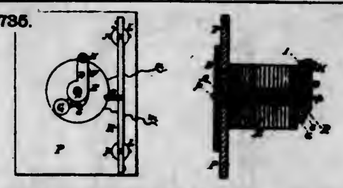
2. The combination of a vessel having a socket tapering outward and a wedge within the socket, with a tubular metal handle having a butt-joint, and adapted to be expanded and fixed by being driven into the socket, substantially as set forth.

258,734. CRIMPING-MACHINE FOR BOOTS AND SHOES. JOHN W. D. FIFIELD, North Brookfield, Mass. Filed Feb. 28, 1882. (No model.)

Claim.—1. The longitudinally-movable form carrying rack having the inclines d 5, combined with the rock-shafts p p^1, their arms, and the bolt-shipper, to operate substantially as described.

2. The rack having the inclines 4 5, the form thereon, the rock-shafts p p^1, and the bolt-shipper, combined with the toothed wheels e f, pinions e^1 f^1, and pulleys c^1 f^2, to operate all substantially as described.

3. The shaft i, its loose pulley and three fast pulleys, the pulleys g h c^1 f^1, pinions e^1 f^1, gears e f, and pinion d^2, combined with the rack-bar and its form, and the jaws a b, substantially as described.



4. The jaws a b and their carrying arms or levers, and projections or rollers 8 thereon, combined with the rack-bar, its projection r, and the form, substantially as and for the purpose described.

258,735. ELECTRICAL ANNUNCIATOR. FRANK E. FISHER, Detroit, Mich. Filed Mar. 6, 1882. (No model.)

Brief.—When the current passes the armature is attracted, the shoulder X is released from the stop S, and the outer end of the armature, together with the crank-arm D, falls by gravity upon the stop o. This crank-arm actuates the pointer through the medium of the rod p, to which both are rigidly attached.

Claim.—1. The combination, substantially as hereinbefore described, of the supporting-plate, the electro-magnet having a hollow core provided at one end with an interior screw-thread, the hollow screw extending through the supporting-plate and engaging the interior screw-threaded end of the core of the magnet, and the crank-rod having its bearing in the hollow screw.

258,736.

2. In an electric annunciator, an electro-magnet having its inner end faced with a diamagnetic substance, a hollow core projecting beyond the inner end of the electro-magnet, a diamagnetic rod passing through the hollow core, and having at its inner end a diamagnetic crank-arm rigidly fastened thereto, and an armature pivoted to the free end of said crank-arm, and having therein a shoulder adapted to engage with a suitable stop fastened in the facing of the inner end of the electro-magnet, substantially as herein shown and described.

3. The combination of the electro-magnet E, core E, rod p, pointer B, crank-arm D, having stop F, armature I, having shoulder X and weighted end G, and stop S, substantially as herein shown and described.

4. The combination of crank-arm D, rigidly fastened to rod p, and having stop F, armature I, having weighted end G and shoulder X, and pivot H, connecting said crank-arm and armature, all constructed, arranged, and operating substantially as herein shown and described.

258,736. GAGE ATTACHMENT FOR SEWING-MACHINES. HORACE FISHER, Troy, N. Y. Filed Oct. 21, 1881. (Model.)

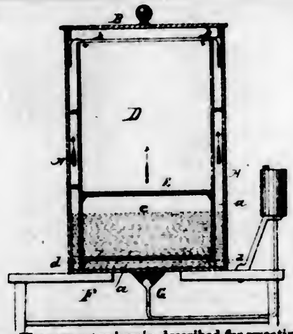
Claim.—1. In a gage attachment for sewing-machines, the combination of a horizontal blade, B, pivotally connected to a foot, F, a connecting-mandrel, M, and surrounding coil-spring H, substantially as described.

2. In a gage attachment for sewing-machines, the combination of the horizontal blade B, pivotally attached to the foot F, the mandrel M, with coil-spring H, the leg L, with perforated projections G′ G″, and the slot S′, and pin and button P, substantially as shown and set forth.

3. In a sewing-machine gage attachment, the combination of the frame A, with slotted ends, the slotted member L, with perforated projections G′ G″, mandrel M, surrounding coil-spring H, foot F, and pivoted gage-plate B, substantially as and for the purpose set forth.

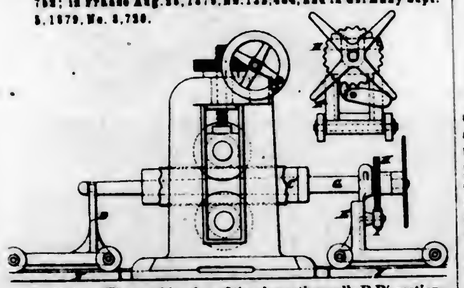
258,737. TREATMENT OF PRAIRIE SOIL TO OBTAIN USEFUL PRODUCTS THEREFROM. CHARLES L. FLEISCHMANN, Washington, D. C. Filed Mar. 20, 1882. (No specimens.)

Claim.—The herein-described method of extracting the alkaline, carbonaceous, and nitrogenous matters existing in or derivable from the vegetable mold of prairie or other rich soils, by exposing such soils to the heat of combustion and sublimation, and subsequently treating the products thus obtained by purification and lixiviation, as set forth.



258,738. CARPENTER'S FLOORING-TONGS. WILLIAM B. FORSTER, Bakerville, Tenn. Filed Mar. 6, 1882. (No model.)

Claim.—In a ceiling and flooring tongs, the combination of the jaws A, pivoted together, and having the points B, the spring C, catch D, pivoted brace F, and spring G, substantially as shown and described.



258,739. APPARATUS FOR SWEATING TOBACCO. WILLIAM FOUS, Mansfield, Ohio. Filed Aug. 18, 1881. (No model.)

258,739.

Claim.—The apparatus herein described for sweating tobacco, which consists of the covered casing A and uncovered casing D, the latter being supplied with the grate E and water-space *f*, and being placed within the casing A, the water-space *a* and steam-passage *b* being formed between the two casings, the steam-passage *b* leading from the space *a* directly into the uncovered casing D, the two water-spaces mentioned being independent of each other, substantially as set forth.

258,740. MACHINE FOR MAKING METAL TUBES AND PIPES. SAMSON FOX, Leeds, County of York, England. Filed Apr. 7, 1882. (No model.) Patented in England Feb. 26, 1879, No. 782; in France Aug. 26, 1879, No. 132,464, and in Germany Sept. 5, 1879, No. 8,730.

Claim.—The combination of the elongating-rolls R R', sectionally-constructed collapsible mandrel C, and supporting-carriages D and E, all constructed, combined, and arranged to operate substantially as and for the purpose specified.

258,741. WASHING-MACHINE. BENJAMIN F. FUCHS, Tiger Mill, Tex. Filed Sept. 1, 1881. (No model.)

Claim.—1. An attachment for a washing-machine, consisting of the wash-board D, provided or formed with a rectangular board, *d'*, and a rectangular board, *d''*, hinged to the upper end of the board *d'* of the wash-board D, and provided with a rubbing-surface, substantially as described.

2. In a washing-machine of the class described, having a longitudinal moving disk and crank-shaft, the tilting board serving a two-fold purpose—to wit, a brace to prevent the crank-shaft and its rotating disk from moving longitudinally and a guard for the dropped clothes—substantially as described.

3. In a washing-machine, the combination, with the wash-board D, of the endwise-moving rotating wash-board E, provided with a crank and a balance-weight, substantially as and for the purpose stated

258,742. MAGNETO GENERATOR FOR RAILROAD-SIGNALS. WESLEY WARD GARY, Boston, Mass. Filed Jan. 5, 1882. (No model.)

Brief.—A rotary magneto-generator actuated through a rock-shaft, one arm of which engages an arm on the shaft carrying the revolving armature, the other arm of the shaft being actuated by a passing car-wheel, the armature-shaft carrying a fly-wheel whereby prolonged rotation is secured after the wheel ceases to act. The foregoing actuates electrically a bell-signal located in advance of the generator, producing by the electric current a protracted signal after the train has passed the generator.

Claim.—1. In an automatic railway-signal, the combination of the following elements: a magneto-electric generator, appliances, substantially as shown, for imparting a continuing motion to said generator from passing railway-trains, a signal-instrument provided with an electro-magnet, whereby it is positively propelled or actuated, and an electric conductor extending from the generator to the signal, substantially as shown, whereby an electric current may be produced by the train and applied as the motive power to propel the signal with a continuing action.

2. In an automatic railway-signal, the combination of a magneto-electric generator, appliances, substantially as shown, whereby a passing car-wheel is caused to actuate the generator in a prolonged or continuing manner, an alarm-bell, a vibrating striker, and an electro-magnet arranged to operate the striker and connected electrically with the generator, substantially as described and shown.

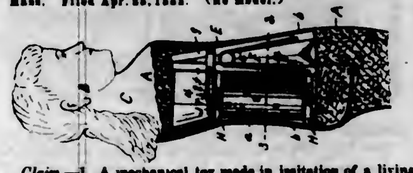
3. In an automatic railway-signal, the combination of a magneto-generator, appliances, substantially as described, for setting said generator in action from passing railway-trains, and a fly-wheel or equivalent device for continuing or prolonging the motion of the generator after the passage of the train.

4. In an automatic railway-signal, the combination, with driving devices adapted to be actuated by passing trains, of a magneto-electric generator having its armature and a fly-wheel mounted on one and the same shaft.

5. In an automatic railway-signal, the combination of an electrically-propelled signal located at a crossing or other point to be guarded, a magneto-electric generator located beside the railway-track in advance of the signal and electrically connected with the signal, and appliances, substantially as described, whereby a passing car-wheel is caused to actuate the generator so as to produce a prolonged current or succession of currents.

6. The combination, in a railway-signal system, of a bell-alarm provided with an electro-magnet, whereby it is propelled, a magneto-generator connected electrically with said signal, a fly-wheel applied to the generator, and appliances, substantially as shown, whereby motion is imparted to the generator by the action of passing trains.

7. The combination of the rock-shaft having the two arms with the armature, its shaft, and the arm or bar upon said shaft.



8. The combination of the rotary shaft, having an armature thereon, a bar or arm attached to said shaft, and a rock-shaft provided with an arm to operate upon said bar, and with a second arm adapted to be operated by passing railway-trains.

9. The combination of the shaft, the armature thereon, the yielding dogs attached to the shaft, and a rock-shaft provided with the two arms, as described and shown.

10. In combination with the rock-shaft having the horizontal and vertical arms, the vertical shaft provided with the armature, the fly-wheel, and the yielding dogs *e*.

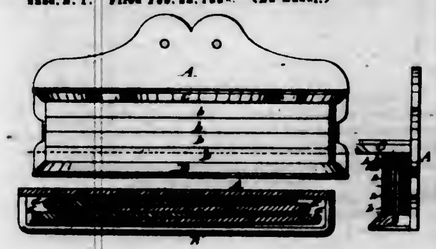
11. In combination with the vertical shaft having the armature mounted thereon, the rock-shaft provided with the two arms, and an intermediate connecting-dog arranged to yield in one direction only.

258,743. MECHANICAL TOY. JOHN L. GIVEN, Cambridge, Mass. Filed Apr. 28, 1882. (No model.)

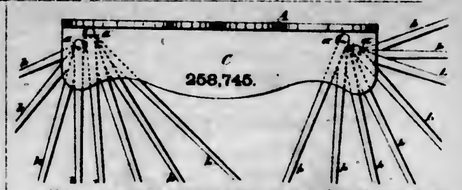
Claim.—1. A mechanical toy made in imitation of a living being and having placed within it bellows F, reeds *m*, and reed-chambers *l* in a board, A, and in communication with said bellows, and the face *o* of the board A, and a perforated musical drum G, adapted to be driven by the movement of the bellows, and all combined and arranged together to be operated from the outside of the doll, substantially as described, and for the purpose specified.

2. The music perforated drum G, rotating in standards H, concave seat *o* for said drum, having air-passages *a*, leading to reed-chambers *l* of a reed-board, A, in combination with springs *c*, arranged to press upon said drum with an elastic yielding pressure, substantially as described.

258,744. APPARATUS FOR THE DISPOSAL OF SEWAGE. AMASEN S. GLOVER, Brockton, Mass. Filed Oct. 15, 1881. (No model.)

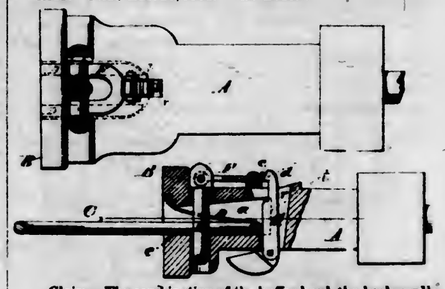


Brief.—The noxious gases are directed by the inclined roof into the chimney.

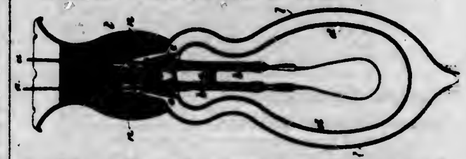


Claim.—1. In an apparatus for the disposal of sewage, the combination of a series of tanks, a sewer main or pipe arranged to discharge sewage matter into the first tank of the series, from which said matter flows successively through the other tanks, a building or inclosure over said tanks, having an inclined roof forming a flue having an opening, H, at its lower end for the admission of external air, and a chimney, A, connected to the upper end of said roof or flue, said chimney, flue, and opening causing a current of air to pass over the series of tanks to the chimney and carry with it from the building all the gases and odors arising from the matter in the tanks, as set forth.

2. The improved apparatus or building for the disposal of sewage, consisting of, first, a central structure receiving a sewer-main, and provided with a ventilating flue or chimney; and, secondly, radiating wings or inclosures, each having a series of tanks adapted to receive sewage matter from the central structure, and an inclined roof or flue communicating with the central chimney and adapted to conduct to the chimney the gases and odors from the sewage matter in the tanks, the central structure being provided with means for shutting off the sewage from either of the wings whenever the tanks require cleaning, as set forth.



258,745. FOLDING CLOTHES-BARS. JOHN S. GOURLEY, Syracuse, N. Y. Filed Feb. 25, 1882. (No model.)



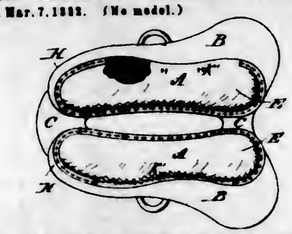
Claim.—In combination with the back A, base B, and shelf C, two or more rods, *a a*, secured to each end of the base and shelf and at different distances from the back A and from the ends of the shelf, and the bars *b b*, pivoted on said rods and adapted to fold over one another alternately from opposite ends of the shelf and base, and tapered to lie closely together when folded, all as shown and set forth.

258,746. CAR-COUPLING. EDWARD W. GRANT, Ypsilanti, Mich. Filed Mar. 25, 1882. (No model.)

Claim.—The combination of the buffer-head, the backwardly-flaring chamber at the rear rounded abutment, *t*, thereof, the independent springs D, having free inner ends, which are also rounded to fit the abutment *t*, the gravitating catch-lever G, extended vertically through the base A in rear of the abutment *t* and the rounded ends of said springs, the catch F on top of the bar A, and the coupling-pin E, pivoted to the catch F, all arranged and operating substantially as described.

258,747. ELECTRIC INCANDESCENT LAMP. JOHN H. GODDY, Brooklyn, N. Y. Filed Dec. 23, 1881. (No model.)

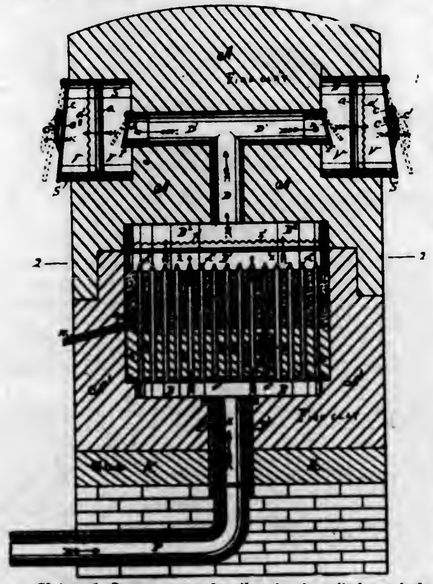
Claim.—1. The metal conductors for an electric lamp cased with glass inside the globe and united by the glass cross-bar, substantially as set forth.



2. The combination, in an electric lamp, of the globe, the metal conductors, the glass cases covering such conductors, the carbon filament, and the lead or similar metal surrounding the conductors and within the glass tests of the globe, substantially as set forth.

3. In an electric lamp, the combination, with the inner and the outer glass globes, of tests through which the metallic conductors pass, and one or more projections or tests on the inner globe projecting into glass tests on the outer globe, and the glass melted together for supporting the inner globe in its proper position in the outer globe, as set forth.

4. The method herein specified of exhausting and hermetically sealing the inner globe of an electric lamp, consisting in providing an open test on the inner globe, passing into a closed test on the outer globe, exhausting both globes, and then hermetically sealing the parts by melting the glass of the outer and inner tests together, substantially as set forth.



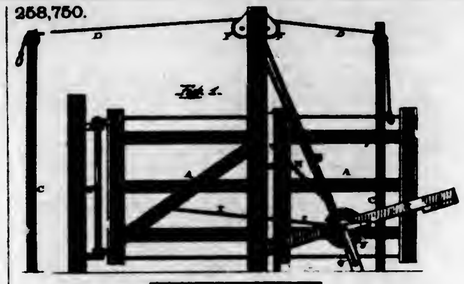
5. In an electric lamp, two globes made wholly of glass, and each globe being of nearly uniform thickness throughout, and the glass of the globes contracted around the conductors, and the two globes exhausted of air and each hermetically sealed, in combination with the conductors passing through the globes, and the incandescing filament within the inner globe, substantially as set forth.

258,748. SADDLE-PAD. FRANCIS ANTON HAHN, Cuero, Tex. Filed Mar. 7, 1882. (No model.)

Claim.—A saddle-pad consisting of an upper and lower cover, connected by lacing, provided with pockets to fit saddle-tree projections and filled intermediately with layers of felt or cloth, as shown and described.

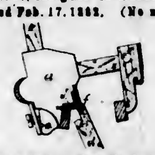
258,749. PROTECTOR FOR OIL-TANKS. WILLIAM J. HALL, Syracuse, N. Y., assignor to himself and William J. Hutchins, Joliet, Ill. Filed Nov. 21, 1881. (No model.)

Claim.—1. In a protector for oil-tanks, the cylinder or body A and A', provided with the pipes P and P', chambers B, B', and B², orifices or openings D and D', chambers V, and self-closing valves a and e, for the use and purpose set forth.



2. In a protector for oil-tanks, the exterior case, constructed in two parts, A and A', and containing the chambers B, B', B², D, D', and V, pipe w, perforated clay partition r, containing the pipes d, provided with gas-burners d', and filling T, metal disk e, valves a, e, and e', and partitions a a' and x x', all arranged to operate as set forth, and supported on the glass plate K and connected to an oil-tank by means of the pipe P', having the glass lining H, and pipes P, P², and L, in the manner and for the purpose set forth.

258,750. SELF-OPENING GATE. WILLIAM B. HAMBLETON, Winchester, Ill. Filed Apr. 4, 1882. (Model.)

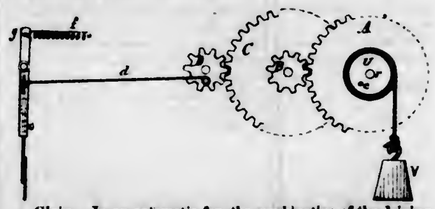


Claim.—1. The combination of the hinged gate, the connecting-cords D, the standard or standards E, provided with guides for the cords to pass over, a pivoted lever which is connected by a rod, a chain, and pulley, and a pivoted rod having one of its ends bent so as to catch over the side of the lever, substantially as set forth.

2. The combination of the lever, which is connected to the gate by a rod, a rod or shaft which is journaled upon the lever, and which has a pulley rigidly secured at one end and a bent lever at the other, the pulley having a chain secured to it for regulating the distance the lever shall move, and the bent arm or lever having the operating-cords secured to it, substantially as specified.

258,750.

258,751. REPETITION-ACTION FOR PIANOS. JOHN HARDMAN, New York, N. Y., assignor to Hardman, Dowling & Peck, same place. Filed Feb. 17, 1882. (No model.)

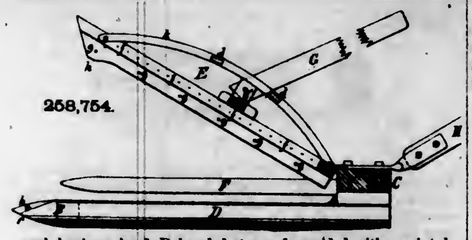


Claim.—In a piano-forte action, the butt-block *a*, with its projecting shoulder *f*, in combination with the cut-away shouldered end of the jack *d*, as shown at *e i*, all constructed and operating substantially in the manner and for the purposes set forth.

258,752. REFRIGERATOR. GUS J. HARRER, Louisville, Ky. Filed Apr. 15, 1882. (No model.)

Claim.—The refrigerating-box A, having the sectional cover K, K', and K², arranged as described, and provided with the central chamber or compartment, C, having faucet D, waste-pipe G, and brackets *e e*, detachable ice-box E, having drain-spout F, and detachable chipping-board H, and detachable side racks, I, all constructed and combined substantially as and for the purpose herein shown and described.

258,753. AUTOMATIC FAN. THOMAS HEATON, Cornwall, N. Y. Filed Feb. 8, 1882. (No model.)

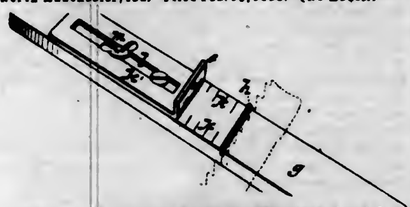


Claim.—In an automatic fan, the combination of the driving mechanism, adjustable blades so constructed that they may be raised and lowered, and the adjustable flexible connecting-cord *d* and return-spring *f*, to operate the fan back and forth, constructed and arranged substantially in the manner herein set forth.

258,754. CRANBERRY REAPER AND DETACHER. CHARLES W. HEISLEY, Tuckahoe, N. J. Filed Feb. 28, 1882. (No model.)

Claim.—1. In a cranberry-gathering machine, the troughs D,

258,754.



each having a head, B, beveled at *c*, and provided with a point, *b*, and ledges or shoulders *a*, as described and shown, and for the purposes set forth.

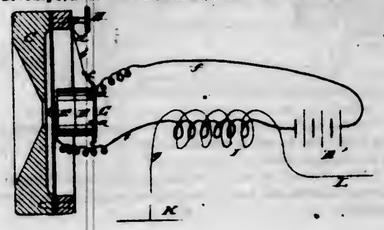
2. In a cranberry-gathering machine, the combination of troughs D, reapers A, and auxiliary reapers *g*, substantially as described and shown.

3. In a cranberry-gathering machine, the hinged lid E, provided with reapers *g*, cross-bars *f*, and a handle, G, combined substantially as specified.

4. In a cranberry-gathering machine, the troughs D, separated from each other by spaces K, in combination with the sides or fenders F, substantially as and for the purposes set forth.

258,755. SAW-JOINTING MACHINE. REMUS HOLSHUMAN, North Manchester, Ind. Filed Feb. 13, 1882. (No model.)

Claim.—1. In a saw-file having the filing-blade *b* and bearing *a*, the handle *d* and heel set-screw *s*, substantially as specified.



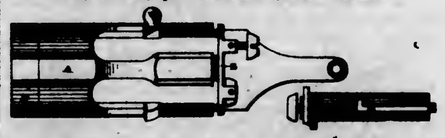
2. The combination, with a side file for saws, having its filing-blade *b* set at a slight angle to its bearing *a*, of the check-gage *g*, its tooth-bar *h*, and gage-slide *k'*, substantially as specified.

258,756. VEHICLE-CUSHION. KING W. HOLMES, Columbus, Ohio. Filed Mar. 9, 1881. (Model.)

Claim.—As a new article of manufacture, the described carriage-cushion, consisting of a skeleton frame, to which pieces of canvas are tacked and filled in with hair or moss without stitching at any point, and provided with an independent rear and end edge piece constructed of suitable facing material, similarly filled and tacked to the cushion-frame, with intermediate and outside welts, and having a front upper edge, composed of folds of leather tacked firmly to the wooden frame, and a bottom welt and a fall, as shown and described.

258,757. TELEPHONE-TRANSMITTER. STEPHEN M. HOPKINS, Brooklyn, N. Y. Filed Mar. 30, 1882. (No model.)

Claim.—The combination, with a piano-faced hard-carbon button carried by the diaphragm, of a vibratory electrode suspended by two or more threads, serving the double purpose of suspending and pressing the button F into contact with the button E, substantially as described.

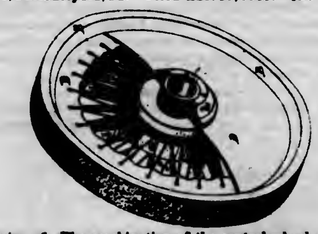


258,758. LAMP-BURNER. WILLIAM L. HORNE, Meriden, Conn. Filed June 21, 1881. (No model.)

Claim.—1. In combination with the wick-tube of a lamp-burner, an adjustable hood having in its upper end a chamber, which extends over a portion only of the wick in the direction of its greatest diameter for collecting the gas and directing it to any portion of the wick which is left burning, substantially in the manner and for the purpose set forth.

2. The combination, in a lamp-burner, of an adjustable hood having in its upper end a chamber which extends over a portion only of the wick in the direction of its greatest diameter for collecting the gas and directing it to any portion of the wick which is left burning, a wick-tube, and a gas-tube for conducting any gas that may be generated in the lamp to the chamber in the hood, substantially as and for the purpose set forth.

258,759. BREECH-LOADING FIRE-ARM. FERDINAND HUNNIUS, Sr., Paducah, Ky. Filed Feb. 28, 1881. (Model.)



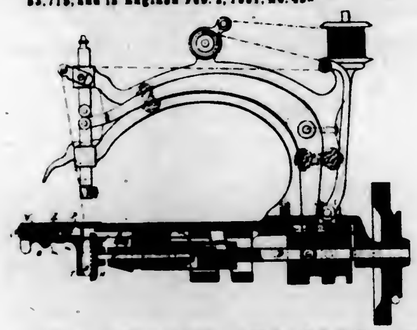
Claim.—1. In a breech-loading gun, the combination of the frame, two endwise-moving bolts, stops for regulating the movements of the bolts, and a plate, I, for connecting the rear ends of the bolts loosely together, substantially as shown.

2. The combination of the frame A, two endwise-moving bolts, D, having the slots *s* in their outer sides, and provided with teeth or cogs for causing them to turn in opposite directions, the plate I, for connecting the two bolts together, and the screws I, provided with friction-rolls, substantially as described.

3. The combination of the two bolts D, connected together at their rear ends by a plate, I, and a shield, N, the shield being attached to the plate and made to move with the bolts, substantially as set forth.

4. In a breech-loading fire-arm, the combination of the frame, A, open upon its top, endwise-moving bolts provided with levers or projections, a connecting-plate, I, the shield N, connected to the plate, and provided with the spring-wings O, substantially as specified.

258,760. GRINDING OR POLISHING WHEEL. CHARLES V. HUNT, Philadelphia, Pa. Filed Mar. 27, 1882. (No model.)



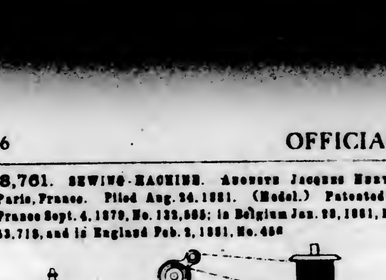
Claim.—1. The combination of the central wheel, the covering-strip B, and lacings *f*, whereby said covering-strip is drawn over the rim of the said wheel, as set forth.

2. The combination of the central wheel, the covering-strip B, the lacings *f*, and the side plates, D D, as specified.

3. The combination of the central wheel, the covering B, the lacings *f*, the side plates, D, and the bushing F, with flange *g* and nut A, as specified.

258,761. SEWING-MACHINE. AUGUSTE JACQUES HENRY, Paris, France. Filed Aug. 24, 1881. (Model.) Patented in France Sept. 4, 1879, No. 132,885; in Belgium Jan. 28, 1881, No. 53,715, and in England Feb. 2, 1881, No. 466

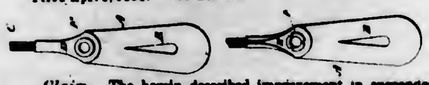
Claim.—1. The combination, with the shaft D D' and rotary hook H, of the toothed segment F, bevel-pinion G, and cam E, substantially as and for the purpose set forth.



2. The spring Y, arranged as described, the feed-claw I, the lever S, and arm M, having common pivotal points in the swinging lever L, cams J and Q, and shaft D, all said parts being combined substantially as and for the purpose set forth.

3. The combination, with a shuttle having an arm attached on one side, of the tension-spring h, entering, at its lower end, a recess, i, of said shuttle, substantially as described.

4. The combination, with the bed-plate having a slot one side of which is notched, as shown, of the plate V, having a device for holding the shuttle attached, and the pivotal catch X, and spring Z, acting thereon, as and for the purpose specified.



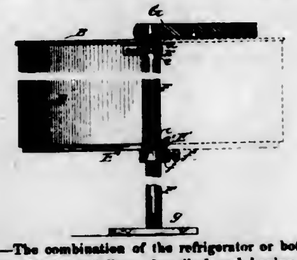
5. The combination of the elastic bar N, with segment O, worm P, and knob P', the lever S, pivoted to adapt it for adjustment in a horizontal plane, and carrying at its inner end a journaled block, d, the lever L, swinging in a vertical plane, and the tapered cam J, shaft D D', and hook H, all as set forth and described, for use in varying the length of stitch.

258,762. STEAM-TABLE. JOHN W. HYATT, Newark, N. J. Filed July 25, 1881. (No model.)

Claim.—A steam-table composed of two corresponding plates, in the inner surface of one or both of which is formed a continuous channel for the circulation of the heating or cooling agent, and having a groove containing an elastic packing, for the uses and purposes substantially as shown and described.

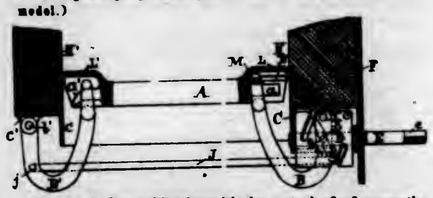
258,763. SUSPENDER-END. JAS. G. HYDE, West Haven, Conn., assignor to the West Haven Buckle Company, same place. Filed Apr. 8, 1882. (No model.)

Claim.—The herein-described improvement in suspender-ends, consisting of the tab A and a cord C, combined with the two parts D E of the clasp, one part attached to one side of the tab and the other upon the opposite side, the two parts closed upon the cord, substantially as described.



258,764. BIT-STOCK. WILLIAM A. IVES, New Haven, Conn. Filed Apr. 8, 1882. (No model.)

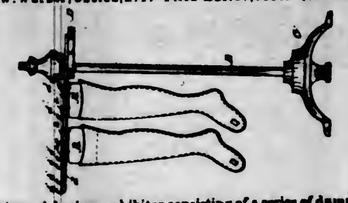
Claim.—1. In a bit-brace, the combination of the socket A constructed with a longitudinal slot, D, opening through the head, and with an annular shoulder, d, above the head, with a bridge, F, across the slot, an internally-screw-threaded sleeve, G, arranged upon the socket to bear against the shoulder a, and the collar provided at the other end to prevent longitudinal movement of the sleeve, but yet leave the sleeve free for rotation, the follower H, constructed with the recess e, threaded upon its ends and arranged in the slot of the socket, its threaded end engaging the internal thread of the sleeve, whereby the rotation of the sleeve imparts longitudinal movement to said follower, the jaws L L, pivoted in the recess in said follower and constructed to bear upon the bridge near their inside tail ends, and inclined upon their back at their ends, substantially as described



2. In a bit-brace, the combination of the socket A, constructed with a longitudinal slot, D, opening through the head, and with an annular shoulder, d, above the head, with a bridge, F, across the slot, an internally-screw-threaded sleeve, G, arranged upon the socket to bear against the shoulder a, and the collar provided at the other end to prevent longitudinal movement of the sleeve, but yet leave the sleeve free for rotation, the follower H, constructed with the recess e, threaded upon its ends and arranged in the slot of the socket, its threaded end engaging the internal thread of the sleeve, whereby the rotation of the sleeve imparts longitudinal movement to said follower, the jaws L L, pivoted in the recess in said follower and constructed to bear upon the bridge near their inside tail ends, and inclined upon their back at their outer ends, with the U-shaped spring l, arranged in the recess in the follower and so as to bear upon the outside of the jaws, substantially as and for the purpose described.

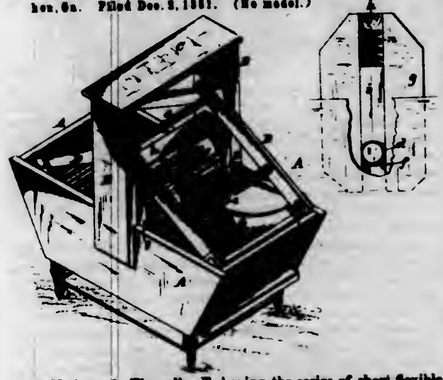
258,765. REFRIGERATING BOTTLE-SAFE. PATRICK KEARNS, Shamokin, Pa. Filed Mar. 11, 1882. (No model.)

Claim.—The combination of the refrigerator or bottle-safe A B, constructed substantially as described, and having the top and bottom brace-bars, E and E', provided respectively with eye-plates e and e', and vertical supporting-rod F, having the shoe G, and provided with the adjustable collar f, substantially as set forth.



258,766. GRATE FOR STOVES AND RANGES. THOS. KEARNS, San Francisco, Cal., assignor to the Adjustable Grate Manufacturing Company, same place. Filed Oct. 19, 1881. (No model.)

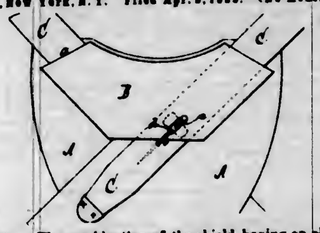
Claim.—1. In combination with the grate A of a furnace, the levers B, B', and G, rod J, cam D, and rod E, as and for the purpose herein described.



2. The levers B, B', and G, and rod J, when operated by suitable means to raise and lower the grate A, as and for the purpose described.

258,767. METHOD OF AND APPARATUS FOR EXHIBITING HOSIERY. J. H. KENNARD, Waterloo, assignor of two-thirds to J. W. Warner, Oneida, N. Y. Filed Mar. 27, 1882. (No model.)

Claim.—A hosiery-exhibitor consisting of a series of dummies, A A, provided with rings a a, the standard B C, the segmental bar D, provided with vertical holes, and the pivotal arms d d d', the said dummies being suspended from said arms, the whole combined and arranged as and for the purpose set forth.

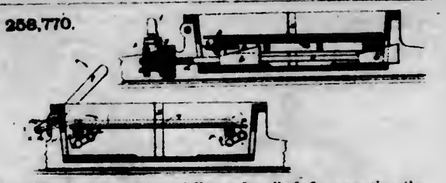


258,768. WASHING-MACHINE. JOHN W. KENNEDY, Sr., Hoboken, Ga. Filed Dec. 3, 1881. (No model.)

Claim.—1. The roller E, having the series of short flexible rubbers composed of the strips c, secured in the body of the roller by means of the wedge-blocks b, the two edges projecting beyond the periphery of said roller, as and for the purpose set forth.

2. The combination of the frame A B and the pivoted oscillating frame D, having the segmental corrugated bed c, with the roller E, mounted in spring-bearings within said oscillating frame, and having projecting flexible rubbers, as set forth.

258,769. NECKWEAR SHIELD AND FASTENER. ALBERT KOHP, New York, N. Y. Filed Apr. 8, 1882. (No model.)



Claim.—The combination of the shield having an elongated slot, d, the pin having a loop, c, arranged in and projecting through said slot, and the key or wedge e, inserted into the projecting part of the loop against the shield, substantially as described.

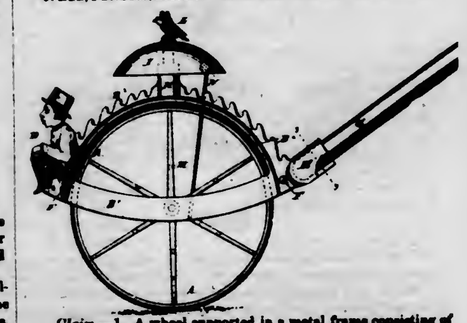
258,770. LITHOGRAPHIC PRINTING-PRESS. JOS. KRATZER, Johannisberg-on-the-Rhine, Germany. Filed Mar. 2, 1882. (No model.) Patented in Germany Aug. 16, 1879, No. 6,666.

Claim.—1. In a lithographic press, the supporting-plate for the stone, resting upon a series of wedges, as set forth, in combination with mechanism, substantially as described, for moving the same either singly, in pairs, or all at once, whereby the stone may be adjusted to a horizontal position and then raised or lowered vertically, as may be desired.

2. In combination with the stone-holder, the wedges b b', connected together at either side of the same, the supplemental wedges

258,770.

b, and mechanism, substantially as described, for operating the wedges in pairs or singly, substantially as set forth.



3. In combination with the holder and plate a, the wedges b b' b, ratchet-wheels c, screw-rods d, and connected levers f, having pawls e, as set forth.

4. In combination with the holder, the supporting-plate k for the stone, and mechanism, substantially as described, for raising the same flush with the upper edge of the holder, and for lowering it, as set forth.

5. In combination with the holder, the supporting-plate k, shaft m, lever l, rods o q, and bell-crank levers p, substantially as described.

6. In combination with the stone-holder of a lithographic press, the plate a, having independently-movable wedges at the corners thereof for adjusting the plate horizontally, the supplemental supporting-plate k, and mechanism, substantially as described, for lifting the latter flush with the edge of the holder and for lowering it upon the plate a, as set forth.

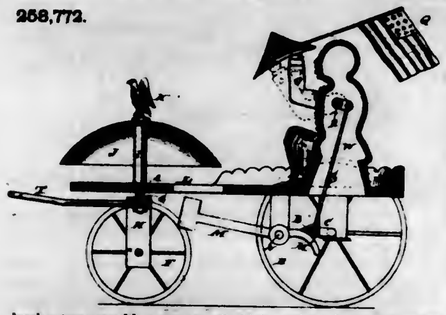
258,771. TOY MUSICAL WHEEL. LOUIS KYZER and ALFRED C. REX, Philadelphia, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—1. A wheel supported in a metal frame consisting of a horizontal bar and a curved bar at top, inclosing the upper part of said wheel, and provided with striking-pins and adapted to be propelled along the ground, in combination with a bell held rigidly upon said frame, and a spring-hammer rigidly secured at its bottom to said frame and adapted to be vibrated by said striking-pins to cause the bell to ring, substantially as and for the purpose specified.

2. A wheel, A, provided with pins M, in combination with a frame, B, carrying at the top a bell and on one end a core, E, handle G, and spring-hammer N, all substantially as and for the purpose specified.

3. A wheel, A, in combination with a frame, B, composed of two pieces, riveted together at F, each of said pieces being formed with a hollow part to form core E, a side bar, B', to carry the wheel A, and curved parts which, when the frame is riveted together, form an arch or curved part, B', over the upper half of the wheel, substantially as and for the purpose specified.

4. The combination of wheel A, having striking-pins M, frame B, having core E, figure D, hollow hub H, support J, with its nut L, bell I, spring-hammer N, and handle or rod G, substantially as and for the purpose specified.



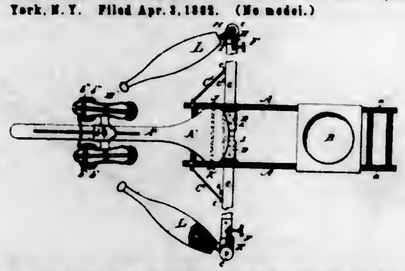
5. The wheel A, in combination with a frame, B, provided with hollow hub H, figure D, and hollow core E, substantially as and for the purpose specified.

6. The wheel A, in combination with a frame, B, having side bars, B', and top curved bar, B', and figure D, substantially as and for the purpose specified.

258,772. TOY CHARIOT. LOUIS KYZER and ALFRED C. REX, Philadelphia, Pa. Filed Dec. 31, 1881. (No model.)

Claim.—1. A toy provided with wheels and adapted to be propelled on the ground, having a bell rigidly secured to the frame mechanism independent of the figure to ring said bell, and a figure

258,772.



having two movable arms, one of which carries a flag and the other a hat, substantially as and for the purpose specified.

2. The combination of a carriage upon wheels with bell J, pivoted hammer M, crank D, figure W, having pivoted arms O O', one of which carries a hat and the other a flag, Q, crank R, and rod S, substantially as and for the purpose specified.

3. In a toy chariot, the frame A upon wheels B F, crank-axle C, figure W, having arms O O', one of which puts a hat on and off the head of the figure and the other waves a flag, Q, crank R, and rod S, substantially as and for the purpose specified.

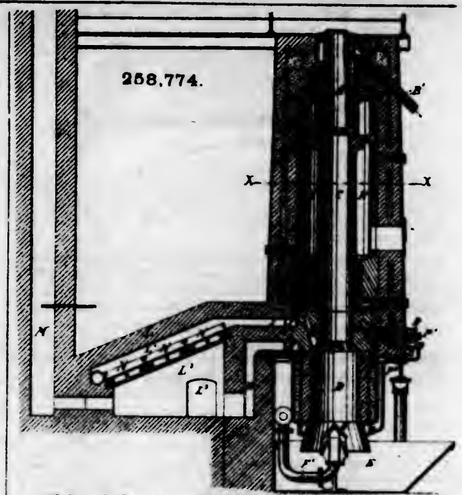
258,773. EXERCISING APPARATUS. JOHN H. LAFLIN, New York, N. Y. Filed Apr. 3, 1882. (No model.)

Claim.—1. In an exercising apparatus, the body A, having one or more outriggers, C, in combination with coiled springs F at the ends of said outriggers, capable of receiving Indian clubs or other similar devices to be used in guise of oars, substantially as herein specified.

2. In an exercising apparatus, the body A and one or more outriggers, C, in combination with coiled springs F and adjusting means E', to regulate the force of said springs, substantially as and for the purpose specified.

3. In an exercising apparatus, the body A and one or more outriggers, C, adapted to receive oars or their equivalents, in combination with the slotted center piece, A', and foot-rest B', adjustably connected to the latter by means of a thumb-screw or its equivalent, substantially as herein specified.

4. In a rowing-machine, the counter H and its operating means, in combination with an oar or its equivalent, the whole arranged so as to co-operate substantially as herein specified.



5. In a rowing apparatus, the body A, carrying sockets D, in combination with suitable outriggers capable of sliding in said sockets, and with means for adjustably fixing the same in the latter, substantially as herein specified.

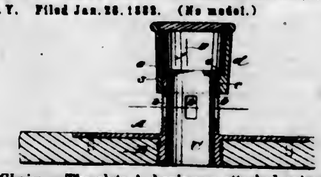
6. In an exercising apparatus substantially as herein set forth, the rubber pieces *a*, fixed to the bottom parts of the apparatus, so as to be interposed between the latter and the floor, substantially as and for the purpose herein specified.

7. In a rowing apparatus, the body A, having grooves *a'*, in combination with the sliding seat B, having at its bottom a series of running wheels, *b*, formed of rawhide and adapted to run in the grooves of the body A, substantially as and for the purposes herein set forth.

258,774. APPARATUS FOR THE MANUFACTURE OF COMBUSTIBLE GAS. EUGEN LAVERS, Cologne, Germany. Filed May 26, 1881. (No model.) Patented in England May 2, 1881, No. 1,894; in France May 9, 1881, No. 142,751; in Belgium May 19, 1881, No. 54,617; in Italy May 31, 1881; in Austria July 3, 1881, and in Spain Oct. 6, 1881.

258,774.

Claim.—1. In apparatus for the manufacture of gas, a vertical retort having side openings at its lower part, communicating with passages leading into a surrounding chamber for leading off carbonic oxide and nitrogen into the latter, in combination with means for supplying steam or water to the interior of the retort at a point above the said side openings, substantially as and for the purpose set forth.

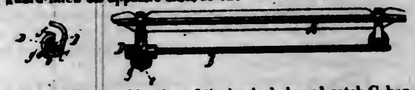


2. A gas-producer consisting of a vertical retort having side openings in its lower part, communicating with passages leading into the upper part of a combustion-chamber surrounding the retort, into the upper part of which chamber also open passages for conducting heated air from a regenerator, and having a third set of passages leading from the bottom of the said chamber to the regenerator for conducting the hot products of combustion from the former into the latter, in combination with the regenerator, substantially as herein described.

3. A regenerator for imparting the heat from the products of combustion to the incoming air, consisting of a chamber divided by a metallic partition, N, into a narrow compartment, L', through which the air passes, and a comparatively large compartment, L', through which the products of combustion pass, the said metallic partition consisting of plates having ribs or projections on both sides, offering very extended surfaces both for taking up heat from the products of combustion and for imparting such heat to the air, substantially as described.

4. The combination of the feeding-chamber A with annular chamber B, for leading off the products of distillation, shaft or retort C, the annular chamber H, chamber D, flues G, J, and K, regenerator L, and pipe or pipes Q, for the introduction of steam or water, all arranged and operating as herein set forth.

5. Apparatus for introducing a regulated supply of steam or water into a gas-producer, the said apparatus consisting of a tank, P, with overflow-cocks P' at different levels, in combination with one or more pipes, Q, leading from the bottom of the tank upward through the producers to a height at or above the highest water-level of the tank, substantially as described.

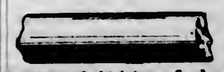


258,775. BOAT-PLUG. GEORGE A. LEAVITT, Jr., Newburg, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—The plate A, having an attached externally-screw-threaded tube, C, arranged to project from opposite faces of it, and provided with one or more lateral openings in one of its projecting screw-threaded portions, and with a flaring end, *a*, on such portion, in combination with the cap D, having a closed top and internally-screw-threaded inner end, *c*, and enlarged interior chamber or body portion, *f*, essentially as shown and described.

258,776. CATCH FOR JEWELRY. PHILIP A. LEIBBACH, New York, N. Y. Filed Apr. 13, 1882. (Model.)

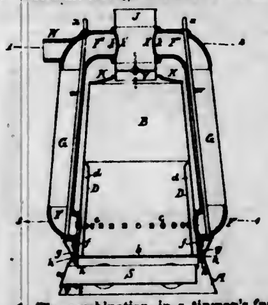
Brief.—The ends of the finger-piece are fastened to the rotating guard-latch on opposite sides of the hooked catch.



Claim.—The combination of the hooked-shaped catch C, having stops *e* and *f* projecting from its surface, the rotating guard-latch D, arranged in the hooked catch, and a yoke-shaped finger-piece, *g*, secured to the guard-latch on opposite sides of the hooked catch, substantially as described.

258,777. SHAVING-MUG. PETER H. LUCHARS, New York, N. Y. Filed Mar. 4, 1882. (No model.)

Claim.—The combination, with the cylindrical or tapering shaving-mug A, of the soap-compartment E, formed of the horizontal partition D and the vertical transverse partition B, and provided with the spout F, projecting from the outer side of the said vertical partition, the said compartment being within and only about one-half the depth of the mug, substantially as herein shown and described, whereby the superfluous water in the said compartment can be poured into the mug, as set forth.



258,778. MODE OF MANUFACTURING NAPHTHALINE INTO A FORM FOR CARBURETING. JAMES LIVESEY, Westminster, and JAMES KIDD, St. Bride's Street, Ludgate Circus, London, County of Middlesex, England. Filed July 26, 1881. (No model.)

Claim.—The process of obtaining refined naphthaline, consisting in first heating the crude naphthaline in a closed boiler, then passing a current of air over its surface for collecting the naphthaline, then conducting the air impregnated with the naphthaline into a condensing-chamber, where the naphthaline is freed from the air, then reheating the collected naphthaline, and finally molding the same in refrigerated molds, substantially as described.

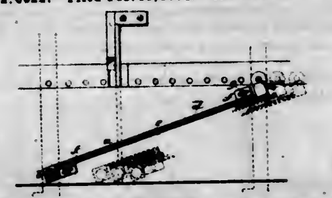
258,779. FINMAN'S FURNACE. JAMES F. LOCKWOOD, Philadelphia, Pa. Filed Feb. 28, 1882. (No model.)

Brief.—By a partial revolution of the cover K, which bears the fine J, the holes in the latter are moved so as not to coincide with flues F'. The draft through said flues is therefore closed.

Claim.—1. The combination, in a tinman's furnace, of the fire-pot casing B, having a grate and an opening for the soldering-irons, with a cap, K, adapted to close the top of the casing, and having a chimney, J, and side flues forming a communication between said chimney and the lower end of the fire-pot, as set forth.

2. The combination, in a tinman's furnace, of the fire-pot casing B, having a grate and an opening for the soldering-irons, side-flue casings pivoted at their lower ends, and a cap, K, adapted to close the top of the casing B, and having a chimney, J, said chimney and cap being carried by the side-flue casings, so as to swing with the same, as set forth.

3. The combination of the fire-pot casing, the elbows F, pipe-sections G, elbows F', with ring H, having openings *h*, the top K, and the chimney J, free to turn in the ring H, and having openings *h'*, as set forth.



4. The combination of the fire-pot casing with the door-frame M, the door N, having openings *n n*, and the pivoted cover-plate P, as set forth.

5. The combination of the flanged base A, having an ash-drawer opening, with lower flange, *v*, and the ash-drawer S, having a lug or pin, *t*, as set forth.

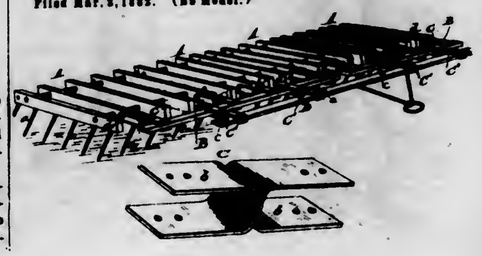
6. The combination of the base A, having a grate-opening, the fire-pot casing B, and the grate *b*, the plate forming which has flanged edges, forming a pan or tray around the base of the fire-pot, as set forth.

7. The combination of the upper elbow, F', with the tubular projection W, forming a mandrel for expanding or contracting the ends of sheet-metal tubes, as set forth.

258,780. COUPLER FOR ORGANS. JOHN B. LOMAS, West Haven, Conn. Filed Feb. 18, 1882. (No model.)

Claim.—1. The herein described coupler for organs, pianos and like instruments, consisting of the two levers *a d*, crossing each other, pivoted together midway of their length, and arranged to swing in a vertical plane, one end of one lever engaged with the spindle or valve or key to be coupled, the opposite end of the other lever beneath the active key, the opposite ends of the two levers taking a bearing below, and so that the depression of the active key will, through the said two levers, depress the coupled valve, spindle, or key, combined with means, substantially such as described, to throw the said lever out of or into engagement, substantially as described.

2. The herein-described coupler for organs, pianos, and like instruments, consisting of the two levers *a d*, crossing each other, pivoted together midway of their length, and arranged to swing in a vertical plane, one end of one lever engaged with the spindle or valve or key to be coupled, the opposite end of the other lever taking a bearing below, and so that the depression of the active key will, through the said two levers, depress the coupled valve, spindle, or key, the said levers arranged upon and combined with the hinged board C, and mechanism for turning the said board upon its hinge to engage or disengage the said levers with the active key, substantially as described.



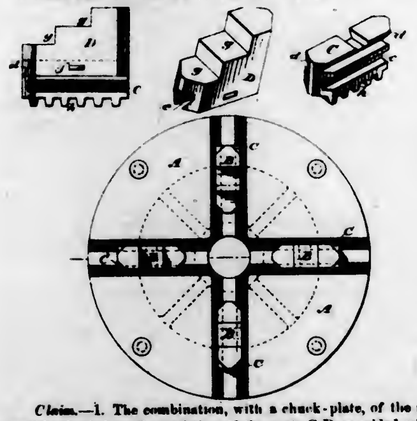
258,781. CIGAR. THOMAS S. LUBY, Baltimore, Md. Filed Mar. 10, 1882. (No model.)

Claim.—1. A cigar having a wrapper rolled from the middle to each end, as set forth.

2. A cigar tipped at both ends and having a wrapper rolled from the middle to the ends, as set forth.

258,782. HARROW. EDWARD P. LYNCH, Davenport, Iowa. Filed Mar. 3, 1882. (No model.)

Claim.—1. The coupling for connecting a harrow-frame with a draft-bar, the same consisting of two U-shaped jaws adapted to embrace the harrow-frame and the draft-bar, respectively, and united at their closed ends by a swiveling connection.

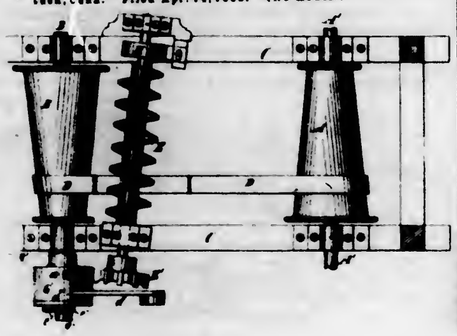


2. The coupling for connecting a harrow with a draft-bar, consisting solely of two U-shaped heads or jaws extended in opposite directions and united by a swivel-connection, substantially as shown, each jaw having its arms provided with a hole to receive a pivot-pin.

3. The combination of the independent harrow-frames A, the secondary draft-bars B, two connections, substantially as shown, between each harrow-frame and the corresponding draft-bar, and the main draft-bar D, connected with the secondary bars, as shown.

4. As an improvement in convertible sectional harrows, the frame A, secondary bars B, coupling C C', and the main draft-bar D, adapted, as described, for connection with the harrow-frames A or with the secondary bar B at will, whereby the one draft-bar is adapted for use with any required number of sections, substantially as and for the purpose set forth.

5. In a convertible harrow, the combination of the main draft-bar D, two or more secondary draft-bars, B, harrow frames or sections A, and connecting devices C, said parts constructed, substantially as described and shown, to permit the frame-sections to be connected to the main draft-bar or to the secondary draft-bars at will, substantially as and for the purpose described.



258,783. REVERSIBLE CHUCK-JAW. CÁRLOS MADUELL, New Orleans, La. Filed Feb. 18, 1882. (No model.)

Claim.—1. The combination, with a chuck-plate, of the reversible chuck-jaw, B, consisting of the parts C D, provided with radial grooves *c*, and tongues *d* of dovetail shape, and secured together by means of keys *f*, all constructed and arranged substantially as shown and specified.

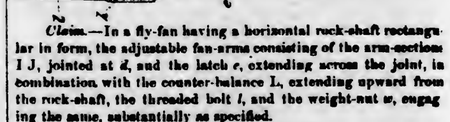
2. The combination, with a chuck-plate, of the reversible chuck-jaws B, consisting of the parts C D, having dovetailed shape grooves *c*, and tongues *d*, arranged radially on the parts C D, secured together by keys *f*, and means for adjustment, all arranged substantially as and for the purpose set forth.

258,784. SPEED-REGULATOR. FRANCIS T. MALLON, Pawcatuck, Conn. Filed Apr. 14, 1882. (No model.)

Claim.—1. The combination, with reversely-coned pulleys or drums and a driving-belt thereon, of a worm or screw arranged transversely to the belt, and receiving the latter between the convolutions of its thread, a rotary governor or regulator deriving motion from the driven pulley or drum, and adapted to turn said worm or screw in one direction, and means applied to said worm or screw for turning it in the opposite direction, substantially as and for the purpose herein described.

2. The combination, with reversely-coned pulleys or drums and the driving-belt thereon, of the worm or screw provided with a wheel, the rotary governor or regulator provided with dogs, which are adapted to engage with the wheel upon said worm or screw for turning the latter in one direction, and means applied to said worm or screw for turning it in the opposite direction, all arranged and operating substantially as herein described.

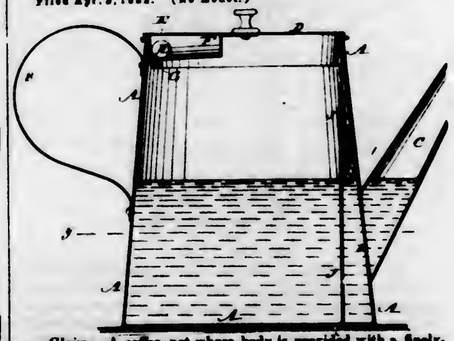
3. The combination, with reversely-coned pulleys or drums and a driving-belt thereon, of the worm or screw, a rotary governor or regulator adapted to turn said worm or screw in one direction, and a spring or weight applied to said worm or screw for turning it in the reverse direction, all arranged and operating substantially as herein described.



4. The combination, in a rotary speed governor or regulator, of a case and a shaft extending through the same, a radial arm mounted loosely on said shaft and forming a drag, a spring supporting said arm on one side, and dogs connected with said arm and adapted to be thrown out by the backward movement of said arm against the force of said spring, substantially as herein described.

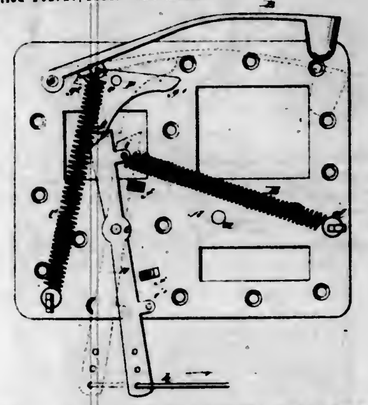
5. The combination, with the case G and shaft B', of the drag-arm *d* and its attached dogs *a*, the bent spring *f*, and the arm *e'*, forming an abutment for said spring, substantially as herein described.

6. The combination, with the case G and shaft B', of the drag-arm *d* and its attached dogs *a*, the loose sleeve *e*, carrying the ratchet-wheel *e'*, and the abutment-arm *e*, the pawl *e*, and the spring *f*, arranged between the arm *d* and abutment-arm *e*, all substantially as herein described.



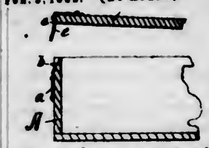
258,785. FLY-FAN. THOMAS A. MARTIN, Evansville, Ind. Filed Mar. 16, 1882. (No model.)

Brief.—The rock-shaft, rectangular in form, is provided with adjustable arms having square bearings, whereby they engage the shaft. The fan can be raised by turning the lower section upward. An arm extending upward from the rock-shaft carries an adjustable counterbalance-weight.



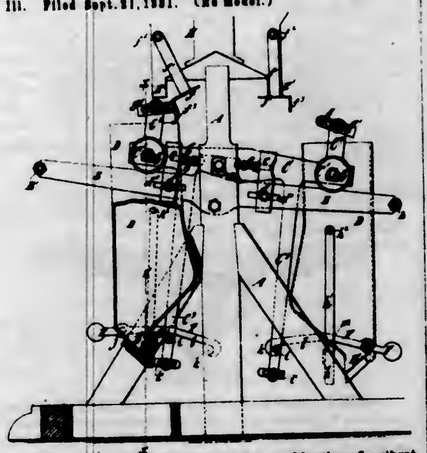
Claim.—In a fly-fan having a horizontal rock-shaft rectangular in form, the adjustable fan-arms consisting of the arm-sections I J, jointed at *d*, and the latch *e*, extending across the joint, in combination with the counter-balance L, extending upward from the rock-shaft, the threaded bolt *l*, and the weight-nut *w*, engaging the same, substantially as specified.

258,786. COFFEE-POT. JOHN MCANERNEY, Philadelphia, Pa. Filed Apr. 5, 1882. (No model.)



Claim.—A coffee-pot whose body is provided with a finely-perforated upright plate, J, and the aperture I, leading to the spout, the plate J being solid at its lower part, whereby the coffee-grounds are kept back and prevented from flowing out with the liquid, as described.

258,787. DOOR-BELL. ROBERT MCSHANE, Brooklyn, N. Y. Filed Feb. 27, 1882. (No model.)



Claim.—In a door bell, the combination, with the hammer B and the spring C, of the lever D, provided with the lugs *i i'*, the spring E, and the dog F, provided with the projections *g g' g²*, substantially as and for the purpose set forth.

258,788. CIGAR-BOX CATCH. JULIUS E. HERRCOTT, Newark, N. J. Filed Feb. 3, 1882. (No model.)

Claim.—A box-fastener composed of the plate *a*, adapted to be secured to the outside of the recessed wall of a box, and provided with the upwardly-projecting flexible tongue terminating with the outwardly-projecting lip *b*, and adapted to be bent backward into said recessed wall, and the plate *c*, adapted to be secured to the outside of the lid of a box, and provided with the downwardly-projecting flexible and slotted tongue *c*, arranged and operating, when closing the box, to engage with the lip *b*, as herein described, for the purpose set forth.

258,789. AUTOMATIC SCALE. BERNHARD C. MEYER, Bethalto, Ill. Filed Sept. 21, 1881. (No model.)

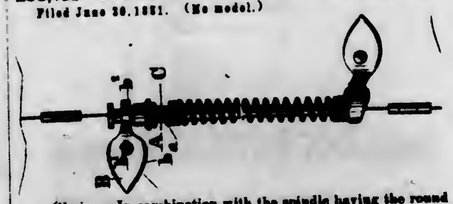
Claim.—1. In an automatic scale, the combination of a vibrating beam, a carriage movable thereon, a stationary hopper or hoppers, and two weighing or movable hoppers pivoted to said carriage, one upon each side of the center of vibrations of said beam and adapted to be brought alternately under the stationary hopper or hoppers by the movements of said carriage to receive their load, substantially as specified.

2. In an automatic scale, the combination of a vibrating beam, a single carriage movable thereon, adjustable stops for limiting the movements of said carriage in either direction, a stationary hopper or hoppers, and two weighing or movable hoppers pivoted in said carriage, one upon each side of the center of vibration, and adapted to be brought alternately under the stationary hopper or hoppers by the movement of said carriage to receive their load, substantially as specified.

3. The combination, with the vibrating beam and the wheeled carriage, with its pivoted weighing-hoppers, of the stationary hopper provided with outlets and the swinging valves or gates pivoted above said outlets, and adapted to be swung bodily to open said outlets by the impact of said carriage or devices projecting therefrom, substantially as specified.

4. The combination of the vibrating beam B B', the wheeled carriage C, provided with rigid downwardly-projecting arms C', connected by cross-rods *i*, the pivoted weighing-hoppers D, the swinging valves or gates A, and the pivoted trip-levers F, all substantially as specified.

258,790. DUMPING-WAGON. JAMES HILLS, Wilmington, Del. Filed Mar. 20, 1882. (No model.)



Claim.—1. The combination, in a dumping-wagon, of the sills A, the wagon-body B, the actuating bar or bars F, pivoted to the body, hauling mechanism for said bar or bars, and inclined-plane devices, substantially as described, for elevating the body as it is moved rearward, as set forth.

2. The combination of the sills A, the wagon-body B, inclined-plane devices, substantially as described, the pivoted bar or bars F, and hauling mechanism having a retracting-chain, *w*, as set forth.

3. The combination of the wagon-body B, the sills A, having a support on which said body can tilt, hauling mechanism for imparting a rearward movement to the wagon-body, and a retaining device adapted to be brought into action as the body is moved rearward and before said body reaches the tilting position, as set forth.

4. The combination of the wagon-body B, the sills A, having a support on which said body can tilt, hauling mechanism for imparting a rearward movement to the wagon-body, a retaining device adapted to prevent premature tilting of said body, and a rod whereby the retaining device can be operated from the rear end of the body, as set forth.

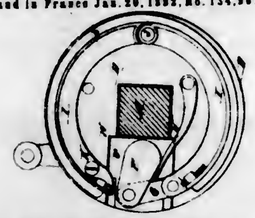
258,791. DOOR-SPRING. MARVIN C. HOUK, Manchester, Iowa. Filed June 30, 1881. (No model.)

Claim.—In combination with the spindle having the round and angular portions, as described, the bearing-bracket B, with angular portion, as described, and the cap *a'*, securing the bracket to the spindle, as set forth, whereby by rotating the bracket or its screw the tension of the spring may be regulated as desired, substantially as described.

258,792. SAFETY-PIN CATCH. SAMUEL MOSES, Providence, R. I., assignor to the Oakville Company, Waterbury, Conn. Filed Apr. 8, 1882. (No model.)

Brief.—A U-shaped spring is arranged within a U-shaped catch, one leg resting upon the base, the other leg closing the recess on the opposite side, its ends projecting to one or both sides, so that the end of the pin pressed down upon the spring will open the passage into the catch for the entrance of the pin and close as soon as the pin has entered.

Claim.—1. The U-shaped catch A B C, the one leg, B, re-

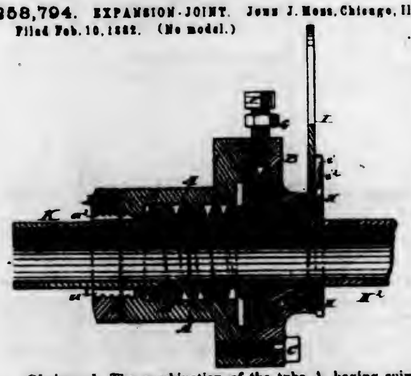


258,792.

ceased upon its under side to receive the pin, combined with a correspondingly U-shaped spring, D E, one leg resting upon the base, the other closing the recess, and provided with a projection, *b*, at its outer end upon one or both sides, substantially as described.

2. The U-shaped catch A B C, the one leg, B, recessed upon its under side to receive the pin, combined with a correspondingly U-shaped spring, D E, one leg resting upon the base, the other closing the recess, and provided with a projection, *b*, at its outer end upon one or both sides, the inner edges of the part C turned inward over the bend F of the spring to secure the pin to the catch, substantially as described.

258,793. CARRIAGE-BRAKE. WALTER RUSSELL MORTIMER, Rogate Lodge, Rogate, County of Sussex, England. Filed Mar. 24, 1882. (No model.) Patented in England July 26, 1881, No. 3,279, and in France Jan. 20, 1882, No. 134,967.

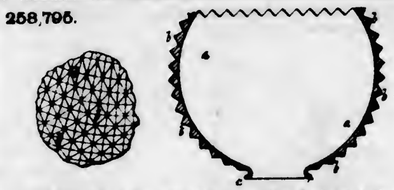


Claim.—1. The combination, with a ring secured to the nave of a wheel or to a drum and a ring secured to an axle or other fixed support, of a divided expanding ring or segments of a ring secured to the said disk, and a lever connected to the expanding ring or segments for expanding the same, substantially as and for the purpose set forth.

2. The combination, with the ring B, and the disk D, of the ring H I, secured to the said disk, the lever E, provided with the arm F, and the connecting-link G, substantially as and for the purpose set forth.

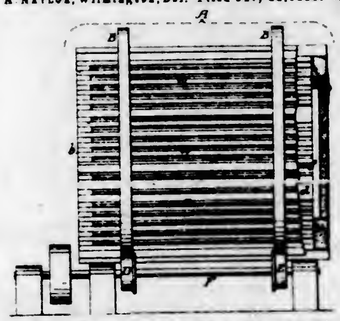
3. The combination of disk D, ring H I, lever E F, bearing U, and the ring B of a wheel or drum, substantially as specified.

4. The combination of disk D, ring H I, lever E F, spring N, and the ring B of a wheel or drum, substantially as specified.



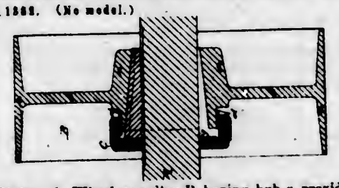
258,794. EXPANSION-JOINT. JOHN J. MOSS, Chicago, Ill. Filed Feb. 10, 1882. (No model.)

Claim.—1. The combination of the tube A, having spiral middle recess *a*, collar *a*', and longitudinal compression-slots *a*', with the case B, the nut E, and the screw F, as and for the purpose specified.



2. The combination, with a tube, A, constructed as above described and provided with a collar, *a*, having recesses *a*', of the case B D, provided with set-screws F, arranged with reference to said recesses, substantially as and for the purpose herein described.

258,795. GLASS GLOBE FOR ELECTRIC AND OTHER LIGHTS. JOHN D. HULLER, New York, N. Y. Filed Oct. 29, 1881. (No model.)



Claim.—As a new manufacture, a glass shade or globe having the inner surface smooth and the outer surface formed entirely of abutting pyramidal projections, substantially as and for the purpose described.

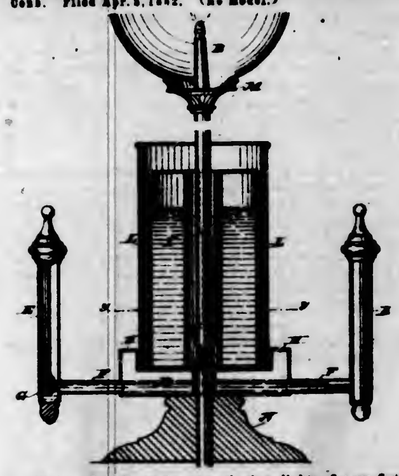
258,796. TUMBLING-REEL FOR CLEANING CARPETS. THOS. A. NAYLOR, Wilmington, Del. Filed July 25, 1881. (No model.)

Claim.—The combination of the polygonal reel having slotted sides, annular rails B, and a covered opening in one or both ends, with flanged wheels D E, adapted to support said reel in a horizontal position and to drive the same by contact with the annular rails B, as set forth.

258,797. DEVICE FOR CLAMPING WHEELS OR PULLEYS UPON SHAFTS. AUGUSTUS NEWELL, Chicago, Ill. Filed Apr. 24, 1882. (No model.)

Claim.—1. Wheel or pulley B, having hub *a*, provided with radial longitudinally-tapering grooves, and with screw-threaded flange *d*, in combination with taper keys *e* and clamp C, all constructed and arranged substantially as and for the purpose set forth.

2. Wheel or pulley B, having hub *a*, provided with radial longitudinally-tapering grooves for taper keys *e*, and with screw-threaded flange *d* for clamp-nut C, and with washer *f*, all substantially as and for the purpose set forth.

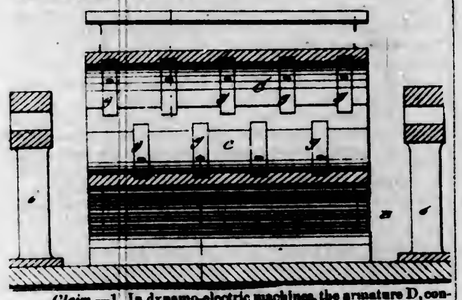


258,798. CLAMP FOR CARRIAGE-TOPS. BAXTER B. MOYER, Greenfield, Mass., assignor to Sanford A. Smith, Guilford, Vt. Filed Feb. 9, 1882. (No model.)

Claim.—1. The combination of the base-plate C, the collar G, the thimble H, and the nut I, these parts being combined and operating in combination substantially as and for the purposes described.

2. The combination, with the supporting-bar, of the base-plate, the collar, the thimble, and the clamping-nut, substantially as and for the purposes described.

258,799. CIGAR-LIGHTER. EDWARD A. PARKER, Meriden, Conn. Filed Apr. 5, 1882. (No model.)



Claim.—1. A fountain-reservoir cigar-lighter for gas-fixtures, consisting of a body, D, provided with one or more torch-receivers, E, and reservoir-support H, in combination with a laterally-removable reservoir, I, having feed mechanism K, substantially as and for the purpose set forth.

2. The body D, provided with supporting-rim H and one or more torch-receivers, E, in combination with the laterally-removable reservoir I and surrounding shell L, substantially as and for the purpose set forth.

258,800. DYNAMO-ELECTRIC MACHINE. WILLIAM S. PADEN, New York, N. Y. Filed Mar. 4, 1882. (No model.)

Brief.—The pole-pieces of the field-magnets are of cast-iron and have grooves in their faces next the armature. The grooves are filled with soft-iron bars. The carriers for the armature-coils are formed of thin iron turned up at the edges and having slots cut through the turned-up edges.

Claim.—1. In dynamo-electric machines, the armature D, consisting of heads *c* and bars *d*, formed with separated flanges *e*, and wound with wire, substantially as shown and described.

2. In armatures for dynamo-machines, the soft-iron bars *d*, formed with flanges *e*, separated by the interspaces *f*, substantially as and for the purposes set forth.

3. The pole-blocks C C', having transverse grooves in their concave faces, and soft-iron bars *g*, fitted in said grooves, as shown and described.

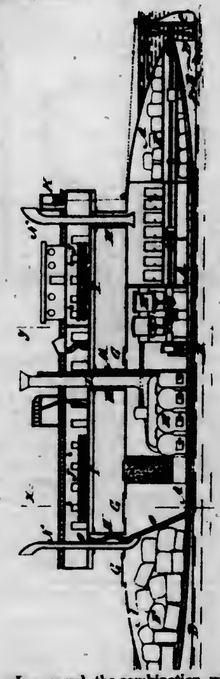
258,801. CLOCK-DIAL. JOSEPH R. PATSON, Jr., Chicago, Ill. Filed Jan. 30, 1882. (No model.)

Claim.—1. A supplemental clock-dial phosphorescently illuminated and adapted to be attached to an ordinary clock-dial, substantially as described.

2. The combination, with a clock-dial, of a phosphorescently-illuminated supplemental dial having a common center with the clock-dial, substantially as described.

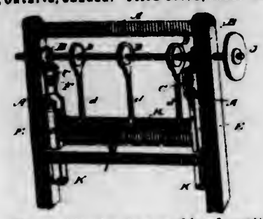
3. The combination, with a clock-dial, of a phosphorescently-illuminated supplemental dial having a common center with the

258,801.



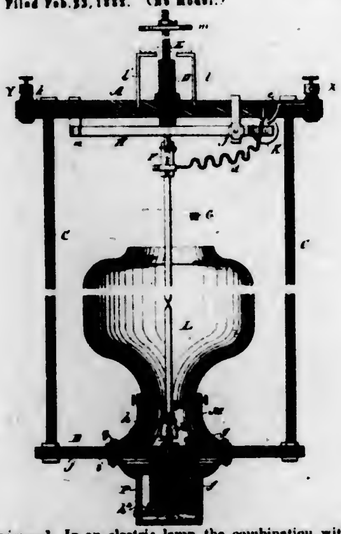
clock-dial, and arranged within a circle having a common center with the clock-dial, but not extending beyond the key-holes, substantially as described.

258,802. CAP FOR MINERS' LAMPS. HENRY P. PEARCE, Hyde Park, Pa. Filed Apr. 6, 1882. (Model.)



Claim.—As an article of manufacture, a cap for a miner's lamp, having a lining arranged to form a space, *d*, and having the annularly-located perforations *c*', whereby none of the perforations in the lining directly communicate with the vent in the cap, substantially as shown and described.

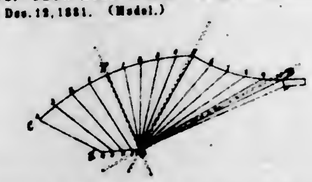
258,803. CONSTRUCTION OF VESSELS. THEODORE W. PHINNEY, Newport, R. I. Filed Jan. 9, 1882. (No model.)



Claim.—In a vessel, the combination, with the hull A, made egg-shaped in cross-section, and adapted to receive the driving mechanism E and cargo F, and provided with the hatches G, of the hollow columns H, attached to the top of the said hull, and the deck I, supported upon the upper ends of the said columns, and provided with cabins J, and pilot-house K, substantially as shown and described, whereby provision is made for giving access to the hold and passages for the smoke-stack, steam-pipe, and ventilating-flues, formed as set forth.

258,804. BARREL-HOOP-CUTTING MACHINE. JOHN B. PIKE, Pikeville, Ontario, Canada. Filed Oct. 2, 1880. (No model.)

Claim.—The combination, in a machine for cutting and shaping hoops, of the frame A, having the fixed table I and studs K K, drive-shaft L, having eccentrics D and pinions B, connecting-rods or pitmen *d*, knife-bar H, oscillating guides E, having flanges *e* and slotted heads *a*, and cog-wheels C, having cams F, for operating said guides, all constructed and combined substantially as and for the purpose herein shown and specified.

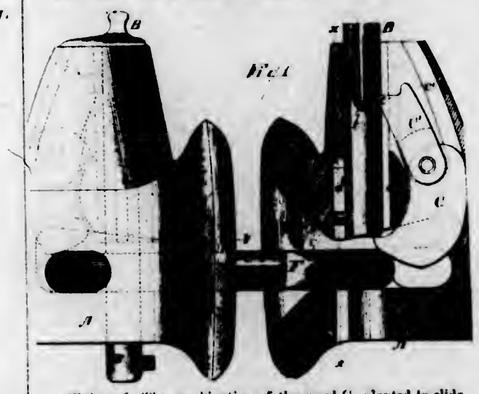


258,805. ELECTRIC-ARC LAMP. ROBERT J. PRATT, Troy, N. Y. Filed Feb. 23, 1882. (No model.)

Claim.—1. In an electric lamp, the combination, with the progressively-fed carbon and its holder, of a pair of levers disposed at right angles thereto upon opposite sides of said holder, and provided with clamping-faces, a pair of armatures arranged upon the ends of said levers, an electro-magnet arranged in the light-circuit, and placed between the armatures of the two levers to bring said levers together, and one or more springs for forcing said levers apart, substantially as and for the purpose described.

2. The combination, with the carbon-holder stem E, of the horizontal levers H H, arranged upon opposite sides of the carbon, and provided with clamps *b b*, the springs I I, and the horizontal magnet K, arranged between the ends of said levers, as and for the purpose described.

258,806. PLOW MOLD-BOARD. JOHN QUIS, Wakeman, Ohio. Filed Dec. 12, 1881. (Model.)



Claim.—1. A mold-board having the exterior curvature set forth, in which all the lines of its concave surface radiating from the point O upward, and also forward to the point B, lie in contact with a straight-edge revolved upon the mold-board with the point O as a center, substantially as described, and for the purpose set forth.

2. A mold-board having the exterior curvature set forth, in which all the lines of its concave surface radiating from the point O upward, and also forward to the point B, lie in contact with a straight-edge revolved upon the mold-board with the point O as a center, and the end of the mold-board in rear of the line O P, constructed as specified, substantially as described, and for the purpose set forth.

3. The method of constructing a plow mold-board as herein described, consisting in first forming on a block, in the manner set forth, the upper and lower construction-lines, C P B and E O K, and the points O and P, connected by the straight line O P, forming one line of the mold-board, then cutting away said block so that a straight-edge centered at O and revolved from the point P forward to the point B will always be in contact with the face of the block, and finally in constructing the end of the mold-board in rear of the line O P, as specified, substantially as described.

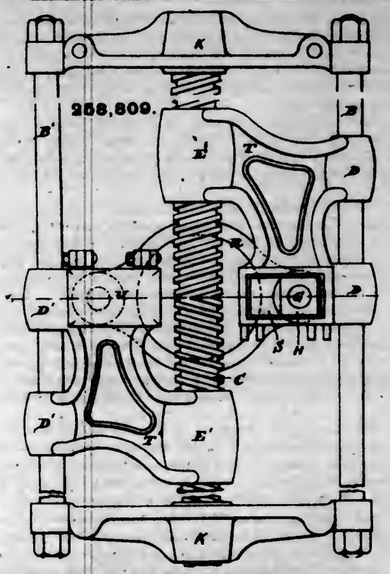
258,807. CAR-COUPLING. HORATIO G. H. REED, Milwaukee, Wis. Filed Mar. 30, 1882. (No model.)

Claim.—1. The combination of the pawl C, adapted to slide in a curved way, with a dog hinged to it and adapted to slide up and down in inclined pockets in the pin-guide above the curved way, and to suspend it (the pawl C) in position to carry its lower end or point under the pin-hole and out contact with the bottom of the throat of the draw-head, but in position to be tripped from beneath the pin by an entering link, as set forth.

2. The sliding block and a dog hinged to it, both working in suitable guides, in combination with a pin having wings adapted to rest on flanges of the dog, which, when the link is beneath the pawl, will prevent the pin from falling through the link, as set forth.

3. The combination of the pin having a short bolt in its lower end with the draw-head, having the vertical recess *e* and heart-shaped recess *E e' e'*, as set forth.

258,808. ORNAMENTION OF GLASSWARE. FRANK REIDS, Brooklyn, N. Y. Filed Jan. 30, 1882. (No model.)

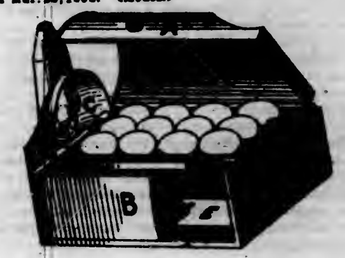


Claim.—As a new article of manufacture, a glass cylinder for lamp-pedestals, having its inner surface coated with gum and a covering of any suitable colored granular substance applied to the gum while wet, as set forth.

258,809. STEERING MECHANISM. NATHAN RICHARDSON, Gloucester, Mass. Filed Feb. 4, 1882. (No model.)

Claim.—The combination, with a rudder-head having arms carrying journals G, of a frame consisting of cross-heads K K and guides B B, a right-and-left screw, C, turning in the cross-heads, and L-shaped arms T, slotted to receive the journals, bearing with their long arms on and sliding on the guides B B, and formed into nuts receiving the screw at the ends of their inner arms, as specified.

258,809.

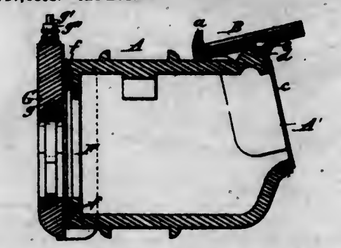


258,810. TOY PISTOL. CHARLES F. RITCHELL, Bridgeport, Conn., assignor to Edward R. Ives, same place, and Cornelius Blakeslee and Edward G. Williams, Brooklyn, N. Y. Filed Jan. 30, 1882. (No model.)

Claim.—1. The combination, with a toy designed for use with explosives, and having a barrel which receives gases generated by explosives, and is provided with a transverse opening, of a cover connected with the toy and adapted to be applied to the transverse opening, as and for the purpose specified.

2. The combination, with a toy designed for use with explosives, and having a barrel which receives gases generated by explosives, and is provided with a transverse opening, of a cover pivoted to the toy and adapted to be applied to the transverse opening, as and for the purpose specified.

258,811. EGG-TESTER. THOMAS H. B. SAUNDERS, St. Louis, Mo. Filed Mar. 20, 1882. (Model.)

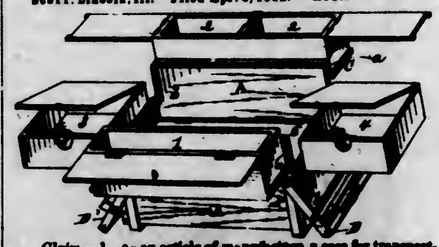


Claim.—An egg-tester consisting of a tight box having an egg-tray and looking-glass, and a concave lid at the top, and provided with a lamp at one end, inclosed in a lamp-house, all specifically constructed, combined, and arranged as herein described, and for the purposes set forth.

258,812. LEMON-SQUEEZER. ALBERT SCHLAPBACH, Seaside, Kans. Filed Apr. 10, 1882. (No model.)

Claim.—The herein-described hand-press or fruit-squeezer, consisting of a tube having an enlarged chamber and flaring slotted mouth at its lower end, and provided with a plunger and rod having a detachable handle, and a spiral spring for holding the plunger normally elevated, substantially as and for the purposes specified.

258,813. CAR-AXLE BOX. JAMES O. SCOTT, Tyler, Tex. Filed Mar. 27, 1882. (No model.)



Claim.—1. In an axle-box, the combination, with the box A, having ridge *d*, and opening A', provided with packing *e* around its edges, groove C, with extensions C', wall D, and projection E, with recess for packing *e*, of the cap B, having arms *b*, provided with pins *b'*, knob *a*, and handle *a*, substantially as shown, and for the purposes set forth.

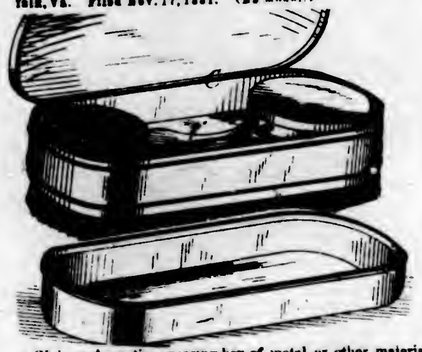
2. The combination, in an axle-box, of the box A, having opening F, with packing *f* around its edges, and ribs *j*, with the dust-plate G, having strips H, provided with recesses *i*, segmental springs I, and tongues *g*, packing *h'*, bolts *g'*, and nuts *g''*, all arranged, constructed, and operating in the manner and for the purposes substantially as shown and described.

3. An axle-box consisting of box A, having ridge *d*, opening A', packing *e*, groove C, with extensions C', cap B, having arms *b*, provided with pins *b'*, knob *a*, and handle *a*, dust-plate G, having slot A, strips H, provided with recesses *i*, segmental springs I, and tongue *g*, bolts *g'*, nuts *g''*, and packing *h'*, substantially as shown and described.

258,814. CASE FOR EXHIBITING SAMPLES. JOSEPH C. SCOTT, Lincoln, Ill. Filed Apr. 6, 1882. (Model.)

Claim.—1. As an article of manufacture, a case for transporting and exhibiting samples, the sides and ends of which consist of hinged sections carrying compartments adapted to be turned outward, the upper rear and front sections being hinged on lines at different distances from the top of the case, whereby one of said sections may be opened without changing the position of the other, substantially as shown and described.

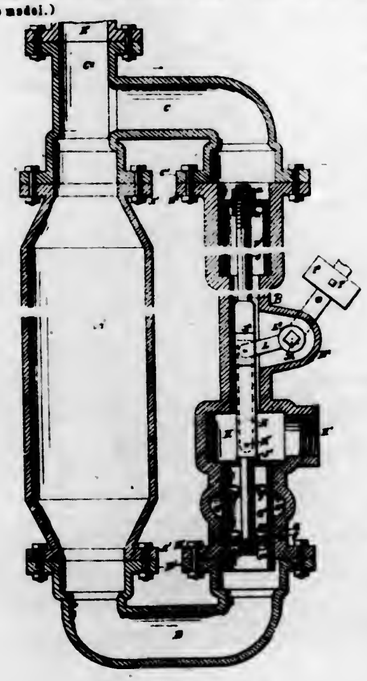
2. In a case for transporting and exhibiting samples, the com-



bination of the sectional hinged jointed sides and ends and the binding-strap D, pivoted to the lower of said side sections, and provided with the bands *d'*, substantially as shown and described.

3. The combination of the centrally-divided cover C, cleats *e e*, and strap D, grooved at *d*, substantially as shown and described.

4. The combination of the tray 5, the outwardly-swinging end compartments, 3 4, and the outwardly-swinging side compartments, 1 2, substantially as shown and described.



5. The combination of the compartments 1, 2, 3, and 4, each provided with a cover and means for locking the same, and each adapted to be folded in the manner described by closing the hinged section to which each is attached, substantially as shown and described.

258,815. BLACKING-BRUSH CASE. ALFRED L. SHARBURY, Norfolk, Va. Filed Nov. 17, 1881. (No model.)

Claim.—An entire incasing-box of metal or other material, consisting of an upper and a lower part, with a brush fitted and fixed in the said upper part, so as to leave space therein for daubing-brush and blacking, and the lower part fitting over the brush and the sides of the upper part of the incasing-box, so that when the lower part of the box is removed the brush is ready for use.

258,816. DRAINAGE APPARATUS FOR STEAM-PIPES. ALBERT B. EDWARD, Cincinnati, Ohio. Filed Jan. 28, 1882. (No model.)

Claim.—1. A steam-trap for draining steam-pipes, provided with a double piston and means for allowing the steam to press on both ends of said pistons, the trap being provided with means for automatically permitting the escape of water condensing in the pipes when the pressure of said water causes the piston to rise, substantially as described.

2. A steam-trap provided with the chambers A and B, connected by the passages C D, the chamber B being provided with a double piston and means for permitting the escape of water when the piston is raised by the pressure of said water, substantially as described.

3. The combination of the chambers A and B, connected by the passages C D, the chamber B being provided with the pistons F and G', connected by the rod J, the piston G' preventing the escape of steam or water when at its lowest point, but provided with openings for permitting the escape of water when the piston is raised, substantially as and for the purposes specified.

4. The chamber A, having inlet C', in combination with the chamber B, having outlet H' and annular passage G^2, said chamber being connected by passages C D, the chamber B being provided with the pistons F G', connected by the rod J, the piston G' having openings to permit water to escape when the piston is raised through the passage G^2, and outlet H', substantially as described.

5. The chamber B, connected at top and bottom with the steam-pipes by the passages C D, and having an outlet-chamber, H, and annular passage G^2, said chamber B being provided with the pistons F G', suitably connected, the latter being provided with openings g' g^3 g^3, substantially as and for the purposes specified.

6. The chamber B, connected at top and bottom with the steam-pipes, and having the supplemental chambers H G^2 and outlet H', the chamber B being provided with the pistons F G', connected by the rod J, the piston G' being provided with openings g' g^3 g^3, so placed that when the piston is lifted by the pressure of the water the openings g' will be in the chamber H, and the openings g^3 and g^3 will coincide with the chamber G^2, substantially as and for the purposes specified.

7. The piston-valve G', having an interior partition, *g*, the sides of said valve being provided with the openings g' g^3 g^3, the openings g^3 being on one side of the partition and the openings g' g^3 on the opposite side of the partition, all in combination with the chambers G^2 and H, substantially as and for the purposes specified.

8. The pistons F G', connected by the rod J, said rod being provided with slot J^2, and the pitman K, located in said slot, one end of said pitman being pivoted at the lower end of the slot, the other end of the pitman being pivoted to the arm L, attached to the rock-shaft M, to which is also attached the counterbalance-arm O, substantially as and for the purposes specified.

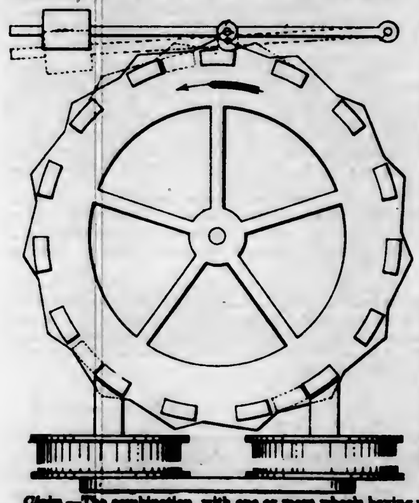
9. The combination of the rod J, connecting the pistons F G', and the pitman K', arm L, rock-shaft M, arm O, and counterbalance-weight P, substantially as and for the purposes specified.

10. The combination of the chamber B, connected at the top and bottom with the steam-pipes, and provided with supplemental chambers H and G^2, and the pistons F G', and the adjustable counter-balance P, and connecting mechanism, substantially as and for the purposes specified.

258,817. GRINDING-MILL. GEORGE K. SMITH, Freeport, Ill. Filed Mar. 4, 1882. (No model.)

Claim.—1. In a grinding-mill, a master-wheel having a central opening for the reception of the grinding-burrs, in combination with a pair of grinding-burrs, one stationary and one movable, arranged in said central opening, and suitable gearing for imparting the motion of the master-wheel to said movable burr, substantially as shown and described.

2. In a grinding-mill, a master-wheel having its shaft centrally chambered for the reception of the grinding-burrs of the mill, in combination with a pair of grinding-burrs, one stationary and the other movable, arranged in said central chamber, and suitable gearing for communicating the motion of the master-wheel to said movable burr, substantially as set forth.



3. In a grinding-mill, the combination of a centrally-chambered master-wheel and a pair of grinding-burrs, one stationary and one movable, located in said central chamber, with suitable gearing connecting said master-wheel and movable burr, said gearing being constructed substantially as described, and so as to drive said burr at a speed different from that of the master-wheel, substantially as shown.

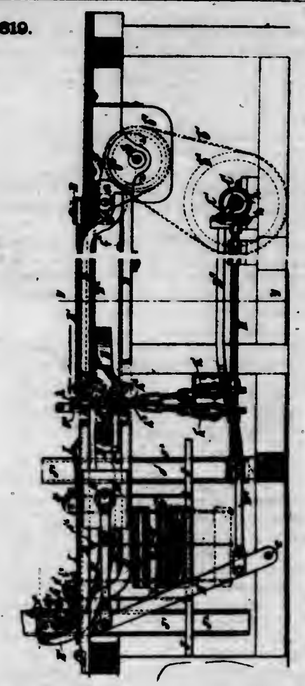
4. In a grinding-mill constructed as shown, the combination of the frame A, plate N, master-wheel N, and covering-plate M, so constructed and attached as to hold said master-wheel in its bearing, and at the same time form the upper bearing of the spindle of the movable grinding-burr of the mill, substantially as shown, and for the purpose set forth.

5. In a grinding-mill constructed as described, the combination of the plate N and yoke G thereto attached, the covering-plate M and cross-bar H, and stationary grinding-burr K thereto attached, the spindle F, having bearings in yoke G and cross-bar H, the movable grinding-burr L, and the regulating device consisting of rod I and hand-wheel W, all substantially as and for the purpose described.

6. The combination, in a grinding-mill, of the frame A, plate N, master-wheel N, covering-plate M, spur-wheels C D E, spindle F, and grinding-burrs K L, all substantially as and for the purpose set forth.

258,818. ELECTRIC MOTOR FOR CLOCKS. LOUIS E. SPELLIER, Doylestown, Pa. Filed Dec. 17, 1881. (No model.)

Claim.—The combination, with one or more wheels having a circular series of armatures and a corresponding series of inclined teeth, of an electro-magnet for attracting the armatures, and a pressing device arranged upon the inclined teeth to operate alternately with the magnet to produce a progressive intermittent movement of the wheel in the same direction, as described.



258,819. PAPER-BOX MACHINE. ALBERT SPEARNS, Brooklyn, N. Y. Filed Dec. 19, 1881. (No model.)

Brief.—The blank is seized by grippers F on reciprocating carrier E and drawn under former E', where it is folded by oscillating folders *g*. Grippers G on carrier E' seize the folded tube and draw it off the former and under the head I of an automatically-adjusted press, where it dries. The grippers F G have each one fixed and one movable spring-pressed jaw, the latter being opened by a cam-lever that strikes a stop at the point where the blank or tube is to be released, and the jaws remain open until the cam is tripped at the point where the tube or blank is to be seized. The carriers are raised and lowered by a sliding gib, *s'*, that strikes a stop at each end of its path, the raising of one carrier causing the lowering of the other.

Claim.—1. In a paper-box machine, the combination, with a former and folders arranged on opposite sides thereof, of grippers for drawing the strips forward under said former, and other grippers for drawing the tubes from said former, substantially as specified.

2. In a paper-box machine, the combination, with a former and folders arranged on opposite sides thereof, of a carrier-slide and mechanism, substantially such as described, for reciprocating it, carriers attached to said slide, and two pairs of grippers attached to said carriers and reciprocated together to draw the strips under said former and to draw the tubes from said former, substantially as specified.

3. In a paper-box machine, the combination, with a former and folders arranged on opposite sides thereof, of grippers for drawing the strips under said former, grippers for drawing the tubes from said former, and mechanism, substantially such as described, for reciprocating said grippers and for giving them a rising and falling movement at the termination of their reciprocating movement, substantially as specified.

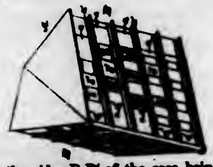
4. The combination of the former F and folders *g*, the carrier-slide D', and guide-bars D, the bar pivoted to said slide and comprising the carriers E E', the sliding gib *s'*, the stops *f f'*, and the pairs of grippers F G, substantially as specified.

5. The combination, with the former F and two pairs of reciprocating grippers, F and G—one pair for drawing strips under the former and the other pair for drawing tubes therefrom—of the folders *g*, pinions *g'* on the shafts of said folders, the cam-shaft H, and the rack-bars h^2, engaging with the cams on said shaft and gearing with said pinions, substantially as specified.

6. The combination of the former F, the carrier-slide D', the gripper-carriers E E', the grippers F, for drawing strips under said former, the grippers G, for drawing tubes from said former, the lever D^2 and link D^3, the connecting-rod D^4, and the crank-shaft C, all substantially as specified.

7. In a paper-box machine, the combination, with a former and folders on opposite sides thereof, of a pair of reciprocating grippers for drawing strips under said former, a second pair of reciprocating grippers for drawing the tubes from the former, and a press into which the tubes are drawn by the last-mentioned grippers, substantially as specified.

8. In a paper-box machine, the combination, with a former, folders on opposite sides thereof, and reciprocating grippers for drawing the strips under said former, and for drawing the tubes from the former, of the pieces I, flared or inclined at the ends, and the weighted piston J, substantially as specified.



9. The combination of the pieces I, forming the head of the press, the piston J, a weight or weights for resting upon said piston, and the supplemental weights, which are taken up as the number of tubes in the press increases, substantially as specified.

258,820. EXPRESS SIGNAL-CALL. HENRY S. SITZ, Cincinnati, Ohio. Filed Oct. 21, 1881. (Model.)

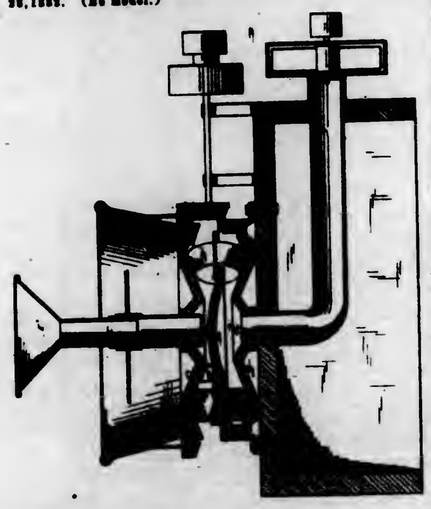
Claim.—1. An express signal-call consisting of a triangular case, two of the sides of which are provided with translucent signs representing one or more express companies, and adjustable covers for rendering the signs visible or invisible at will, substantially as described.

2. An express signal-call consisting of a case, A, having an

258,820.

interior lamp, C, the sides B B' of the case being provided with translucent signs, each sign having adjustable covers *a*, for rendering the sign visible or invisible at will, substantially as and for the purpose set forth.

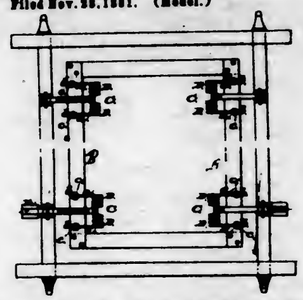
2. An express signal-call consisting of a case, substantially as described, the sides B B' of said case being provided with translucent signs representing one or more express companies, and the sliding covers *a*, provided with the openings *b* and solid portions *b'*, substantially as and for the purpose specified.



258,821. GAME-PIECE AND METHOD OF EXHIBITING THE SAME. JOSEPH STORCK, Boston, Mass. Filed Sept. 1, 1881. (No model.)

Claim.—1. The improved method hereinbefore described of exhibiting representative samples of game, for use especially in restaurants, dining-rooms, and the like, which consists in firmly attaching at various points by means of wires and cement a stuffed and preserved natural specimen of the bird, fish, or other specimen of game to be exhibited to a flat backing of suitable material, and then inclosing the same in an oval or other shaped frame of the character of the ordinary picture-frame, adapted to be suspended, and provided with a transparent glass plate in front of sufficient convexity to inclose the specimens and preserve the same from injury, substantially as set forth.

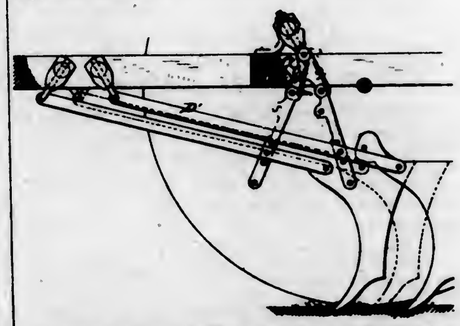
2. As a new article of manufacture, a framed game-piece consisting of a stuffed and preserved bird firmly attached at various points by means of wires and cement to a backing of wood or other suitable material, and an inclosing frame provided with the convex-concave glass plate D, adapted to conform to the contour and relief of the inclosed game specimen without injury to its form, substantially as described and shown.



258,822. MACHINE FOR CRUSHING AND PULVERIZING QUARTZ. JEROME B. SWEETLAND, Pontiac, Mich. Filed Feb. 28, 1882. (No model.)

Claim.—1. The combination of the convex distributer E, having rollers and flanges applied to its circumference, with the bed A, the tank, the rollers D', and the hinged trap-doors *f*, applied to said flanges substantially as described.

2. The combination of a yielding scraper, F, with a revolving distributer, a revolving tank, to which said distributer is attached, crushing-rollers, and a bed on which these rollers revolve, substantially as described.



258,823. VEHICLE-SPRING. CHARLES L. THOMAS, Janesville, Wis. Filed Nov. 28, 1881. (Model.)

Claim.—The springs C, each consisting of the two spiral branches D D, each having an end arm, *a*, extending outward from the spiral to the marginal frame-work B of the body, and secured thereto by means of the screw or bolt *b*, passing through a terminal eye, *c*, in combination with the arms E, pivoted to hangers on the side bars, extending inward and secured to the springs C upon arms *d*, between the spiral branches D D, substantially as specified.

258,824. SEEDING-MACHINE AND CULTIVATOR. JOSEPH W. THOMAS and ABRAHAM R. LUDLOW, Springfield, Ohio, assignors to Thomas, Ludlow & Rodgers, same place. Filed Jan. 9, 1882. (No model.)

Brief.—The draw-bars are alternately attached at their front ends to oscillating bars for adjusting the teeth in and out of line. Near the rear ends of the drag-bars are attached jointed pressure-rods secured to a transverse rock-shaft, which is oscillated to elevate or depress the teeth, they being attached to allow each an independent movement.

Claim.—1. The combination, with a hoe or tooth and a lifting roller or shaft for raising and lowering the same, of a jointed pressure-rod hinged to said shaft and provided with a shouldered or locking joint, substantially as and for purpose described.

2. The combination of the hoe or tooth, the rock-shaft for raising and lowering the same, a jointed pressure-rod interposed between said tooth and rock-shaft, and having a shouldered or locking joint, and a spring arranged to exert its tension to straighten said jointed rod.

3. The combination of the hoes or teeth, the lifting roller or shaft for raising and lowering the same, the jointed rods connecting said teeth and shaft hinged to the latter, and having shouldered or locking joints, and means for locking said shaft, whereby the hoes or teeth may be held locked in working position, while at the same time any one tooth is adapted to rise without disturbing the others or the lifting roller or shaft.

4. The combination of the hoes or teeth, the lifting roller or shaft for raising and lowering the same, the jointed pressure-rods connecting said teeth and shaft and having a hinged or pivotal connection with the latter, and a lever geared to said shaft for actuating it.

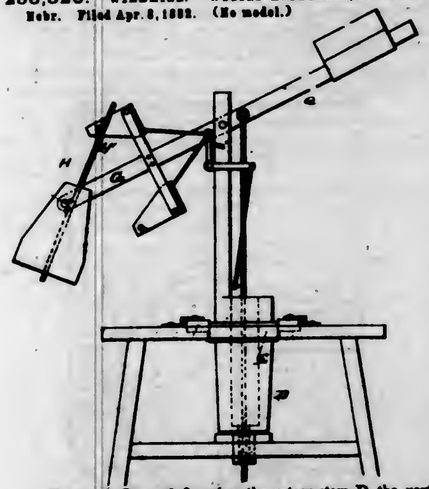
5. The combination of the hoes or teeth, a lifting roller or shaft connected therewith by jointed pressure-rods and provided with a toothed wheel, a lever geared thereto for actuating it, and means for holding said lever at any desired adjustment.

6. A jointed pressure-rod for connecting the hoes or teeth and the rock-shaft, adapted to be hinged to the latter, and provided with the shouldered or locking joints, in combination with the distending springs, substantially as described.

7. The jointed pressure-rods connecting the hoes or teeth and the rock-shaft, hinged to the latter, and provided with shouldered or locking joints, distending springs, and slots permitting the hoes or teeth to fall and rise within certain limits each independently of the others, substantially as described.

8. The jointed and folding pressure-rods connecting the hoes or teeth and the lifting roller or shaft, and having a pivotal connection with the latter, said jointed rods having slots permitting the independent movement of the teeth, perforations and set-screws or bolts adapting them to hold the teeth at any desired adjustment, and self-locking or shouldered joints, in combination with springs applied and operating substantially as described.

9. The jointed and folding pressure-rods connecting the hoes or teeth with the lifting-roller, provided with shouldered or self-locking joints, in combination with distending springs, and means for holding said joints flexed, substantially as described.

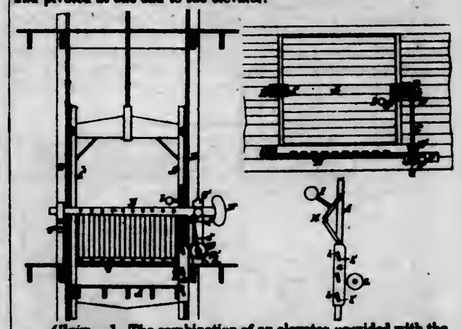


10. The combination, with the hoes or teeth and adjustable drag-bars for changing said teeth from a straight line or single row to a zigzag position, and vice versa, of a lifting-roller hinged to the latter, and provided with shouldered or self-locking joints, substantially as and for the purpose described.

258,825. CIRCUIT-CLOSER FOR TELEGRAPH-KEYS. JOHN A. TIMMERMAN, Odessa, Ontario, Canada. Filed Mar. 13, 1882. (No model.)

Claim.—The circuit-closer consisting of a spring-plate, *d*, attached by one end beneath and in metallic contact with the front contact-point, *c*, and resting at its outer end on the back of lever C, in combination with the lever B, hung on pivot *a*, and extending with its bent forward end through the recessed button *e* of the main lever provided with a flat disk, *i*, and connecting by hook *f* with the screw *g*, resting on said spring-plate, as shown and described.

258,826. WINDMILL. WALTER H. TRUMBLE, Grenwood, Nebr. Filed Apr. 8, 1882. (No model.)



Claim.—1. In a wind-engine, the rotary stem D, the vertically-vibrating lever-beam G, pivoted thereto, the vertically-vibrating sail H, pivoted to an arm of the lever-beam, and the reversing-stops *e* and *f*, substantially as specified.

2. A vibrating wind-engine consisting of a rotary stem in bearings, a vertically-vibrating lever-beam pivoted thereto, a vertically-vibrating sail pivoted to an arm of said lever-beam, and pivoted lever-stops arranged to engage and reverse the sail and limit the movements of the lever-beam, substantially as specified.

258,827. AUTOMATIC GATE FOR ELEVATORS. BENJ. O. VANDUSEN, Cincinnati, Ohio. Filed Sept. 5, 1881. (No model.)

Brief.—A friction-plate on the elevator engages a friction-wheel on one end of a shaft mounted in bearings at the landing. On the other end of the shaft is a crank and lever connecting with a tilting gate. The friction-plate has inclined slots riding on pins, and is moved laterally by a knuckle-joint provided with a handle and pivoted at one end to the elevator.

Claim.—1. The combination of an elevator provided with the plate *a*, friction-wheel D, attached to shaft C, crank D' *d*, connecting-rod *d'*, and the gate E, one end of the connecting-rod *d'* being connected to the crank and the other to the gate, substantially as described.

2. The combination of the gate E, friction-wheel D, and connecting and operating mechanism, and the plate *a*, adjustably attached to the elevator and capable of being adjusted to impinge against the friction-wheel D or pass it without coming in contact therewith as the elevator passes up or down, substantially as and for the purpose described.

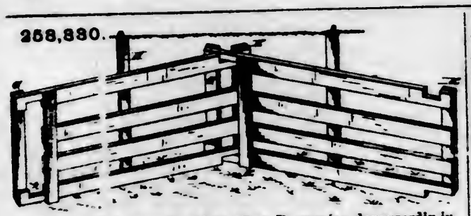
3. The combination of the upright post A' of an elevator, the plate *a*, provided with the oblique slots h, which engage with the pins *h'*, projecting from said upright post, the knuckle-joint H, friction-wheel D, and the gate E, and connecting and operating mechanism, substantially as and for the purpose specified.

4. The combination of the friction-wheel D and plate *a*, provided with oblique notches h, which engage with pins *h'*, projecting from the upright A', and the knuckle-joint H, the lower member of said joint being attached to the plate *a* and the upper member to the upright A', said upper member being provided with the weighted lever I, substantially as and for the purpose specified.

258,828. SAND-DISTRIBUTER FOR LOCOMOTIVES. PLATT B. VISSH, Rochester, N. Y. Filed Oct. 11, 1881. (No model.)

Claim.—The combination, with the sand-tube D and injector *h*, of the valve *d*, arranged to be operated upon by the jet from the injector to open the valve and to close of its own action when the jet is shut off, as herein shown and described.

258,829. MOISTURE-PROOF COATING AND COVERING FOR WALLS, FLOORS, &c. RASMUS VON PETERSEN, Copenhagen, Denmark. Filed Mar. 11, 1882. (No specimens.)

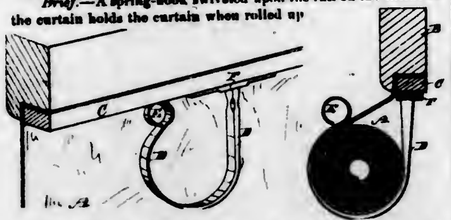


Claim.—1. The herein-described compound or composition for coating floors, walls, roofs, and other surfaces, consisting of natural asphalt or bitumen and comminuted cork mixed in suitable proportions, as set forth.

2. As an article of manufacture, a mixture of natural asphalt or bitumen and comminuted cork molded into bricks or blocks of suitable size, as set forth.

258,830. PORTABLE FENCE. DANIEL B. WAGNER, Mount Blanchard, Ohio, assignor of one-half to David H. Driesbach, same place. Filed Feb. 11, 1882. (No model.)

Claim.—In a portable fence, a panel having at one end an upwardly-opening square notch, C, both sides of the notch rising

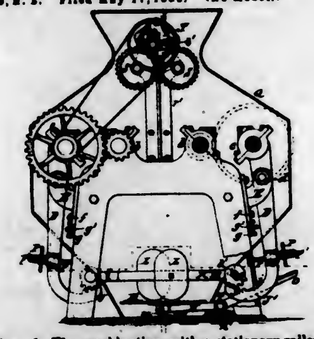


258,830.

flush with the top rail, and an offset, D, opening downwardly in the corner of the lower rail, and a post, E, in combination with a panel having at one end a downwardly-opening notch, N, in the upper rail and an upwardly-opening notch, P, in the lower rail, and the supplemental post G, connecting the extreme ends of the upper and lower rails, all constructed, arranged, and operated as set forth.

258,831. CARRIAGE-CURTAIN FASTENING. WILLIAM H. WEAVER, Emmittsburg, Md. Filed Feb. 28, 1882. (No model.)

Brief.—A spring-hook swiveled upon the rail on the inside of the curtain holds the curtain when rolled up.



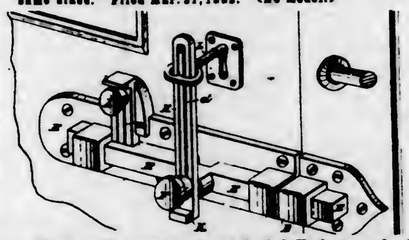
Claim.—1. The combination, with the rail B and the curtain A, of the spring-hook D, swiveled upon the rail, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the rail B and the curtain A, of the spring-hook D, provided with a loop or ring, E, at its free end, which hook is swiveled upon the rail, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the rail B and curtain A, of the hook D and the swivel-plate F, substantially as herein shown and described, and for the purpose set forth.

258,832. ROLLER-MILL. IRA WESCOTT, Buffalo, N. Y., and JOSEPH S. KARNS, Lima, Ohio, assignors to John T. Noye & Sons, Buffalo, N. Y. Filed May 17, 1880. (No model.)

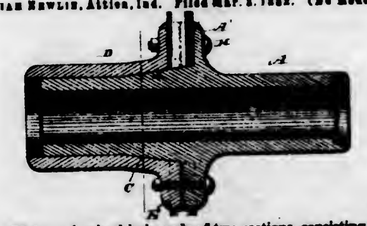
Claim.—1. The combination, with a stationary roller, B, of a movable roller, C, the levers D, supporting the movable roller in their upper ends, and the fulcrum-bearings E, arranged between the ends of the levers, made vertically adjustable on the stationary frame of the machine, substantially as set forth.



2. The combination, with the levers D, pivoted as described, provided at their lower ends with gear-racks J, of the levers K, provided with pinions *h* and weights L, and mechanism whereby the weights L can be raised simultaneously, substantially as set forth.

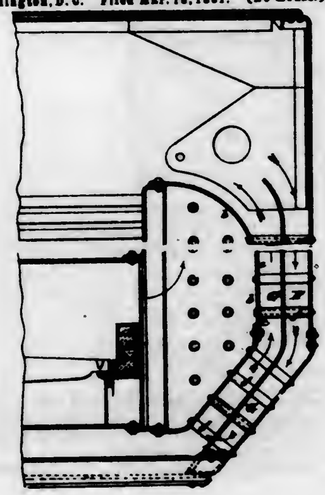
3. The combination, with the levers D, provided at their lower ends with gear-racks J, of the levers K, provided with pinions *h* and weights L, tables M, and lifting-levers N O, substantially as set forth.

4. The combination, with the feed-rolls E, provided with gear-wheels S, of the driving-pinion *s* and supporting-bracket T, made adjustable with reference to the gear-wheels S, substantially as set forth.



5. The combination, with the feed-rolls E, provided with gear-wheels S, of the driving-pinion *s* and supporting-bracket T, pivoted at *t*, and provided with screw-bolts *f* and curved elongated holes f^2, substantially as set forth.

258,833. COMBINED BOLT AND KEY FASTENER. WILLIAM WHITE, Chicago, Ill., assignor of one-half to John Merchant, same place. Filed Mar. 21, 1882. (No model.)



Claim.—The combination of the bolt E, the screw-knob F, and the slotted bar K, adapted to fasten a key, substantially as and for the purposes specified.

258,834. VEHICLE-WHEEL. SAMUEL WHITEHALL and WILLIAM NEWLIN, Attica, Ind. Filed Mar. 3, 1882. (No model.)

Claim.—A wheel-hub made of two sections, consisting of the axle-box A, having the flange A', and extended inclined bearing C, formed integral therewith, the inner face of the flange A' being provided with separate radial grooves, the sleeve D, provided with a flange, E, having separate radial grooves formed in its inner face, said sleeve being provided with an extended conical or tapering bearing that fits upon the inclined bearing C of the axle-box, and fastening-bolts inserted through the flanges and between the spoke-grooves, substantially as set forth.

258,835. SEPARATING-DIAPHRAGM. GEORGE B. WHITING, Washington, D. C. Filed Mar. 16, 1881. (No model.)

Claim.—In a marine boiler provided with a hook-water space F, and having also a water-bottom, a diaphragm, G, constructed as described, inserted midway between the front and rear sheets of the hook-water space, with free passages underneath, and connecting with the water-bottom space for the purpose of promoting circulation, in the manner and for the purposes set forth.

258,836. MILL-PACKER REGISTER. GEORGE L. WILLIAMS, Edwardsville, Ill. Filed July 6, 1881. (No model.)

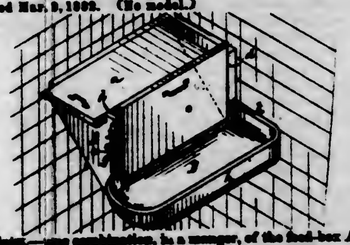
Claim.—1. In a mill-packer register, the combination of the base-plate A, box B, studs *g*, non-circular wheel F, ratchet-wheels G H, dial-plates L *m*, and crank N, substantially as shown and described.

2. The plate A, box or case B, non-circular wheel F, and ratchet-gear wheels G H, having studs and pawls, as shown, in combination with the knee-jointed lever I *j*, spring K, and the reciprocating arm of a mill-packer, substantially as shown and described.

3. The combination, with the actuating-arm of a mill-packer indicator, of the frame or case A B, ratchet-wheels G H, dial-plates L *m*, non-circular plate-wheel F, jointed lever I *j*, having the part I right and the part *j* bear upon the shaft of the wheel F, and spring or weight K, substantially as shown and described.

258,837. ADJUSTABLE BASE-BOARD. CHARLES H. WILLSON, Mount Vernon, N. Y. Filed Dec. 22, 1881. (No model.)

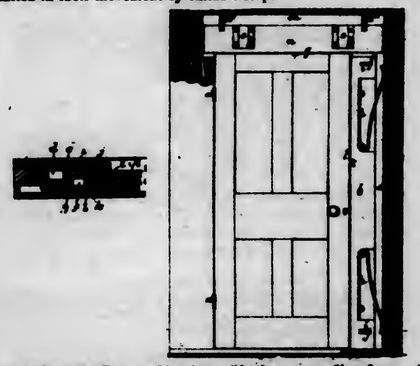
Brief.—The movable section slides in guides on the fixed section and held in place by springs. The joint between the two sections is covered by a projection on the movable section, and points for holding the carpet are secured to the lower side of the movable section.



Claim.—1. A base-board constructed of a stationary section and a movable section, the stationary section being provided with suitable guides to allow the movable section to rise and fall and with springs which act on the movable section, substantially as set forth.

2. The combination, with the stationary section *a*, its guides D, and the movable section *b*, of a projection extending upward from the movable section to cover the joint, substantially as shown and described.

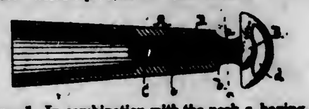
3. The combination, with the stationary section *a*, its guides D, the movable section *b*, and springs *d*, of points *h*, for retaining a carpet, substantially as set forth.



258,838. MANGER. CHARLES H. WILLSON, Mount Vernon, N. Y. Filed Mar. 9, 1882. (No model.)

Claim.—...ger combination, in a manger, of the feed-box A, arranged along the side of a stall, and provided with a sliding vertical door, C, arranged to extend over and form the front of the feed-box, the flat-bottomed feed-basin B, extending laterally from the feed-box, and the extension *b'* of the feed-basin, projecting forward beyond the door C and beyond the adjacent end of the feed-box, and curved within and without, substantially as shown and described.

258,839. FRAME FOR DOORS OR WINDOWS. CHARLES H. WILLSON, Mount Vernon, N. Y. Filed Dec. 26, 1881. (No model.)



Brief.—The door jamb or lintel consists of a spring-actuated strip formed with a tongue and groove, which fit a corresponding tongue and groove in the door-frame. The adjacent edges of the door and movable section are beveled. The movable sections are limited in their movement by suitable stops.

Claim.—1. The combination, with the surrounding frame of a door or window, of a movable section, *b*, both the said section and the frame being provided with tongues *e g* and grooves *d f*, respectively, the stops *i i*, and springs *h h*, substantially as and for the purpose set forth.

2. The combination, with the surrounding frame of a door or window, of a jamb or lintel composed of a movable section, *b*, springs *h h*, acting on the movable section, suitable stops for limiting the motion of said movable section, and beveled edges *b f* on the movable section and door or window, respectively, substantially as and for the purpose shown and described.

258,840. WHIFFLETREE-HOOK. HARRY H. WILSON, Baltimore, Md. Filed Apr. 1, 1882. (No model.)

Claim.—1. In combination with the neck *a*, having screw F, the hook B, rod *b*, having inclined recess E, and the spring *c*, as set forth.

2. In combination with the shell A, the hook B, adapted to be retracted and turned to attach the trace and to automatically return to its normal position upon being released, as set forth.

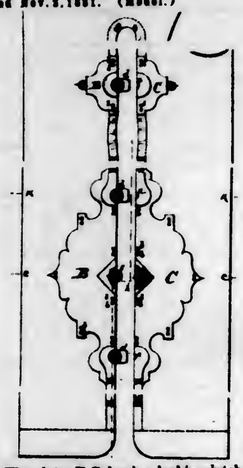
3. In combination with the shell A, the hook B, having opening *d*, the rod *b*, spring *c*, and screw F, as set forth.

258,841. PROCESS OF MANUFACTURE OF MILK-SUGAR. LEWIS E. WITTE, Cleveland, Ohio. Filed Oct. 19, 1878.

Claim.—1. A process in the manufacture of milk-sugar, consisting in filtering whey through caseous or albuminous matter, substantially as and for the purpose shown.

2. As a process in the manufacture of milk-sugar, a treatment of whey consisting of the application of acid and heat, substantially as and for the purpose shown.

3. A filter for purifying whey in the process of making milk-sugar, consisting of an envelope of fabric having an internal layer or lining of caseous or albuminous matter, substantially as and for the purpose shown.

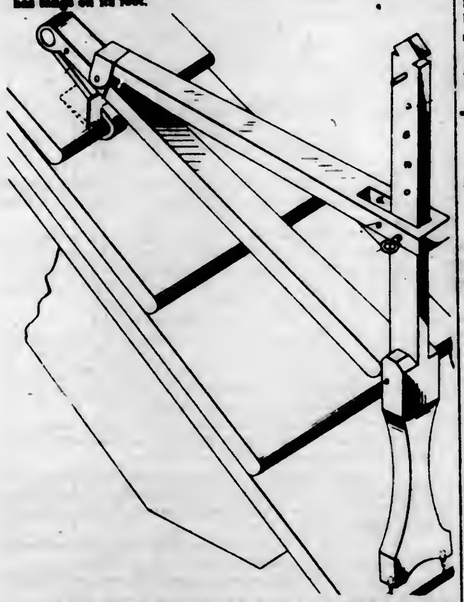


4. As an article of manufacture, milk-sugar made according to the process herein specified, substantially as shown.

5. The combination of whey and muriatic acid, substantially as shown.

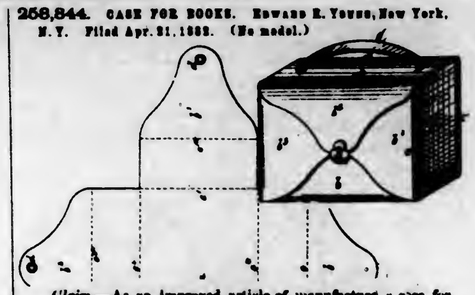
6. One, two, or more filters, A B, in combination with suitable apparatus for feeding to and collecting from them, substantially as and for the purpose shown.

7. The process of preparing whey for the manufacture of milk-sugar, consisting in the scalding and filtering of the whey, substantially as and for the purpose described.



258,842. GLOVE-FASTENING. JULIUS WOHLSKA, New York, N.Y. Filed Nov. 3, 1881. (Model.)

Claim.—The plates B C, having locking-latches *d* and socket *e*, in combination with the pin *f* and spring A, which spring is contained in the recess *g*, substantially as specified.



258,843. ROOFING-BRACKET. STEPHEN WOODARD, Delano, Minn. Filed Feb. 28, 1882. (No model.)

Brief.—The upper end of the main beam has a pivoted hook and a bifurcated metallic plate, which straddles the hook between the latter and the main beam. The bifurcated plate is serrated at its lower ends. The main beam is pivoted at its lower end to a standard, and has pivoted at its upper end a beam slotted at its other end to engage the standard. It is adjustable upon the standard by a pin engaging perforations in the standard. The standard has tangs on its foot.

Claim.—In combination with the main beam and devices for securing its upper end, the adjustable beam pivoted to said main beam, the standard pivoted thereto, and the devices for adjusting the adjustable beam on the standard, the said standard being provided with tangs at its lower end, adapted to bite into the shingles, substantially as specified.

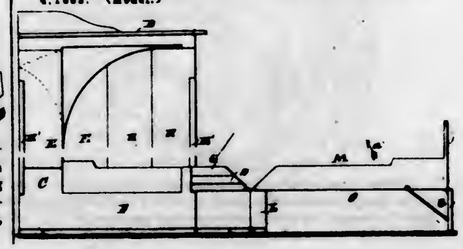
258,844. CASE FOR BOOKS. EDWARD R. YOUNG, New York, N.Y. Filed Apr. 21, 1882. (No model.)

Claim.—As an improved article of manufacture, a case for carrying books, composed of a base, *a*, folding flaps *b b' b² b³*, eyelet-holes in the flaps *b' b² b³*, a clasp secured to the flap *b*, and a handle for carrying the case, all as shown and described.

258,845. EARTHENWARE LIQUID-MEASURE. JOHN W. YOUNG, East Liverpool, Ohio, assignor of one-third to Wm. Brunt, Jr., same place. Filed Dec. 5, 1881. (No model.)

Claim.—1. The combination, with an earthenware measure for measuring liquids, of a supplemental piece adapted to be secured in the bottom of a measure so as not to fall out when the measure is inverted, and also capable of being removed when the measure is being cleaned, substantially as described.

2. The combination, with the herein-described earthenware measure, having the projections *a a* near its bottom, of the removable supplemental piece P, having the notches *b b* on its edges, substantially as described.



258,846. FRUIT-PICKING IMPLEMENT. CHARLES ALLEN, Rochester, N.Y. Filed Dec. 21, 1881. (No model.)

Claim.—1. In a fruit-picking implement, the combination of the notched cylindrical knife C, sliding within the double notched cylinder E B, kept in place by the spring *a* and operated by means of a wire leading downward from the spring, all substantially as shown and described, for the purpose specified.

2. In a fruit-picking implement, the combination of the hollow handle A with the notched cylindrical knife C and the double notched cylinder B E, substantially as and for the purpose set forth.

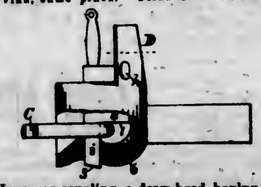
258,847. FOLDING BED. HERBERT H. BURNEY, Port Richmond, assignor to Electa L. Russell, New York, Henry Jordan, Jr., Nyack, and Rosa D. Bement, Port Richmond, N.Y. Filed Jan. 4, 1882. (Model.)

Claim.—1. The combination, with the stationary head-piece A, composed of top and side pieces, of a horizontally-sliding box, G, and a swinging box, M, hinged to the outer edge of the latter and provided with a closed bottom, said hinged box being adapted to swing upward, so that its closed bottom constitutes a front wall for the stationary head-piece, substantially as and for the purpose described.

2. The combination, with the stationary head-piece A, composed of top and side pieces and a front base plate or board, of a horizontally-sliding box, G, and a swinging box, M, hinged to the outer edge of the latter and provided with a closed bottom, said hinged box being adapted to swing upward, so that its closed bottom constitutes a front wall for the stationary head-piece, in connection with the front base plate or board of the latter, substantially as and for the purpose described.

3. In a folding bedstead, the combination of the head-piece composed of top and side pieces, the horizontally-sliding box G, the hinged pillow-section J, adapted to turn downward when the sliding box is moved outward, and the box M, having a closed bottom and hinged to the outer edge of the sliding box, said hinged box being adapted to swing upward, so that its closed bottom constitutes a front wall for the head-piece, substantially as described.

4. In a folding bedstead, the combination of a head-piece composed of top and side pieces and a front base board or plate, of a sliding box, G, provided at its inner edge with a hinged pillow-section, J, and a box, M, hinged to the outer edge of the sliding box, and having a closed bottom which constitutes a front wall to the head-piece when said box is turned to a vertical position, substantially as described.



5. The folding bed herein described, composed essentially of the head-piece A, provided with attached folding doors E at its sides, the horizontally-sliding box G in the base of the head-piece, and a box, M, hinged to the outer edge of the sliding box, said hinged box being adapted to turn vertically to constitute a front wall to the head-piece, substantially as set forth.

6. The folding bed herein described, composed essentially of the head-piece A, provided with a horizontal top plate, vertical side pieces, and hinged side doors having strips E', a sliding box, G, and a hinged box, M, adapted to swing vertically and constitute a front to the head-piece, substantially as set forth.

7. The combination, with the head-piece A, provided in its base with the beveled-edged slats or rails F, having the transverse front check-rail, K, of the sliding box G, provided at its bottom with dovetailed projections F', arranged between the beveled-edged slats or rails, substantially as set forth.

8. In a folding bedstead, the combination, with the base sides D, provided on the inner surface with longitudinal dovetailed grooves, of the sliding box G, the beveled-edged slats or rails F F, the dovetailed projections F' on the under side of the box G, and the longitudinal dovetailed ridges H on the outer surfaces of the sides of the sliding box G, substantially as herein shown and described, and for the purpose set forth.

258,848. CAR-COUPLING. JOHN C. BLOSSER, Lima, Ohio, assignor of three-fourths to George W. James, Byron Bowers, and James Irvine, same place. Filed Feb. 16, 1882. (No model.)

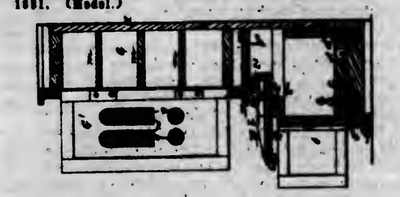
Claim.—1. In a car-coupling, a draw-head having upon its top and rear part a beam, D, which projects vertically above the draw-head, and said beam provided on its front side with a vertical slot, *e*, which has within it on each side a vertical groove, *g*, in combination with a coupling-pin having a lower straight end, *i*, to engage with the link, and provided above the lower straight end with a rear projecting part, *c*, to slide in the slot on the front side of the beam, and said rear projecting part having a key whose ends slide in the vertical grooves, as set forth.

2. In a car-coupling, a draw-bar having an upward-projecting beam provided with a vertical slot, *e*, and within the slot on each side a vertical groove, *g*, closed at the upper end, and a key-hole, in combination with a coupling-pin provided with a rear projecting part to slide in the slot, and having a key whose ends slide in the groove, as set forth.

3. In a car-coupling, the combination and arrangement of a draw-head having a notch, *d*, in its top adjoining the pin-hole, an upward projecting beam provided with vertical side grooves closed at the top, and a coupling-pin provided with a key whose ends slide in the vertical grooves, as set forth.

4. In a car-coupling, a draw-head having in its top a slot, *d*, and at the rear end thereof an intersecting slot with a vertical wall, *f*, and in the bottom of its mouth a horizontal seat, which, with the vertical wall, forms a right-angled notch, *6*, in combination with a coupling-pin having a rear projection provided with a lower horizontal edge, *l*, and a rear vertical edge, *i'*, as set forth.

258,849. COTTON-GIN CONDENSER. WILLIAM B. BURRISS and JOSEPH H. BENNER, Troy, Ala.; said Burriss assignor to Frank Baltzell, same place. Filed Oct. 24, 1881. (No model.)



Claim.—The combination, in a cotton-gin condenser, of the receptacle A, having hinged bottom B', perforated false bottom B, having concave *b*, deflector *b'*, and toothed cylinder C, provided with the flexible strips *a*, substantially as and for the purpose herein shown and set forth.

258,850. PURIFICATION OF ALKALINE SOLUTIONS OBTAINED IN THE MANUFACTURE OF SODA. EUSTACE GARDY, HOLBROOK GASKELL, Jr., and FERDINAND HUNTER, Widnes, County of Lancaster, England. Filed Dec. 19, 1881. (No specimens.) Patented in England Feb. 11, 1880, No. 668.

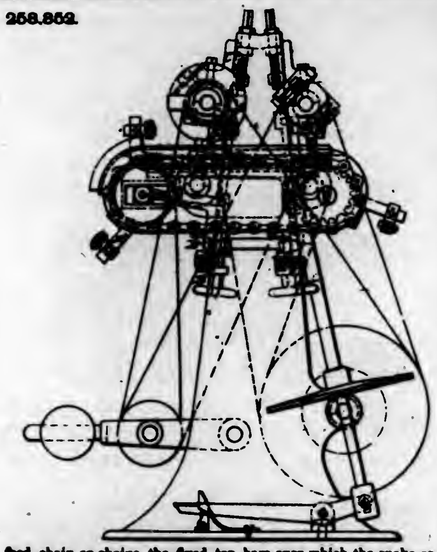
Claim.—1. The method of purifying alkaline solutions by oxidizing the sulphur compounds therein with the aid of manganous oxide, sodium nitrate, or other suitable oxygen compound, and then heating the liquor to a high temperature, as indicated, to cause the double decomposition of the said oxidized sulphur compounds and the cyanogen compounds in the liquor, substantially as described.

2. In the purification of alkaline liquor, the production of ammonia by the decomposition of nitrogen compounds—such as ferrocyanides and nitrates—during the heating of the liquor and recovery of the ammonia produced, substantially as described.

258,851. KITCHEN-CABINET. WILLIAM B. CRAIG, De Witt, Nebr., assignor to Mary E. Craig, same place. Filed Aug. 3, 1881. (Model.)

Claim.—1. The combination, with the rolling-board E, provided with racks *h l*, and cover F, provided with racks F', of the pinions and shaft *I F*, substantially as herein shown and described, whereby said board and cover are simultaneously moved in opposite directions, as set forth.

2. In a kitchen-cabinet, the combination, with the closet D and the cupboard G, of the sink K, provided with the water-retaining depression *e*, hinged to the said closet and adapted to fold against the side of the cupboard, substantially as and for the purpose set forth.



258,852. SPOKE TENONING AND CHAMFERING MACHINE. WILLIAM H. DOANE and GEORGE W. BUCHER, Cincinnati, Ohio. Filed Apr. 18, 1881. (No model.)

Brief.—The spokes are fed to the endless carrier-chains, and by a cam-surface alongside the chains the spokes are lifted into contact with the clamps on the chains, when they are carried forward between the heads for tenoning and chamfering the corners.

Claim.—1. The combination, substantially as before set forth, of the tenoning cutter-heads, the spoke-tapering cutter-heads, and the feed chain or chains provided with pairs of dogs for feeding spokes through between the respective cutter-heads.

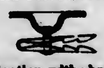
2. The combination, substantially as before set forth, of the

258,852.

feed chain or chains, the fixed top bars over which the spoke or other object is moved, and the dogs on said chains, provided with spring-clamps.

3. The combination, substantially as before set forth, of the spoke-supporting top bars, constructed at one end with downwardly-curved eccentric portions, the feed chain or chains, and dogs on said chains, provided with spring-clamps.

4. The combination, substantially as before set forth, of the spoke-supporting top bars, constructed at one end with downwardly-curved eccentric portions, the feed chain or chains, the dogs on said chains, provided with spring-clamps and laterally-projecting anti-friction guide-rollers, and the guides for said rollers.



5. The combination, substantially as before set forth, of the spoke-supporting top bar provided with a dull-edged rib, and the spring-clamps on the feed chain or chains.

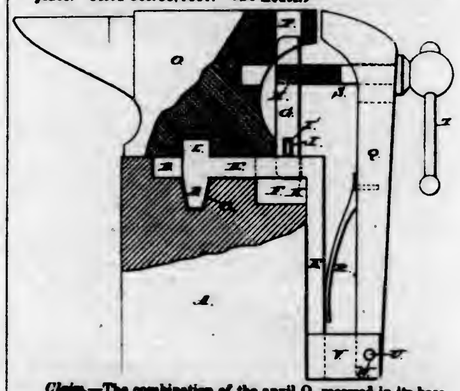
6. The combination, substantially as before set forth, of the feed chain or chains, the worm-gearing for driving the same, the upright worm-shaft carrying a friction-disk, the counter-shaft provided with a friction-driver, and the treadle for lifting the worm-shaft to disconnect its friction-disk from the said friction-driver.

7. In a machine for tenoning and tapering spokes, a frame having diverging faces, upon which are mounted the four slides supporting the two sets of cutter-heads, combined with said slides and cutter-heads, substantially as before set forth.

8. In a machine for tenoning and tapering spokes, the combination, substantially as before set forth, of the endless feed chain or chains, the fixed top bars constructed with ascending grades or inclines at the feeding-in end of the machine, and independent dogs on the chain or chains, whereby a spoke is first automatically gripped for holding it firmly in feeding it through between the cutter-heads, and then automatically released and discharged.

258,853. BUTTON. Enno Fischer, Stuttgart, Wurtemberg, Germany. Filed Feb. 20, 1882. (No model.) Patented in Germany Mar. 10, 1881, No. 15,091; in France Dec. 17, 1881, No. 146,399, and in Austria Feb. 14, 1882. No. 41,818.

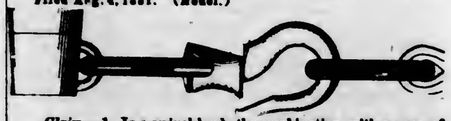
Claim.—The combination, with a button provided with a screw-threaded socket, of the pair of serrated jaws, and the screw-threaded button-shank passing through said jaws and received in the screw-threaded socket of the button, whereby by turning down the latter upon its shank the jaws will be forced together, substantially as described.



258,854. TRUSS. Joseph Fay, Ligonier, Pa. Filed Apr. 11, 1881. (No model.)

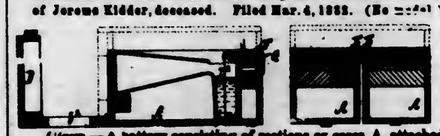
Claim.—In a truss, the combination of the hip-band or spring B, formed with a pivot arm or extension, b, the pad A, provided with arm a, having holes a' and a'', the torsional spring S, and studs P P', substantially as described.

258,854.



258,855. COMBINED ANVIL AND VISE. John J. Glover, Dardanelle, Ark., assignor of one-half to Louis C. Hall, same place. Filed Oct. 26, 1881. (No model.)

Claim.—The combination of the anvil O, recessed in its base at M, with the anvil-block A, having the channel B, recesses C and F, the angular arm E, having slot K, studs D and L, and the legs V V, the piece G, slotted at I, key I', movable jaw Q, pin U, screw S, and lever T, substantially as and for the purposes specified.



258,856. WHIFFLETREE-HOOK. John H. Reuteree, Janesville, Wis., assignor of one-half to Charles Dutton, same place. Filed Aug. 4, 1881. (Model.)

Claim.—1. In a swivel-hook, the combination, with an eye, of a hook eccentrically pivoted to said eye, substantially as set forth.

2. In a swivel-hook, the combination, with an eye formed at its lower edge with a circumferential shoulder cut away at one side, of a hook eccentrically swiveled to said eye, substantially as set forth.

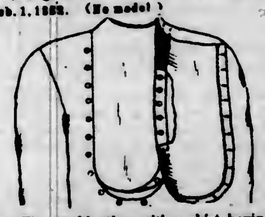
258,857. GALVANIC BATTERY. Francis H. Kidder, New York, and Hannah W. Keyes, Brooklyn, N. Y., Administrators of Jerome Kidder, deceased. Filed Mar. 4, 1882. (No model.)

Claim.—A battery consisting of sections or cases A, attached to a lid or support, B, containing cells of a battery, and provided with strips or rods of metal E, for electrically connecting the cells in any of said sections or cases with the cells of adjoining cases when charged and in the proper position, substantially as and for the purposes above described.

258,858. DENTIST'S FLASK. Elias H. Locke, Troy, Ala., assignor of one-half to Frank Baltzell, same place. Filed Oct. 10, 1881. (No model.)

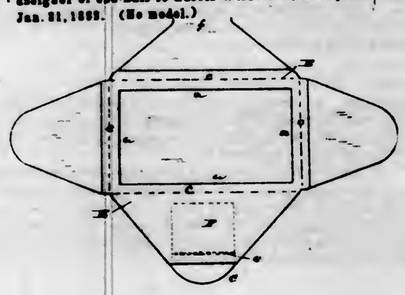
Claim.—A dentist's flask consisting of the solid bottom A, having uprights B B, the middle ring, C, consisting of two parts, C' C', having legs b, and connected by hinges D D', having removable knuckle-pins d, the top ring, C'', having notches N, and the detachable top E, having projections P, all arranged and operating substantially as and for the purpose set forth.

258,859. ELECTRICAL CONNECTION FOR RAILWAY-TRAINS. Jesse H. Low, Pulaski, N. Y., assignor of one-half to Frank S. Low, same place. Filed Mar. 1, 1882. (No model.)



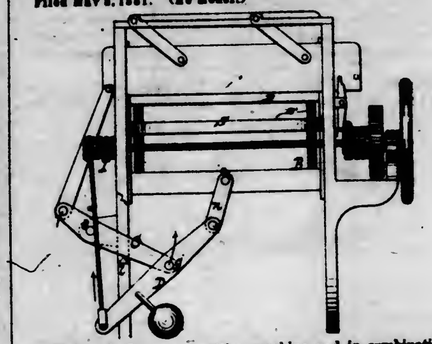
Claim.—1. In an organized system of electrical conductors attached to the cars of a railway-train for the purpose of signaling the engineer in charge of the train, the combination, with the electrical conductors a and a', fixed to each car and adapted to connect and disconnect by means of the fixed conducting-pieces G and the flexible conductors H, provided with the metallic springs f', constructed and arranged to operate as set forth, and one or more push-buttons, F, fixed in or on the cars, and electrically connected to the conductors a and a', as herein described, of the battery C and alarm-bell D, fixed on the engine of the train, as and for the purpose specified.

2. In an open-circuit system of electric conductors, the combination, with the conductive pieces G, provided with the projections f', as herein described, of separable conductors provided with springs f', adapted to engage in the pieces G in such manner that a closing of the open circuit will be automatically effected by every engagement and disengagement of said springs with the pieces G, in the manner herein specified.



3. The device herein described for connecting and disconnecting the lines of open-circuit electric conductors, composed of the conductive pieces G, containing the projections f' and insulated from each other, as herein set forth, and the springs f', insulated from each other and adapted to engage with the pieces G in such manner that the open circuit will be momentarily closed every time the said springs are connected to or disconnected from the said pieces G, as herein specified.

258,860. REVERSIBLE SHIRT. David Lubin, Sacramento City, Cal., assignor of one-half to Harris Weinstock, same place. Filed Feb. 1, 1882. (No model.)



Claim.—The combination, with a shirt having a bosom-flap open on one side only, of a breast and back protector having a flap opening opposite to the said bosom-flap, substantially as and for the purposes described.

258,861. ENVELOPE. David Lubin, Sacramento City, Cal., assignor of one-half to Harris Weinstock, same place. Filed Jan. 31, 1882. (No model.)

Claim.—An envelope having a self-sealing tongue, f, on its closing-flap, a re-enforcing frame, E, for the four corners of the envelope, and the flap G, a pocket, F, for receiving the tongue, and a slit, e, all substantially as described.

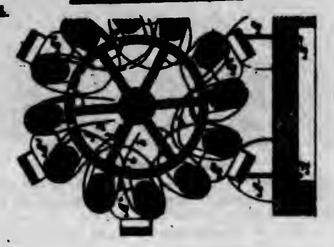
258,862. PAPER-CUTTING MACHINE. Alexander Hall, Brooklyn, assignor to T. W. & C. B. Sheridan, New York, N. Y. Filed May 2, 1881. (No model.)

Claim.—1. In a paper-cutting machine, and in combination with the knife and the clamp-bar of the same, a compound lever composed of bars C D, one member whereof is coupled to the knife and fulcrumed on the frame, and the other member whereof is pivotally jointed to the first member and coupled to the movable clamp-bar, substantially as shown, and its free end coupled to the driving-power.

2. In a paper-cutting machine, the combination of a knife-lever fulcrumed on the main frame and having a pivotal traction connection with the knife-stock, a clamp-frame and a clamp-lever having a pivotal connection thereto and pivotally attached intermediate its ends directly to the knife-lever, and a traction device connected to the outer end of the clamp-lever, the said members being arranged in the described relation, to operate as set forth.

3. The combination, substantially as hereinbefore set forth, of the knife-lever pivoted intermediate of its ends to the machine-frame and having a pivotal connection with the knife-stock at the outer end, a clamp-lever pivoted intermediate of its ends to the inner end of the knife-lever and having a pivotal connection with the clamp-frame at the inner end, and the balance-weight and the traction device connected to the outer end of the clamp-lever.

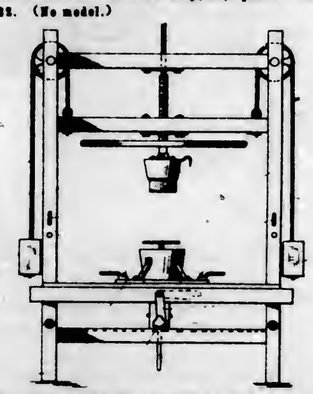
258,863. DRIVE-CHAIN. Dennis B. McKernan, Chicago, Ill. Filed Mar. 6, 1882. (Model.)



Claim.—1. In a detachable link, the combination, with the hook and with a lug on the end bar, of a key fitting in grooves abutting against and forming substantially a uniform continuation of the point of the hook and the end bar, and adapted to close the throat of the hook, substantially as described.

2. In a drive-chain, a link one end of the side bars of which are provided with lugs projecting above the same, and their opposite ends joined by a hook, in combination with a removable key closing the throat of the hook, substantially as described.

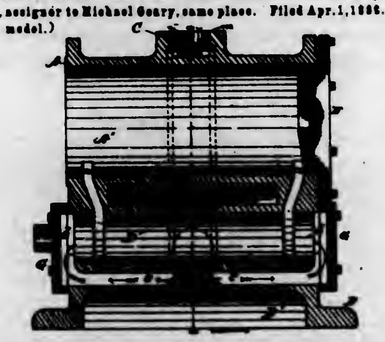
3. The link A, provided with the lugs *a a*, and the hook *b*, having its point provided with internal grooves, in combination with the end bar and its grooved rib, and the key *c*, fitting in said grooves, substantially as described.



258,864.

258,864. DYNAMO-ELECTRIC MACHINE. HARE J. HELLER, New York, N. Y., assignor (if one-fourth to Alexander Lovett, same place. Filed Oct. 13, 1879. Patented in England Apr. 25, 1881, No. 1,737; in France Apr. 26, 1881, No. 142,636; in Belgium Apr. 26, 1881, No. 54,504; in Canada May 31, 1881, No. 13,283; in Spain July 21, 1881, No. 1,520, and in Austria July 29, 1881, No. 14,283.

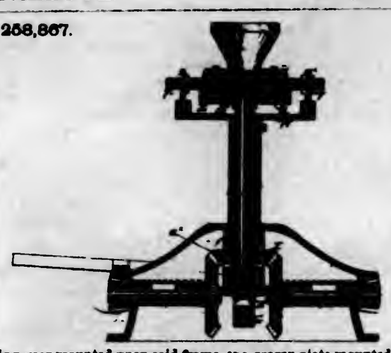
Claim.—In a dynamo-electric machine, the combination, with opposite field-of-force magnets, of an armature-wheel having its coils J', J², &c., placed in an inclined position to radii of said wheel, substantially as shown and described, for the purpose specified.



258,865. POTTERY-PRESS. DANIEL PIKE, New Orleans, La., assignor of one-half to H. J. Deady, same place. Filed Mar. 18, 1882. (No model.)

Claim.—1. In combination with the mold, the plunger secured to a screw passing through a cross-beam, arranged to move in ways or guides, and counterbalanced by means of suitable weights and chains, substantially as specified.

2. In combination with the mold, the rotating plunger having a series of beveled faces on its bottom, substantially as and for the purposes specified.



258,866. STEAM-ENGINE. JAMES W. PLIMPTON, Oil City, Pa., assignor to Michael Geary, same place. Filed Apr. 1, 1882. (No model.)

Claim.—A casting for a steam-engine having a cylinder, A, with piston-chamber A', a pedestal, D, for supporting the same, a steam-chest, B, with valve-chamber B', lying below and parallel with said cylinder and within said pedestal, and connected to said piston-chamber by ports *a a*, and being sufficiently shorter than said cylinder to leave spaces *b b* at its ends, an exhaust-passage, E, leading from said valve-chamber directly through the walls of the pedestal, and, finally, a supply-passage, C, which passes from above the cylinder to below the steam-chest, and there branching into passages *c c*, leading to the spaces *b b*, all of which parts are produced in said casting at the operation of casting.

258,867. GRINDING-MILL. GEORGE RAYNOR and ALBERT RAYNOR, Chicago, Ill., assignors of one-half to Orville H. Tuboy, same place. Filed July 12, 1881. (No model.)

Claim.—1. In a grinding-mill, the combination of a base-frame provided with the tubular upright post or standard, the driving-gear mounted upon said frame, the geared plate mounted upon the central post, the vertical central spindle, the revolving disk attached to the spindle, and the stationary grinding-disk, and devices, substantially such as shown, connecting the stationary disk with and supporting it from the tubular post, as described and shown.

2. In a disk-action grinder, the combination of a base-frame having a tubular post thereon, a central vertical spindle mounted within the post and provided with a grinding-disk at the upper end, two horizontal driving-shafts geared to the spindle upon opposite sides of its axis, and a revolving peripherally-toothed driving-plate mounted on an axis concentric with the mill-spindle and engaging with pinions upon the outer ends of the two driving-shafts, whereby the power is applied uniformly upon the two sides of the spindle.

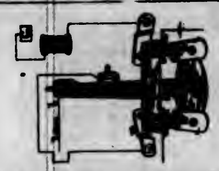
3. In a grinding-mill, the base-frame provided with a central opening, the central tubular standard sustained above the openings by the bridge-tree, and bearings for two horizontal shafts located upon opposite sides of the opening below the level of the bridge-tree.

4. The combination of the base-frame provided with the central opening, the bridge-tree, and the tubular standard upon the latter, the central spindle, the pinion upon the lower end of the spindle, the two vertical pinions engaging with opposite sides of the spindle-pinion and sustained by outwardly-extending shafts, and the central spindle-adjusting lever, G, located between the vertical pinions beneath the bridge-tree, as shown and described.

5. In a grinding-mill, the base-frame provided with the bridge-tree, and the tubular standard thereon, in combination with the horizontal shafts provided with beveled pinions on their two ends, the vertical central spindle provided with the beveled pinion upon its lower end, and the revolving toothed plate mounted upon and around the central standard, and provided at its outer edge with teeth engaging with the pinions upon the outer ends of the horizontal shaft.

6. The base-frame, the bridge-tree, the central standard upon the latter, and the cross-bar D, in combination with the central vertically-adjustable mill-spindle and its driving-pinion mounted between the bridge-tree and bar D, as shown, having a sliding connection with the spindle.

7. The base-frame provided with the central opening, the bridge-tree spanning the same, and the tubular post or standard sustained upon the bridge-tree, in combination with the cross-bar beneath the bridge-tree, the vertical spindle, its driving-pinion, and the adjustable step for the spindle seated in bearing B, substantially as shown.



8. In combination with the two grinding-disks and the curb or casing Z, the sustaining-frame W, constructed, as described, to permit the curb to be dropped below the grinding-faces of the disks.

9. The combination of the two grinding-disks, the spindle, the frame W, the vertical screws, the top plate, and the curb or casing, substantially as shown.

258,868. TELEPHONE-EXCHANGE SWITCH-BOARD. CHAS. W. ROSS and GEO. H. TWISS, Columbus, Ohio, assignors to the Western Electric Manufacturing Company, Chicago, Ill. Filed Mar. 10, 1882. (No model.)

Claim.—1. The subscriber's ground-circuit in combination with two contact-springs, one for connecting with the operator's outfit, the other for taking off the ground, and an intermediate non-conducting pin whereby, when the former is depressed so as to connect with the operator's outfit, the latter will be moved automatically, so as to take off the ground.

258,868.

2. The combination of the circuit of a telephone-line through the spring-jack and annunciator to ground with two springs, one for connecting with the operator's outfit, the other for connecting with the generator, and means whereby the ground is automatically taken off when either spring is depressed, as and for the purpose specified.

3. The combination, upon the switch-board of a telephone-exchange, of spring-jacks, one for each line, each line passing through its spring-jack to ground, and pairs of keys, one pair for each spring-jack, one key of each pair for connecting to the operator's outfit, the other for connecting with the generator.

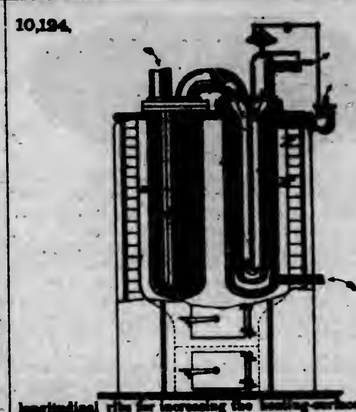
4. The combination, upon the switch-board of a telephone-exchange, of spring-jacks, one for each line, each line passing through its spring-jack to ground, and pairs of keys, one pair for each spring-jack, one key of each pair for connecting to the operator's outfit, the other for connecting with the generator, and means at each pair whereby the ground is automatically removed when either key is depressed.

258,869. BURIAL-VAULT. JAMES F. WINCHELL, Springfield, Ohio, assignor to George W. Boyd & Co., same place. Filed Feb. 8, 1881. (No model.)

Claim.—An outer metallic coffin having an open end surrounded by an inwardly-projecting flange, in combination with a head or door, E, having catches G G at its lower edge, on the inner face thereof, and pivoted weighted catches I I near the upper edge, on the same face, to engage the flange and lock the head from the inside, substantially as shown and described.

REISSUES.

10,123. UNDERGROUND-TELEGRAPH LINE. DAVID BROOKS, Philadelphia, Pa. Filed Apr. 26, 1882. Original No. 254,868, dated Feb. 28, 1882.

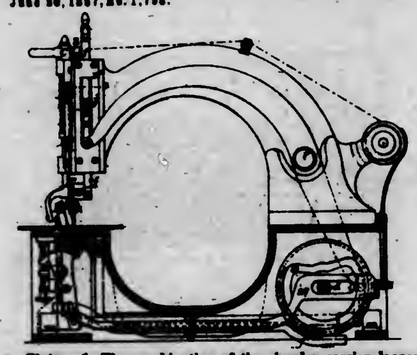


Claim.—The mode herein described of preventing the escape of insulating-fluid from the terminal pipes of underground-telegraph lines, the said mode consisting in introducing paraffine or similar material into such terminals, and compressing the same around the wires in the pipe near the end of the said pipe.

10,124. APPARATUS FOR SUPERHEATING STEAM OR HEATING AIR. SOLOMON H. CARVALHO, New York, N. Y., assignee to Jacob S. Carvalho, same place. Filed Apr. 10, 1882. Original No. 242,502, dated Nov. 15, 1881.

Claim.—1. In an apparatus for superheating steam or heating air, a retort composed of an exterior and an interior casing, the latter provided with a longitudinal diaphragm which extends centrally through it to a point at some distance from the bottom of the same, substantially as set forth.

2. In an apparatus for superheating steam or heating air, a retort composed of an interior and an exterior casing, the former having a central longitudinal diaphragm extending to a point at some distance from the bottom, both casings being provided with



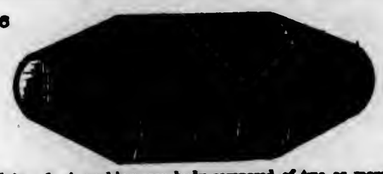
10,124.

longitudinal ribs for increasing the heating-surface, substantially as specified.

3. In an apparatus for superheating steam or heating air, the combination, with a retort composed of an interior and exterior casing, of inlet and outlet pipes connected to the outer casing and mechanism whereby the temperature to which the steam or air which is to be heated is controlled by the admission of cold air, substantially as specified.

10,125. SEWING-MACHINE. AUGUSTE JACQUES HAUTH and VICTOR JOSEPH HAUTH, Paris, France, assignors, by mesne assignments, to Hauth Sewing Machine Company, of New York. Filed Mar. 24, 1880. Original No. 23,064, dated Dec. 21, 1858. Patented in France June 11, 1867, No. 78,719, and in England June 20, 1867, No. 1,798.

Claim.—1. The combination of the circular carrier, looper, and devices for revolving the same, and ring 16, and operating appliances whereby the loop is thrown off the carrier, substantially as set forth.



2. The combination of the awl and needle carriers, and devices for sliding them and appliances for rotating them to bring the needle and awl successively over the same point in and passing them through the material without moving the latter, substantially as set forth.

3. In a double-thread sewing-machine, the combination of a needle and shuttle, an independent take-up having a positive motion, a gripping device acting positively, and appliances whereby the same is caused to bear against the bobbin at the time the take-up is in operation and prevent the thread from being then unwound, substantially as set forth.

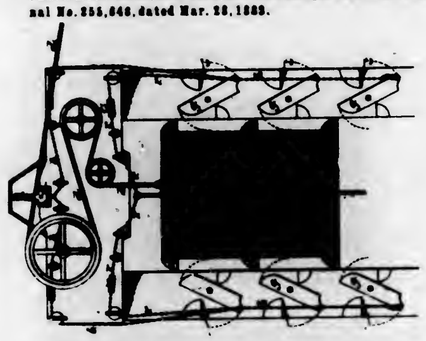
4. The combination, with the gripper and appliances to positively operate it to grip the upper thread and with the positively-moving take-up, whereby the upper thread is drawn up after being interlocked with the lower thread and while it is gripped, of an adjustable device for regulating the extent to which the thread is drawn up by the take-up, as set forth.

10,126. PACKING-CASE. RALPH S. JENNINGS, Baltimore, assignor to Joshua Levering, Baltimore, and George C. Manning, Baltimore County, Md., Trustees. Filed Mar. 11, 1882. Original No. 237,673, dated Feb. 15, 1881.

10,126

Claim.—1. A packing-case body composed of two or more sheets of veneer cemented together and having its side seam united by corrodible stitches, said seam and stitches being covered by a coating of non-corrodible cement, substantially as described.

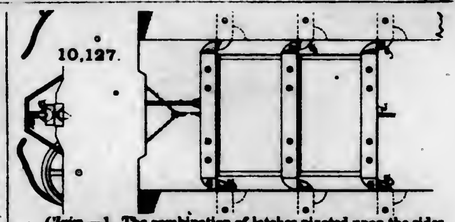
2. A packing-case having a veneer body whose seam is secured by corrodible stitches, said seam and stitches being covered by a coating of non-corrodible cement, for the purpose set forth.



3. The packing-case herein described, consisting of a veneer body, with its wall-seam secured by stitches, and having flanged metallic heads secured to the body by stitches, substantially as described.

4. A packing-case consisting of two or more sheets of veneer cemented together with the grain crossed, the wall-seam being secured by stitches, and of metal flanged heads secured to the body by stitches and by a water-proof material, substantially as described.

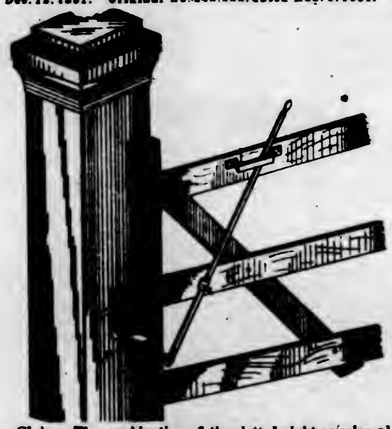
5. As a new article of manufacture, a water and acid proof packing-case consisting essentially of a veneer body with a wall-seam secured by corrodible stitches, the seams and stitches being protected by a covering of non-corrodible cement, and a head secured to the body by stitches, substantially as described.



6. A packing-case consisting of two or more sheets of veneer cemented together, and having a flanged metallic head secured to the body by stitching, substantially as set forth.

10,127. SELF-ACTING ELEVATOR SAFETY APPARATUS. JAMES MCCARROLL, New York, N.Y. Filed Apr. 29, 1882. Original No. 255,646, dated Mar. 28, 1882.

Claim.—The combination of the slotted right-angular plate, the pivoted wedge-shaped or oblique-faced catch having a horizontal top flange, the movable latch bolt or rod, and the pivoted unlatching-lever, with the gate-post, and the gate having an aperture for the passage of the latch-bolt, as and for the purpose set forth.



10,127.

Claim.—1. The combination of latches pivoted upon the sides of an elevator shaft or frame, and adapted to engage projections or recesses in the elevator, with a spring brought into play by the tension thereon of the main rope, under the weight of the elevator suspended therefrom, and with intermediate cords, by which the spring, when relieved from tension, will be made to act upon the latches and throw them into effective engagement with the elevator to arrest and support it, substantially in the manner and for the purpose herein set forth.

2. The cam, bellow tube, and auxiliary chains in their connection with the latches, substantially in the manner and for the purpose herein set forth.

10,128. GATE-LATCH. PHILIP J. WISE, Fork Union, Va. Filed Dec. 12, 1881. Original No. 245,253, dated Aug. 2, 1881.

Claim.—The combination of the slotted right-angular plate, the pivoted wedge-shaped or oblique-faced catch having a horizontal top flange, the movable latch bolt or rod, and the pivoted unlatching-lever, with the gate-post, and the gate having an aperture for the passage of the latch-bolt, as and for the purpose set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE WILSON PACKING COMPANY *et al. v.* THE CHICAGO PACKING AND PROVISION COMPANY *et al.*

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

THE WILSON PACKING COMPANY *et al. v.* HUNTER *et al.*, (two cases.)

APPEALS from the Circuit Court of the United States for the Southern District of Illinois.

Decided May 8, 1882.

1. REISSUED LETTERS PATENT NO. 6,370 INVALID.

Reissued Letters Patent No. 6,370, granted to William J. Wilson for improvements in processes of preserving and packing cooked meats as limited by the two disclaimers filed October 26, 1880, construed and held to be void for want of novelty and invention.

2. SAME—MERE CHANGE—AGGREGATION.

All the other parts of a process of preserving meats remaining unchanged, a mere change in the mode of cooking the meat from broiling, roasting, or steaming to boiling cannot be called invention and entitle the party who suggests the change to a patent for the process. It is a mere aggregation of old elements, bringing out no new product nor any old product in a cheaper or otherwise more advantageous way.

3. REISSUED LETTERS PATENT NO. 7,923 INVALID.

Reissued Letters Patent No. 7,923, for an improvement in sheet-metal cases, held to be void for want of novelty.

Mr. Wm. Henry Clifford and *Mr. Jno. N. Jewett* for the appellants.

Mr. L. L. Coburn and *Mr. Jno. W. Noble* for the appellees.

STATEMENT.

By stipulation of the parties these cases were argued together as one case.

The bills of complaint charged the defendants with the infringement of their several reissued letters patent of the United States, of which the complainants were the assignees and owners. Only two of these patents are relied on. These are: First, Reissue Letters Patent No. 6,370, granted to William J. Wilson, dated April 6, 1875, upon an application filed April 2, 1875, for improvements in processes for preserving and packing cooked meats; and, second, Reissue Letters Patent No. 7,923, granted to John A. Wilson, dated October 23, 1877, upon an application filed October 15, 1877, for improvement in sheet-metal cases. The bills of complaint were dismissed on final hearing by the courts below in which, respectively, the cases were tried, and the complainants have brought them to this Court by appeal. The controversy relating to these patents will be separately stated and considered.

The original patent to William J. Wilson bore date March 31, 1874. The specification of this patent was as follows:

Be it known that I, William J. Wilson, of Chicago, in the county of Cook and State of Illinois, have invented certain new and useful improvements in processes for preserving and packing cooked meats; and I do hereby declare that the following is a full, clear, and exact description thereof.

The nature of my invention consists in a process for packing cooked meats for transportation in a compressed form, while heated with cooking, into an air-tight package, so as to preserve the meat in its integrity and retain all the natural juices and nutritious qualities of the meat.

In carrying out my invention, the meat is first cooked thoroughly at a temperature of 212° Fahrenheit, so that all the bone and gristle can be removed and the meat yet retain its natural grain and integrity. The meat is then in proper condition for eating, and is wholesome and palatable. A measured quantity of this cooked meat is then, while yet warm with cooking, pressed by any suitable apparatus into a previously-prepared box or case with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake. The box or case is then closed air-tight upon the meat.

The meat is thus packed and compressed in its natural state—that is, without disintegration or desiccation—and it retains all the juices and nutritious qualities of the meat, the compression only removing the superfluous moisture. The meat thus put up is available at all times, even when cooking is impracticable, as it is already cooked before it is packed. It is more economical, as it is compressed and reduced in weight one-half from the uncooked weight, being free from bone and gristle and put up in a compact portable shape for transportation, rendering the usual expensive cooperage unnecessary. Besides this, there is a great saving in the cost of transportation. A barrel containing two hundred pounds uncooked meat weighs, gross, three hundred and twenty pounds meat, salt, brine, and barrel, while by my process it would weigh only one hundred and ten pounds, gross, making a saving in cost of freight alone of nearly two-thirds.

The box or case may be made of wood or metal, or both combined, of any suitable form or shape, and of any desired dimensions.

The claims were thus stated:

1. The within-described process for packing cooked meats for transportation, by compressing the same, while heated with cooking, into an air-tight package, so as to preserve the meat in its integrity and retain all the natural juices and nutritious qualities of the meat, substantially as set forth.

2. As a new article of merchandise, cooked meat put up in solid form, in its natural state, without disintegration or desiccation, in hermetically-sealed packages, as set forth.

The differences between the specification and claims of the reissue and the original patents of William J. Wilson were these: First, in the omission from the second clause of the reissue specification of the words "while heated with cooking," contained in the corresponding clause of the original specification; second, the insertion of the word "preferably" in the third clause of the reissue specification before the words "while yet warm with cooking;" third, omitting from the first claim of his reissue the words "while heated with cooking," contained in the first claim of the original patent. In all other respects the specification and claims of the original and reissued patents are identical. Therefore the original and reissued patents of William J. Wilson are the same, except that the reissue covers the process of packing the meat cold, if preferred, while the original required that it should be packed while warm with cooking. There is nothing in either the original or reissued patent in regard to the boiling or in regard to any preliminary corning or curing of the meat.

While the causes were pending in the court below, and after the testimony in chief of the defendants had been taken, to wit, on October 26, 1880, the patentee and the complainants filed in the Patent Office a disclaimer, disclaiming the word "preferably" where inserted in the specification of the reissued patent, and also any process described and claimed by which meat is to be compressed into the packages in any other than a warm or heated condition. On the same day the

patentee and complainants filed another disclaimer, whereby they disclaimed any interpretation or legal construction of the words of the specification of the reissued patent broader than is conveyed by the words "the meat is first cooked thoroughly by boiling it in water, so that all the bone and gristle can be removed and the meat yet retain its natural grain and integrity." The effect of this disclaimer was to restore the claims of the reissued patent to what they were in the original patent, except that the claim of the original patent is limited by the second disclaimer to the packing of meat cooked by boiling. As amended by these disclaimers the claims of the reissued patent were as follows:

1. The within-described process of packing for transportation meats cooked by boiling by compressing the same, while heated with cooking, into an air-tight package, so as to preserve the meat in its integrity and retain the natural juices and nutritious qualities of the same.

2. As a new article of manufacture, meat cooked by boiling put up while heated with cooking, so as to form a solid cake in the package in its natural state, without disintegration or desiccation, in hermetically-sealed packages, as set forth.

It will be seen that the invention covered by the letters patent of William J. Wilson after the disclaimers was a process consisting of the following elements:

First. The thorough cooking of the meat by boiling in water at a temperature of 212° Fahrenheit and the removing of the bone and gristle.

Second. The pressing of the meat, while warm with cooking, into a box or case with sufficient force to remove the air and superfluous moisture, so as to make the meat form a solid cake.

Third. The closing of the box or case air-tight upon the meat.

It also covered the product of this process as described in the second claim.

The defense set up was want of novelty, and it was averred that the process described in the reissued letters patent of William J. Wilson was also described in prior English, French, and American patents, which are specified, and was practiced by many persons, whose names and residences are given, at various dates prior to the application of Wilson for his patent.

Mr. Justice WOODS delivered the opinion of the Court.

The patent does not specify what kind of box or case was required, nor what kind of meat was to be used in its processes, whether corned or fresh, nor in what manner or by what process it was to be compacted in the case or box, provided sufficient force was used to remove the air and all superfluous moisture and make the meat form a solid cake, nor the degree of warmth necessary in the meat when it was put in the case or box. Neither does it state the method by which the case was to be sealed up. It was simply required to be "closed air-tight upon the meat," the air having first been excluded from the case by cramming the latter full of meat. The patent, therefore, apparently covers only the process of cooking meat by boiling and while it is still warm pressing it compactly in cases and sealing it up air-tight.

The second disclaimer of Wilson is a substantial admission that his patent only covered the process in which the boiling of the meat was one of the elements. That is to say, any one might pack cooked meats for transportation by compressing the same, while heated with cooking, into an air-tight hermetically-sealed package, so as to preserve the meat in its integrity and retain all its natural juices and nutritious qualities, substantially as set forth in the Wilson patent, and not infringe the patent, provided he did not cook the meat by boiling. If any other method of cooking the meat should be adopted, there would be no infringement. The patentee and the complainants, it appears, were induced to make this disclaimer by the evidence introduced by the defendants in this case, especially the patent of A. S. Lyman, dated June 22, 1869, "for an improved mode of preparing and pressing roast meat in a condensed and concentrated form;" and it amounts to an admission that they could not sustain the process covered by their patent, except as applied to boiled meats.

We are clearly of opinion that a change in the mode of cooking the meat from broiling, roasting, or steaming to boiling, all the other parts of the process remaining unchanged, cannot be called invention, and entitle the party who suggests the change to a patent for the process.

All improvement is not invention, and entitled to protection as such. Thus to entitle it it must be the product of some exercise of the inventive faculties, and it must involve something more than what is obvious to persons skilled in the art. (*Pearce* v. *Mulford*, 102, U. S., 112.) (See, also, *Rubber Tip Pencil Company* v. *Howard*, 20 Wall., 498; *Hotchkiss* v. *Greenwood*, 11 How., 248; *Simpson* v. *Hardman*, 10 Wall., 117.)

If meat cooked by roasting or steaming and put up in a given mode formed a valuable article of commerce, the cooking of the meat in other ways—as, for instance, by boiling—would naturally occur to any one engaged in the business of packing such food for the market. But we think there is nothing new in the process covered by the patent under consideration. Clearly all its separate elements are old and well known, and have been long used. This is not controverted. The evidence shows that the process of boiling meat, packing it while warm in cans, and sealing it air-tight had long been used before the application of Wilson for his original patent. There is, it is true, much conflict in the evidence, but, taken all together, it leaves no doubt in our minds that the process of cooking meat, lobsters, and other articles of food by boiling and compacting them in cans while warm from the cooking and then sealing them up air-tight was practiced in many places and many years before the application of Wilson for his patent. Complainants, however, insist that there are two elements in their process which, taken in connection with the others above mentioned, form a combination never used before the date of Wilson's patent. The first of these is the subjecting of the cases after they are packed and sealed air-tight to what is known as the "Appert process." This consists of placing the cans after they have been filled and sealed up in a bath of hot water, and thereby heating them, after which they are removed and punctured and the heated air and gases which have formed in the cans are allowed to escape, and the puncture is immediately closed by a drop of solder. The contention is that all this is made a part of the process covered by the Wilson patent by the description of the new article of merchandise covered by the second claim of the patent as "cooked meat" "in hermetically-sealed packages." It is insisted that "hermetically-sealed packages" is a term which, among those dealing in canned goods, implies that the packages have been subjected to the Appert process. We think that this is an unwarrantable stretch of the meaning of the second claim of the patent. The article of merchandise covered by the second claim is that produced by the process disclosed by the specification and first claim. The second claim expressly states that it covers cooked meat put up in solid form, &c., "in hermetically-sealed packages, as set forth."

Recurring to the specification and first claim of the patent, we are not left in doubt about what the process

of sealing the cases or cans hermetically is which is set forth. The specification declares the invention to consist in a process for packing cooked meats into an air-tight package. The method of doing this is thus described:

A measured quantity of this cooked meat is, while yet warm with cooking, pressed by any suitable apparatus into a previously-prepared box or case with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake. The box or case is then closed air-tight upon the meat.

The process of hermetically sealing as set forth is simply to exclude the air from the case by filling it compactly with cooked meat still warm, so that the cover, when applied, will rest on the meat, and then closing the case by fitting on the cover air-tight. There is no suggestion here of anything further to be done to make the package a hermetically-sealed one. The process described leaves it hermetically sealed. There is no hint that the Appert process is to be subsequently applied as a part of the process covered by the patent. On the contrary, that idea is excluded by the terms of the second claim, "hermetically sealed, as set forth."

It is further contended by the appellants that the process disclosed by the Wilson patent includes the cooking of the meat to be canned by plunging it into water already heated to the boiling-point. That is, the process of cooking is commenced by placing the meat in water already heated up to 212° Fahrenheit. By this method of cooking it is said the meat is preserved in its integrity, and all its natural juices and nutritious qualities are retained.

We think that the plan of beginning this process of cooking by putting the meat in water already heated to the boiling-point is not set forth in the specification or claims. The conditions prescribed by the specification would just as well be filled by placing the meat in cold water and then heating the water to the boiling-point, and allowing the meat to remain in it until cooked thoroughly. No person on reading the specification could extract the idea that there was any advantage to be gained by heating the water to the boiling-point before placing the meat in it to be cooked, or that any such method was in the mind of the inventor. This part of complainants' process is clearly an afterthought, and not intended by the inventor to be covered by his patent when he applied for it. It is evident that the part of the process now under consideration is nowhere described in the specification in full, clear, and exact terms, as required by law. On the contrary, it is not described at all.

The Appert process and the cooking of meats by plunging them into water already heated to the boiling-point may be of great advantage to the canned meats put up by the complainants, and to these practices their alleged superiority to the products of other parties may be attributed; but the trouble with complainants' case is that these elements are not included in the process disclosed by the patent which they allege is infringed by the defendants.

Our conclusion is, therefore, that there is nothing new in the process described in the William J. Wilson patent. All the elements of the process are old. They are merely aggregated, and the aggregation brings out no new product, nor does it bring out any old product in a cheaper or otherwise more advantageous way. This disposes of the first claim of the patent under consideration. If that claim cannot stand, it follows that the second claim, which is for the product made by the employment of the process described in the first claim, is also invalid. We are of opinion, therefore, that the patent to William J. Wilson, on which the complainants rely, is void for want of invention and for want of novelty in the process described therein.

We shall next consider that branch of the case which rests on the letters patent to John A. Wilson for improvements in metallic cans for containing cooked meats.

The specification declares that—

My invention relates to hermetically-sealed cans used in packing meats or other articles; and it consists in a pyramidal-shaped can having rounded corners, and both ends slightly flaring to form shoulders, against which the head or end pieces rest.

a represents the body of my can, made in the form of a truncated pyramid with rounded corners, and with any desired number of sides, though I prefer to make it with four sides. Both ends of the body are made slightly flaring, so as to form interior shoulders of offsets c, against which the heads B and C are to rest. The edges of these heads are turned outward, as shown, a b, and the flaring edge d of the end of the can is turned over the flange b, and the three thicknesses of metal pressed together by machinery, with or without solder, so as to make air-tight joints.

In packing cooked meats it is done by means of a plunger through an aperture in the large head B, which opening is afterward hermetically sealed by means of a cap or plate, D. * * * The can is to be opened at the larger end at or near the shoulder a by means of a suitable can-opener, so that when the can is reversed again a slight tap on the smaller head c will cause the solidly-packed meat to slide out in one piece, so as to be readily sliced, as desired.

The claims which are in controversy in this case are the first and third, which are as follows:

1. A can for packing food, hermetically sealed, and constructed of pyramidal form, with rounded corners and offset ends to support the heads, said heads being secured, as shown and described.

3. As an improved article of manufacture, solid meat compressed and secured within a pyramidal case or can, so that said can forms a mold for the meat and permits its discharge as a solid cake, substantially as specified.

The defenses set up to this branch of complainants' case are that the devices covered by the patent are not new and that the defendants do not infringe.

The evidence clearly shows that none of the defendants use cans "with offset ends to support the heads, said heads being secured as shown and described" in the patent. The cans which they use are made by turning a flange of the head down over the outside of the shell of the can and fastening the head in place with solder.

It also appears that this method of fastening the heads and bottoms of the cans was practiced before the date of Wilson's application for his patent by Gibbie and Perl as early as 1872. The method was also described in the fifth addition of the French patent of Emile Peltier, dated April 1, 1869.

All, therefore, that is left to consider is whether the shape of the can described in the John A. Wilson patent is new and whether the defendants use it.

The shape of the can described in the patent is pyramidal, with round corners, and with four or more sides. It is admitted on the record by counsel for complainants that conical tin cans were made and used for canning alimentary substances and sealed air-tight prior to the date of the Wilson patents. If it be conceded that the change of a conical can to a pyramidal can with rounded corners involves invention, the complainants are met with distinct and unequivocal evidence that cans used for containing preserved food and closed air-tight, having four or more sides, and pyramidal in form, with rounded corners, were mentioned in the fifth addition to the patent of Emile Peltier, before referred to, and that the machinery for making them was therein described.

The cans used by the defendant, The St. Louis Beef

Packing Company, and by the defendants, Robert D. Hunter and others and The Chicago Packing and Provision Company, are all included in the descriptions of the Peltier patent. The defense of want of novelty set up by the defendants against the first claim of the patent of John A. Wilson must therefore prevail.

What has been said leaves nothing for the third claim of the John A. Wilson patent to rest on. There is nothing new either in the shape or construction or material of his cans. There is abundant evidence in the record of the packing, long before the date of his patent, of cooked meat in cans, so that the can served as a mold for the meat, and the meat formed a solid cake. The use of a pyramidal can, which was old, for the purpose of receiving the meat cake, which was also old, involved no invention. The use of vessels with flaring sides as receptacles and molds for edible substances is as old as the art of cookery.

Our conclusion is that both the first and third claims of the John A. Wilson patent are void for want of novelty. The result of the views expressed is that the decree of the court below, dismissing the bills of complaint, were right and should be affirmed.

—

The case of *The Wilson Packing Company et al.* v. *William B. Clapp* (appeal from the Circuit Court of the United States for the Northern District of Illinois) was argued at the same time with the cases disposed of in the foregoing opinion. The case involved the validity of both claims of the reissued patent of William J. Wilson and the first and third claims of the reissued patent of John A. Wilson. Upon these questions the opinions of the judges of the court were divided, and a decree dismissing the bill was thereupon entered in accordance with the opinion of the presiding judge.

The views expressed by us in the foregoing cases dispose of this case also. We concur in the opinion of the presiding judge of the circuit court, and the decree of that court, dismissing the bill, must be affirmed.

Supreme Court of the United States.

GUIDET *v.* THE CITY OF BROOKLYN.

Decided April 17, 1882.

PAVEMENTS—PATENTABILITY—MATTER OF DEGREE.

Where a firm bed and an open joint for foothold had been before obtained by using parallelopipeds with rough side surfaces in conjunction with a filling of sand it required no invention to secure the entire result by selecting stones with rougher side surfaces and dispensing with artificial means for keeping the stones apart. The change was only of degree and not patentable.

APPEAL from the Circuit Court of the United States for the Eastern District of New York.

Mr. Geo. Harding for the appellant.

Mr. William C. De Witt for the appellee.

Mr. Chief Justice WAITE delivered the opinion of the Court.

The invention of Guidet covered by his reissued patent may fairly be stated thus:

Take stone blocks in the form of parallelopipeds, with the ends sufficiently smooth and the sides sufficiently rough, and put them together in a street-pavement so that the ends will be parallel to the street and the sides at right angles.

How large the blocks should be, how smooth the ends, or how rough the sides is nowhere stated. All that has been left to the judgment and skill of him who does the work.

The evidence leaves no doubt whatever in our minds that pavements made of blocks of stone broken into the general form of parallelopipeds and set on edge, with their ends parallel to the street and their sides across it, were in use long before the date of Guidet's invention. This is conceded, in fact, both in the original patent and the reissue, for in the original it is said: "I do not claim broadly as my invention a pavement composed of blocks made in the form of parallelopipeds;" and in the reissue: "I am aware that pavements have been produced of blocks made in the form of parallelopipeds." The difficulty had been, undoubtedly, that the spaces between the sides of the blocks in ordinary use before Guidet's invention were not sufficient to furnish a firm foothold for draft-animals, especially after the surfaces had been worn smooth. How to remedy this defect was the problem to be solved. Formerly it had been done, as is said in the reissued patent, by interposing between the adjoining blocks thin strips of wood or stone. As a substitute for this Guidet chamfered the edges of the broad sides, and thus got the advantage of placing the blocks close against each other and keeping the pavement firm while he secured on the surface the necessary open joint to furnish a good foothold. That, as it seems to us, was all there was of his invention, and we are by no means inclined to hold it was not patentable to him. He took the block of stone in ordinary use, and, by substituting the chamfered edge on the broad side for the narrow strip of wood or stone, got the space that was needed for the joint, and solidified the pavement by bringing the stones that furnished the surface which was to be used for travel firmly together. But after he got his patent he seems to have found that by selecting blocks sufficiently rough on their sides the joints could be made open enough for all practical purposes without chamfering, and so in his reissue he abandoned that feature of his patent and claimed for rough side surfaces only. In this way, as it seems to us, he left the field of invention and entered that of mechanical skill only. Pavements of stone in the form of parallelopipeds being confessedly old, he has really done no more than suggest the best kind of stone to be used in that way. The pavements in Rochester and Buffalo, which it is agreed antedated his invention, were laid in all substantial respects like his. The quality of the stone was different and the side surfaces were comparatively smoother than his, though to some extent they were rough. He, as has already been seen, does not say what degree of roughness is required. The effect of his specification and claim is that if blocks are selected with their sides rough enough joints can be made that will furnish a suitable foothold without the use of strips and without chamfering. It is true that in Rochester and Buffalo sand may have been used to some extent to keep the blocks apart; but that was only another way of doing what it is agreed had been done before. What Guidet did was to show that if stone were used with rougher side surfaces than those found in the old pavements, all artificial means of keeping the transverse joints opened might be abandoned and the requisite surface secured. This was simply carrying forward the old idea and doing what had been done before in substantially the same way, but with better results. The change was only in degree, and consequently not patentable. Clearly the reissued patent cannot be sustained.

The decree is affirmed.

DESIGNS.

12,954.—DOCTOR-ENGINE.—*George J. Fritz*, St. Louis, Mo. Application filed March 24, 1882. Term of patent 14 years.

12,955.—SUSPENDERS.—*Victor Guinzburg* and *Samuel Glass*, New York, N. Y. Application filed March 23, 1882. Term of patent 3½ years.

12,956.—WINDOW-SHADE.—*Benjamin Handforth*, Hoboken, N. J., and *Alonzo E. Wemple*, Brooklyn, N. Y. Application filed April 8, 1882. Term of patent 7 years.

12,957.—FINGER-RING.—*Heinrich Henrich*, New York, N. Y., assignor to *Ross Henrich*, same place. Application filed April 1, 1882. Term of patent 3½ years.

12,958.—WALL-PAPER.—*Eduard Leisner*, New York, N. Y. Application filed April 21, 1882. Term of patent 3½ years.

12,959.—CARPET.—*William McCallum*, Yonkers, N. Y., assignor to *The Bigelow Carpet Company*, Clinton, Mass. Application filed April 22, 1882. Term of patent 3½ years.

12,960.—IMITATION SHELL FOR FLOWER-BEDS.—*Edward Mueller*, Indianapolis, Ind. Application filed April 10, 1882. Term of patent 3½ years.

12,961.—EARTHENWARE TEA-POT.—*Jacob Shenkel*, East Liverpool, Ohio. Application filed April 10, 1882. Term of patent 3½ years.

12,962.—WOVEN FABRIC.—*James Simpson*, Paterson, N. J., assignor to *Hamil & Booth*, same place. Application filed April 13, 1882. Term of patent 3½ years.

12,963.—BADGE.—*Erasmus D. Wilt*, Pittsburg, Pa. Application filed April 11, 1882. Term of patent 7 years.

12,964.—RAZOR.—*William H. De Pew*, New York, N. Y. Application filed April 19, 1882. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,431.—PERFORATED MUSIC-SHEETS.—*The Automatic Music Paper Company*, Boston, Mass. Application filed May 15, 1882.

"The three musical notes arranged substantially as shown."

9,432.—ILLUMINATING-OILS.—*Consolidated Tank Line Company*, Cincinnati, Ohio, and Hannibal, Mo. Application filed April 14, 1882.

"The picture of a woman surrounded by a circular band and reading by a lamp."

9,433.—HAMS, BACON, AND LARD.—*Henry Denny & Sons*, Chicago, Ill. Application filed May 9, 1882.

"A representation of a sunflower."

9,434.—LINIMENT.—*Henry D. Huggan, Amini R. Hahn, George W. Copeland*, and *William H. Grainger*, East Boston, Mass. Application filed April 29, 1882.

"The arbitrarily-selected word 'EEL.'"

9,435.—PACKING.—*Jenkins Bros.*, Boston, Mass., and New York, N. Y. Application filed May 10, 1882.

"The word 'STANDARD.'"

9,436.—BUTTONS.—*Morris Livingston*, New York, N. Y. Application filed May 11, 1882.

"The letters 'R H L.'"

9,437.—BUTTONS.—*Morris Livingston*, New York, N. Y. Application filed May 11, 1882.

"The letters 'S J F.'"

9,438.—CANNED GOODS.—*E. B. Mallory & Co.*, Baltimore, Md. Application filed May 9, 1882.

"The word 'ARROW' and a representation of an arrow, either in conjunction or each by itself."

9,439.—RHEUMATIC LINIMENT.—*George W. May*, Norwich, Conn. Application filed April 14, 1882.

"The arbitrarily-selected word 'VICTOR.'"

9,440.—CRUCIBLES AND OTHER CHEMICAL WARE.—*The Morgan Crucible Company*, Battersea, county of Surrey, England. Application filed May 10, 1882.

"The words 'THE MORGAN CRUCIBLE COMPANY,' arranged in circular form, inclosing the words 'BATTERSEA, LONDON,' and surrounded by a circular line, the whole surmounted by the words 'MORGAN'S CRUCIBLE.'"

9,441.—CRUCIBLES.—*The Morgan Orucible Company*, Battersea, county of Surrey, England. Application filed May 10, 1882.

"A device or representation of a nest of triangular crucibles."

9,442.—CRUCIBLES.—*The Morgan Orucible Company*, Battersea, county of Surrey, England. Application filed May 10, 1882.

"A device or representation of a nest of round crucibles."

9,443.—BROMA.—*Henry L. Pierce*, Boston, Mass. Application filed April 19, 1882.

"The words 'WALTER BAKER & Co.'s' printed on a scroll over the branches, leaves, flowers, and fruit of the cocoa."

9,444.—HALF-VANILLA CHOCOLATE.—*Henry L. Pierce*, Boston, Mass. Application filed April 19, 1882.

"A diamond-shaped figure, inclosing on the top thereof the words 'W. BAKER & Co.'s,' with an octagonal figure at each end of the diamond, with a belt connecting the same, as shown and described."

9,445.—PENS.—*Turner & Harrison*, Philadelphia, Pa. Application filed May 10, 1882.

"The word-symbol 'MOHKTA.'"

LABELS.

2,693.—Title: "BIRCH BITTERS FOR THE BLOOD AND GENERAL DEBILITY, INDIGESTION ETC."—*George G. Campbell*, Rochester, N. Y. Application filed May 13, 1882.

2,694.—Title: "SMITH & SHAKMAN'S CELEBRATED HORSE AND CATTLE POWDERS."—*Smith & Shakman*, Baltimore, Md. Application filed April 26, 1882.

2,695.—Title: "'THICK SET" STEEL BARB FENCING."—*Washburn & Moen Manufacturing Company*, Worcester, Mass. Application filed May 9, 1882.

2,696.—Title: "FOUR POINTED GLIDDEN" STEEL BARB FENCING." *Washburn & Moen Manufacturing Company*, Worcester, Mass Application filed May 9, 1882.

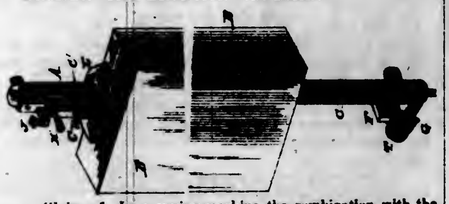
2,697.—Title: "GLIDDEN FOUR POINTED STEEL BARB FENCING." *Washburn & Moen Manufacturing Company*, Worcester, Mass. Application filed May 9, 1882.

2,698.—Title: "WHITTALL BRUSSELS," (FOR CARPETS.)—*Matthew J. Whittall*, Worcester, Mass. Application filed May 6, 1882.

2,699.—Title: "THE ORIGINAL HOP BITTERS WITH IRON."—*M. J. Williams*, Oshkosh, Wis. Application filed May 4, 1882.

DISCLAIMER.

242,486.—*William Westlake*, Brooklyn, N. Y., patent dated June 7, 1881. IMPROVEMENT IN CUSPIDORS. Disclaimer filed May 27, 1882.



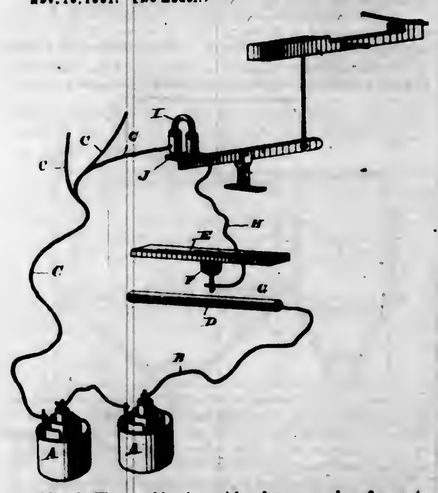
Enters his disclaimer to the first claim in said letters patent in words as follows:

"1. A cuspidor provided with a flat rigid base plate or platform secured to its bottom and extended laterally beyond its body, substantially as and for the purpose described."

PATENTS

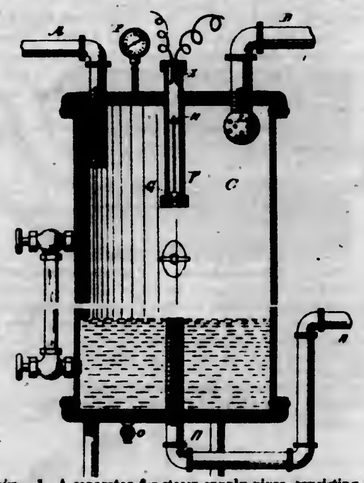
GRANTED JUNE 6, 1882.

258,870. NEEDLE-THREADING ATTACHMENT FOR SEWING-MACHINES. FRANK G. ALTMANS and FRED POEHNS, Edina, Mo. Filed Mar. 4, 1882. (No model.)



Claim.—1. In a sewing-machine, the combination, with the needle-bar, of the vertically-sliding rod and threading-tube mounted in a frame hinged to the lower end of said rod, as set forth.

2. The combination of the needle-bar A, having groove D and ring or flange E, with the sliding rod C, having pin or stud K, and hinged frame G, carrying the threading-tube T, as set forth.



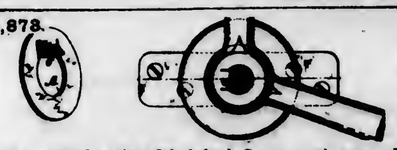
3. The combination of the frame B, having spring-supported pin M, the needle-bar A, having groove D, ring E and catch J, and the sliding rod C, having handle H, notch I, pin K, and hinged frame G, carrying the threading-tube T, all arranged and operating substantially as and for the purpose set forth.

258,871. ELECTRO-MAGNETIC ACTION FOR MUSICAL INSTRUMENTS. CHARLES H. ANDREWS, San Francisco, Cal. Filed Nov. 18, 1881. (No model.)

Claim.—The combination, with a key or a valve of an automatic musical instrument, of the battery A A, conducting-wires B C, insulated cylinder D, connected with the positive pole of said battery, helix I, connected with the negative pole of the battery, an armature, J, mounted upon a pivotal support connected with the key or valve to be acted upon, a platinum rod, G, adapted to have a vertical play in its insulator F, a conducting-wire, H, connecting said platinum rod with the helix, and a strip of slotted or perforated non-conducting material, O, adapted to pass between the cylinder D and point or rod G, whereby the circuit is alternately opened and closed, substantially as and for the purpose shown and described.

258,872. WATER AND STEAM SEPARATOR. EDWARD H. ASHCROFT, Lynn, Mass. Filed Apr. 19, 1882. (No model.)

Claim.—1. A separator for steam-supply pipes, consisting of the separator or vessel C, inlet and outlet steam-pipes A and B, and means for signaling or alarming the attendant or engineer of a steam-engine, by means of an electric battery, of a surplus of water, as set forth.



2. The combination, in a steam and water separator, of a water-trap, the inlet and outlet steam-pipes A and B, the water-escape pipe D, the float-chamber F, and float G, and guide H, being arranged to operate a signaling device, substantially as shown and described.

3. A steam and water separator and alarm consisting of the vessel C, steam-pipes A and B, float-chamber F, float G, guide H, metallic springs I, waste-pipe D, and signaling mechanism, all arranged in the manner set forth and described.

258,873. NUT-LOCK. SELDEN A. BAILEY, New York, N. Y. Filed Sept. 24, 1881. (No model.)

Claim.—1. A metallic washer provided at its inner edge with a short tongue formed by transverse slits cut in the body of the washer, said tongue being adapted to open outward for the placing of the washer and to close flush under pressure of the nut, the end of the tongue being square or straight and adapted to bite firmly

258,873.

against a flattened portion of the bolt, shaft, or pupp when pressed home, substantially as described.

2. The combination of a prop, bolt, or shaft screw-threaded at one end and flattened on one side, a brace or other part on said prop, a nut for holding said brace, and a washer between the brace and nut provided with a short tongue the end of which bites firmly against the flattened side of the prop as the nut is screwed home and holds the nut rigidly to the shaft, substantially as described.

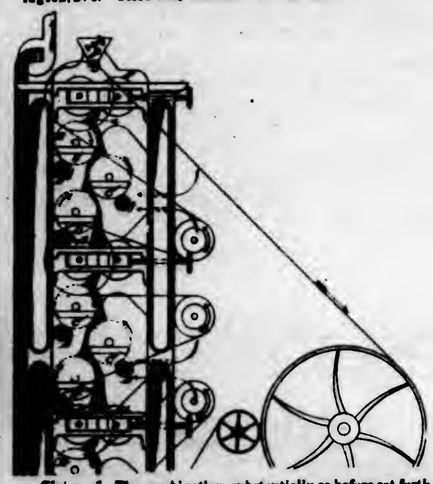
258,874. BRUSH. JAMES F. BARTLETT, Cleveland, Ohio. Filed Mar. 23, 1882. (No model.)

Claim.—The combination and arrangement, as herein described, of the socket A, having opening C, the wedge or shell D, in which a nut, F, is soldered or otherwise secured, spaces a being left between the sides of the nut and said shell, and the handle G, having screw H, as set forth.

258,875. DUST-COLLECTOR FOR GRINDING-MILLS. SAMUEL L. BEAR, Washington, D. C. Filed Jan. 6, 1881. Renewed Oct. 11, 1881. (No model.)

Claim.—The combination, substantially as before set forth, of a screen or separator, and a blast-pipe within it, provided with a longitudinal slot serving as the air-outlet, the blast-pipe moving with respect to the screen, or vice versa, whereby those portions of the screen not subjected to the dust-laden air-blast are more readily freed from the dust during their intervals of relief from pressure.

258,876. FLOUR-DUST-COLLECTING BALLOON. SAMUEL L. BEAR, Washington, D. C. Filed Nov. 16, 1880. (No model.)



Claim.—1. The combination, substantially as before set forth, of a stellated dust-catching balloon and an automatically-operated cut-off or gate within the same, which periodically cuts off the air-current from a portion of the angles or separating-chambers of the balloon to permit the dust to be shaken from the cloth sides of such cut-off angles.

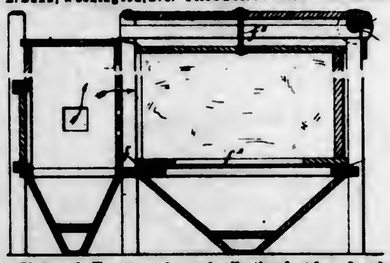
2. The combination, substantially as before set forth, of a stellated dust-catching balloon and a traveling gate within the same for cutting off the air-current from successive angles of said balloon.

3. The combination, substantially as before set forth, of a stellated dust-catching balloon, a traveling gate within the same for cutting off the air-current from successive angles of said balloon, and a traveling knocker.

258,877. ROLLER GRINDING-MILL. SAMUEL L. BEAR, Washington, D. C. Filed July 13, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of a pair of grinding-rollers and a rotating cylindrical screen, onto the exterior surface of which the chop from the grinding-rollers falls.

2. The combination, substantially as before set forth, of a pair of grinding-rollers and a series of rotating cylindrical screens, onto the exterior surface of which the chop from the grinding-rollers falls, arranged stepwise, so that the chop shall pass from the exterior surface of one down upon the next.



3. The combination, substantially as before set forth, of a pair of grinding-rollers, a rotating cylindrical screen, onto the exterior surface of which the chop from the grinding-rollers falls, and a brush at a point outside of the flow or current of chop.

4. The combination, substantially as before set forth, of a pair of grinding-rollers, a rotating cylindrical screen, onto the exterior surface of which the chop from the grinding-rollers falls, and a shaking-trough for conveying away the particles separated from the chop by the rotating screen.

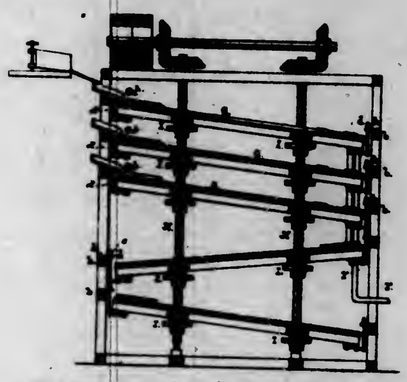
5. The combination, substantially as before set forth, of a pair of grinding-rollers, a rotating cylindrical screen, onto the exterior surface of which the chop from the grinding-rollers falls, and a shaking-trough within the screen.

6. The combination, substantially as before set forth, of a pair of grinding-rollers, a rotating cylindrical screen, onto the exterior surface of which the chop from the grinding-rollers falls, a shaking-trough within the screen, and a brush operating on the screen at a point outside of the flow or current of chop.

258,878. DUST-COLLECTOR FOR FLOUR-MILLS. SAMUEL L. BEAR, Washington, D. C. Filed Dec. 31, 1880. (No model.)

Claim.—1. For separating and collecting dust from dust-laden air in grinding-mills, the combination, substantially as before set forth, of an anti-settling chamber and an air-straining separator or screen communicating therewith and designed to strain all remaining dust from the air before the air escapes.

2. For separating and collecting dust from dust-laden air in grinding-mills, the combination, substantially as before set forth, of a settling-chamber and a separator or screen communicating by a series of slots.



2. The combination, substantially as before set forth, of a screen for separating dust from dust-laden air-currents in grinding-mills, a means for jarring the screen in vertical directions to shake the dust therefrom, and a dust-receptacle on that side of the cloth against which the dust-laden air-currents impinge to be screened.

4. The combination, substantially as before set forth, of a vertical dust-laden air-straining screen constructed with elastic-cloth rails, and means for periodically contracting said screen vertically and permitting it to expand endlessly, whereby a snapping of the cloth of the screen is effected.

5. The combination, substantially as before set forth, of a screen for separating dust from dust-laden air-currents in grinding-mills, a lift-and-let-fall mechanism for jarring the screen in vertical directions to shake the dust therefrom, and a dust-receptacle on that side of the cloth against which the dust-laden air-currents impinge to be screened.

6. The combination, substantially as before set forth, of a separator or screen, a series of air-ports, and means for moving the former with respect to the latter.

258,879. ORE-CONCENTRATOR. ANDREW BLATCHLY and SHIRO KUSUMI, San Francisco, Cal. Filed Apr. 3, 1881. (No model.)

Claim.—1. In an ore-concentrating machine, the two suspended tables C C, mounted in the same plane and provided with bumpers G G, in combination with one or more upright shafts, H, arranged between said tables and provided with cams I, substantially as and for the purpose specified.

2. In a swinging concentrating-table, C, the rod-hangers d, each of which is provided with an adjustable block, e, and a V-shaped projection, g, in combination with the slotted supporting-plate A, with its notched upper surface, substantially as and for the purpose described.

3. In a laterally-shaking concentrating-table, the india-rubber surface, one portion of which is corrugated, while the remainder is plain, substantially as described.

4. In an ore-concentrating machine, a series of inclined tables suspended in pairs, side by side, in combination with mechanism for producing an outward motion, substantially as shown and described, said tables being provided with a partially-corrugated and a partially-plain surface, and having at their lower ends dividers q q and screen Q, substantially as and for the purpose specified.

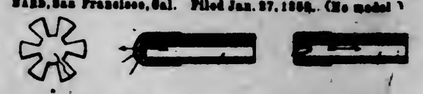
258,880. BALING-PRESS. ARGEL E. BLOOMBURG, Hackett City, Ark. Filed Apr. 8, 1882. (No model.)

Claim.—1. In a bale-press, the combination, with the frame A, having beams N, of the press-box, the packing-chamber C of which is provided with the detachably-hinged side G and hinged side and top E D, and the clamp L, having shoulders M and handle O, as set forth.

3. In a bale-press, the packing-chamber having hinged covers adapted to fold one over the other, as set forth.

3. In a bale-press, the packing-chamber having hinged cover H H, in combination with the frame-partitions I I, as and for the purpose set forth.

4. The lever S, having pawls T U, pivoted above and below its fulcrum, the upper one, T, being provided with a slot, D', in combination with the connecting-rods E' and bell-crank levers C', pivoted to the upper end of lever S, as set forth.



5. In a bale-press, the press-box having extension P and cross-pieces A', provided with rollers S, in combination with the follower X, having rollers Y and stem W, as set forth.

6. The press-blocks F', having grooves G' and recesses H', in combination with the rods or clamps J', having hooks I', as set forth.

7. The combination, in a bale-press, of the press-box having a detachable side, F, with the hinged platform K', as set forth.

8. The combination of the packing-chamber having hinged covers with the press-box D, follower X, having ratchet-stem W, lever S, having pawls T U and mechanism for releasing said pawls, the press-blocks F', clamps J, and hinged platform K', all constructed and operating substantially as set forth.

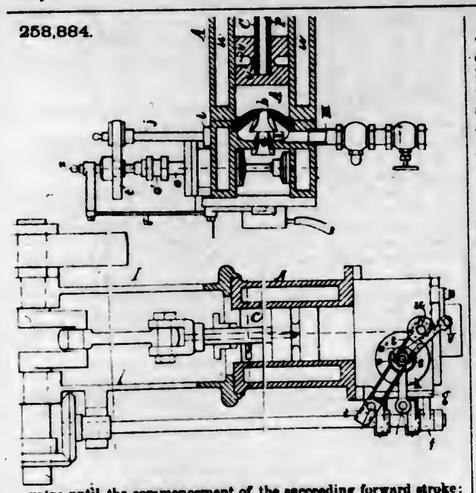
258,881. VALVE FOR COLLAPSIBLE FLOATS. ALBERT BOSSARD, San Francisco, Cal. Filed Jan. 27, 1882. (No model.)

Claim.—In a sack, bag, or buoy capable of being inflated with atmospheric air, the elastic valves provided with a disk or fillet fitting over the introduced ends of the pipes or tubes contained in said sacks or bags, and provided with radial bolding arms or flaps and intermediate spaces, through which air is caused to pass when said valves are inflated, and adapted to be closed by the backward pressure of the air upon the said disks or fillets, substantially in the manner as herein set forth and specified.

258,882. DRAWER-PULL. RICHARD BERGL, Bridgeport, Conn., assignor to Smith & Egge Manufacturing Company, same place. Filed Dec. 23, 1879.

Claim.—The ferrule I and shank A, connected together substantially as described, in combination with the escutcheon B, having a raised central portion or annular shoulder, the whole adapted to be held together and in position on a drawer by a key-wedge or nut, as hereinbefore set forth.

258,883. LABEL-HOLDER. JOHN F. BURGOYNE, Buffalo, N. Y. Filed Mar. 3, 1882. (No model.)



Claim.—A label-holder consisting of an open metallic reversible frame, B, adapted to be attached to a shipping-package and to swing on a hinge, and to have its sides and one end bent over to form lips or grooves *a b*, and with corresponding lips or grooves formed on the reverse side of the holder, adapted to hold labels or address-cards, one side being for the address of the consignor and the other side for the consignee, substantially as shown, and for the purpose specified.

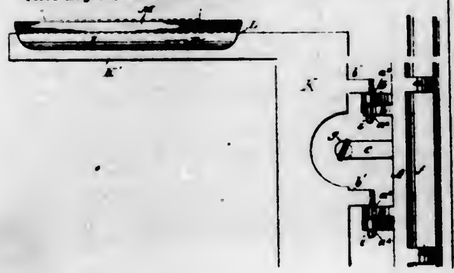
258,884. GAS-MOTOR ENGINE. ERNEST H. DUBRITZ, Newark, N. J. Filed Oct. 11, 1881. (No model.)

Claim.—1. The method herein described of supplying a compressed charge of mingled air and gas to the cylinder of a gas-motor, consisting, first, in drawing the air and gas in suitable proportions into one end of the cylinder by the reverse movement of the operative piston; second, in compressing the same into a recess or cavity near the ignition-chamber by the forward movement of the piston; third, in retaining the mixture in the recess by a suitable

258,884.

valve until the commencement of the succeeding forward stroke; and, fourth, in discharging the compressed mixture into the ignition-chamber at such time by suitable valve, substantially as and for the purpose set forth.

2. The improved method of converting the heat of explosion into useful power, consisting, first, in exploding the gaseous mixture in a chamber separate from the operative cylinder; second, in conducting the products of the explosion through a chamber located between the ignition-chamber and the cylinder and mingling cold air with the heated gases on their passage to the cylinder; and, third, in conducting the products of the explosion, mingled with cold air, to the cylinder, to operate conjointly upon the piston, substantially as and for the purpose set forth.

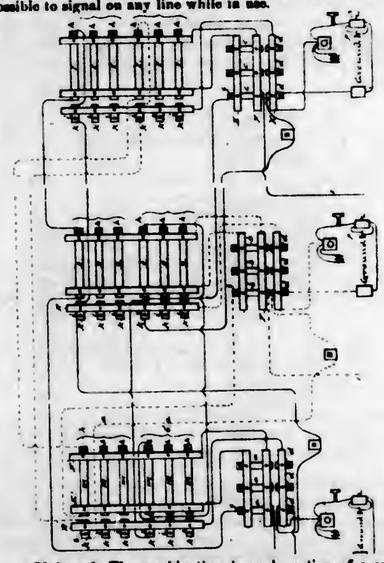


3. The combination, in a gas-motor, of the cylinder A, provided with an operative piston, an ignition-chamber supplied with an explosive charge for the purpose set forth, and an intermediate injector-chamber, constructed and operated to supply a current of air through a feed-pipe, M, to the ignited gases on their passages to the operative cylinder, substantially as and for the purpose described.

4. The combination, in a gas-motor, of an operative cylinder and piston, substantially as described, an injector-chamber supplied with air-inlet and nozzles *a b*, for the purpose specified, and ignition-chamber supplied with an explosive charge for the purpose set forth, inlet and outlet valves combined with the ignition-chamber as described, and a gas-slide operated to fire the charge by connection to the inlet-valve, so as to open when the latter is closed, substantially as herein shown and described.

5. The combination, with the piston of a gas-motor, of a hollow rod, as *C p*, an annular space in the body of the piston, as *r*, and a connection between the two, as *r'*, substantially as and for the purpose set forth.

6. The method herein described for generating and supplying the vapor of gasoline to a gas-motor, consisting in vaporizing the gasoline in a suitable vessel in contact with the heated gases exhausted from the gas-motor, and in mixing the vapor of the heated gasoline with air and applying it to charge and operate the motor, substantially as herein described.



258,885. BRACKET. ALEXANDER CAMPBELL, Brooklyn, N.Y. Filed Aug. 25, 1881. (Model.)

Claim.—The combination, with a table or shelf, M, provided with ribs *l l* and set-screw *n*, and a bracket, K, formed with a lateral arm, K', adapted to support the table M, and provided with hinges *b' b'* and pins *i i*, of the vertical rods A A', each provided with claws *a a* and curved arms *b b*, the levers *c c'*, a set-screw, *g*, and seat A, the whole being arranged and constructed substantially as shown and described.

258,886. TELEPHONE CENTRAL-OFFICE SWITCH. MARTIN J. CAHNEY, Toledo, Ohio, assignor of one-half to John H. Wheeler, same place. Filed Oct. 14, 1881. (No model.)

Brief.—Each section of a duplicate switch-board system has, in addition to the usual switch-board, a supplemental switch-board, through which the lines from all other sections pass before going to ground through the annunciators of the sections to which the lines severally belong. Any operator can connect any line of his own section with any line of any other section through his supplemental switch-board, and in so doing cuts out the line from its annunciator and ground. The breaking of the line renders it impossible to signal on any line while in use.

Claim.—1. The combination, in each section of a sectional telephone switch-board, of line strips or plates connected to the lines assigned to that section, connecting strips or plates adapted to be connected to said line-strips, a series of supplemental line-strips interposed in the circuit of the lines assigned to and connected with line-strips on another section of the apparatus, and a connecting-strip common to said supplemental strips, and with which any one of said supplemental strips may be connected, said latter connecting-strip being joined to the plate or strip which is adapted to make connection with principal line strips or plates of the first-named section.

2. A sectional telephone switch-board each section of which contains a set of principal line-strips and means for connecting any two line-strips for oral communication, one or more sets of supplemental line-strips, the number of said sets being one less than the whole number of sections, each of said line-strips forming a portion of a loop from a principal line-strip and the ground connection plate of another section, supplemental connecting-strips connected with the principal line-strips of the section, and a supplemental instrument-strip adapted to be connected with the loop at a point between the various supplemental line-strips and the ground connection plate in which said loop terminates.

3. The combination, with the principal line-strips and the ground connection plates of one section of a sectional switch-board, of leading-wires connected to said line-strip and containing corresponding supplemental line-strips in another section, return-wires connected to the ground-plates, connecting-plates and switch-plugs normally interposed in said return-wires, and a supplemental instrument-strip combined with said connecting-plates, the whole arranged in the manner described, so that when any one of said plugs is shifted to the instrument-strip the connection of a return-wire with a normally-connected ground-plate is broken, and connection is at the same time made between the instrument-strip and a principal line-strip of the first-named section.

4. The combination, with the principal line-strip in one section of a sectional switch-board, of a leading-wire passing through supplemental line-strips in the other sections, a return-wire adapted to be connected with a supplemental instrument-strip in each of said sections, switch-plugs normally forming a part of the leading-wire, as described, and supplemental connecting-strips, the whole combined in the manner described, so that said plugs may be removed and used for connecting a supplemental line-connecting strip with a supplemental line-strip, and so that at the same time the continuity of the leading and return wire will be broken and the use of the supplemental instrument-strips in other sections for sending signals be prevented.

5. The combination, in each section of a sectional switch-board, of main or principal line-strips and connecting devices adapted to connect any of the lines assigned to that section, one or more sets of supplemental line-strips, the strips in each set being connected in local circuits or loops leading from the corresponding principal line-strips of another section or sections and terminating in the ground-connecting plates of that section or sections, and connecting-strips joined to the principal connecting devices of the first-named section, and adapted to make connection with the supplemental line-strips in the latter section, all combined in the manner and for the purpose set forth.

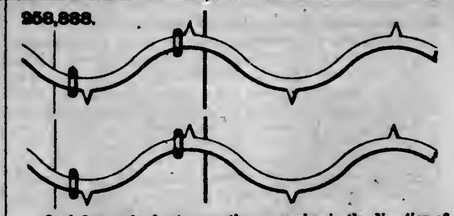
6. The combination, in each section of a sectional switch-board, of line-connecting and indicating devices for the lines assigned to that section, signaling and communicating apparatus adapted to be placed in connection with any one of said lines, a series of supplemental plates placed in the circuit of lines assigned to another section of the switch-board, and interposed between the line strips or plates and the ground-plates of that section, an instrument strip or plate common to said series of supplemental plates and connected to the signaling apparatus of the section in which said plates are located, and switch-connecting plugs forming a portion of and adapted to preserve the continuity of the loops or connections in which the plates are normally connected, or to connect said plates to the instrument-strip, at the same time breaking the normal connection.

7. The combination, with a sectional telephone switch-board apparatus, in which the line-circuits for each section pass to and through supplemental devices in the other sections, of annunciators for each section, placed in circuit between the earth and the supplemental devices of other sections, so that when connection is made with said circuit upon the supplemental portion of other sections for the purpose of signaling to a subscriber's station from such other sections the annunciator at the central office may be cut out and a false signal at the section of board to which the annunciator belongs be prevented.

8. A switch-plug consisting of a stem or spindle having attached to its lower end two semi-cylindrical springs embracing the stem and free at their upper ends, substantially as described.

258,887. BARBED FENCE-STRAP. JAS. CARPENTER, Moravia, N.Y. Filed Feb. 4, 1882. (No model.)

Claim.—1. The strap *a*, having enlarged or re-enforced edges and transversely crimped or corrugated surfaces, and barbs *b b*, pressed or struck out of said re-enforced edges, substantially as set forth.

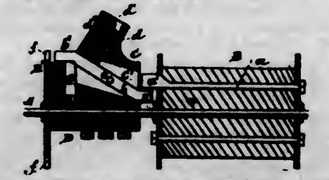


2. The strap *a*, formed with enlarged or re-enforced edges and with crimped or corrugated surfaces, and the barbs *b b*, pressed or struck out of said enlarged edges at the convex side of the corrugations and alternately in opposite directions from the plane of the strap, substantially as described and shown.

3. The within-described method of forming barbed fence-strips, consisting in first rolling out the strap with enlarged or re-enforced edges, then corrugating said bead and pressing out of the enlarged edges thereof barbs standing in opposite directions from the plane of the strap, substantially as described.

258,888. BARBED FENCE. JAS. CARPENTER, Moravia, N.Y. Filed Oct. 7, 1881. (No model.)

Claim.—1. A fence-wire of oval or elliptic form in cross-section, and bent serpentine or waving longitudinally and in the same plane as the greater diameter of the said wire, as shown and set forth.

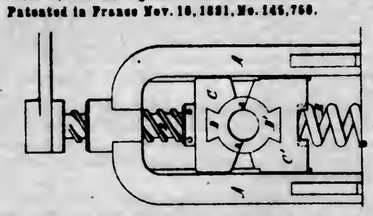


258,888.

2. A fence-wire bent serpentine or waving in the direction of its length, and having projecting from the alternate upward and downward bents or curves, respectively, upward and downward projecting barbs.

3. A fence-wire bent serpentine or waving in the direction of its length, and secured with its bents in a vertical plane by fastenings to the post at the highest and lowest points of two or more of the bents in the wire, substantially as and for the purpose set forth.

258,889. WINDING-DRUM. MATTHEW T. CHAPMAN, Aurora, Ill. Filed Nov. 5, 1881. (No model.)



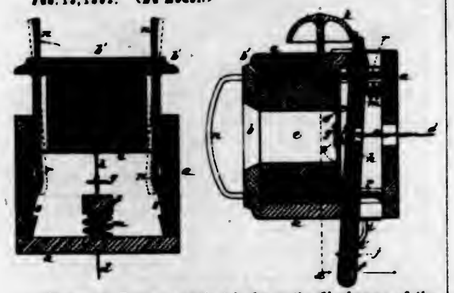
Claim.—1. The loose winding-drum B, having a stationary catch or lock and stationary head or block C, carrying a movable catch or lock, in combination with an adjustable cam for operating the movable catch or lock and releasing the drum, substantially as and for the purposes specified.

2. The loose winding-drum B, having a stationary catch or lock and stationary head or block C, carrying a movable catch or lock, in combination with a raising or lifting cam, *e*, and adjustable plate D', carrying the cam for changing the position of the cam relative to the drum and automatically tripping the catch or lock to release the drum, substantially as and for the purposes specified.

3. The loose winding-drum B, having a stationary catch or lock, *a a'*, stationary head or block C, carrying a movable catch or lock, *b b' b''*, and returning-spring *d*, in combination with a raising or lifting cam, *e*, adjustable in relation to the drum for automatically engaging and disengaging the catch or lock to cause the drum to wind or unwind, substantially as specified.

4. The loose winding-drum B, having a stationary catch or lock, *a a'*, stationary head or block C, carrying a movable catch or lock, *b b' b''*, and returning-spring *d*, in combination with a raising or lifting cam, *e*, plate or disk D', having notches *f*, and lever E, substantially as and for the purposes specified.

258,890. MACHINE FOR CAPSULING BOTTLES. CHAS. CHESWRIGHT, London, England. Filed Feb. 18, 1882. (No model.) Patented in France Nov. 16, 1881, No. 145,760.



Claim.—1. A machine for capsuling bottles, having semicircular clamping and plaiting segments made from an elastic and yielding material, whereby said segments are enabled to adapt themselves to bottle-necks of various shapes and sizes, as set forth.

2. The combination, to form a capsuling-machine, of a press-frame and screw and upper sliding boxing coupled to the screw, a lower sliding boxing elastically mounted, and the rubber segments D D', all constructed and arranged substantially as set forth.

3. The combination of the frame A, screw B, boxings C C', rubber segments D D', springs E, nut I, screw G, and disk F, all constructed and arranged to operate substantially as set forth.

258,891. TELEPHONE. JAMES W. CLARK, Etna, Ohio. Filed Feb. 13, 1882. (No model.)

Claim.—1. In an acoustic telephone, the diaphragm of the speaking and hearing part, connected with the vocal line by a short section of cord of some suitable flexible material, in combination with the signal-operating lever, a sustaining-spring therefor, and a fixed part or case within which the said speaking and hearing part is adapted for adjustment to render the said diaphragm connection slack or taut in relation to the vocal line, substantially as described, for the purpose specified.

2. The combination, in an acoustic telephone, of a fixed part or case and the vocal line with an adjustable speaking and hearing part, a short cord or flexible section connecting it with the vocal line, a pivoted device connected with the said fixed part or case and the vocal line, and a sustaining-spring for said pivoted part, substantially as herein set forth, for the purpose specified.

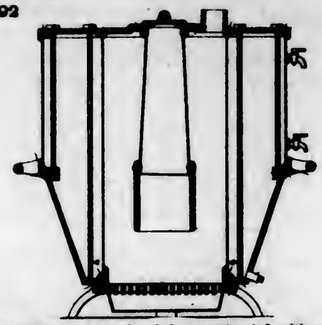
3. In an acoustic telephone, the transmitting and receiving instrument, composed of a fixed part or case and an adjustable speaking and hearing part having the diaphragm, the latter being connected to the vocal line by a short flexible cord-section and adapted to be set toward and from the end of the vocal line to render the said flexible section slack or taut in relation to said vocal line, substantially as described, for the purpose specified.

4. The combination, in an acoustic telephone, of the fixed part or case, the vocal line, and means for connecting it with said fixed part or case with the adjustable speaking and hearing part, the flexible cord-connection of the diaphragm with said vocal line, and means for operating said speaking and hearing part and holding the same when set in taut connection with the vocal line, substantially as described, for the purpose specified.

5. In combination, in an acoustic telephone, the fixed part or case *a*, the adjustable speaking and hearing part *b*, having the diaphragm *c*, the vocal line *d*, the signal-operating lever *f*, its supporting-spring *m*, the flexible cord-section *h* of the line, the signal device, and means for operating and holding the adjustable part in relation to the fixed part, substantially as described, for the purpose specified.

6. The combination, in an acoustic telephone, of the fixed part or case *a*, the adjustable speaking and hearing part *b*, having the diaphragm *c*, the flexible cord-section *h*, the lever *f*, its supporting-spring *m*, the line *d*, and the signal device, with the handles *n n*, forming the ratchet-pawls *r r*, and carried by said adjustable part, and the racks *s s*, carried by said fixed part, substantially as described, for the purpose specified.

7. The combination, in an acoustic telephone, of the line *d*, the lever *f*, and the line-button *g*, having a non-fixed relation to said lever, with an adjustable speaking and hearing part, a supporting-spring, *m*, for said lever, and a signal device operated by said lever.



8. In an acoustic telephone, the combination of the line and means for supporting it independent of the diaphragm with an adjustable carrying part for the diaphragm and a short cord-section connecting said diaphragm with the line, substantially as described, for the purpose specified.

258,892. STEAM-GENERATOR. GORDON W. CONSTOCK, New York, N. Y. Filed Oct. 12, 1881. (No model.)

Claim.—1. A steam-generator consisting of the combination, substantially as hereinbefore set forth, of the cast-metal base, a conical section of cast metal supported thereon, a cast-metal top, united with said section by bolts, two intervening cylinders of sheet metal jointed therewith, and a central magazine supported from said top and provided with a lid of cast metal.

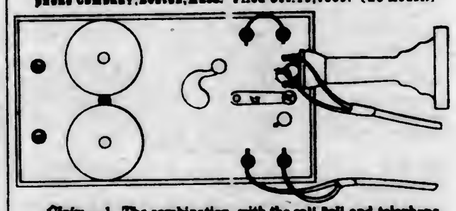
2. In a steam-generator, the combination, substantially as hereinbefore set forth, of a cast-metal base, a cast-metal top, an intervening water-chamber, a combustion-chamber, and a fuel-

258,892

magazine, said water-chamber being constructed with an inner cylindrical wall and an outer wall, consisting of an upper cylindrical section and a lower section converging toward the bottom of said inner wall and having its sheet-metal sections jointed with cast-metal portions of the generator, and said top being constructed with an outer annular casting forming the top of the water-chamber, and a second annular casting resting upon the inner edge of the outer casting.

3. In a steam-generator, the lower section of the outer wall of the water-chamber, constructed of cast metal, and provided with a flange projecting inwardly from its lower edge, a circular groove around the upper side of said flange, and a similar groove at the upper extremity of said section, substantially as shown and described.

258,893. GIG-SADDLE. WILLIAM H. COGLESER, Portland, Mich. Filed Apr. 10, 1882. (No model.)

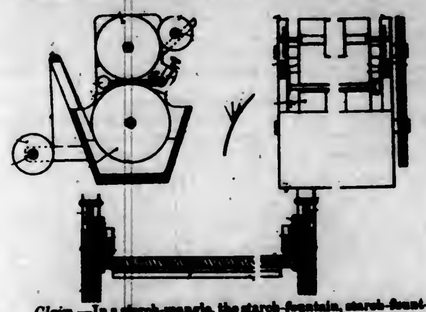


Claim.—1. The combination, with the cross-tree having bridges or supports C C, and housing H, having slots I I, covered by flaps or jockeys J J, of the separate billets passing under the jockeys through slots I I and resting on bridges C C, in which position they are secured, as set forth.

2. The combination, with the cross-tree having bridges or supports C C, housing H, having slots I I, covered by flaps or jockeys J J, and separate billets having their inner ends resting on bridges C C, of the turret-rings having their screw-threaded bolts or shanks passing down through the jockeys, housing, billets, and bridges, as set forth.

3. The combination, with the cross-tree, to the ends of which are secured the skirts and the housing having the flaps or jockeys, of the screws K K, passing through the ends thereof and into the cross-tree, as set forth.

258,894. TELEPHONIC SWITCH APPARATUS. HENRY W. CONNER, Newport, R. I., assignor to the American Bell Telephone Company, Boston, Mass. Filed Oct. 16, 1880. (No model.)



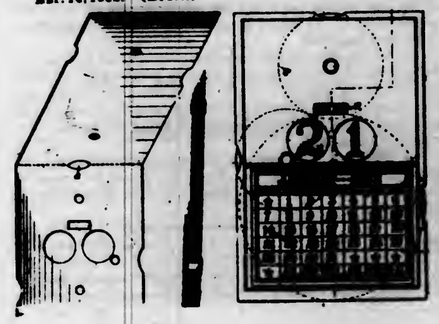
Claim.—1. The combination, with the call-bell and telephone circuits and their contact-plates, of a switch-lever having a knob or handle, and a telephone-hook so placed with reference to the

contact-plate of the telephone-circuit that when the switch is on said contact-plate the knob or handle will be under and to one side of said hook, and present an obstacle to the hanging of the telephone thereon, substantially as described.

2. The combination, with the contact-plate of the telephone-circuit and a switch-lever, of a telephone hook or support so placed with reference to said contact-plate that said switch-lever cannot be moved into contact therewith so long as the telephone is on said hook or support, substantially as described.

258,895. STARCH-MANGLE. JOHN CRAWSHAW and JOHN H. CRAWSHAW, Central Falls, R. I. Filed Jan. 7, 1882. (No model.)

Claim.—In a starch-mangle, the starch-fountain, starch-fountain roll, and the pivoted doctor-plate, with mechanism for giving it a yielding pressure, in combination with means for adjustably varying the angle of the doctor-plate with respect to the surface of the starch-fountain roll, and with mechanism for drawing the cloth through the starch and between the yielding doctor-plate and the starch-fountain roll, substantially as described.



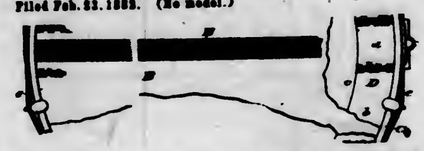
258,896. SIGN. HENRY S. CROCKER, New York, N. Y. Filed Apr. 1, 1881. (No model.)

Claim.—1. A sign composed of separate and contrasting pieces of tin-foil united to form a homogeneous sheet, and having portions removed from one of the pieces so as to disclose the other, substantially as described.

2. The method of forming signs by removing ornamental shapes or portions from a sheet of tin-foil and then covering the openings formed by said removed portions with a separate sheet of foil, and uniting the two to form a single homogeneous sheet, substantially as described.

258,897. CALENDAR. JOHN GUSSOW, Glen Allen, Va. Filed Mar. 14, 1882. (Model.)

Claim.—1. A calendar made substantially as described, and adapted to show the figures indicating the day of the month through suitable openings formed in the face of the calendar-frame for said purpose, by means of two dials, one of which is smaller than the other, and carries three figures and a blank, while the larger dial carries ten figures, the dials being arranged, substantially as described, so that the smaller one shall partially overlap the other, and while exposing its own figure at its own aperture shall conceal the figure on the larger dial, which would otherwise be exposed at the aperture of the small dial, another figure of the larger dial being exposed at a central aperture, substantially as described.



2. The combination, in a calendar, of a frame of card-board or similar material, doubled in long folds and provided with perforations and notched edges, dials containing the days of the week and the days of the month pivoted within said frame and adapted to register with the openings formed therein, and a tear-off tablet attached to the face of the frame, substantially as described.

258,898. COMBINED SASH HOLDER AND FASTENER. ANDREW J. DAVIS, Hartford, Mich. Filed Jan. 30, 1882. (Model.)

Claim.—In a sash holder and fastener, the combination of the trough-shaped friction-plate A, having a catch, B, on its upper end, with springs D, plate E, and set-screw C on the lower sash, and with the pin F on the upper sash, substantially as and for the purpose set forth.

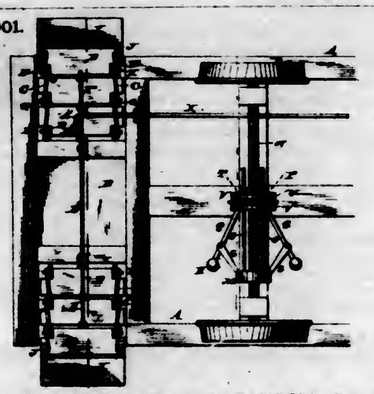
258,899. SNARE-DRUM. HENRY C. BOSTON, New York, N. Y. Filed Feb. 23, 1882. (No model.)

Claim.—1. In a drum, the combination of body A, snare-head B, sheet-metal ball D, consisting essentially of annular portion *b* and flange *a*, or equivalent means of connection with the drum-body, as described, interposed between the body A and snare-head B, and the snare B, strained across said ball, whereby the distorting tendency of the tension of the snare is resisted and the drum-body is retained in shape, substantially as set forth.

2. The combination of drum-body A, parchment head B, sheet-metal ball D, having depressions *d d*, snare E, and means for tightening said parchment and snare, substantially as set forth.

258,900. FLOOR. WILLIAM L. DOBERSAM, West Newton, Mass. Filed Apr. 3, 1882. (No model.)

Brief.—Composed of foundation-timbers, covering-course of boards, superimposed course of grooved planks, and water-proof composition in the grooves.

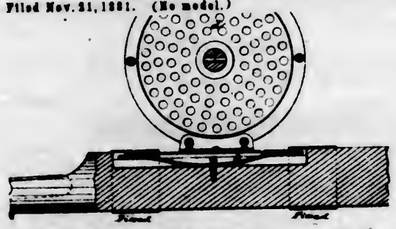


Claim.—A water-proof floor, substantially as described, composed of the foundation-timbers *c*, the covering-course of boards B, the superimposed course of grooved or rabbeted planks A, and the elastic, adhesive, and water-proof composition fillings *b*, arranged and combined essentially as explained.

258,901. SAFETY-STEP FOR CARS. THOMAS H. BOYLE, Norwich, N. Y. Filed Apr. 11, 1882. (No model.)

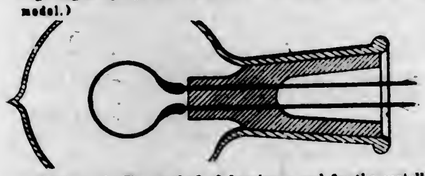
Claim.—1. The combination, with a railway-car, of the brackets C, pivoted steps D, connecting-rod K, a governor mounted upon the car-axle, and mechanism for operating the said pivoted steps automatically by means of said governor, as set forth.

2. The combination of the car-axle, the governor having sliding eccentrically-grooved disk F, the band U, forked lever V, shaft X, having cranks Y A', connecting-rod K, brackets C, pivoted steps D, and the connecting-rod K, having eye L, as set forth.



258,901.

3. The combination of the car-axle, the disk M, having guide-rods O, the sliding disk P, having weighted hinged arms Q, the connecting-rods S, the pivoted steps D, and mechanism, substantially as described, connecting said pivoted steps with the sliding disk P, as set forth.



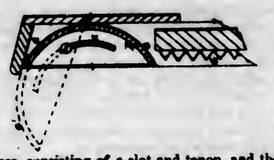
4. The combination of the brackets C, the pivoted steps D, the connecting-rods K, the rod or chain B', the lever C', and ratchet-bar D', substantially as set forth.

258,902. REEL-SEAT FOR FISHING-RODS. HIRAM EGGLESTON, Manchester, Vt., assignor to Charles F. Orvis, same place. Filed Nov. 21, 1881. (No model.)

Claim.—In a reel-seat for fishing-rods, a spring-clamping seat, *b*, in combination with the rod having the fixed ring-bands, substantially as described.

258,903. ELECTRIC INCANDESCENT LAMP. MOSES G. FARMER, Newport, R. I., assignor to the United States Electric Lighting Company, New York, N. Y. Filed May 27, 1881. (No model.)

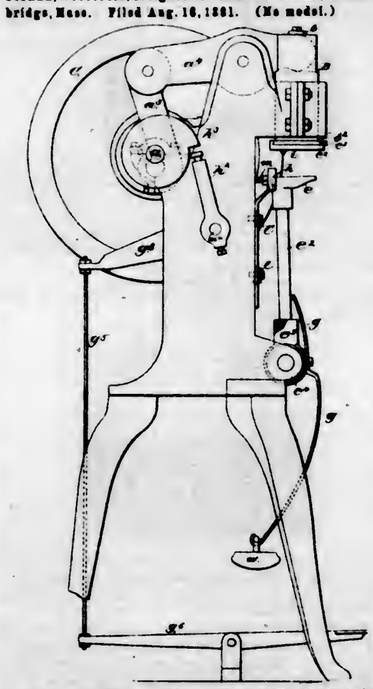
Claim.—1. The method of forming a seal for the metallic conductors of an incandescent lamp, which consists in embedding them in a plastic material, molding it to the desired shape, solidifying and hardening the same by heat, and then fitting the same to an opening in the lamp, as set forth.



2. In an incandescent electric lamp, the combination, with a plug or stopper composed of porcelain, earthenware, or a similar material, of conducting-wires of nickel or an alloy containing nickel, embedded in the stopper, as described.

258,904. WASH-BOARD PROTECTOR. MARSHALL M. FARNSWORTH, Brooklyn Village, assignor to the Ohio Wooden Ware Manufacturing Company, Cleveland, Ohio. Filed Oct. 18, 1881. (No model.)

Claim.—1. A protector in combination with the upper part of a wash-board, and connecting devices between the side pieces thereof, arranged substantially as described, whereby the protector may slide between said sides, as and for the purposes set forth.



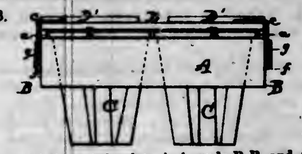
2. A wash-board provided with a groove or notch, *e*, the connecting devices, consisting of a slot and tenon, and the protector, all in combination, and arranged to operate in the manner substantially as described, and for the purpose set forth.

258,904.

3. In a wash-board, a semi-cylindrical protector adapted to roll or slide within the sides thereof and provided with ends having curved slots therein and pins extending from the said sides into the slots, respectively, whereby the protector is retained in position for use or for being packed for transportation, substantially as set forth.

258,905. BOOT AND SHOE HEELING MACHINE. EDWIN PIERCE, Worcester, assignor to James W. Brooks, Trustee, Cambridge, Mass. Filed Aug. 16, 1881. (No model.)

Claim.—1. The metal last *c*, the spindle c^3, adapted to vertically adjust the said last, the pivotal bearing c^2 for said spindle, the rest A, and the weighted arm *g*, for normally pressing the spindle and last toward the frame of the machine to hold the counter of the boot or shoe in the said rest, combined with the nail-driving mechanism and means to operate the same, substantially as shown and described.

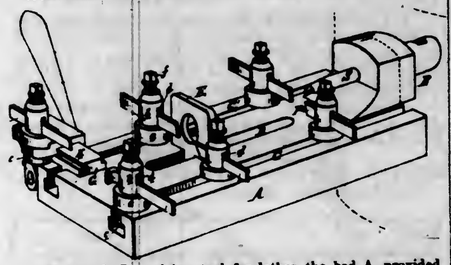


2. In a machine to nail heels to boots and shoes, the iron last and spindle to carry it, combined with the plunger and removable plate connected with the foot of the plunger, and provided with a type or stamp to mark the heel as the nails partially driven therein are driven through the heel into the sole of the boot or shoe, substantially as described.

3. The rest A, made vertically and horizontally adjustable, and the stop and adjusting-screw *m*, combined with the last *c*, spindle c^3, its pivoted bearing c^2, and weighted arm g^3, all substantially as and for the purposes described.

258,906. FRUIT-PACKAGE. ASA B. FISK, Lyndonville, N. Y. Filed Feb. 9, 1882. (Model.)

Claim.—1. In combination with a peach basket or baskets, C C, having a rim or shoulder, *b*, around the upper edge, the cover

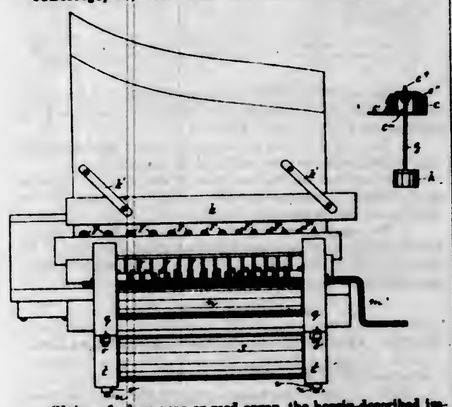


258,906.

and frame consisting of the slats A A, ends B B, and top D, arranged so as to leave the space *a* at the sides, between the top D and sides A A, and suitable fastening devices, substantially as and for the purpose specified.

2. In combination with the basket C and covering A B D, the locking device consisting of the bent hasps *c c*, stay-piece D', and eccentrically-pivoted locking-piece *g g'*, all arranged and operating substantially in the manner and for the purpose specified.

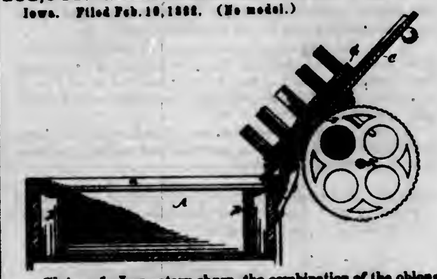
258,907. SIZING-TOOL FOR LATHES. JAMES FLOWER, Detroit, Mich. Filed Feb. 18, 1882. (No model.)



Claim.—1. In a sizing-tool for lathes, the bed A, provided at one end with a shank, B, and having two parallel mortises, C C', running from end to end, in combination with a series of cutter-holders secured in said mortises on both sides of the center of the bed, substantially as described.

2. The combination, with a sizing-tool for lathes, of one or more steadying-posts, E, provided with round holes *e* and adjustably secured in a slot, D, of the bed, said post or posts being adapted to support the work at different points as the work is fed to the cutters, substantially as and for the purpose specified.

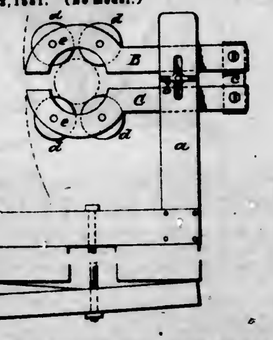
3. In a sizing-tool for lathes, the bed A, provided at one end with a shank, B, and having a central longitudinal slot, D, and two parallel mortises, C C', one on each side of said slot, in combination with one or more apertured steadying-posts, E, adjustably secured in the slot, and a series of cutter-holders secured in the mortises on both sides of the steadying-posts, substantially as described.



258,908. ORGAN. CARL FOEHLDRG and GEORGE W. GRAVES, Cambridgeport, Mass. Filed Jan. 14, 1881. (No model.)

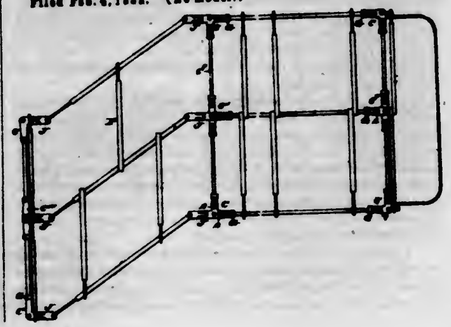
Claim.—1. In a pipe or reed organ, the herein-described improved valves, consisting of the main or common valve *a*, with its relief-vent a''', and auxiliary relief-valve a'' and stop a^4, for the purpose set forth.

2. The herein-described fall-stop, consisting of the swinging bar A, pivoted to the case, as shown, in combination with the pipes *f f*, as and for the purpose set forth.



258,909. ROTARY CHURN. SAMUEL FOSELER, Eagle City, Iowa. Filed Feb. 10, 1882. (No model.)

Claim.—1. In a rotary churn, the combination of the oblong rectangular churn-body A, having its upper edges recessed and beveled, with the lid C and the corner-pieces B, beveled upon their upper ends, substantially as described, whereby when the lid is raised or the cream is driven upward through the interstices about the edges of the lid said cream is returned to the churn-body, and whereby the cream is prevented from collecting in the corners of the churn, and thereby retarding the formation of the butter.

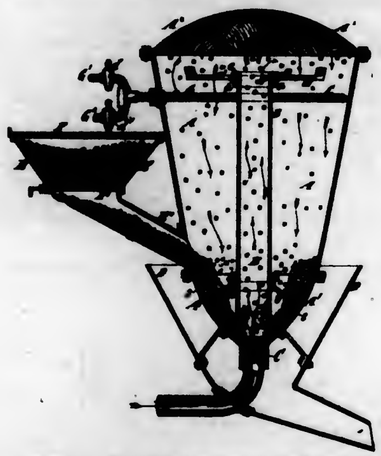


2. The combination, with the churn-body A, of the corner-pieces B, of prismatic shape, and having their upper ends beveled, substantially as described, whereby the butter and cream are prevented from collecting in the corners, and whereby the churn may be easily cleaned.

258,910. LATHE-REST. EUGENE S. FULLER, Hartford, Conn. Filed Dec. 12, 1881. (No model.)

Claim.—In a center-rest for lathes, the combination, with the slotted standard *a*, of the pivoted horizontal arms B C, removably connected to the standard, said arms being arranged one above the other and having curved or semicircular ends *e*, carrying friction-rollers *d*, substantially as and for the purpose set forth.

258,911. FRAME FOR CANOPIES, AWNINGS, AND TENTS. WESLEY B. GARVER and EDWARD VARIAN, Philadelphia, Pa. Filed Feb. 4, 1882. (No model.)



Claim.—1. The standards and horizontal beams, in combination with the couplings, which are provided with sockets *c*, the plugs H, and sleeves G, substantially as and for the purpose set forth.

2. The standards, horizontal beams, ridge-poles, couplings with sockets, king-posts, plugs, and sleeves, combined and operating substantially as and for the purpose set forth.

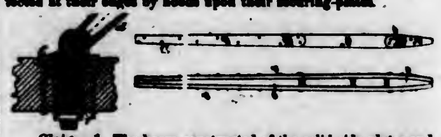
3. The frame for canopies, &c., formed of standards and horizontal beams, having couplings C and knuckle-joints J, said couplings C being connected to the standards and the joints J to the horizontal beams and the couplings, substantially as and for the purpose set forth.

4. The standards, horizontal beams, ridge-poles, couplings, knuckle-joints, and king-posts, combined and operating substantially as and for the purpose set forth.

258,912. APPARATUS FOR DISINTEGRATING VEGETABLE SUBSTANCES. GUSTAVUS O. GOSSELINK, Jersey City, N. J. Filed Dec. 29, 1880. (No model.)

Claim.—1. The combination, with a closed vessel or chamber having a perforated bottom or lower portion, of a pipe or trunk supported therein and open at both ends, and a nozzle through which air or steam or water may be injected to produce an upward current of the material to be disintegrated through said pipe or trunk and against the top or head of said vessel or chamber, whereby I provide for a continuous delivery of the disintegrated material through the perforated bottom or lower portion of said vessel or chamber, substantially as specified.

2. The combination, with the closed vessel or chamber, of a pipe or trunk supported therein and open at both ends, the nozzle through which air, steam, or water may be injected to produce an upward current of the material to be disintegrated through said pipe or trunk, and a removable and adjustable head against which the material is impelled by said air, steam, or water, substantially as specified.



3. The combination, with a closed vessel or chamber having a perforated bottom or lower portion, of a pipe or trunk supported therein and open at both ends, a nozzle through which air or steam or water may be injected to produce an upward current of the material to be disintegrated through said pipe or trunk and against the top or head of said vessel or chamber, and a pipe for supplying water to the contents of said vessel or chamber, substantially as and for the purpose specified.

4. The combination, with a closed vessel or chamber having a perforated bottom or lower portion, a pipe or trunk supported in said vessel or chamber and open at both ends, and a nozzle through which steam or air or water may be injected to produce an upward current of the material to be disintegrated through said pipe or trunk and against the top or head of said vessel or chamber, of a hopper communicating with said vessel or chamber between its top or head and its perforated bottom or lower portion, substantially as and for the purpose specified.

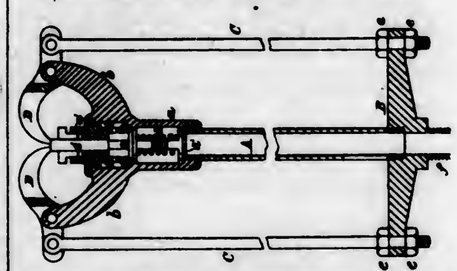
5. The combination of the closed vessel or chamber A, having a perforated bottom or lower portion, A', and head A^2, the hopper B, provided with gates F F', the spout E', the pipe or trunk B, and the air, water, or steam nozzle C, all substantially as specified.

258,913. DREDGING APPARATUS. ALBERT E. HALL and MILAN W. HALL, Plainfield, N. J. Filed Nov. 26, 1880. (No model.)

Brief.—A dredging-boom having solid side pieces and tapered end blocks, which leave an enlarged opening for the dipper-handle, said boom being stepped in a socketed pintle having a circular flange resting in a tubular socket. Hawse-hole sheaves are protected at their edges by hoods upon their mooring-plates.

Claim.—1. The boom constructed of the solid side plates and the tapered middle pieces, the latter arranged to leave an elongated opening to receive the dipper-handle and to form with the side pieces a solid butt and peak for the boom, substantially as set forth.

2. The combination, to form a step for the boom, of the socketed pintle provided with a circular flange, the tubular socket provided with a flange at its top, and a circular recess therein to receive the flange on the pintle, and the socket for the boom, all constructed and arranged substantially as set forth.



3. The combination, with the plate a, of the cheeks or plates *p p p*, the sheaves *q q q'*, and the triangular hoods *s s*, all constructed and arranged substantially as set forth.

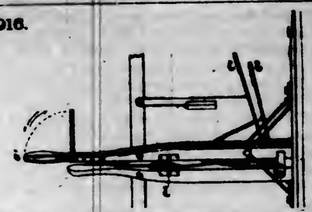
258,914. BARB-FENCE. WILLIAM H. HARRIS, Neola, Iowa. Filed Mar. 31, 1882. (Model.)

Claim.—As an article of manufacture, a perforated sheet-metal strand provided with a wire barb the central portion of which is bent about a portion of the strand at an angle to its length, the legs of which are disposed side by side therethrough, and the points of which are projected in opposite directions from opposite sides of the strand, substantially as shown and described.

258,915. STEAM-TRAP. JAMES L. HASTINGS and JAMES S. STEWART, Philadelphia, Pa. Filed Sept. 17, 1881. (No model.)

Claim.—1. The levers D D, in combination with the valve *c* in the slotted plug *c'*, the spring *d*, and bearing-piece *d'*, substantially as and for the purposes described.

2. The plug *c'*, slotted and screwed into the head-piece *a*, in combination with a valve, *c*, substantially as set forth.



3. In combination, the head-piece *a*, slotted plug *c'*, valve *c*, spring *d*, and the bearing-piece *d'*, provided with a pin, substantially as and for the purposes described.

4. The combination, with the head-piece *a*, slotted plug *c'*, valve *c*, spring *d*, and bearing-piece *d'*, provided with a pin, of the yoke B, levers D D, and the rods C C, provided with set-nuts *e*, substantially as and for the purposes described.

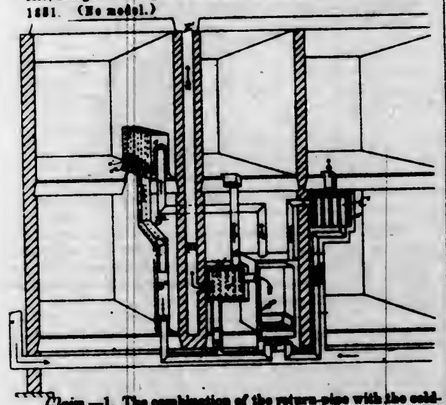
258,916. APPARATUS FOR LASTING AND TREEING WOOL FELT. ALFRED A. HAWLEY, Merrimac, assignor to the Merino Shoe Company, Boston, Mass. Filed Feb. 13, 1882. (No model.)

Claim.—1. The device for steaming the felt of a wool boot, consisting of a perforated cone-shaped steam-distributer and a convex-convex disk in the lower part of it, in combination with any suitable conductor of steam.

258,916.

2. The device for opening a wool boot, as that it will admit a last and tree, consisting of the upright beams *c*, the foot-opener *c'*, the levers c^3 and c^4, and the rods and jointed coupling c^5 and c^6.

3. The above-described machine for lasting and treeing wool boots, consisting of a supporting-frame and table, the double tongs a^2, the actuating devices a^3, the fixed blocks c^3 and c^4, and the tree-opening devices *c c' c³ c⁴ c⁵*, all made substantially as described.



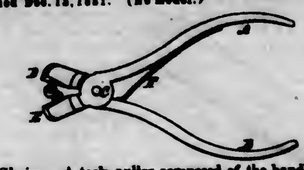
4. In a machine and apparatus for lasting and treeing wool boots, in combination with a tree in the boot and the devices a^3, *c*, *c'*, and c^6, for opening the tree, the block c^3, substantially as described.

258,917. FORMER FOR SUPPORTING HOLLOW FELTED ARTICLES. ALFRED A. HAWLEY, Merrimac, assignor to the Merino Shoe Company, Boston, Mass. Filed Feb. 13, 1882. (No model.)

Claim.—The improved former herein described, consisting of an air-tight flexible elastic bag approximating in form to and inflated with compressed air in the article to be finished on it, and provided with suitable devices for inducting, retaining, and discharging air, all substantially as described, and for the purpose set forth.

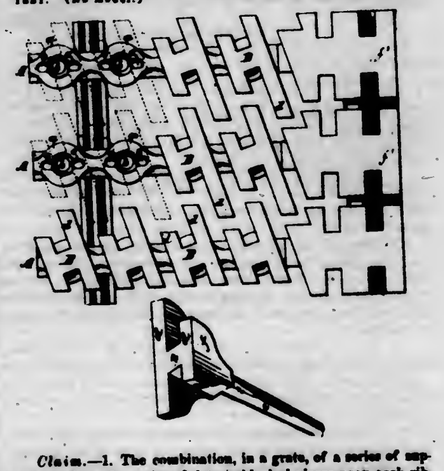
258,918. HEATING SYSTEM. BENJAMIN R. HAWLEY, Chicago Ill., assignor to Agnes Hawley, same place. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination of the return-pipe with the cold-air duct, through which it passes without opening therein to, whereby the return-pipe is subjected to the cooling effect of the outside atmosphere before the latter becomes warmed, substantially as specified.



2. The combination, with the return-pipes, the radiators, and the cold-air duct, of the passages surrounding the return-pipes and connecting the cold-air duct with the radiator, substantially as set forth.

258,919. CIGAR-REAMER. RANDOLPH HAYDEN, Haddam, Conn. Filed Dec. 14, 1881. (No model.)



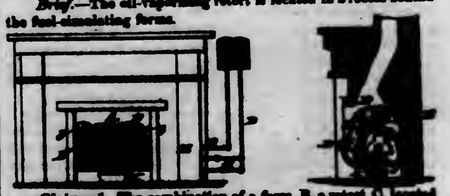
Claim.—The grooved and needle-pointed cigar-reamer blade B, provided with four straight cutting-edges, B', extending back from the point, in combination with a suitable handle for rotating it, substantially as described.

258,920. TACK-PULLER. RANDOLPH HAYDEN, Haddam, Conn. Filed Dec. 13, 1881. (No model.)

Claim.—A tack-puller composed of the handles A B, held apart by the spring F, and the jaws D E, provided with sharp flaring edges set opposite each other at an angle with the line of the handles and meeting at their inner ends only, substantially as described.

258,921. GRATE. HENRY T. HILL, Manchester, N. H., assignor of one-half to Person C. Cheney, same place. Filed Sept. 19, 1881. (No model.)

Claim.—1. The combination, in a grate, of a series of supporting-ribs and a series of detachable bed-pieces upon each rib, each bed-piece having bars *d d*, of different lengths, substantially as and for the purpose set forth.

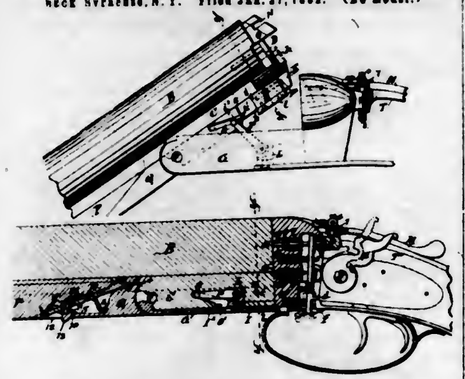


2. The combination, in a grate, of the series of supporting-ribs, each having a series of sockets, *b*, and the bed-pieces, having shanks constructed to project through the sockets and below the edges of the ribs, for the purpose set forth.

3. The supporting-rib A, each having a series of socketed beams, *a*, with side notches, *e*, and constructed to support each a series of bed-pieces, B, with shanks and feathers *f*, substantially as set forth.

4. The combination of the ribs and bed-pieces supported thereby, each consisting of two or more bars arranged at an angle to the rib, substantially as set forth.

258,922. FIRE-PLACE. CHARLES HOLLAND, Chicago, Ill. Filed Sept. 27, 1880. (No model.)



Brief.—The oil-vaporizing retort is located in a room behind the fuel-simulating forms.

Claim.—1. The combination of a form, B, a retort, C, located behind, beneath, or within, and receiving heat radiated from said form and connected with a liquid-hydrocarbon-supplying tube, D, a heating-pipe, F G, and a pipe, J, substantially as and for the purpose set forth.

2. The combination of the retort C, located in a chamber, A, within a form, B, simulating burning fuel, with the pipes J and F, as and for the purpose set forth.

258,923. BREECH-LOADING FIRE-ARM. FRANK A. HOLLENBECK, Syracuse, N. Y. Filed Jan. 27, 1882. (No model.)

Claim.—1. The combination of the tang T, provided with the boss 1 and vertical hole 2, the lever M, pivoted on said boss, the sight 4, having the stem 3 in the hole 2, and the spring 7 at the side of the stem and overlapping the top of the lever, all combined and arranged as shown and set forth.

2. The combination of the tang T, provided with the vertical hole 2, the sight 4, having the stem 3, provided with the slot 5, and the connecting-pin 6, substantially in the manner described and shown.

3. The combination, with a three-barreled gun, of a shifting-bar arranged across the rear end of the firing-pins and provided with passages for the firing-pins, arranged in such relative position that while one of said passages is brought in coincidence with a firing-pin the other is normally out of coincidence with its respective firing-pin.

4. In combination with the barrels B C, their firing-pins *a* and *a'*, and the hammer H, the shifting-bar *s*, arranged across the end of said firing-pins, having the apertures *r* and *r'*, arranged as described, and the plunger *b*, provided with the cavity *c*, as set forth and shown.

5. In combination with the barrels B C, their firing-pins *a* and *a'*, and the hammer H, the shifting-bar *s*, provided with apertures *r* and *r'* and with the catch or shoulder *d*, the springs *e e' e''*, and the plunger *b*, provided with the cavity *c*, substantially as and for the purpose specified.

6. In combination with the shifting-bar *s*, provided with the shoulder *d*, and arranged so as to be movable laterally in the stock, as shown, the eccentric screw or button *f*, as and for the purpose specified.

7. The combination and arrangement, with the two barrels B B, situated side by side, of the third barrel, C, placed beneath the former and central between them, and the extractor E, arranged beneath the third barrel and adapted to engage the cartridge or shell in the barrel C, and to actuate simultaneously the extractor of the barrels B B, substantially as described and shown.

8. The combination, with the two barrels B B, situated side by side, of the third barrel, C, placed beneath the former and central between them, the extractor E, adapted to engage the cartridge or shell of the barrel C, and provided with the shoulder *g*, and the extractor D, having the plate *h* in front of said shoulder, substantially as described and shown, for the purpose set forth.

9. In combination with the three barrels B B and C, arranged as described, the lug *i*, projecting from the bottom of the barrel C, and provided with the channel *h*, the extractor E, having the tongue *h'* in said channel, and the plate *l*, detachably applied to the bottom of the said lug, as and for the purpose set forth.

10. In combination with the barrels B B and C, the lugs *i i'*, having the channel *h* and inclined slot *o*, with notch *o'*, the extractor E, having the tongue *h'* in said channel, and provided with the slot *m*, the pin *n*, and the link *p*, hinged on the bridge L and having its free end in the slot *o* and engaging the front end of the extractor, all constructed and combined in the manner shown and set forth.

11. The combination of the fore-end P, forwardly-inclined shank R, tip-strap Q, having a beveled forward end, and the spring V, as and for the purpose set forth.

12. In combination with the fore-end P and breech-extension G, the forwardly-inclined shank R, provided with the segmental face 14, the tip-strap Q, fitted to the shank and having a corresponding segmental face, and the set-screw 15, inserted in the tip-strap at said face, substantially as and for the purpose set forth.

13. The combination of the forwardly-inclined shank R, fixed to the barrel and provided with a mortise, and with the stud 9 in said mortise, the fore-end inserted under said shank, the tip-strap Q, having a beveled forward end and provided with the mortise S, and with the pin 11 and hook 8 in said mortise, and the spring U, connected to the hook 8 and having at its forward end the reversed curved face V, bearing on the stud 9, and its extremity 10, extended underneath the pin 11, all constructed and combined substantially in the manner described and shown, for the purpose set forth.

258,924. MANUFACTURE OF FLOUR. JESSE HOLLINGSWORTH, New York, assignor of one-half to James A. Whitney, Dobbs Ferry, N. Y. Filed Feb. 14, 1882. (No specimens.)

Claim.—1. The process of manufacturing flour which consists in crushing decorticated wheat to liberate the husk within the crease of the berry, separating the said portion of the husk from the food-product, and then converting the purified food-product to flour, substantially as herein set forth.

2. As a new article of manufacture, wheat-flour composed of the starchy and the glutinous components of wheat in substantially the proportions in which they exist in nature in the wheat-berry, and freed from ground bran or germ, substantially as herein set forth.

258,925. PAPER AND OTHER BAGS. JESSE H. HOLMES, St. Louis, Mo. Filed Feb. 14, 1882. (Model.)

Claim.—As a new manufacture, the bag D, having the part *d'* of the bottom between the sides d^2 d^3, the side d^3 being folded inward at its lower end, and the side d^4 projecting beyond the folded side d^3, substantially as shown and described.

258,926. WINDOW-WASHER. GEORGE A. KENDE, Lynn, Mass., assignor of one-half to Charles W. Melcher and Gustavus M. Spinney, same place. Filed Feb. 23, 1883. (No model.)

Claim.—The herein-described improved window-washer, consisting of the elastic mouth-piece B, provided with the central opening, B', and bead *b*, the rigid back piece or reservoir, A, provided with the inlet-hole *a*, and the pole-holder D, all combined and arranged substantially as and for the purpose set forth.

258,927. COTTON-GIN FEEDER. ERWIN H. KEITH, Bridgewater, Mass., assignor to the Eagle Cotton Gin Company, same place. Filed Aug. 29, 1881. (No model.)

Claim.—1. In a cotton-gin feeder, the support I, having the upper portion, I', in combination with the lower end, K', of the bracket, the casing A, and screws, substantially as and for the purpose set forth.

2. The combination of the lever G, provided with a square hole, the stud *g*, and horns or guides *d*, said stud being fitted in a corresponding opening in the head of the horns or guides *d*, by means of which the lever is rendered reversible, so as to be readily attached to either side of the frame, substantially as set forth.

3. The recessed bracket *e*, provided with the reversible spring *e'*, substantially as and for the purpose set forth.

4. In a cotton-gin feeder, the rocker-arm E, having on its face side, both above and below the center bearing, a recess provided with scale-marks, in combination with the separately-adjustable boxes *b b*, pawls *a a*, attached thereto, and ratchet-wheel C, adapted to be actuated by said pawls, all substantially as and for the purpose specified.

258,928. SEED-DRILL AND FERTILIZER. HORACE M. KEITH, Commerce, assignor of one-half to Joel P. Harger, Pontiac, Mich. Filed Feb. 16, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a seed-drill, of a hopper having interior vertical seed-conducting tubes or chutes, provided with top inclined trays, with feed-wheels having internal buckets adapted to operate in relation to said trays, for the purpose specified.

2. The combination, substantially as hereinbefore set forth, in a seed-drill, of a hopper having interior vertical seed-conducting tubes or chutes, provided with top inclined trays, with feed-wheels having internal buckets and means for laterally adjusting said feed-wheels in relation to the trays, for the purpose specified.

3. In combination, the hopper, the fixed vertical tubes or chutes therein, the open feed-wheels having internal buckets, the shaft upon which they are fixed, and means for effecting the end-wise adjustment of said shaft, and the feed-wheels thereon, consisting of the screw-stems *i*, the coupling-plates *i'*, the screw-nuts *j*, and the spring *j'*, arranged at the end of the hopper, whereby to set the feed-wheels toward and from the fixed hopper-tubes, for the purpose specified.

4. The feed-wheel band *d*, mounted at one edge upon spokes *d'*, and having buckets *c*, arranged upon the interior wall of said band, in combination with a fixed tube or chute having a tray extending within and beneath the said band toward its spoked side and below the path of the buckets, and the hopper through the bottom of which the said chute passes, substantially as described, for the purpose specified.

5. The combination, in a seed-drill, of the hopper for the fertilizer having longitudinal side slots, *k*, on a plane with its bottom, with feed-arms *r*, passing into and through said slots and having a reciprocating movement across and upon the bottom of the hopper, and means for producing such movement, whereby to effect the feed of the fertilizer from both sides of the hopper, substantially as described.

6. The hopper for the fertilizer adapted to have an endwise movement, and provided with longitudinal side slots, *k*, on a plane with its bottom, in combination with feed-arms *r*, adapted to operate within and through said slots and across the hopper-bottom, and means for operating both the hopper and the said feed-arms, substantially as described, for the purpose specified.

7. In combination, the hopper for the fertilizer adapted to have an endwise movement, and having longitudinal side slots, *k*, on a plane with its bottom, feed-arms *r*, adapted to operate within said slots upon and across the hopper-bottom, bell-crank levers pivoted to the frame, and serpentine cams *p*, for operating said levers, the said feed-arms being carried by a bar pivoted to said levers and operated, in the manner and for the purpose specified, by suitable drill drive-gear connections.

8. The hopper for the fertilizer adapted to have an endwise movement, having longitudinal side slots, *k*, and side strips, *s*, adapted for vertical adjustment in relation to said slots, the scraper G upon the rear side of the hopper, and the feed-arms *r*, adapted to operate within said slots upon and across the hopper-bottom and beneath the said regulating-strips *s*, and the scraper, all constructed and combined with the seed-drill tubes and with the chutes *b*, substantially as described, for the purpose specified.

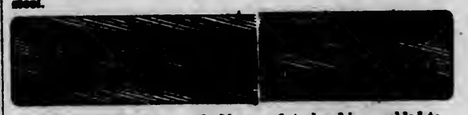
9. The combination, with the drill-tubes of a seed-planter, of the hopper for the fertilizer, the guides *l* for said hopper, the serpentine cam *m*, for operating said hopper, the feed-arms *r*, operating through slots in the sides of the hopper, the bell-crank levers pivoted to the carrying-bar of said feed-arms, the serpentine cams *p*, and the shaft *n*, operated by the drive-gear of the drill, the said serpentine cams being arranged in relation to each other to operate simultaneously the hopper and the feed-arms to deliver the fertilizer from both sides of the hopper.

10. The combination, substantially as hereinbefore set forth, in a seed-drill, of the drill-tubes thereof with a supplemental drill-point or cutting-edge adapted for attachment to said drill-tube, and operating in front thereof, for the purpose specified.

11. The supplemental drill device, consisting of an arm, *c*, having a yoke and a dip, *c'*, whereby it is secured to a drill-tube, and a narrow point or cutting-edge, *u*, carried by said arm in front of and below said drill-tube, substantially as described, for the purpose specified.

12. The combination, substantially hereinbefore set forth, of a seed-conducting tube with a thin narrow cutting blade or point, *u*, and a covering device, substantially as described, and adapted to travel in the slit made by said narrow cutting-blade, for the purpose specified.

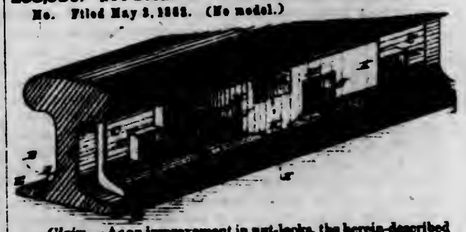
13. The combination, substantially hereinbefore set forth, of a seed-conducting tube and an attachable thin or narrow cutting blade or point, *u*, with an attachable covering-blade, *w*, constructed substantially as described, and adapted to travel in the slit or narrow opening made by said cutting-blade, for the purpose specified.



14. The combination of the seed-conductor with the arm *c*, extending in front thereof, the clip *c'*, the narrow drill-forming point *u*, a clamp, c^2, therefor, and a covering dish-shaped wheel, *w*, substantially as described, for the purpose specified.

15. The combination, in a seed-drill, of a seed-conductor, a thin or narrow cutting-blade or point, *u*, and a covering-blade, *w*, as described, with the seed-hopper C, a feed device for feeding the seed continuously, and a chute, *c*, substantially as and for the purpose specified.

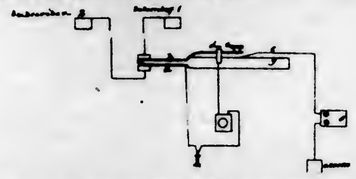
16. In combination in a seed-drill and fertilizer, the hopper C, its feed device, the hopper B, its feed device, means, substantially as described, for connecting and operating the feeding devices of said hoppers, means for rendering the feed devices of the hopper A non-operative, a drill-forming point or cutting-blade adapted for attachment to the drill-tube, and a covering device adapted to travel in the cut made by the drill-forming point, substantially as described.



258,929. JAIL, PRISON, AND GRATING BAR. GEO. KINSEY, Wyoming, Ohio. Filed Mar. 25, 1882. (No model.)

Brief.—The inner layers of iron are provided with cores of steel.

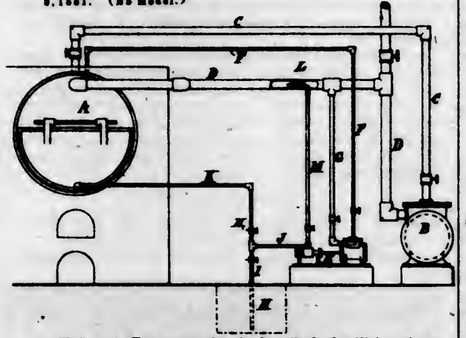
Claim.—A bar composed of layers of steel and iron welded together, the inner layer or layers of iron being provided with a core or cores of steel, substantially as and for the purpose described.



258,930. NUT-LOCK. DAVID M. KIRKPATRICK, Kansas City, Mo. Filed May 3, 1882. (No model.)

Claim.—As an improvement in nut-locks, the herein-described combination and arrangement of the bolts F, having nuts H, the fish-plate C, having flange D, provided with recess L, the flexible metal strip M, and the lock-plate I, having tongue K and recesses J, substantially as and for the purpose set forth.

258,931. PLUG FOR ELECTRICAL SWITCH-BOARDS. HARRY W. LELAND, South Framingham, assignor to himself and Joel C. Clark, Framingham, Mass. Filed Jan. 3, 1882. (No model.)

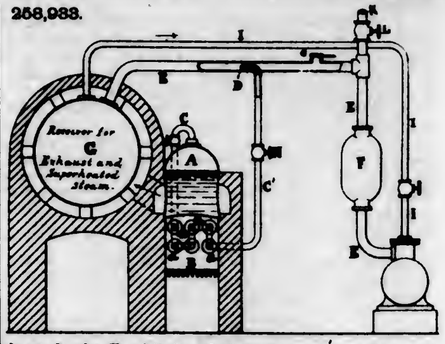


Brief.—The plug is provided with one or more keys and circuit-connections, whereby subscribers may be called by the same hand that is used for the insertion of the plug.

Claim.—1. A switch-board plug of the class described, supporting a back contact, a terminal or anvil, and a spring-key, said parts being connected respectively with the operator's telephone, with a generator or battery, and with one of the metal plates of the plug, whereby the operator is enabled to manipulate the key and make and break the usual connections with the same hand that holds the plug, as set forth.

2. A switch-board plug of the class described, supporting one or more back contacts, one or more terminals or anvils, and one or more spring-keys, said parts being connected respectively with the operator's telephone, a battery or generator, and one or both of the metal plates of the plug, whereby the operator is enabled to make and break the usual connections with the same hand that holds the plug, and when two back contacts, spring-keys, and terminals are provided the operator is enabled to connect both of the metal plates of the plug with a generator or battery, and thereby send currents to both parts of a line-circuit into which the plug is inserted, as set forth.

258,932. UTILIZING EXHAUST-STEAM. HARVEY T. LITCHFIELD, Hull, and DAVID RUSSHAW, Cohasset, Mass. Filed Aug. 8, 1881. (No model.)



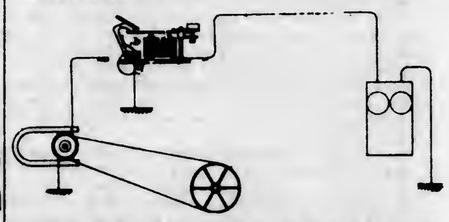
Claim.—1. The process herein described of utilizing the exhaust of an engine, consisting of first drawing or pumping water from a working-boiler, then forcing it under greater pressure than the boiler-pressure into the exhaust-pipe of an engine, whereby the water and the exhaust of the engine is forced into the same boiler from which they were taken, substantially as described.

2. The combination, in an apparatus for utilizing the exhaust of engines, the boiler A, cylinder B, pump E, with their supply and exhaust pipes, the tank H, and pipes I, J, M, and D, whereby water may be fed to the boiler for leakage and supply, in the manner set forth and described.

258,933. UTILIZING WASTE STEAM. HARVEY T. LITCHFIELD, Hull, and DAVID RUSSHAW, Cohasset, Mass. Filed July 10, 1881. (No model.)

Claim.—1. The process herein described of utilizing exhaust-steam by means of a boiler, superheater, and a receiver or reservoir and suitable connections, which consists in first generating steam, then superheating it and using it to draw in air, then heating the mixture to working-pressure and utilizing it as motive power, then forcing the exhaust of said mixture into the receiver and revivifying it, whereby it can be repeatedly used, in the manner set forth.

2. The combination, in an apparatus for utilizing the exhaust of an engine, of the generator, superheater, and reservoir, the exhaust-chamber F and its branch pipes, air-valve *e*, and the superheated-steam nozzle D, all arranged to operate together, for the purpose described.



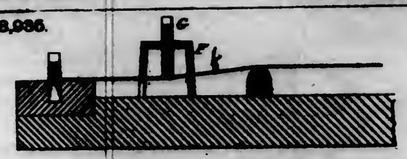
3. The combination, in an apparatus for generating motive power and the utilization of the same, of the generator, superheater, and reservoir-pipe I, exhaust-chamber F and its branches E, air-valve *e*, and superheated-steam pipe C' D, constructed and arranged in the manner shown and described.

4. In an apparatus for generating motive power, the boiler A, superheater *a a*, and the reservoir G, arranged concentrically within a flue, by which the waste products of combustion from the furnace are utilized in maintaining the temperature of its contents, and also the means for connecting one with the other, in the manner shown and described.

258,934. ELECTRICAL SIGNALING-CIRCUIT. THOMAS D. LOCKWOOD, Malden, Mass. Filed Apr. 12, 1882. (No model.)

Brief.—Subscribers' lines normally grounded through annunciator. When a signal is sent to central office by a subscriber the annunciator-drop in falling breaks the ground and connects the line to another ground branch, including a generator, thereby automatically sending a return-signal to notify the subscriber that his call has been received.

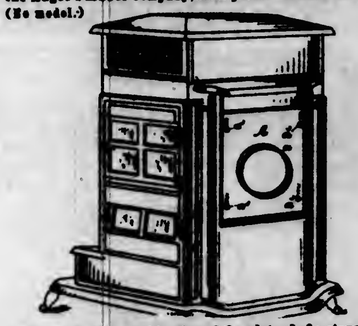
Claim.—1. A main line, an annunciator, and a branch circuit to earth direct, combined with a magneto-electric machine or other generator of electricity in a normally-open branch circuit, and an electric switch automatically operated by the annunciator and adapted to change the circuit of the main line from the earth branch circuit to the normally-open generator branch circuit.



2. The combination, substantially as hereinbefore described, of a series of main-line circuits, each provided with an annunciator, and branch circuit to earth direct, with a normally-open branch circuit, including a magneto-electric generator or other source of electricity common to the series of main lines, and means, substantially as indicated, whereby one or more of the main lines may be connected to the said generator for the purpose of transmitting a return-signal over the main line or lines so connected.

3. The electric generator, the anvil forming a support for the annunciator-drops, and a conducting-wire connecting one with the other, combined with the electro-mechanical switch or circuit-changer, and a main-line annunciator, as described.

258,935. TUNING ATTACHMENT FOR PIANO-FORTES. JOHN H. LOWRY, Chicago, Ill., assignor of one-half to John A. Newman, same place. Filed Mar. 7, 1882. (No model.)

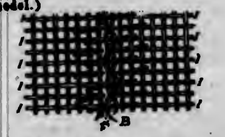


Claim.—1. In piano-fortes, the combination, with the bed thereof, of a tuning attachment which consists of a frame extended across the strings and which is provided with threaded perforations and with a series of adjusting-screws that bear directly upon the strings beneath, substantially as described.

258,936.

2. The combination, with the bed or frame of a piano-forte, of the arched frame E, provided with adjusting-screws G and guide-slots *f*, and extending across the strings, substantially as described.

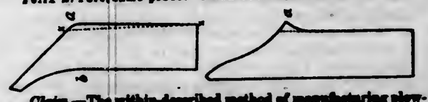
258,936. STOVE. JOEL HAGER, Chelsea, Mass., assignor to the Hager Furnace Company, same place. Filed Mar. 27, 1882. (No model.)



Claim.—1. The combination of the plate a^2 of a stove, having the long aperture *a* opening into one of the direct flues of the stove, with the plate A, having a pipe collar or ring, *c*, and means for securing said plate to the stove and for adjusting it upon said plate, all substantially as and for the purposes described.

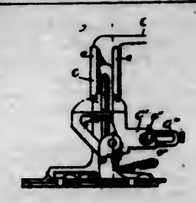
2. The combination of the back plate, a^2, of a stove, having the slots a^4 and the plate A, carrying the pipe collar or support *c* and the bolts a^3, all substantially as and for the purposes described.

3. The combination of the back plate, a^2, of a stove, recessed as described, and having the slots a^4 and aperture a^5, with the plate A, adapted to fit within the recess and carrying the pipe collar or support *c* and the bolts a^3, all substantially as and for the purposes described.



4. The reversible plate A, having the pipe collar or support *c* nearer one edge thereof than the other, all substantially as and for the purposes described.

258,937. SEAM FOR WIRE-CLOTH FOR PAPER MANUFACTURE. MARY A. MARTIN, Springfield, Mass. Filed Apr. 14, 1882. (No model.)



Claim.—In a seam for wire-cloth for paper manufacture, the combination of the unraveled and backward-bent strands, and the seam-wire B, carried half-way around the edge-wires F F, and over and behind the knuckle of each alternate opposite wire I, as and for the purpose set forth.

258,938. MANUFACTURE OF PLOWSHARES. LEWIS MCKINNISS, Decatur, Ill., assignor of one-half to Joseph S. Tait and Felix B. Tait, same place. Filed Oct. 15, 1881. (No model.)

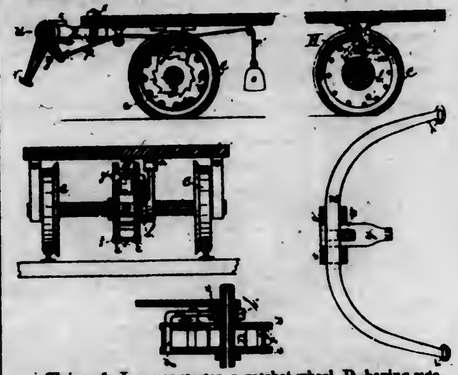
Claim.—The within-described method of manufacturing plowshares, consisting in making the blank with a bold projection, *a*, at a point opposite the concave *b*, and then forging down said projection, thereby widening and strengthening the share in the concave *b*, substantially as set forth.

258,939. RUFFLING ATTACHMENT FOR SEWING-MACHINES. ALEXANDER MCMULLEN, Chicago, Ill. Filed Apr. 3, 1882. (No model.)

Claim.—1. In a ruffler attachment, the horizontal carrier of the ruffler-blade provided with carriage-rollers b''', as and for the purpose specified.

2. In a ruffler attachment, a vertical slide, C, having an inclined adjustable slot or way and arms C', substantially of the construction shown.

3. In a ruffler attachment, a notched sliding bar, C''', having the part *c*, in combination with dog c', as and for the purpose specified.



4. In a ruffler attachment, a vertical slide, C, operated by the needle-bar, and provided with an inclined slot or way, in combination with the horizontal carrier of the ruffler-blade, having an arm and pin connecting with such inclined way or slot, substantially as and for the purpose specified.

258,940. CIGAR-MOLD. FREDERICK C. HILLER and HENRY C. PETERS, New York, N. Y. Filed Dec. 6, 1881. (No model.)

Claim.—The combination, in a cigar-mold, of the lid having at its extreme end an outer bearing and turning point resting on the lower part of the mold, extended beyond the end cup or matrix a sufficient distance to enable the plunger to be moved out of the matrix in a plane substantially parallel with the sides of the matrix, and without subjecting the edges of the plunger or the side walls of the matrix to strain, with the gain or rabbet at or near the opposite end of the mold, substantially as described.

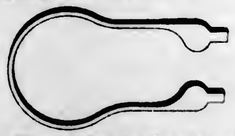
258,941. CAR-STARTER. DOMINGO MENDOZA, Jr., and WILLIAM B. FLEMING, New Orleans, La. Filed Mar. 21, 1882. (No model.)

Claim.—1. In a car-starter, a ratchet-wheel, D, having axle bosses on which are fitted levers *e d'*, connected by means of bolts *f*, around which the rope *p p'* is wound, as described, and for the purpose set forth.

2. In a car-starter, the annular ring or slide *i*, fitted on a stationary bearing, and provided with a slot, *s*, in which operates the end of a pin, *i'*, said pin being connected with the pawl H, and acting in guides *h* of the lever *d* to throw the pawl in or out of gear, as described, and for the purpose set forth.

3. In combination with a car-starter composed of a ratchet-wheel, D, operating-levers *e d'*, and pawl H, a draw-bend, E, provided with straps *t t'*, forming bearings for a single-tree, U, having a stud, *w*, for operating a lever, *y*, connected with the starter, as described, and for the purpose set forth.

258,942. CARBON FOR INCANDESCENT LAMPS. JOSEPH V. NICHOLS, Brooklyn, assignor to the United States Electric Lighting Company, New York, N.Y. Filed Feb. 1[illegible]1882. (No model.)



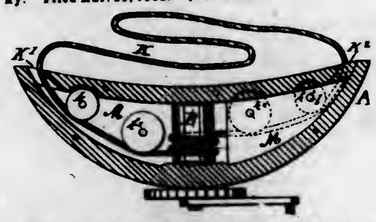
Claim.—1. A carbon conductor for incandescent lamps, having its clamping ends composed in part of metal mechanically incorporated therewith, as described.

2. A carbon conductor for incandescent lamps, re-enforced at its ends by a film or strip of metal mechanically incorporated therewith, substantially as described.

3. As a new article of manufacture, a conductor for incandescent lamps, composed of a single or compound strip of carbonized material, having enlarged clamping ends, re-enforced by a film or strip of metal mechanically incorporated therewith, substantially as described.

258,943. INCANDESCENT LAMP. JOSEPH V. NICHOLS, Brooklyn, assignor to the United States Electric Lighting Company, New York, N.Y. Filed Sept. 7, 1881. (No model.)

Brief.—The object is to render the ends of the filament much better conductors than the body thereof.



Claim.—1. The method of manufacturing carbon conductors for incandescent lamps which consists in re-enforcing a sheet of fibrous material by a strip or strips of similar material united thereto, then cutting or punching partly from the main and partly from the re-enforced portions thereof strips of the desired shape, and carbonizing such strips, substantially as set forth.

2. The method of manufacturing carbon conductors for incandescent lamps which consists in forming a compound sheet of fibrous material, re-enforced by a strip or strips of a similar material united thereto, and consolidating the same by heat and pressure, as described, then cutting or punching partly from the main and partly from the re-enforced portions thereof strips of the desired shape, and carbonizing such strips, substantially as described.

3. The conductor for incandescent electric lamps, composed of one or several superposed layers or strips of fibrous material, with a re-enforcing strip or strips at the ends, united together and carbonized, substantially as described.

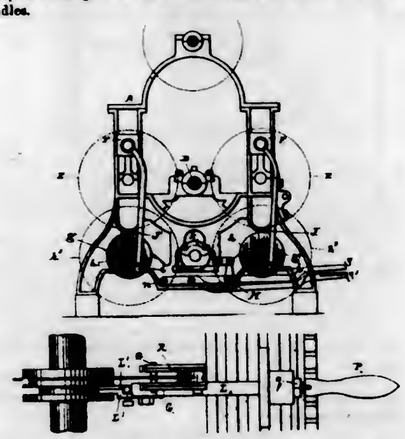
258,944. BARREL-TRUSS. JAMES M. O'BRYAN, Paynesville, Ky. Filed Mar. 20, 1882. (No model.)

Claim.—1. The portable crescent-shaped case A, provided with the central shaft, B, the ratchet and pawl, and the rope K, wound in opposite directions on the shaft, the whole being combined, arranged, and operating substantially as shown and described.

2. In a barrel-truss, the combination of the crescent-shaped case A, provided with the partitions M, shaft B, rope K, and pulleys h h' h^2 h^3, located in pairs on opposite sides of the partitions, substantially as shown and described.

258,945. CHATELAINE. THOMAS W. RICHARDS, Jersey City, N.J. Filed Apr. 17, 1882. (No model.)

Brief.—The frame carries and protects a memorandum-book and pencil, to which the chatelaine can be attached.



Claim.—1. As a new article of jewelry and ornamentation, a chatelaine consisting essentially of an open frame adapted to receive a memorandum-book, whereby convenient means is afforded for carrying such book and protecting its edges, substantially as described.

2. In a chatelaine, the combination of an open frame, a pencil-holder on such frame, provided with a spring arranged to retain one end of a pencil, and a pencil-point support, substantially as set forth.

258,946. EDGER. JAMES A. REDD, San José, Cal. Filed Jan. 4, 1882. (No model.)

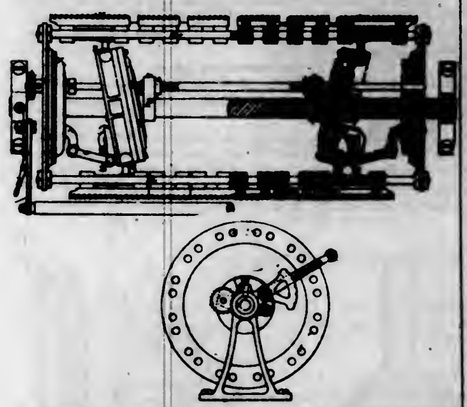
Brief.—The boxes of the feed-rolls are lifted by connecting-rods from wrist-pins or disks g, one or the other of which may be thrown into gear with a friction-driver. The setting-levers are clamped in the grooved lever-bar by means of screw-nuts on the handles.

Claim.—1. In a gang-edger, the combination, with the upper feed-rolls journaled in sliding boxes F, of the shafts A, with their friction-wheels, the disks g j g, having wrist-pins i, the connection-rods J J, the shaft with friction-pulley k, and mechanism, substantially as herein described, for shifting or laterally throwing one end of said shafts toward either of the said shafts G G, for the purposes set forth.

2. The combination, with the shifting box m, of the rock-shaft N, fixed arm, and link r, the lever S, in said rock-shaft, and the secondary lever, S', pivoted at t to the frame, and having the inner end of the lever S attached to it at a point in front of its fulcrum, substantially as described.

3. The combination of the slotted bar T with the end of the setting-lever L, having the T-slot, the handle with a threaded shank, and the nuts q q', substantially as described.

4. In combination with the setting-lever L, the detachable nose-piece L', formed of two plates, which are provided with a spreading or setting means whereby they are moved from each other and held in such position, substantially as and for the purpose set forth.



5. The detachable nose-piece for the ends of the setting-levers in edgers, consisting of the two separable plates L' and the separating-screws 2 3 4, by which the upper edges of the plates can be spread and held apart to a greater extent than the lower portion thereof, in combination with grooved saw-collars, substantially as described, for the purposes set forth.

6. In combination with the grooved saw-collars and the separable plates L', forming the nose-piece, as described, the clamp W and lubricator material, applied substantially as described, for the purpose specified.

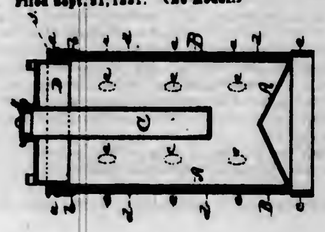
7. In combination with the upright end of the setting-lever L, the sawdust-spout R, having the adjustable saw-stops G G, substantially as described.

258,947. CLOTH-STRETCHING MACHINE. FREDERICK P. UPHAM, GEORGE A. SANDBERG, and HENRY A. SHELDEN, Pawtucket, assignors of one-half to John E. Goldsworthy, Central Falls, R.I. Filed Jan. 6, 1879.

Brief.—The stationary cam-disks and the guide-wheels inclosing the same are adjusted to vary their obliquity and adjust the stretch of the cloth upon fixed fulcra located substantially at the outer ends of radii of the guide-wheels, whereby the angle of the said disks and wheels may be varied without changing the position of their inner sides. The cam-disks are pivoted upon sleeves splined to the supporting-shaft, and are simultaneously adjusted by means of a right and left hand screw-shaft passing through the ends of the cylinder. The interior of each cam-disk is made as an oil-reservoir, which communicates with the surrounding guide-wheel through openings.

Claim.—1. In combination, substantially as specified, the adjustable cam-disks and guide-wheels, devices for adjustment substantially as described, and the fixed fulcra for said disks, located substantially at the end of a radius of the guide-wheels.

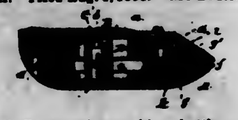
2. The combination of the cylinder provided with parallel rods, the series of linked stretcher-blocks, the guide-wheels, the cam-disks chambered out to serve as reservoirs for oil, fixed fulcra for said disks situated near their peripheries, and means of adjustment, substantially as described.



3. In combination, substantially as specified, the adjustable cam-disks and guide-wheels, the central shaft, the sleeves splined thereto, and the right and left hand screw-threaded rod for simultaneously changing said cam-disks and guide-wheels.

4. The combination, substantially as specified, of the cylinder provided with parallel rods, the series of linked stretcher-blocks, the adjustable cam-disks, and the guide-wheels having fixed fulcra near their peripheries.

5. The combination of the adjustable cam-disk and guide-wheel, the cylinder-head, the jointed arm, one end of which is fixed to the said cylinder-head and the other end to the said cam-disk, and suitable means of adjustment, substantially as specified.



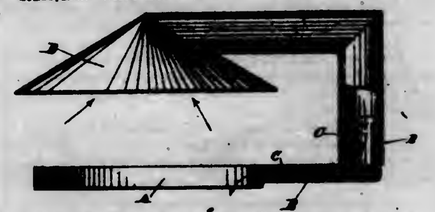
6. The combination, substantially as specified, of the adjustable cam-disks and guide-wheels, sleeves splined to the central shaft and having projections provided with female screws, and the adjusting-rod provided with a right and left hand screw adapted to the female screws in said projections to simultaneously adjust the cam-disks and guide-wheels to their proper planes of divergence while the machine is at rest or in motion.

258,948. MILK-CAN. CHARLES S. SHEPARD, Cherry Creek, N.Y. Filed Sept. 21, 1881. (No model.)

Claim.—The milk can and cooler described, consisting of an inner can, A, provided with the shoulder a, cover D, and cooling-tube C, and the outer can, B, provided with the bead c, and extending below the base of the can A, the whole being constructed of metal and having an air-chamber, f, between the can A and case B, substantially as set forth.

258,949. SEWING-MACHINE SHUTTLE. JOHN BIGWALT, Jr., Chicago, Ill. Filed Aug. 2, 1881. (No model.)

Claim.—1. In a sewing-machine shuttle, a spool or bobbin having its upper flange or end provided with an exterior face of a conical shape to form a bearing-point, b, for reducing the frictional contact between the surfaces of the flange or end and the cover and giving the spool or bobbin a freer movement, substantially as specified.



2. In a sewing-machine shuttle, a post or pivot, E, having a conical-shaped bearing-point, a, in combination with a spool or bobbin, C, having a conical-shaped flange or end to form a bearing-point, b, and a corresponding bearing-surface for giving the spool or bobbin a small bearing in either direction, substantially as and for the purposes specified.

3. The shuttle A, provided with a post or pivot, E, having a conical-shaped bearing-point, a, in combination with a cover, B, and spool or bobbin C, having its flange or end of a conical exterior shape to form a bearing-point in holding the spool or bobbin in position and giving it perfect freedom of movement in revolving, substantially as and for the purposes specified.

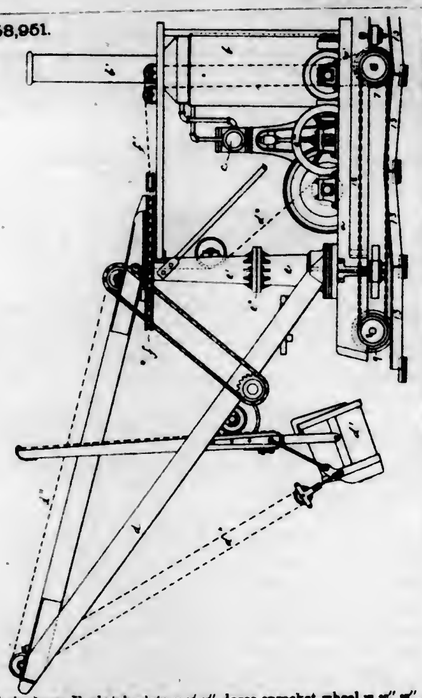
4. The cover B, the post or pivot E, having a conical-shaped bearing-point, a, and spring c, in combination with a spool or bobbin, C, having a bearing-point, b, on its flange or end for keeping the thread under proper tension and preventing it from coming off too rapidly or becoming slack, substantially as specified.

5. The cover B, the post or pivot having a conical-shaped bearing-point, a, and spool or bobbin C, having a bearing-point, b, on its flange or end, and spring c, in combination with the shuttle A, tension-disks g g', and devices for controlling the tension-disks, substantially as and for the purposes specified.

258,950. DEVICE FOR CARRYING OFF STEAM AND ODORS FROM COOKING-VESSELS. DEXTER M. SMALL, East Providence, R.I. Filed Nov. 16, 1881. (No model.)

Claim.—The rim A, with the arm B B, having a passage, C C, therein, in combination with the cover D and a pipe or tube connecting them, substantially as described.

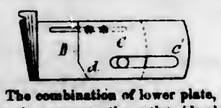
258,951. EXCAVATING AND DREDGING MACHINE. GEORGE DOUTHIT, Boston, Mass. Filed Feb. 13, 1882. (No model.)



Claim.—1. In an excavating or dredging machine, the hollow metal crane-post, made in two parts, as described—viz., an upper detachable part, d', and a lower stationary part, c—bolted together at c'', as and for the purpose set forth.

2. In an excavating or dredging machine, the combination of the trunk-rolls 6 6 and trunks 7 7 9 9 with chain-wheels 10 10 11 11 and the endless connecting-chains 12 12, the chain-pulley w''' on shaft 6, and its endless chain w', actuated by drum-shaft W' and its chain-pulley w, as and for the purpose set forth.

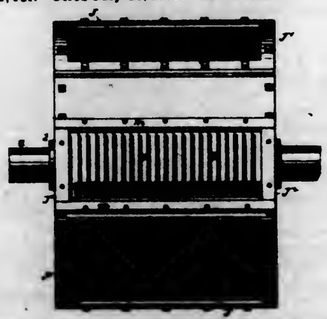
3. In an excavating or dredging machine, the hoisting mechanism, as described, consisting of shaft k', loose gear-wheel k, annular flange k''', friction-shoes k k, guide L l l, levers l''' l''', sleeve l', rods l l, bab m, drum D, spindle m''', and connecting mechanism to the trunnion p', as set forth.



4. In an excavating or dredging machine, the herein-described swinging and propelling mechanism, consisting of shaft W', loose

258,951.

chain-drum F, clutch-plate *y y' y''*, loose sprocket-wheel *w w' w''*, bevel-gear W, shaft *t*, loose bevel-gears U V U' V', adjustable cones *u v*, and connecting mechanism for its operation, as and for the purpose set forth.



258,952. HEMMER FOR SEWING-MACHINES. EDWD. STERN, Boston, Mass. Filed Mar. 18, 1882. (No model.)

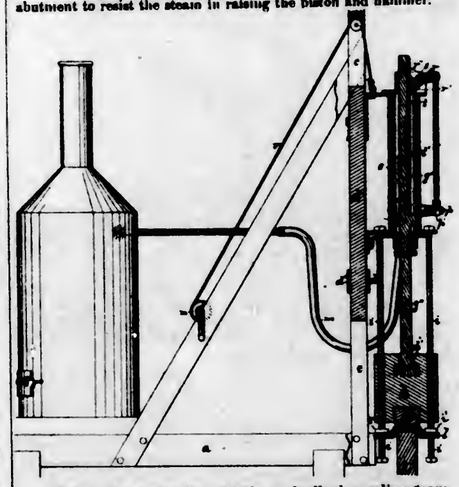
Claim.—1. The combination of lower plate, C, with plate D, the former having its corner on the outlet side obliquely cut away at *d*, the remainder of its forward edge being approximately at right angles to its sides.

2. In combination, the plates C D, adapted to be secured in place by a screw passing through them, and with the lower plate, C, formed with a beveled edge, *b*, and the oblique corner *d*, essentially as explained.

258,953. ROTARY PULVERISER. JAMES O. STEWART, Alameda, Cal. Filed July 20, 1881. (No model.)

Claim.—1. In a rotary barrel pulveriser, the hollow trunnion C, provided with flanges *d e*, in combination with the sections A A, which form the end of the barrel, combined and arranged substantially as described.

2. A rotary barrel pulveriser the inner surface of which is composed of alternate binding and grinding plates H, arranged transversely across the barrel, and the interposed screen-protecting bars I, arranged in line with the travel of the balls and ore, substantially as described.



3. In a rotary pulveriser, the grinding and binding plates H, cast or formed with a groove, *i*, in each edge, in combination with the connecting screen-bars I, substantially as described.

4. In a rotary pulveriser, the grinding and binding plates H, spaced by transverse grate or screen bars I, and having the outward projecting flanges *n* at each edge, in combination with the screen J, secured to the outer edges of the flanges, substantially as and for the purpose described.

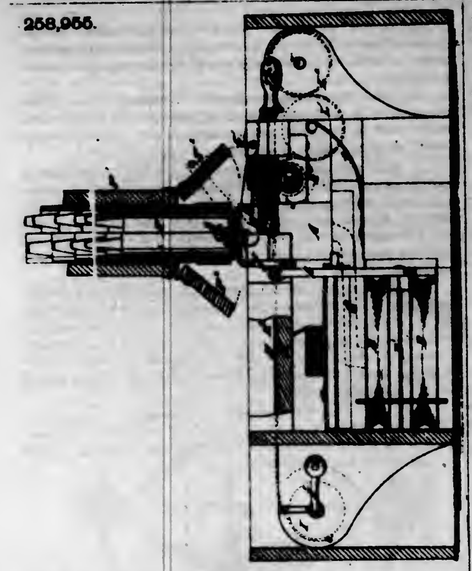
5. In a rotary pulveriser, the screen-bars I, each of which has a projecting shoulder, *s*, at each end on one side, and an opening or recess, *t*, in its opposite edge, near one end, substantially as and for the purpose described

258,954. PILE-DRIVER. STEPHEN H. TARBELL and GEORGE SOUTHER, Boston, Mass. Filed Dec. 31, 1880. Renewed Jan. 9, 1882. (No model.)

Brief.—The steam-cylinder and hammer descend gradually, the hammer striking a shoe which rests loosely upon the top of the pile, the shoe and cylinder being so connected by rods with heads and collars upon them that the shoe and pile become the abutment to resist the steam in raising the piston and hammer.

Claim.—In combination with the gradually-descending steam-cylinder *e* and its hammer A, the shoe *l*, resting loosely on the top of the pile, as and for the purpose set forth and described.

258,955. MECHANICAL MUSICAL INSTRUMENT. HENRY S. TAYLOR, New York, assignor of one-half to George H. Chinnock, Brooklyn, N. Y. Filed July 18, 1880. (No model.)



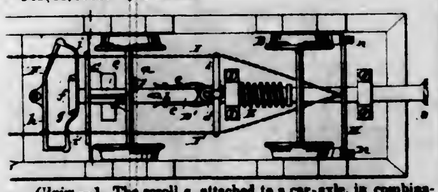
Claim.—1. The combination of the wind-chest A, the movable sound-board D, constructed with ducts or passages *a*, the springs *c*, and the cam-levers G, all substantially as specified.

2. The combination of the wind-chest A, the vertically-movable sound-board D, constructed with air ducts or passages *a*, springs for keeping said sound-board down, the pipes F, the inclosing-case F', and the swells F² at opposite sides of said case, substantially as specified.

3. The combination, in a mechanical musical instrument adapted to be operated by a perforated music-sheet, of a wind-chest and a vertically-movable sound-board arranged above said wind-chest, between which the music-sheet passes, and the latter of which is constructed with a series of air ducts or passages, and a top plate, channeled or recessed at *d*, so as to form guides for the music-sheet and for the vertically-movable sound-board, substantially as specified.

4. The combination, in a mechanical musical instrument adapted to be operated by a perforated music-sheet, of feed-rollers, between which the music-sheet passes, one of which is movable transversely, springs for holding said movable roller in contact

258,956.



with said sheet, and devices acting directly upon said springs for raising them and holding them in an elevated position to permit of the roller being freely raised to allow of the insertion of the music-sheet under it, substantially as specified.

5. The combination of feed-rollers J K, a take-up roller, L, wheels K² L' L², connecting said take-up roller with the feed-roller J, the worm-wheel J' and worm or screw J³, the bellows B B', and the crank J⁴, and rod S, for operating said bellows from the worm or screw J³, all substantially as specified.

6. The combination, in a mechanical musical instrument adapted to be operated by a perforated music-sheet, of a stationary tube or hollow cylinder having a longitudinal slot or slit in its periphery, and a pair of feed-rollers arranged parallel with said tube or cylinder, between which the music-sheet passes, and by which it is fed through the said slot into said tube or cylinder and coiled therein, substantially as specified.

7. In a mechanical musical instrument, the tube or hollow cylinder M, open at one or both ends, and constructed with the longitudinal slot or slit *g*, and the notch *h* in its end, substantially as and for the purpose specified.

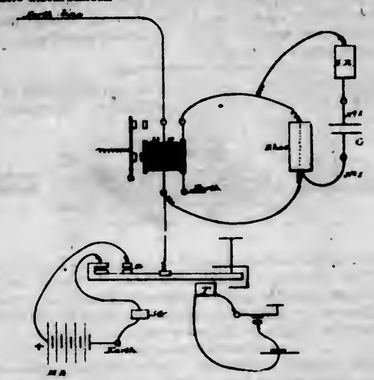
258,956. CAR-BRAKE. SAMUEL H. TERRY, Guthrie, Mo. Filed Feb. 27, 1882. (No model.)

Claim.—1. The scroll *a*, attached to a car-axle, in combination with the hinged section or prolongation D' of the draw-bar, having the projection or pin *b*, substantially as specified.

2. The pivoted lever or frame F, composed of the bars *h i*, in combination with the cross-head *f* of the bar D', substantially as described.

3. The combination of the bar D', having the flange or projection *e*, with the guide-bridge G and the head *f*, with the pivoted lever or frame F, substantially as set forth.

4. The combination of the pivoted sliding bar D', having the projection or pin *b* and head *f*, with the pivoted frame F and brake-operating chain I, substantially as specified.



5. The side springs *c*, in combination with a sliding draw-bar, D, having a pivoted section, D', for setting the pivoted section when moved out of line, substantially as described.

6. The combination of the sliding draw-bar D, spring E, pivoted section D', pin *b*, and scroll *a* with the pivoted lever or frame F and the brake-operating chain I, substantially as set forth.

7. The pivoted frame F, having the bar *i*, with its head or stop *f'*, in combination with the head *f* of the bar D', and the pin *g*, whereby the brake can be operated by pulling on the draw-bar, substantially as specified.

258,957. DUPLEX TELEGRAPH. BENJAMIN THOMPSON and CHARLES SELDEN, Toledo, Ohio. Filed July 10, 1879.

Brief.—A condenser is placed in the artificial line between the transmitter and the receiving-instrument, and so arranged as to utilize the charge and discharge of both faces in overcoming static disturbances.

Claim.—1. The combination, with the equating-circuit in a multiple telegraph, of an artificial resistance placed in said equating-circuit between the key and the equating-coils, and a condenser connected in a loop of the equating-circuit, one end of said loop being connected to said circuit at a point between the resistance and the main-line circuits and the other end at a point between the resistance and the equating-coils, substantially as and for the purpose described.

2. The combination, with the equating-circuit of the condenser C, connected to the same at a point between the key and the equating-coils, and the rheostats Rheo. and S R, all arranged substantially in the manner and for the purposes set forth.

258,958. PNEUMATIC COUNTER-BALANCE FOR PUMP-RODS OF DEEP-WELL PUMPS. WILLIAM F. TOOTHAKER, San Francisco, Cal. Filed Jan. 31, 1882. (No model.)

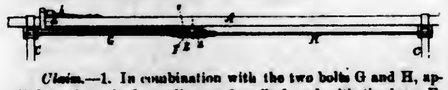
Claim.—1. In combination with the pump-rod of a deep-well pump, the piston D, arranged and adapted to work in a cylinder in which are provided air inlet and outlet apertures controlled by valves or cocks, substantially as hereinbefore described, whereby air is taken in behind the said piston during its stroke in one direction and is expelled or caused to escape through contracted or smaller openings on the return-stroke and from in front of the piston, substantially as and for the purpose set forth.

2. The cylinder E, adapted to receive the piston or head D of a rod to be counterbalanced, having the apertures a in the side, and the apertures L J, communicating with the ends of the cylinder-space, substantially as described, the said apertures being provided with or controlled by cocks or valves, for the purposes set forth.

3. In a direct-acting steam-pump for bored and other deep wells, the combination, with the steam-cylinder having its piston-rod extended beyond and working through the top of its cylinder, of the piston D, secured to the end of said piston-rod, the cylinder in which said piston is adapted to work, and the inlet and outlet apertures in said cylinder, provided with cocks or valves, substantially as hereinbefore described, whereby the movements of the

main or steam pistons are caused to produce an alternate induction and expulsion of atmospheric air into and from the said cylinder in front of its piston, the amount or velocity of which entering and escaping air is controllable for the purpose set forth.

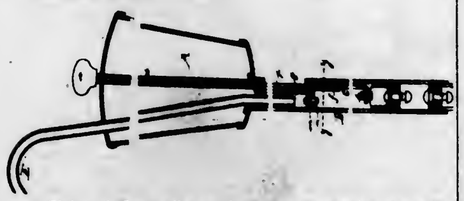
258,959. DOUBLE RAZOR-STROP. JOS. R. TORREY, Worcester, Mass. Filed Mar. 18, 1882. (No model.)



Claim.—The combination of a cushioned casing or pocket, A, having one or more cushioned stropping parts, B, upon the same, with removable stropping part F, provided with suitable stropping-surfaces, and contained within said cushioned casing A, substantially as shown and described.

258,960. DIE-STOCK. BENJAMIN L. WALKER, Sing Sing, N.Y., assignor to Walker, Cady & Co., same place. Filed Jan. 15, 1881. (No model.)

Claim.—The combination of the stock piece or body A, the dies C C', the set-screw F, for adjusting the die C, the rigid handle B, the pivoted handle B', provided with a cam-face, *g*, and a push-pin or plunger, *e*, through which said cam-face acts upon the die C', substantially as and for the purpose specified.



258,961. HORSE-DETACHER. JAMES T. WALKER, Falmouth, Mass. Filed Dec. 23, 1881. (No model.)

Claim.—1. In combination with the two bolts G and H, applied to the axle draw-clips, as described, and with the lever E, adapted as set forth, the catch-hook *a*, latch *b*, and spring F, the said lever being provided with the stopping-ear *c*, and all being arranged and applied to the axle substantially in manner and to operate as explained.

2. The lever E, pivoted to the front side of the axle, and provided with the catch-hook *a*, to rest on and extend across the axle when said lever is down, in combination with the bolts G H, arranged on the front side of the axle, and also with the latch *b*, arranged on the rear side of the axle, the said catch-hook serving not only as a stop to arrest the downward motion of the lever, but to act with the latch in holding down the lever, as set forth.

258,962. OIL-PUMP. ALBERT J. WHITE, Chicago, Ill. Filed Mar. 11, 1882. (No model.)

Claim.—1. In an oil-pump having an air-chamber above the pump-barrel and a discharge-nozzle extending above such air-chamber, an opening below such air-chamber that communicates with the inside of the tube or tubes for guiding the plunger-rod, and which furnishes an outlet for any oil forced into or through such tube, all substantially in the manner set forth.

2. In oil-pumps, the air-chamber A, having central tube, *c*, for guiding the plunger-rod C, and discharge-nozzle E, in combination with the pump-barrel B, eccentrically connected with such air-chamber A, substantially as and for the purpose set forth.

3. In oil-pumps, the air-chamber A, having central tube, *c*, for guiding the plunger-rod C, such tube *c* extending through both ends of the air-chamber and being connected therein by air-tight joints, substantially as and for the purpose set forth.

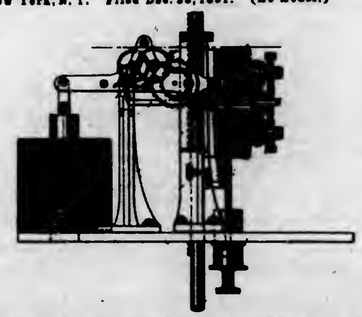
4. In oil-pumps, the air-chamber A, having central tube, *c*, for guiding the plunger-rod C, and the pump-barrel B, eccentrically connected with each air-chamber A, in combination with the discharge-nozzle E, extending through the air-chamber into each pump-barrel B, all substantially as and for the purpose described and shown.

5. In oil-pumps, the air-chamber A, having tube *c*, and the pump-barrel B, having notch *p*, tube *f*, and partition *g*, in combination with the pump-rod passing through and guided in tubes *c* and *f*, all substantially as and for the purpose set forth.

6. In oil-pumps, the air-chamber A, having central tube, *c*, and the pump-barrel B, connected eccentrically with each air-chamber A, and having notch *p*, tube *f*, and partition *g*, in combination with the plunger-rod C, passed through the tubes *c* and *f*, and with the discharge-nozzle E, projected through the air-chamber A and into the pump-barrel B, all substantially as and for the purpose set forth.

7. In oil-pumps, the air-chamber A, having central tube, *c*, and the pump-barrel B, connected eccentrically with each air-chamber A, and having notch *p*, tube *f*, partition *g*, and check-valve *n*, in combination with plunger-rod C, passed through the tubes *c* and *f*, and with the discharge-nozzle E, projected through the air-chamber A and into the pump-barrel B, all substantially as and for the purpose set forth.

258,963. SAFETY-LAMP. LAVINA A. WESTLAND, Providence, R.I., Administratrix of Charles S. Westland, deceased. Filed Apr. 24, 1882. (No model.)



Claim.—1. The combination, with the oil-vessel A and the burner *b*, of the cover *c*, the rod *h*, and spring *i*, constructed to extinguish the flame when the spring is released, as described.

2. In an oil-lamp, the combination, with the burner, of a spring resting against the inner walls of the oil-vessel and connected with an extinguisher constructed to extinguish the flame when the vessel breaks, as described.

3. The combination, with the oil-vessel A and burner *b*, of the sleeve *g*, provided with the hinged cover *c*, the abutment *f*, rod *h*, and spring *i*, the whole constructed to extinguish the flame when the vessel breaks, as described.

258,964. ELECTRIC LAMP. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N.Y. Filed Dec. 30, 1881. (No model.)

Claim.—1. In an electric lamp, the combination, with the upper-carbon holder, of two electro-magnets in the main or lamp circuit, and an electro-magnet in a shunt-circuit, for the purpose of forming and regulating the arc.

2. In an electric lamp, the combination, with a gravitating carbon-carrier, and feed-controlling mechanism connected therewith, of a helix in the lamp-circuit, and two electro-magnets in the lamp-circuit and in a shunt about the lamp, respectively, for the purpose of forming and regulating the arc.

3. The combination, with a movable frame or lever, carrying a train of gears in engagement with a gravitating carbon-carrier, of an electro-magnet or equivalent in the lamp-circuit connected to the said frame or lever, and two opposed electro-magnets, one in the lamp-circuit, the other in a shunt around the lamp, and a detent controlled by said magnets, substantially as and for the purpose set forth.

4. The combination, with a pivoted frame or lever, carrying a train of gears in engagement with a gravitating carbon-carrier, of an electro-magnetic helix in the lamp-circuit, for moving the frame, and two electro-magnets in the lamp-circuit and in a shunt around the lamp, and a detent controlled thereby for locking or releasing the train of gears, as set forth.

5. The combination, with a pivoted frame, of a train of gears and escapement, having its shaft in line with the pivotal axis of the frame, a carbon-carrier engaging with the train, a magnet or its equivalent in the lamp-circuit, for moving the frame, and a detent controlled by the action of two electro-magnets, as set forth, for the purpose of locking or releasing the escapement.

258,965. ELECTRIC-LAMP BRACKET. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N.Y. Filed Dec. 13, 1881. (No model.)

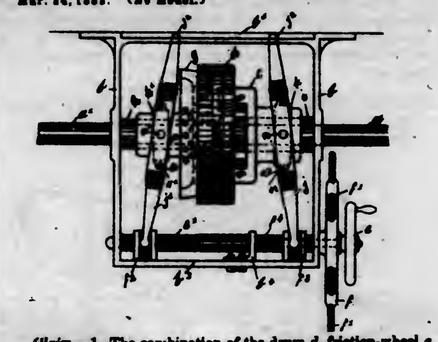
Claim.—1. The combination, with an electric lamp of the kind described, of two oppositely-placed holders or sockets, connected by a rigid insulating-frame and a spring-contact, arranged in conjunction with one of said sockets and adapted to hold the lamp in place, substantially as described.

2. A bracket for incandescent electric lamps of the kind described, consisting of a socket or holder adapted for attachment to a suitable support, a retaining cone or cap, a spring-carried contact-piece arranged therein, and one or more rods connecting the said cone to the socket, the rod or rods being insulated from the socket and serving as conductors for the current, substantially as set forth.

3. The combination of socket A, rod or rods B, insulated therefrom, cone B, and spring C.

258,966. INCANDESCENT LAMP. EDWARD WESTON, Newark, N.J., assignor to the United States Electric Lighting Company, New York, N.Y. Filed July 12, 1881. (No model.)

Claim.—An electric lamp consisting of a transparent, exhausted, and hermetically-sealed receiver, surrounding a conductor capable of being rendered incandescent, and containing a small quantity of an air-absorbent substance, such as thorina, as and for the purpose set forth.

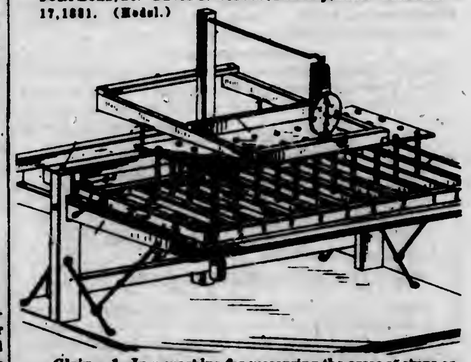


258,967. INDIRECT RADIATOR. ELISHA T. WEYMOUTH, Brooklyn, N.Y. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a steam-radiator of the character herein set forth, the similar sections A A, each having corrugated sides *a b* and partitions B B, the right and left threaded nipples N N, the inlet-pipe E and the outlet-pipe F, the several parts being arranged and combined substantially in the manner and for the purposes set forth.

2. In a steam-radiator of the character herein set forth, the similar sections A A, each having corrugated sides *a b* and partitions B B, the right and left threaded nipples N N, the inlet-pipe E and the outlet-pipe F, and the box or casing D, provided with the air-inlet H at the bottom and the air-outlet K at the top, the several parts being arranged and combined substantially in the manner and for the purposes and objects named.

258,968. CLUTCH. EDWARD WILKINSON, Paterson, N.J. Filed Mar. 24, 1882. (No model.)



Claim.—1. The combination of the drum *d*, friction-wheel *g*, collar *h'*, sleeve *h*, feather *o'*, pins *n'*, perforations P, shifting-arm *f*, screw-nut *f'*, screw *o'*, hand-wheel *o*, step *b'*, slot *f'*, frame *b'*, frame *b'*, frame *h*, and shaft *a'*, substantially as described, and for the purpose set forth.

2. The combination of the drum *d*, clutch *c*, lugs *m*, openings *m'*, collar K, pins *n*, shifting-arm *f*, screw-nut *f'*, hollow screw *f'*, screw *o'*, step *b'*, wheel *e*, wheel *f*, slot *f'*, groove *q*, collar *i*, oil-hole *i'*, frame *b'*, frame *b b'*, and connected shaft *a*, substantially as described, and for the purpose set forth.

3. The combination of friction-wheel *g* and the clutch C, when the same are in engagement, as and for the purpose set forth.

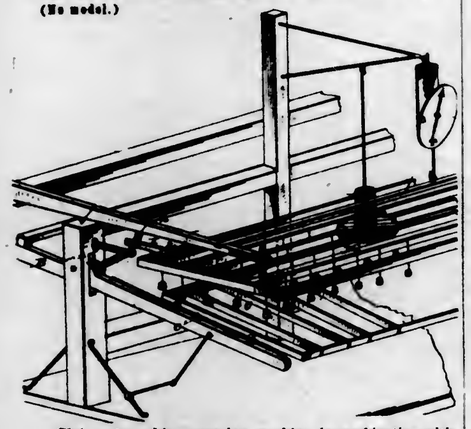
258,969. MACHINE FOR MEASURING THE AREA OF HIDES, SURFACES, &c. DAVID T. WINTER, Peabody, Mass. Filed Mar. 17, 1881. (Model.)

Claim.—1. In a machine for measuring the areas of skins or other articles, the combination, with an upper weighted table, of a lower lever-frame fulcrumed at the rear of the machine and arranged to be lowered at its front when the skin is introduced, and to be raised to a horizontal position to lift the skin to the weights.

2. In an area-measuring machine, a sliding table or carriage for supporting the article to be measured, and arranged to run in and out on guideways to receive such article and to convey it to and from the weights or pins which determine the measurement.

3. In an area-measuring machine, the combination of a lever-frame and a table-carriage arranged to travel thereon, the combination being and operating substantially as and for the purposes set forth.

4. The lever-frame provided with a counter-balance at its rear and with connecting rods or links beneath the same at its front, serving to limit both its upward and its downward motions, substantially as shown and described.



5. In combination with an under lever-frame having a vibratory motion for receiving and raising the skin to be measured,

a weighted and balanced upper table directly connected to the indicating apparatus, and whereby the needless lifting and swinging of the weights or pins and disturbance of the indicator may be avoided.

6. A weighted table carrying a system of weights or pins in which those of each adjacent row are all of uniform weight and length, and in which the several rows are placed at varying distances apart or graded as to weight, in the manner and for the purpose substantially as shown and described.

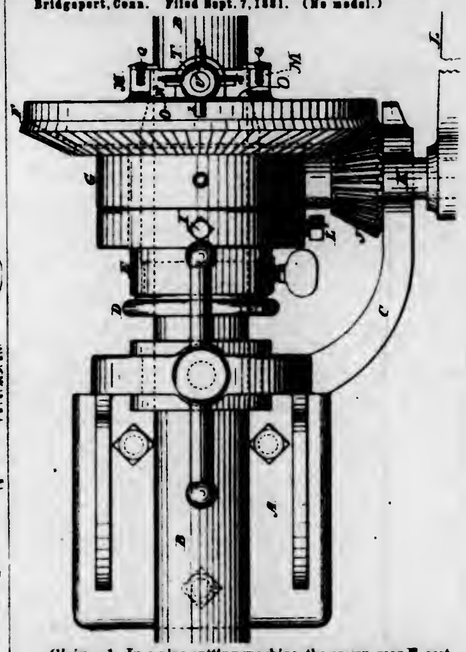
7. A weighted table in which the weights or pins of each row vary as to weight from those of its next adjacent row or rows, substantially as and for the purposes described, and in which the several rows reach down to the same level and are equidistant from each other.

258,970. MACHINE FOR MEASURING THE AREA OF HIDES, &c. DAVID T. WIGTON, Peabody, Mass. Filed June 10, 1881. (No model.)

Claim.—In a skin-measuring machine, in combination with a system of weights of equal weight and arranged in rows equidistant from each other, a system of equalizing-levers, substantially as and for the purpose described.

258,971. REED-PLANE. FREDERICK V. YEAGER, Philadelphia, Pa. Filed Aug. 26, 1881. (No model.)

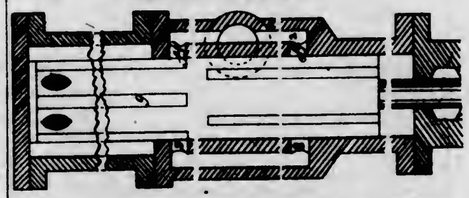
Claim.—1. In a plane for working reeds across the grain of wood, the combination of advance cutters D D', having serrated cutting-edges *d*, plane-bit B, having convex cutter *b*, outside ground or bevel, *b'*, sole F, having adjustable section *f'*, and gage G, secured to the body of the plane by links *g g*, and provided with a thumb-screw, H, substantially as shown and described.



2. In a plane for working reeds across the grain of wood, the combination of main bit B, having convex cutter *b*, outside ground or bevel, *b'*, advance cutters D D', provided with serrated cutting-edges *d d*, and adjustable sole-section *f'*, substantially as shown and described.

258,972. TOY CAP-EXPLODER. EDWARD ALDEN, Brooklyn, N.Y. Filed Jan. 20, 1882. (No model.)

Claim.—A ball with a slot cut half-way through to the center, in combination with hammer A, pivoted in said slot, and spring B, bearing upon the hammer, with a string attached to the lower part of hammer, at E, combined and arranged to operate substantially as and for the purpose set forth.



258,973. PIPE-CUTTING MACHINE. FRANK ARMSTRONG, Bridgeport, Conn. Filed Sept. 7, 1881. (No model.)

Claim.—1. In a pipe-cutting machine, the crown-gear F, cast with hub E, and having arranged thereon the fast and loose collars H G, the latter provided with a crank-shaft bearing, in combination with the cutters R, vise A, support C, crank-shaft K, and pinion J, substantially as and for the purpose set forth.

2. The crown-gear F, provided with suitable guides and ways or ribs, M O, and bearings T, in combination with the cutter-blocks N, feed-screws S, provided with sprocket-head U, and the cutters R, substantially as and for the purpose set forth.

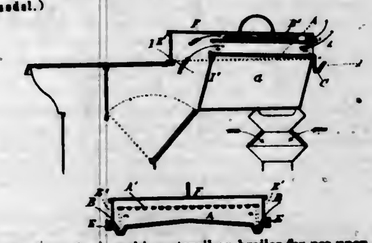
258,974. STEAM ROCK-DRILL. WILLIAM T. BELL, New York, N.Y. Filed Feb. 13, 1882. (No model.)

Claim.—A rock-drill composed of a piston having two or more elliptical studs adjusted to the upper end thereof, and having a series of straight grooves or steamways at each end thereof, a series of connected irregular grooves in which the elliptical studs attached to the piston operate to produce a rotary motion at each stroke of the piston, substantially as described.

258,975. PAINT. EDWIN BENNETT, Hornellsville, N.Y. Filed Feb. 13, 1882. (No specimens.)

Claim.—A paint composed of a suitable oil having an admixture of rosin, beeswax, and muriatic acid, or its equivalent, as set forth, and a coloring-matter which will not be deleteriously affected by the acid, substantially as specified.

258,976. ELECTRIC INCANDESCENT LAMP. ALEX BERNSTEIN, New York, N.Y. Filed Dec. 24, 1881. (No model.)



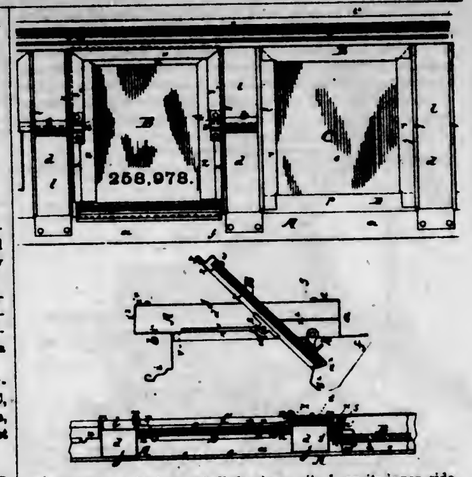
Claim.—1. In an electric lamp based on the principle of incandescence, a light-giving part composed of a non-conducting and infusible carrier and of a film or deposit of carbon covering partly or entirely the surface of the carrier, substantially as set forth.

2. In an electric lamp, the combination of the conducting-wires having enlarged end clamps with a light-giving part supported thereby, said light-giving part being composed of a non-conducting and infusible substance, and being partly covered with a film of carbon, substantially as specified.

3. In an electric lamp, the combination, with a bulb, A, having a centrally-channeled stopper, B, of conducting-wires C C, sealed into a collar of the stopper below the upper end of the same, and adapted to support the light-giving part D, substantially as set forth.

258,977. BROILER FOR OIL OR GAS STOVES. LEWIS F. BUTTS, Norton, Pa., assignor to John H. Irwin, same place, and Robert E. Dietz, New York, N.Y. Filed Mar. 14, 1882. (No model.)

Claim.—1. A cooking utensil or broiler for use upon oil or gas stoves, having a raised center, gradually sloping to grooves or gutters formed near the edge of a pan and leading to a receptacle at the extremity thereof, in combination with a raised gridiron located above said pan, and a rim attached to the edge of the pan, and extending around three sides thereof, the whole being surmounted by a removable cover, substantially as shown and described.



2. In a cooking utensil or broiler for use upon oil or gas stoves, a pan, A, having a raised center, gradually sloping to grooves or gutters B in the edge of the pan, receptacle C, having lip D, rim E', cover F, and gridiron A', the whole adapted and arranged to fit upon the top of a stove, substantially as shown and described.

3. In a cooking utensil of the character herein specified, the combination, with pan A, having grooves or gutters B, receptacle C, and opening I, of rim E', gridiron A', and cover F, adapted and arranged to fit upon rim E', the pan, rim, and cover forming a conduit for the heated products of combustion, in which the gridiron is located, substantially as shown and described.

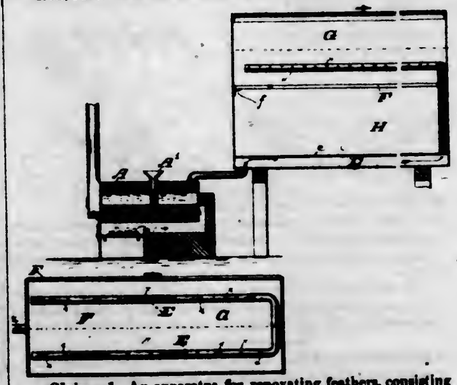
258,978. TURRET FOR SKYLIGHTS. ADAM BICKELHUPT and GERSON BICKELHUPT, New York, N.Y. Filed Dec. 19, 1881. (No model.)

Brief.—The posts consist of a U-shaped metallic piece and an outer piece doubled to embrace the edges of the U-shaped piece, and extended laterally at one edge to form the inner flange for the glass. Doubled strips are placed over the fold of the two pieces, and are extended at one edge to form the outer flange for the glass. The swinging glass rests in a sheet-metal frame having grooves at the sides and top, and held by locking-strips therein. The bottom of the frame is formed with a shoulder for the glass, a suspended ledge, and a rib. The suspended ledge overlaps a depending portion of the base of the sash-frame and the rib engages a lip on an upward extension of the base. The upper portion of the sash abuts against a depending flange attached to a gutter-cornice on the sash-frame. The depending portion of the bottom of the fixed frame rests directly on the sill.

Claim.—1. The base *a*, having upwardly-projecting ledge *c* on its inner side, and outwardly-extending lip *g* thereon, in combination with the swinging sash B, having a rib, A, on its inner side, which rib is adapted to enter beneath the lip *g*, substantially as described.

2. The post *d*, constructed of the U-piece *j* and of the outer portion, *l*, which is doubled at *m* in line with the transverse walls of the U-piece *j*, to embrace the edges of the U-piece, substantially as described.

3. The posts *d*, made with outwardly-projecting doubled extensions *l*, and combined with doubled strips *r r* and with the lower supporting-piece, D, having shoulder *p*, and upper receiver, E, all arranged for receiving and securing the glass C in the frame A, substantially as specified.



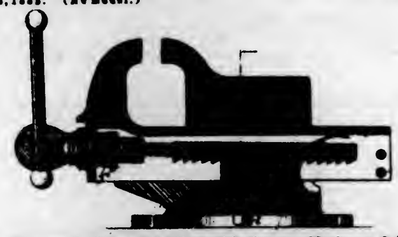
4. The posts *d*, made with outwardly-projecting doubled extensions *l*, and combined with the lower supporting-piece, D, having shoulder *p*, and upper receiver, E, all arranged for receiving and securing the glass C in the frame A, substantially as specified.

5. The combination of the vibrating sash B with the base *a*, having ledge *c*, and with the top *b*, having cornice *i*, bends *i' i'' i'''*, and downwardly-projecting flange *e*, substantially as described.

6. The sash-frame *w*, constructed with lower shoulder, *a'*, suspended ledge *b'*, and rib *h*, substantially as specified.

7. The sash-frame *w*, having grooves at the sides and top, and combined with the locking-strips *s*, which are inserted in said grooves and hold the glass in place, together with said frame *w*, substantially as specified.

258,979. FEATHER-RENOVATOR. JOHN W. BINGAMAN, Aberdeen, Ohio. Filed Feb. 3, 1882. (No model.)

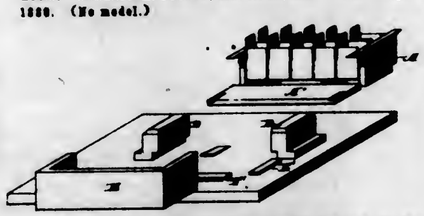


Claim.—1. An apparatus for renovating feathers, consisting essentially of a steam-boiler, a feather-receptacle divided into two compartments by a removable diaphragm, a steam-chamber forming one side of one compartment of said receptacle, a steam-pipe leading from the boiler to said steam-chamber, another pipe leading from said chamber to the other compartment, where it connects

with perforated tubes or pipes, and said pipes or tubes located inside said compartment, all substantially as set forth.

2. The combination of two chambers, G H, separated by a removable partition, F, the removal of which precipitates the contents of one chamber into the other, the boiler A, steam-chamber C, perforated pipes E, and connecting-pipes, whereby the same current of steam can be utilized both in drying and steaming feathers at the same time, substantially as set forth.

258,980. VISE. JOHN A. BLAKE, Watertown, N. Y. Filed Apr. 3, 1882. (No model.)



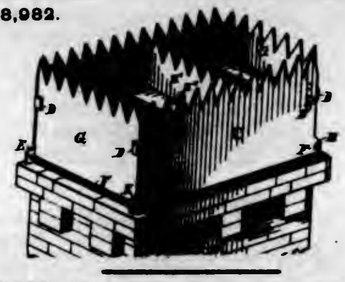
Claim.—1. The combination, with the movable jaw and its slide, of a toothed bar contained in said slide and screw-threaded at one end to engage with an internal thread in a nut held in the end of said slide, and a series of fixed teeth or projections for engaging said toothed bar, the latter having sufficient vertical play in said slide to enable it to be lifted out of engagement with said teeth or projections by pressing downward on the head of said nut, substantially as described.

2. In a vise, the combination of the movable jaw carried by a slide which works in an opening formed in the body of the vise below the fixed jaw, an internally-threaded nut and handle for turning the same, a toothed bar threaded at one end and engaging with said nut, one or more fixed teeth or projections for engaging said toothed bar, and a spring bearing upon said bar and tending to keep it in engagement with said teeth or projections, substantially as described.

3. The combination of the hollow slide, nut turning in the end of said slide and having a collar formed thereon, and a spiral spring encircling said nut and bearing at one end against said collar and at the other against the end of said slide, substantially as and for the purpose set forth.

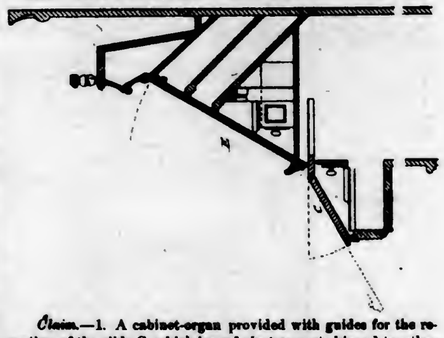
4. The combination of the hollow support provided with an internal shoulder, the bottom plate of the vise fitting in and turning on said support, the spider-frame fitting in said support and against said shoulder, screws for attaching said frame to the bottom plate, nut engaging one of said screws, and handle for turning said nut, said screw being eccentric to the axis of the vise and said handle and nut above the bottom plate, substantially as described.

258,981. DEVICE FOR HANDLING FILLED BOXES OR PACKAGES. CHARLES E. BOLTON, Cleveland, Ohio. Filed Sept. 9, 1880. (No model.)



Claim.—1. The combination, with a prime receiver, A, having swinging sides $A' A^3$, constructed to be locked in closed position, of a second receiver, E, substantially as and for the purpose shown.

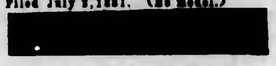
2. In combination, a prime receiver, A, having swinging sides $A' A^3$, constructed to be locked in closed position, guides D, and a second receiver, E, substantially as and for the purpose shown.



258,982. CHIMNEY-CAP. JOSEPH ROSLAND, Valencia, Pa., assignor of one-half to William E. Rose, same place. Filed Mar. 23, 1882. (No model.)

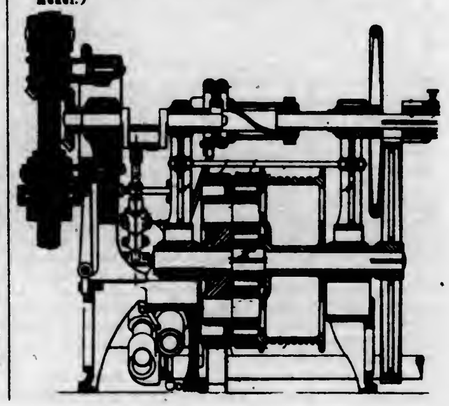
Claim.—In chimney-caps, the side pieces, C, having the lips D E, with the cross-pieces G H', horizontal plate H, lugs C' H'', and tie-rods D' F, substantially as and for the purpose herein shown.

258,982.



258,983. ORGAN-CASE. WILLIAM E. BERARDEY, Detroit Mich. Filed Jan. 26, 1882. (No model.)

Claim.—1. A cabinet-organ provided with guides for the reception of the slide C, which is made in two parts hinged together substantially in the manner described, whereby both parts may be pushed into the guides in the body of the organ-case, entirely out of sight, by first raising the front part of the slide to a horizontal position, as set forth.



2. In a combined cabinet-organ and writing-desk, the hinged front E and sliding hinged portion C, combined and adapted to serve as and for the purposes set forth.

258,984. WRITING-TABLET. MORGAN W. BROWN, Brooklyn, N.Y. Filed July 3, 1881. (No model.)

Claim.—As an improved article of manufacture, a paper pad or tablet composed of a series of sheets or leaves connected upon one or more of their edges by a coating, strip, or layer of permanently-elastic material or composition, substantially as set forth.

258,985. HOISTING APPARATUS FOR STEAM ROCK-DRILLS. MILAN C. BULLOCK, Chicago, Ill. Filed June 24, 1881. (No model.)

Claim.—1. The combination, substantially as before set forth, of the steam-cylinders set at reverse angles of forty-five degrees on the bed-plate and at right angles to each other, the crank-shaft overhead, the hoisting apparatus below the crank-shaft, and the wheel and pinion for transmitting the motion of the crank-shaft to the hoisting apparatus.

2. The combination, substantially as before set forth, of the segments of the brake-strap, the eyebolt, the cam-lever, the screw, and the traveling nut connected with the cam-lever to prevent said nut from turning.

3. The combination, substantially as before set forth, of the brake-strap, the friction-strap, the screw-spindle, screw-threaded sleeve thereon, and the two traveling nuts for operating the cam-levers of the brake-strap and friction-strap, one nut being fitted on the screw-spindle and the other on the screw-threaded sleeve.

258,986. LOCKING-LATCH. RICHARD HERR, Schwenningen, Wirtemberg, Germany, assignor to Mathew Nicolius, New York, N.Y. Filed Jan. 19, 1882. (Model.)

Claim.—1. As an improvement in door-locks, the combination of a tubular spindle, C, having a recessed double cam, *b*, and an interior axially-turning bolt, D', having a cam, D, and also extending through the recessed double cam *b*, with a guided and spring-actuated main bolt, B, having arc-shaped middle pieces, B', and inwardly-extending projections *a* and *d*, which projections are engaged either by the double cam *b* or by cam D, according as the bolt is to be withdrawn or locked, substantially as specified.

2. As an improvement in door-locks, the combination of the guided and spring-actuated main bolt B, having a socket-shaped rear part, B'', and an interior semicircular shank, *f'*, with an axially-turning latch, E', having a semicircular shank, *f*, whereby the main bolt is locked when the shanks are thrown into line with each other, substantially as specified.

3. As an improvement in door-locks, the combination of a recessed double cam, and interior axially-turning bolt having a cam and extending through said recessed cam, and a guided and spring-actuated main bolt having arc-shaped middle pieces, inwardly-extending projections, socket-shaped rear part, and an interior semicircular shank, with an axially-turning latch having a semicircular shank adapted to lock the main bolt substantially as described.

258,987. SULKY-PLOW. WILLIAM L. CASADAY, New Carlisle Ind. Filed Mar. 14, 1882. (No model.)

Brief.—Plow-beam in two sections, each connected by independent pivot to the crank of the axle. The oblique wheel and spindle attached to a plate pivoted upon the axle and adjusted to run on or off by a vertical eccentric shaft. The seat-frame and tongue attached to sleeves upon the axle. A locking-bar is adapted to make rigid the two beam-sections, and they are unlocked by a foot-pawl. A notched bar will hold the plow elevated, and will be automatically disengaged by a plunger moved by the turning of the axle-crank. A coiled spring in a guard on the land spindle-sleeve, and aids the lever in adjusting the wheels.

Claim.—1. In a sulky-plow, the combination, with a crank-axle, of a plow-beam consisting of two independent sections pivotally connected to the crank of the axle, substantially as set forth.

2. In a sulky-plow, the combination, with a crank-axle, of a plow-beam made in sections, one section being pivoted to the crank and the other section pivoted on a bolt extending through the crank, substantially as set forth.

3. In a sulky-plow, the combination, with a crank-axle, of a plow-beam having a rear section provided with arms which embrace the crank of the axle and are pivoted thereto, and a forward section adapted to be centrally pivoted to said crank, substantially as set forth.

4. In a sulky-plow, the combination, with a crank-axle, of a plow-beam consisting of a front and a rear section, said sections being pivotally connected with the crank of the axle, and suitable means for connecting and disconnecting the sections of the beam, substantially as set forth.

5. In a sulky-plow, the combination, with a crank-axle and a frame, of a plow-beam consisting of a rear section and a front section pivotally connected to the crank of the axle, and a depending notched bar or latch pivoted upon said frame and adapted to engage a catch on the rear section of the beam, substantially as set forth.

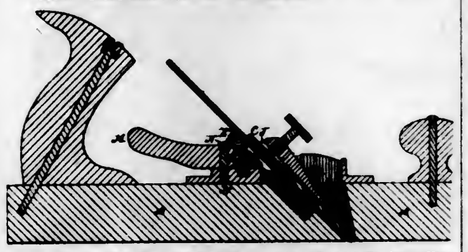
258,987.

6. In a sulky-plow, the combination, with a crank-axle and a seat-supporting frame, of a plow-beam consisting of a rear section and a front section pivotally connected to the crank of the axle, a locking-brace pivoted to said rear section and adapted to engage a catch on the forward section, a depending notched bar or latch pivoted upon said frame and adapted to engage a catch projecting laterally from the adjacent side of said rear section, and a plunger pivoted to the rear end of said forward section, and having a stud arranged to project laterally through a slot in said rear section to automatically disengage the latch from its catch, substantially as set forth.

7. In a sulky-plow, the combination, with a crank-axle and a sectional plow-beam having the adjacent ends of the forward and rear sections pivoted to the crank of the axle, of a guide adapted to receive the forward end of the front section of the plow-beam and allow of a limited vertical movement thereof, substantially as set forth.

8. In a sulky-plow, the combination, with the tongue and forward end of the plow-beam, of a stud or foot-rest projecting laterally from said tongue and pivotally supporting slotted guide-links, within which are supported laterally-projecting studs of the plow-beam, substantially as set forth.

9. In a sulky-plow, the combination, with a crank-axle, of a plow-beam having its rear section pivotally connected to the crank of the axle and its forward section pivoted at one end to said crank, while its opposite end is provided with laterally-projecting studs which receive slotted guide-links, the latter being pivoted to a projecting stud of the plow-beam, substantially as set forth.



10. In a sulky-plow, the combination, with an inclined spindle secured at one end to an oscillating plate connected with the axle, of a vertical shaft and a cam or eccentric for imparting an oscillating movement to said plate, and thereby adjusting the position of the wheel, substantially as set forth.

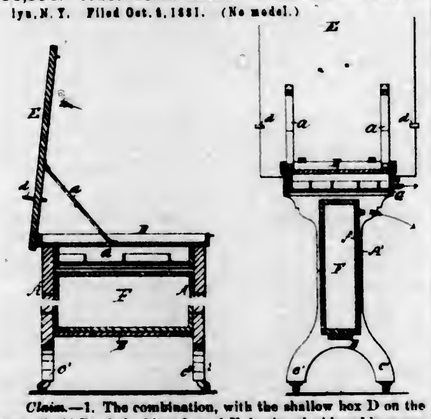
11. In a sulky-plow, the combination, with the furrow side of the axle and with the tongue, of a sleeve or box mounted on said axle and a plate secured to the under side of said sleeve and tongue, the frame of the furrow-wheel pivoted at one end to the outer end of said plate, while its opposite end is adapted to slide in a guide formed on the inner side of said plate, and is provided with an elongated slot, within which is arranged an operating-cam connected to a rotating shaft adapted to be operated by the driver, substantially as set forth.

12. In a sulky-plow, the combination, with the axle, of a seat-supporting frame secured thereto at one end, while its opposite end is secured upon a sleeve mounted on said axle, a plate or bracket secured to the under side of said sleeve and to the tongue, a furrow-wheel axle-frame pivotally connected to the outer end of said plate, while its inner end is adapted to a guide formed on the inner side of said plate, and is slotted to receive an operating-cam, the latter being connected to a rotating vertical shaft which ex-

tends through a perforated and indented plate secured to the adjacent side of the seat-frame, and is provided with a hand-lever or dog whereby the furrow-wheel may be adjusted, substantially as set forth.

258,988. BENCH-PLANE. WILLIAM S. CASE, New Britain, Conn. Filed Mar. 17, 1882. (No model.)

Claim.—In a bench-plane, the combination of the laterally-swinging lever M, provided with the cam L and the vertically-swinging forked lever J, pivoted to the plate or frame E, with the said plate and the plane-iron, substantially as described.

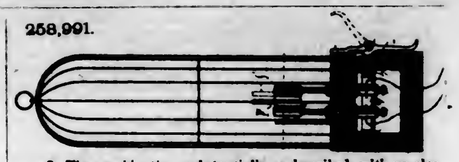


258,989. ATTACHMENT FOR TELEPHONES. JOSEPHUS C. CHAMBERS, Cincinnati, Ohio. Filed Apr. 25, 1881. (Model.)

Claim.—1. A telephone attachment consisting of a bent spring having means at one end adapting it to be secured to a telephone-tube and bearing at the other end a pad which, when the attachment is in position, closes the unused ear, for the purpose set forth.

2. The telephone-tube attachment consisting of a bent spring having at one end a pad for closing the unused ear and at the other a device for attaching it to the telephone-tube, and a set-screw for modulating the pad pressure, as set forth.

258,990. COMBINATION-EASEL. ALONZO CHAPPEL, Brooklyn, N. Y. Filed Oct. 4, 1881. (No model.)



Claim.—1. The combination, with the shallow box D on the frame A A' B, of the hinged easel E, having the hinged braces *e*, the cross-bars *c*, the cramp-plates *d*, and the clamps *g*, arranged as shown and described.

2. In combination with the hinged easel E and the receptacle D, the portfolio F and drawer G, substantially as and for the purposes set forth.

258,991. ELECTRIC LAMP. CHARLES A. CHEEVER, New York, N. Y. Filed Mar. 28, 1882. (No model.)

Claim.—1. The combination, substantially as described, with an electric lamp, of an inclosing or protecting cage or cover and means, substantially as described, for automatically shunting or diverting the current from the lamp when the inclosing and protecting cage and the parts supporting the light-giving portion of the lamp are disconnected.

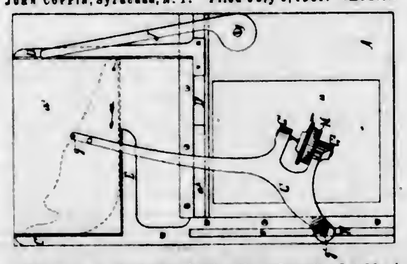
258,991.

2. The combination, substantially as described, with an electric lamp, of an inclosing-cage, an electric switch for cutting out the lamp, and a lock for preventing the detachment of the protecting cage or guard, whereby the disconnection of the cage and the lamp proper is made dependent upon the operation of the lock, and the act of unlocking is made to operate the switch.

3. The combination, substantially as described, with an electric lamp, of a base-block supporting the light-giving portions of the lamp, binding-posts connected to the bottom of the base-block, and an inclosing base-plate, substantially as and for the purpose described.

4. The combination, with an electric lamp, of an inclosing or protecting cage or cover connected to the lamp by a bayonet-joint, a locking device to prevent the turning of the cage or cover to disconnect it, and an electric switch controlled by the locking device, substantially as and for the purpose described.

5. The combination, substantially as described, of an electric lamp, a protecting cage or globe for the light-giving portions of the lamp, an electric switch held in proper position to cause the current to pass through the lamp when the cage and lamp are connected, and means for securing the cage and the lamp together.



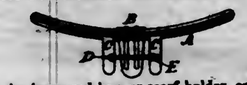
258,992. COMPOUND TO BE USED IN THE PLACE OF BUTTER FOR COOKING PURPOSES. SAML. H. COCHRAN, Everett, Mass. Filed May 2, 1882. (No specimens.)

Claim.—1. The described method or process of purifying and flavoring beef-suet oil, which consists in mixing therewith slippery-elm bark, substantially in the proportions and in the manner and for the purpose shown and described.

2. The described method or process of purifying and flavoring cotton-seed oil and its equivalent oils, which consists in mixing therewith slippery-elm bark, in the proportions, substantially, and in the manner and for the purpose shown and described.

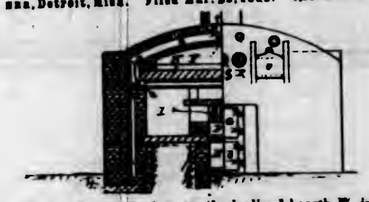
3. The combination of beef-suet oil, cotton-seed oil and its equivalents, purified and flavored, as described, with beef-stearine and slippery-elm bark, substantially in the proportions set forth, and for the purpose shown and described.

258,993. AVERAGEOMETER OR INSTRUMENT FOR MEASURING THE AVERAGE BREADTH OF IRREGULAR PLANES. JOHN COFFIN, Syracuse, N. Y. Filed July 6, 1881. (Model.)



Claim.—1. A planimeter having the soft-surfaced table A *a* and groove or straight guiding means *c*, in combination with the adjustable ruler D, mounted parallel to the line of the groove *c*, and with the wheel M *m*, and bar G, with its guiding-point *g*, and pivot *g'* engaging through the block H or otherwise with the groove *c*, and arranged as herein specified.

2. The combination, with the parts M *m* G *g g'* H A *a c*, of the ruler C, fixed in the extended line of the guiding means *c*, and the adjustable ruler D, parallel to C, as herein specified.

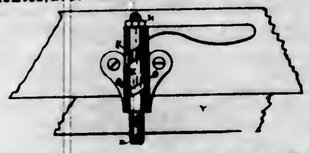


3. The combination, with the ordinary parts of a planimeter, of the spring-ruler C in line with the guiding-groove *c*, adapted to serve both in determining the position and clamping or holding the paper *a'*, on which is the diagram to be measured, and also of the spring-ruler D, parallel to C, arranged to serve both in holding the paper *a'* and guiding the scribing-point *g* in the final movement to determine the height of an equal rectangle, as herein specified.

258,994. BOW OR SCARF HOLDER. JOHN GOEPEL, Boston, Mass. Filed Nov. 25, 1881. (No model.)

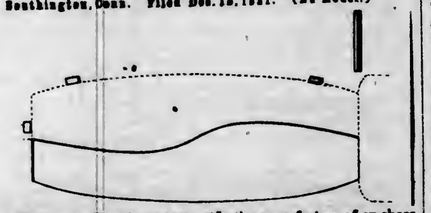
Claim.—An improved bow or scarf holder, consisting of the brace A, hook B, plates C C, pin D, and loops E E, all substantially as shown and described.

258,996. BAKER'S OVEN. JOSEPH GORSLY and JOHN WAUGHAN, Detroit, Mich. Filed Mar. 23, 1882. (No model.)



Claim.—In a baker's oven, the inclined hearth F', in combination with the chamber I immediately under the hearth, the furnace surrounded on three sides by and opening into the chamber I, the flues *c*, *d*, *e*, h, and L, and the dampers K M, substantially as and for the purpose specified.

258,996. LEGGING. MARY E. CORY, Richmond, Ind. Filed Apr. 7, 1882. (No model.)

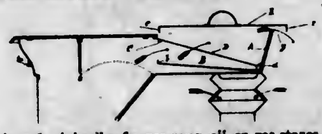


Claim.—An improved water-proof legging, A, provided with the elastic band *a*, elastic gusset *d*, and the inner flap, *f*, all substantially as and for the purpose described.

258,997. SEAT-LOCK FOR VEHICLES. GEORGE L. CHANDAL, Binghamton, N. Y. Filed Feb. 13, 1882. (No model.)

Claim.—In a seat-fastening, the bearing-box K, having the opening C, in combination with the hook B and pin D, substantially as herein described.

258,998. MANUFACTURE OF OX-SHOES. JOHN DESELL, Southington, Conn. Filed Dec. 15, 1881. (No model.)



Claim.—1. That improvement in the manufacture of ox-shoes which consists in cutting two blanks from the width of a bar by dividing the toes from the heels on a line which extends the whole length of said blanks, bringing the edges at the heel end of the blank into substantially its final form of curvature, and then bending the toe end of the blank, substantially as described, and for the purpose specified.

2. That improvement in the manufacture of ox-shoes which consists in first forming a blank in the shape of a truncated oval figure, then dividing it from end to end on a curved line, forming the calks thereon, and bending the toe end, substantially as described, and for the purpose specified.

3. That improvement in the art of forming ox-shoes which consists in first forming the blank with the edges of its heel end having substantially the same curvature as that of a finished shoe, then forming the calks thereon, then bending the toe end, and finally striking the same to finish it, substantially as described, and for the purpose specified.

4. The bending-dies having the calk-forming recess *f*, for forming the calk under pressure, and acting longitudinally with reference to the length of the blank, substantially as described, and for the purpose specified.

258,999. BROILER FOR OIL OR GAS STOVES. ROBERT E. DIRYS, New York, N. Y. Filed Mar. 26, 1882. (No model.)

Claim.—1. A broiler for use upon oil or gas stoves, adapted and arranged to fit within the conduit for products of combustion, the walls of said broiler resting against the walls of said conduit, substantially as shown and described.

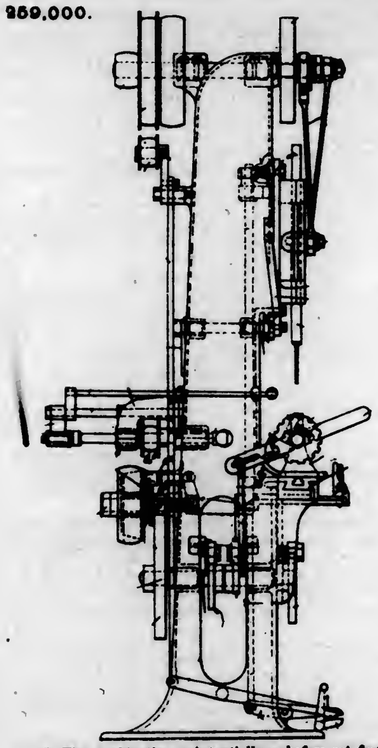
2. A broiling device for use upon oil or gas stoves, consisting of a pan adapted and arranged to fit within the conduit for the products of combustion, said pan being provided with sides and an end wall which rest against the walls of the conduit, as set forth, and a gridiron or grate located below the level of the top of the stove and supported within the pan, substantially as shown and described.

3. In a broiler for use upon oil or gas stoves, a pan, A, open at one end for the admission of heated products of combustion, in combination with a cover, E, adapted and arranged to fit over the pan, leaving an outlet for the exhausted products of combustion at the extremity of the pan most remote from the source of heat, substantially as shown and described.

4. In a broiler for use upon oil or gas stoves, the pan A, having sloping bottom B, cross-bar C, and turned edge *a*, said pan being adapted and arranged to fit within the conduit for the products of combustion from the flame-space, the back and side walls of the pan resting against the walls of said conduit, as specified, in combination with a sloping gridiron or grate, D, inclosed in said pan, and a cover, E, fitting over the whole, substantially as shown and described.

259,000. MORTISING-MACHINE. WILLIAM H. DOANE and GEORGE W. ENGESS, Cincinnati, Ohio, assignors to J. A. Fay & Co., same place. Filed Feb. 21, 1882. (No model.)

Brief.—The lathe for holding the hub is raised to the reciprocating chisels by a cam upon a shaft, which is driven from the shaft which operates the chisels, and the cam-shaft may be stopped without stopping the main shaft by means of a friction-clutch, &c. The hub-rotating locking and unlocking mechanism is also operated by cams on the cam-shaft. Devices are provided for spreading the chisels and for adjusting the chisel-bar yokes for producing staggering mortises.



Claim.—1. The combination, substantially as before set forth, of the continuously-rotating main shaft, the chisel-bars operated thereby, the ascending and descending lathe driven from said shaft, and means, substantially as described, for moving and stopping the lathe without stopping the main shaft.

2. The combination, substantially as before set forth, of the continuously-rotating main shaft, the chisel-bars operated thereby, the ascending lathe, the shaft and lifting-cam for moving the lathe, and the internal friction-pulley and friction-clutch for transmitting motion to said shaft, the friction-pulley being driven from the continuously-rotating main shaft of the machine.

3. In a machine for mortising hubs, the combination, with the lathe, substantially as before set forth, of the internal friction-pulley, the friction-clutch, the treadle for moving said clutch, and a bell-crank for locking and raising the treadle.

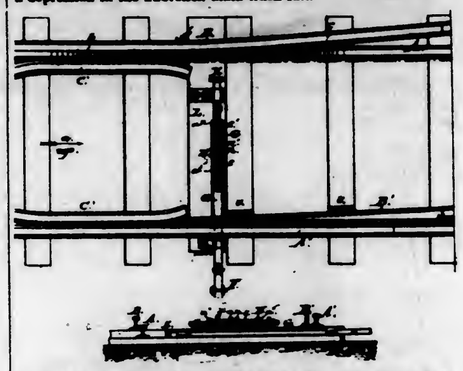
4. The combination, substantially as before set forth, of chisel-bar yokes, the independently-adjustable slides to which the yokes are pivoted, the rocking cross-bar and links for spreading the yokes and chisel-bars, the connected levers for rocking the cross-bars, the shaft and cam for operating said levers, and the internal friction-pulley and friction-clutch for transmitting motion to said shaft.

259,000.

5. The combination, substantially as before set forth, of the chisel-bar yokes, the independently-adjustable slides to which the yokes are pivoted, and the rack connecting the slides and adapted to adjust or move them simultaneously.

6. The combination, substantially as before set forth, of the slides to which the chisel-bar yokes are pivoted, the rack connecting said slides, the lathe-slide carrying the hub-chucking devices and provided with a rack, and the stagger-shaft and pinions for simultaneously moving the lathe-slide and the slides of the chisel-bar yokes.

7. The combination, substantially as before set forth, of the chisel-bars, the hub-chucking devices, and means, substantially such as described, for simultaneously shifting the chisel-bars and hub-chucking devices in cutting stagger-mortises, whereby both sets of mortises will be properly aligned automatically.



8. The combination, substantially as before set forth, of the notched disk on the spindle in the head-stock of the lathe, the spring-latch, the lever and pawl for turning the disk, the latch-lifting finger on said lever, the hub-turning cam and lever, and the adjustable rod for connecting the two levers.

9. In a wheel-hub-mortising machine organized to operate with continuously-reciprocating chisel-bars, and an ascending and descending lathe adapted to be stopped at the will of the operator without stopping the machine, the combination, substantially as before set forth, of the main shaft for driving the chisel-bars and lathe and a boring-spindle, also driven by said main shaft.

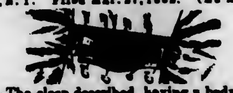
10. A machine for mortising hubs, embodying the following instrumentalities, viz: two continuously-reciprocating chisel-bars, an ascending and descending lathe for presenting the hubs, a boring-spindle for boring the hubs preparatory to mortising them, a continuously-rotating main driving-shaft, and treadles for controlling the means for driving the lathe and boring-spindle at the front of the machine, substantially as before set forth.

259,001. RAILROAD-SWITCH. WILSON P. DODSON, Philadelphia, assignor of one-half to Alexander H. Ege, Cumberland County, Pa. Filed Oct. 7, 1881. (No model.)

Brief.—The switch is formed by a depressed unbroken main-track rail combined with an unbroken siding and main track rail and a spring-held movable siding point-rail. The springs of the movable rail are independently adjustable. The frog is formed by a depression in the unbroken main-track rail.

Claim.—1. In a railroad switch and frog, the depressed rail A of the main track and the rail A′ of the same, in combination with the permanent elbow-rail B and the pointed and movable switch-rail B′ of the siding, as and for the purpose hereinbefore set forth.

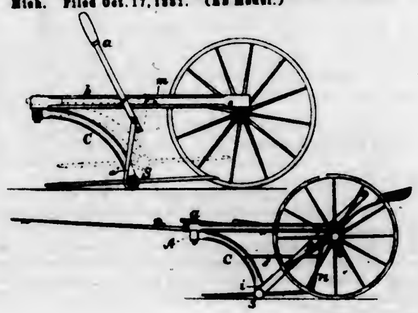
2. In a railroad-switch, the combination, with the main-track rails A and A′, the former being depressed, and the permanent elbow-rail B, and the pointed and movable switch-rail B′ of the siding, of a suitable spring or springs for actuating the pointed switch-rail B′ laterally for the purpose of shunting a car or train from said main track onto the siding, or vice versa, substantially as described.



3. In combination with the springs *s s′*, the housing H, and spring-bar G, the adjusting-nuts *n n′*, movable on the said screw-threaded spring-bar G, to increase or diminish the tension of said springs, substantially as and for the purpose hereinbefore set forth.

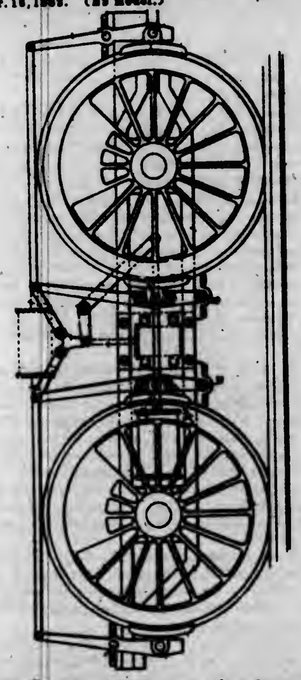
4. The combination, with the main track A A′ and the siding B B′, of the depressed frog O and supporting-rail B″, substantially as and for the purpose set forth.

5. A railroad-frog provided with a depressed main-track rail, and having the necessary mi[s]ing and guard rails associated therewith, substantially as and for the purpose set forth.



6. The combination, with the throw-bar and switch-point, of screw-threaded spring-bar G, the springs *s s′*, and adjustable nuts *n n′*, whereby the tension of said springs may be regulated independently of each other, as and for the purpose set forth.

259,002. CLASP OR DRESS-SUPPORTER. HENRY C. PEARL, New York, N. Y. Filed Mar. 27, 1882. (No model.)



Claim.—The clasp described, having a body, A, with its legs or cars A′ A′ and the single pivot B, sustained thereon, carrying the springs E′ E, the reversed levers C D, each with its narrow body and broad end C′ D′, extending across the full width of the body A, all substantially as and for the purposes specified.

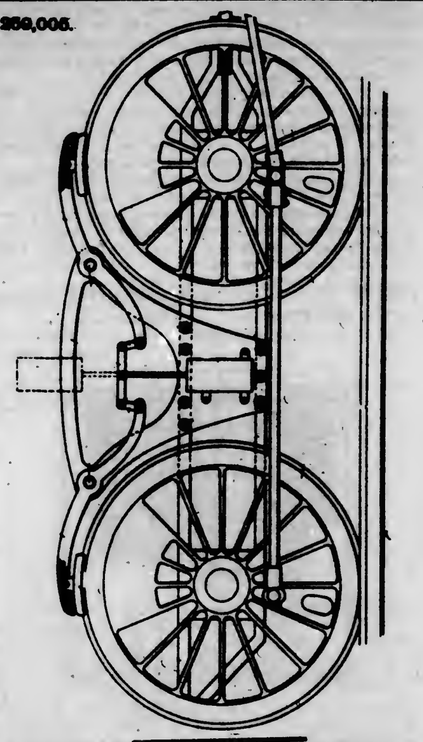
259,003. HORSE HAY-RAKE. THOMAS W. GUERNSEY, Lansing, Mich. Filed Oct. 17, 1881. (No model.)

Claim.—The combination, with the rake-head S, pivoted thereto C, and the bar b of the main frame, of the hook *a′*, pivoted to the lever *a*, the lever *a*, pivoted to the bar b, and the fixed pin *m*, adapted to hook the lever *a* to the bar b when the rake is elevated, the whole being arranged and adapted to serve substantially as and for the purpose set forth.

259,004. LOCOMOTIVE-BRAKE. WILLIAM B. GUERNSEY, Norwich, and WILLIAM B. TURNER, New York, N. Y., assignors of one-third to the Torrey Automatic Brake Company, New York. Filed Mar. 16, 1882. (No model.)

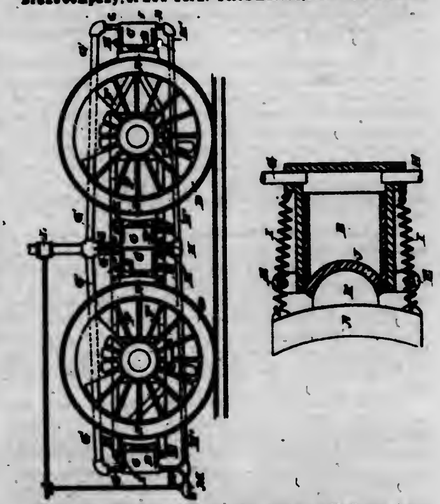
Claim.—1. In a driver-brake for locomotives, the combination of a suitable motor, one or more pairs of brake-shoes arranged on opposite, or nearly opposite, sides of the respective wheels, levers to which said brake-shoes are hinged, constituting the means of support, attachment, and operation of the shoes, and connections between the levers, all in the plane of the wheels, or nearly so, substantially as herein shown and described.

2. In a driver-brake for locomotives, the combination of a suitable motor and one or more pairs of brake-shoes, applying simultaneous pressure to opposite, or nearly opposite, sides of each driving-wheel, and actuated simultaneously by levers of different orders, constituting the means of attachment and suspension of the brake-shoes, the whole being in the plane of the wheels, or nearly so, substantially as hereinbefore set forth.



3. In a driver-brake for locomotives, a system of brake-shoes mounted or suspended by levers of different orders connected substantially as set forth, so as to communicate simultaneously an equal motion to all the shoes of the system from a common motor, the said brake-shoes and connections being in the plane of the wheels, or nearly so.

259,005. LOCOMOTIVE-BRAKE. WILLIAM B. GUERNSEY, Norwich, and WILLIAM B. TURNER, New York, N. Y., assignors of one-third to the Torrey Automatic Brake Company, New York. Filed Mar. 14, 1882. (No model.)



Claim.—1. A top brake for locomotives, having a pair of brake-shoes hinged to the ends of an equalizing-lever and applied to the top of two adjacent wheels by power acting in the plane of the wheels, or nearly so.

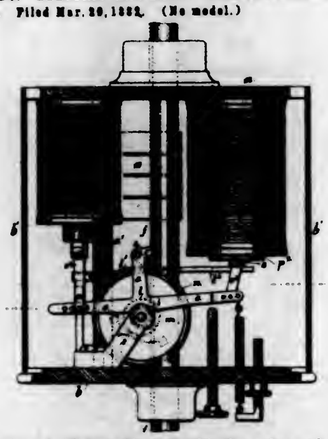
2. A top brake for locomotive-drivers, consisting of a pair of shoe-levers, an equalizing-lever, and a motor-cylinder mounted on a common supporting plate or frame, by which the entire apparatus may be secured to the frame of the locomotive, substantially as herein described.

259,006.

259,006. LOCOMOTIVE-BRAKE. WILLIAM B. GUERNSEY, Norwich, N. Y., assignor of one-third to the Torrey Automatic Brake Company, of New York. Filed Mar. 14, 1882. (No model.)

Claim.—1. A brake consisting of a pressure-cylinder, a piston contained therein, and a shoe supported and actuated through the medium of said piston, substantially as described.

2. The combination, with a cylinder and contained piston and a shoe supported and actuated by connection with the said piston, of springs attached at their respective ends to the cylinder and the shoe for the purpose of retracting the latter when relieved of pressure.



3. In a brake consisting of a pressure-cylinder, a piston contained therein, and a shoe supported and actuated by said piston, an attaching-plate formed with or secured to the pressure-cylinder to permit the bolting of such brakes independently to the frame of a locomotive or car, substantially as described.

4. The combination of a system of brake-shoes, A A, pistons B B, one for each shoe, acting directly thereon, constituting the support and attachment for said shoes, cylinders C C, in which said pistons work, and pipes G G', for applying pressure simultaneously to the said cylinders C, substantially as described.

5. The combination of the piston B, shoes A, and universal joint-bearings J K between them, substantially as described.

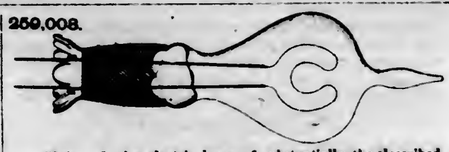
6. The combination, with the cylinders C, pistons B, and shoes A, of the supply-pipes G, exhaust-pipes H, and inlet cocks or valves L, and discharge-cocks M, connected to be operated by a single movement, substantially as described.

259,007. ELECTRIC-ARC LAMP. JOHN H. GUSEY, Brooklyn, N.Y. Filed Mar. 29, 1882. (No model.)

Claim.—1. The combination, with the carbon and carbon-holder, of an electro-magnet the helix of which is of high resistance and is a shunt-circuit, a lever and pawl, a ratchet-wheel and pinion by which the said magnet imparts to the carbon-holder a positive feed motion, and a second electro-magnet of low resistance in the main circuit to draw back the lever and pawl, substantially as set forth.

2. The combination, in an electric lamp, of the magnet C in the main circuit, a lever, *p*, a spring, 26, and an insulated circuit-closing block, *q*, adapted to move vertically, the circuit-connections to the + and – binding-posts, and the spring 30, the parts being arranged substantially as specified, so that the block *q* is supported by the lever *p* previous to the lamp being lighted and dropped when the current is turned on, and the shunt-circuit is closed by the lever *p* and spring 30 acting on said block *q* when the current in the magnet C becomes too weak, substantially as set forth.

3. In a mechanism for feeding carbons in electric lamps, the combination, with the carbon-holder and rack, of a pinion and ratchet-wheel on a sleeve, a shaft passing through such sleeve, a brake-wheel and a ratchet-wheel on the shaft, and a brake and feeding-lever, pawl, and electro-magnet, substantially as specified.



4. The combination, with the lower carbon, carbon-holder, and armature, of four helices and their cores, said helices being in two branch circuits, the wires of each branch circuit being about half the size of the wires in the main circuit, for the purposes and as set forth.

5. The combination, with the carbon-holder, pinion, feed-wheel, lever, and magnet for feeding the carbon, of a friction-wheel, a spring-brake, a magnet in the main circuit, and a lever to apply the necessary pressure to the spring-brake for supporting the carbon when the lamp is in operation, substantially as set forth.

6. The combination, with the carbon-holder and its armature, of four cores and their helices, of comparatively fine wire, connected by branches in the main circuit, so as to obtain the necessary magnetic force in a small space for separating the carbons without materially increasing the resistance, substantially as set forth.

259,008. ELECTRIC INCANDESCENT LAMP. JOHN H. GUSEY, Brooklyn, N.Y. Filed Sept. 12, 1881. (No model.)

259,008.

Claim.—1. An electric lamp of substantially the described kind, having its issuing circuit-wires hermetically sealed into the lamp-globe by a charge of solidified metal deposited in the tubes or apertures surrounding the issuing wires, substantially as herein set forth.

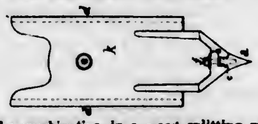
2. An electric lamp consisting of a globe constructed with tubular stems through which its wires issue, and with a charge of adherent metal forced into said tubes around the wires, substantially as herein shown and described.

3. The described mode of sealing circuit-wires into the glass globes of electric lamps, consisting in depositing or forcing into the tubes surrounding the issuing conducting-wires a charge of molten metal having a chemical adhesion for the glass and solidifying the same therein, substantially as herein shown and described.

4. The mode of affixing and sealing luminant loops and their circuit-wires in the globes of electric lamps, consisting in first temporarily supporting the loop and the wires in the globe by a suitable clamping or supporting device, with the ends of the wires protruding from apertures or tubes in the globe, then immersing these tubes and wires in molten metal and causing the same to rise in the tubes around the wires, retaining the column of metal in said tubes and raising them out of the molten mass, and allowing the charge in the tubes to solidify, substantially as herein shown and described.

5. The mode of depositing a charge of solidified metal in the tubes of electric-lamp globes surrounding the issuing wires thereof by immersing said tubes and wires in a mass of molten metal, withdrawing a portion of the air from the globe, and thereby causing the molten metal to rise in said tubes by atmospheric pressure, and thence retaining the metal so raised and allowing it to solidify in said tubes around the wires, substantially as herein set forth.

6. An electric-lamp globe formed with tubes through which its wires issue, flared at both ends, with a charge of solidified metal in said tubes around the issuing wires, substantially as and for the purpose set forth.

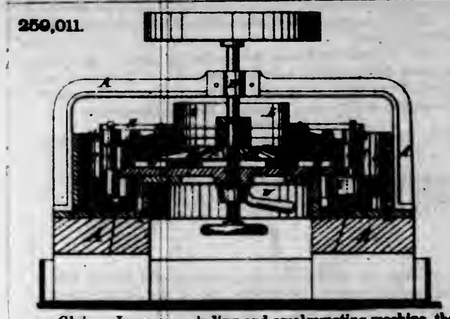


7. An electric lamp formed with a sheath or cap surrounding and extending beyond the stems, through which the wires issue, and concealing and protecting said stems and wires, but open at the end to permit free connection with the wires, substantially as herein shown and described.

8. An electric lamp of substantially the described kind, having the end of its globe where the wires issue provided with a flared cap, *s*, open at the rim, with the protruding circuit-wires terminating with said cap and concealed thereby, substantially as herein shown and described.

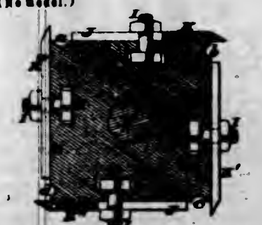
259,009. SHOE-POLISH. MICHAEL MACNETT, New York, N.Y. Filed Jan. 11, 1882. (Specimens.)

Claim.—The herein-described composition of matter, consisting of black ink produced from nut-gall and sulphate of iron, port-wine, gum-arabic, brown rock-candy, and spirits of wine, combined in the proportions herein named, substantially as and for the purposes described.



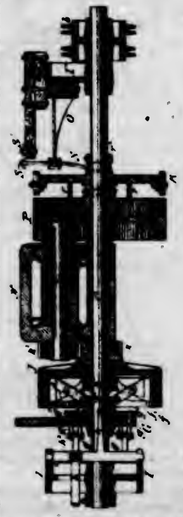
259,010. CUTTER FOR WOOD-SPLITTING MACHINES. WILLARD M. HALL, Worcester, assignor to Edwin A. Hildreth, Harvard, Mass. Filed Feb 21, 1881. (No model.)

Claim.—The combination, in a wood-splitting machine, of the ax-head *k*, formed with the grooved recess *b* in the lower edge thereof to receive the tongue or shank *c* of the ax-edge or knife *a*, bolts *f f*, passing vertically through portions of the ax-head and into the shank *c* of the ax-edge *a*, the groove *b* being formed of sufficient depth to allow the vertical bolts *f f* to bind the ax-edge *a* firmly to the ax-head *k* against the shoulders on both sides of the base of the shank *c*, substantially as and for the purpose specified.



259,011. ORE GRINDING AND AMALGAMATING MACHINE. WILLIAM E. HARRIS, New York, N. Y. Filed Sept. 23, 1881. (No model.)

259,011.



Claim.—In an ore grinding and amalgamating machine, the combination, with the grinding-plates J M, the ring grinding-plates S, and the trough Q, of the copper plates *c d*, substantially as herein shown and described, whereby the ore will be finely ground and thoroughly amalgamated, as set forth.

259,012. CUTTER-HEAD. MURRAY MEYER, Cincinnati, Ohio, assignor of one-half to James Richey, same place. Filed Jan. 28, 1882. (No model.)

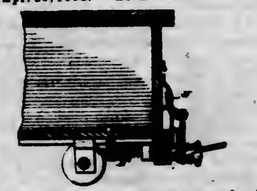
Claim.—A square cutter-head having four flat faces A B C D, slotted respectively as E F G H to receive bolts I, wherewith the slotted knives K K' K'' K''' are secured to said head, the cutters K K'' on two opposite faces of the head being broader relatively than the knives K' K''' on the two other opposite faces thereof, for the purpose stated.

259,013. CAR BRAKE AND STARTER. NEHEMIAH HINCKLEY and HIRAM CULVER, Philadelphia, Pa., assignors, by mesne assignments, of one-fourth to Martha W. Page, same place. Filed Feb. 14, 1882. (No model.)

Claim.—1. The combination, with the hollow friction brake-wheel J, of the spider-wheel E, carrying the brake-shoes *e e e*, the sliding collars F and G, and the guides *g'*, constructed and operating substantially as set forth.

2. The combination of the wheel P, having the internal V-shaped ratchet-gear, with the hub Q, provided with spring-pawls, as described, and the friction-bar R, substantially as set forth.

3. The combination of the friction brake-wheel J, the spider-wheel E, the sliding collars F and G, and the wheel P, provided with the hub Q and pawl-and-ratchet mechanism, and the friction-bar R, substantially as set forth.



4. The combination of the friction-bar R, the hub Q, and the springs *g''*, and coiled spring between the parts Q and R, substantially as set forth.

5. The combination of the wheel J, the small pinion *h*, the larger pinion *h'*, the drum M, of smaller diameter than the pinions *h h'*, and the small pinion *h²*, and the internal gear-wheel, P, substantially as set forth.

6. The combination, with the friction-bar R, of the springs S and cam-lever O, substantially as set forth.

7. The combination of the pivoted standard H, with its arms and the cam-lever O, springs S, friction-bar R, and wheel P, substantially as set forth.

259,014. CAR-COUPLING. DAVID W. HODGES, Washington, Ind. Filed Apr. 29, 1882. (No model.)

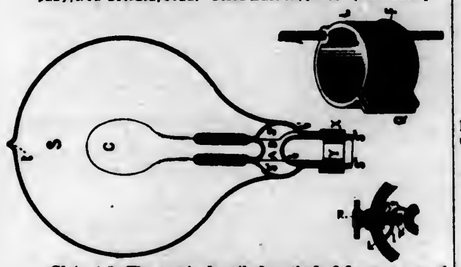
Claim.—1. The combination, with the draw-head capable of a horizontal movement, and having an elastic buffer or cushion, F, at its rear end, of the coupling-pin having pivoted to its head the ends of levers J J, having a series of notches, L, in their upper sides, and the pivoted arms N N, the beveled ends of which engage said notches to hold the pin in an elevated position, the arrangement being such that when the link enters the draw-head it pushes the same back, thus throwing the arms N N from out of engagement with the notches L, to allow the pin to drop and effect the coupling, as set forth.

2. In a car-coupling, the combination, with the pin having a projection adapted to press on the rear end of the coupling-link, when the latter is in position in the draw-head, by aid of suitably-arranged levers, of the coupling-link provided on its under side, near the end, with the projections, one on each side, which act as a fulcrum against the bottom of the draw-head when the front end of the link is raised, as and for the purpose specified.

259,015. BELT-FASTENER. BENJAMIN HOGAN, Saginaw, Mich. Filed Apr. 1, 1882. (No model.)

Claim.—The belt-fastener A, formed with points B B, having shoulders C C and straight knife-edges D D, as set forth.

259,016. SPINDLE AND BEARING THEREFOR. ADDISON S. HOPKINS, Passaic, N.J. Filed Jan. 23, 1882. (No model.)



Brief.—The bolster provided at its upper end with a flange, the under cone-shaped side of which rests loosely upon a correspondingly-formed shoulder on the bolster-case, is eccentrically bored for the reception of the spindle, whereby when if in the revolution of the spindle the same should bind in its bearings the bolster would adjust itself to said spindle. A groove formed in the flange of the bolster is filled with wicking, to facilitate lubrication.

Claim.—1. A spindle-bolster consisting of a tube having at its upper end a circular flange arranged eccentrically with relation to the bore or spindle-bearing of the tube, said flange being beveled upon its lower and provided upon its upper side with a circular groove, and having formed in its peripheral edge an inclined groove, which communicates through openings with said circular groove and with the spindle-bearing.

2. The combination, substantially as before set forth, of the spindle, the bolster-case provided with an oil-well, *a*, and an enlargement, *b*, having a beveled shoulder, and the bolster having a flange, *c'*, which is provided with an annular groove communicating through oil-holes with the spindle-bearing of the bolster.

259,017. ELECTRIC INCANDESCENT LAMP. EDWIN J. HOUSTON, Philadelphia, Pa., assignor to the American Electric Company, New Britain, Conn. Filed Mar. 14, 1882. (No model.)

Claim.—1. The herein-described method of forming a good electrical connection with the carbon strip or filament of an incandescent lamp, consisting in fastening the strip or filament to a conductor of iron or other conducting substance capable of entering into chemical combination with carbon, and then carbonizing the conductor thus attached.

2. The herein-described method of forming an electrical connection between the carbon strip or filament of an incandescent electric lamp and the outside conductor, consisting in fastening the strip or filament to a conductor of a material capable of entering into chemical combination with carbon, electroplating the joint with a similar material, capable also of entering into chemical combination with carbon, and then converting the joint thus formed into a carbide of the material employed.

3. The herein-described method of forming an electrical connection with the strip or filament of an incandescent carbon lamp, consisting in fastening said strip to a length of iron conducting-wire, and then converting the iron thus attached into a carbide.

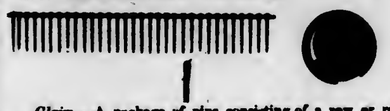
4. The herein-described method of forming an electrical connection with the strip or filament of an incandescent carbon lamp, consisting in fastening said strip to an iron conductor; electroplating the joint with iron or other suitable metal, and then treating the joint thus formed so as to convert the iron into a carbide.

5. The herein-described method of forming an electrical connection between the strip or filament of an incandescent carbon lamp, consisting in connecting the strip or filament before carbonization to an iron conductor, wrapping the iron with a carbonizable material, carbonizing the strip or filament with the conductor thus attached, and afterward electroplating with iron and heating to incandescence in a carbon vapor, gas, or liquid.

6. A compound leading-in conductor for an incandescent light, composed of platinum at the point where it passes through the walls of the glass inclosing-globe and of iron or similar material capable of entering into chemical combination with carbon at the point where it is attached to the carbon strip or filament.

7. In an incandescent electric lamp, a carbon strip or filament, in combination with a leading-in conductor of carbide of iron covered with carbon at the point of junction, deposited in the manner set forth.

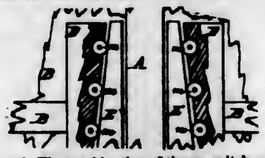
8. In an incandescent lamp, a compound conductor for the purpose of carrying the current to and from the carbon filament, consisting essentially of a metallic wire of suitable material for sealing into the glass support by melting the glass around it, welded to or wrapped around one end of a wire capable of entering into chemical combination with the carbon of the filament, and combined chemically in the manner substantially as described with the end of the filament and with other carbon deposited thereon.



9. A glass supporting and an inclosing globe for the incandescing filament of an electric lamp, fashioned at its bottom into the form of a hollow cylinder, S" S", to the inside and outside of which, respectively, are attached the conducting-rings X Y, connected to the ends of the filament.

10. The combination, substantially as described, of an electric lamp [illegible] at its base with a conducting-ring forming a terminal [illegible] portion, and a ring-socket for holding the [illegible], said ring being provided with a suit[illegible] with the conductor by which [illegible] lamp.

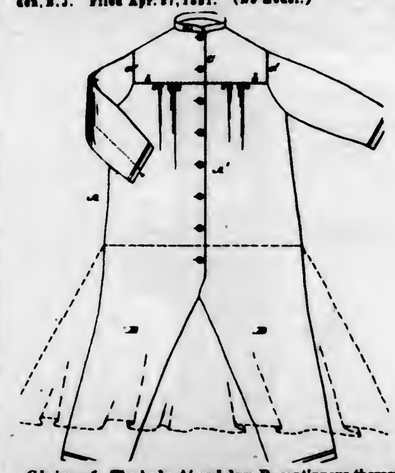
11. The combination of the double-ring socket L and M and shunting-key P.



12. The combination of the double-ring socket L M, springs or conductors projecting from said rings, and the turning screw or spindle P, mounted in the outer ring and provided with means for completing and breaking the circuit between the springs.

259,018. PIN-PACKAGE. WILLIAM C. HOWARD, Brooklyn, N.Y. Filed Mar. 2, 1882. (No model.)

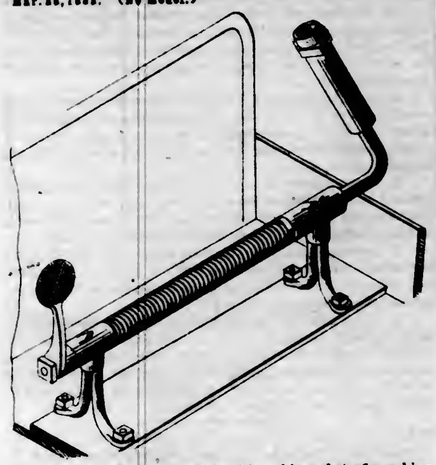
Claim.—A package of pins consisting of a row or rows of pins confined between the folds or plies of the holding material, substantially as described.



259,019. SAFETY APPARATUS FOR PASSENGER AND OTHER ELEVATORS. MERRILL M. HUTCHINSON, New York, N.Y. Filed Apr. 19, 1882. (No model.)

Claim.—1. The combination of the oppositely-arranged blocks or inclined planes D upon the car or cage A, the wedges E, arranged to act in connection with the said blocks or inclined planes, and the post A, placed between the said wedges, so that the upward movement of the wedges with reference to the blocks or inclined planes D will cause the post A to be firmly gripped between the said wedges, all substantially as and for the purpose herein set forth.

2. The oppositely-arranged blocks or inclined planes D, attached to the car or cage B, the wedges E, arranged coincident with the said blocks or inclined planes D, the post A, placed between the said wedges, the lever *a*, the rope F, the counter-weight G, and means, substantially as described, for connecting the rope F with the oppositely-arranged wedges, all substantially as and for the purpose herein set forth.

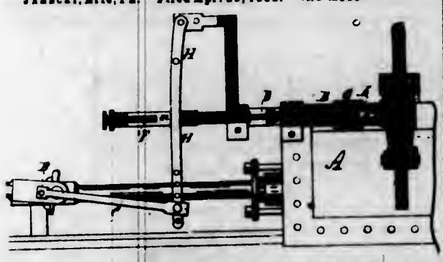


259,020. BATHING-GARMENT. DAVID W. J. HUTTON, Camden, N.J. Filed Apr. 27, 1881. (No model.)

Claim.—1. The body A' and legs B, continuous thereof, in combination with the yoke C, extending from the line *b* in front over the shoulders to the line *b'* at the back, forming an improvement in bathing-garments, as set forth.

2. The bathing-garment consisting of the body A' and legs B, continuous thereof, having the yoke C, which extends from the line *b* over and beyond the top of the shoulders, substantially as and for the purpose set forth.

259,021. WHIP-HOLDER. FRANK HOPP, Allegheny, Pa. Filed Mar. 25, 1882. (No model.)

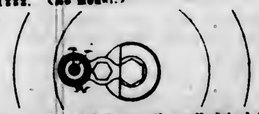


Claim.—1. The combination, with a whip-socket, of a rocking rod, a pedal or treadle, and a spring, substantially in the manner and for the purposes described.

2. The combination of a whip-socket, means for holding a whip therein, a rocking rod having a treadle secured on one end, and a spring which will return the socket to its normal position after it is pressed forward to whip the horse, substantially as described.

3. The combination, with a vibrating whip-socket, of a pedal or treadle, and means for returning the socket to an upright position after it has been pressed forward, substantially as described.

259,022. LUBRICATOR FOR STEAM-ENGINES. FREDERICK JARECKI, Erie, Pa. Filed Apr. 25, 1882. (No model.)

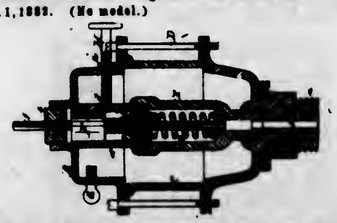


Claim.—1. The combination of the adjusting-bolt B, connecting-rod C, lever H, cylinder E, and adjustable bearing G, substantially as and for the purpose herein specified.

2. The slotted plunger D, in combination with the lever H, substantially as and for the purpose herein specified.

3. The adjusting-screw *p*, in the outer end of the plunger D, in combination with the lever H, substantially as and for the purpose herein specified.

259,023. LUBRICATOR. OMAR H. JEWELL, Chicago, Ill., assignor of one-half to George A. Stannard, same place. Filed Mar. 1, 1882. (No model.)



Claim.—1. In a lubricator, the cylindrical base A, having vertical oil-hole *b*, extending centrally therethrough and through the screw-stem *a*, said base being countersunk on its bottom to form a seat for a conical check-valve, and having tubular extension *c*, bored to form the oil-pump cylinder, and provided with perforations *d d* near its lower end, the rod F, with plunger-head *f*, the check-valve *n*, with spring *o*, and auxiliary valve *p*, with spring *r*, all constructed and arranged substantially as and for the purpose set forth.

2. A lubricator composed of base A, having cylinder *c*, with perforations *d*, screw-stem *a*, and perforated diaphragm M, of glass tube D, cap C, with stuffing-box *e*, and screw-plug *m*, and of plunger-rod F and check-valve *n*, with spring *o*, thimble N, valve-casing O, check-valve *p*, and spring *r*, all constructed and arranged substantially as and for the purpose set forth.

3. A lubricator composed of base A, having cylinder *c*, with perforations *d*, screw-stem *a*, and perforated diaphragm M, of glass tube D, cap C, with stuffing-box *e*, screw-plug *m*, and diaphragm L, and of plunger-rod F and check-valve *n*, with spring *o*, all constructed and arranged substantially as and for the purpose set forth.

4. In a lubricator, the plunger-rod F, passed through a stuffing-box, *e*, and having socketed arm G, in combination with the operating-rod I, guided in eyes *j j'*, having spring J, screw-collar *k*, and arm H, that enters the socket in arm G, and is adjustably secured by set-screw *k*, all constructed and arranged substantially as and for the purpose set forth.

259,024. LUBRICATOR. OMAR H. JEWELL, Chicago, Ill., assignor of one-half to George A. Stannard, same place. Filed Mar. 1, 1882. (No model.)

Claim.—1. In a lubricator, the cylinder *d*, having orifice *j*, cap B, screw H, jam-nut *i*, tubular piece E, piston F, stem *f*, spring *e*, and valve *g*, having notches or grooves *h* in its periphery, the lower end of said valve being arranged to rest upon said spring while its upper end is in contact with the piston F, substantially as and for the purpose set forth.

2. A lubricator secured to the hub of a loose pulley and provided with cylinder *d*, having orifice *j*, cap B, screw H, jam-nut *i*, tubular piece E, piston F, stem *f*, valve *g*, having grooves *h*, and spring *e*, said valve being arranged to rest upon the spring *e* with its upper end in contact with the piston F, and being pressed up into its seat by said spring, and said stem *f* being projected through the rim of the pulley to be reciprocated by the alternate contact of the belt, all substantially as and for the purpose set forth.

3. A lubricator consisting of base A, having screw-stem *a* and oil-hole *b*, of cap B, having cylinder *d*, with orifice *j* and plug *e*, and of glass tube C, in combination with tubular piece E, piston F, stem *f*, valve *g*, having grooves *h*, and spring *e*, all constructed and arranged substantially as and for the purpose set forth.

4. A lubricator consisting of base A, having screw-stem *a* and oil-hole *b*, of cap B, having cylinder *d*, with orifice *j*, plug *e*, and regulating-screw H, and of glass tube C, in combination with tubular piece E, stem *f*, piston F, valve *g*, having grooves *h*, and spring *e*, all constructed and arranged substantially as and for the purpose set forth.

259,025. PROCESS OF RECOVERING WOOL FROM MIXED FABRICS. CHARLES LUNGE and JOHN B. LUNGE, Philadelphia, Pa. Filed Sept. 16, 1880. (No specimens.)

Claim.—The use of impure alum mother-liquors (product of the manufacture of alum) for the destructive solution and consequent separation of all vegetable fibers employed in the manufacture of mixed woolen fabrics, and the consequent recovery for use of the wool contained therein, substantially as described.

259,026. MANUFACTURE OF OXIDES OF LEAD. GEORGE T. LEWIS, Philadelphia, Pa. Filed Apr. 8, 1882. (No specimens.)

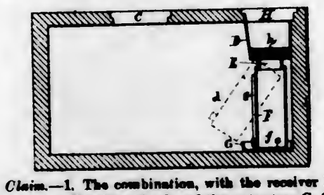
Claim.—The process of manufacturing commercial oxides of lead by subjecting waste-lead fumes to the action of carbonate of soda or caustic soda and heat by roasting in a furnace, substantially as set forth.

259,027. AUTOMATIC GATE. NATHAN E. LONG, Hunnie, Ind., assignor of one-half to William B. Kline, same place. Filed Mar. 27, 1882. (No model.)

Claim.—1. In an automatic gate-hinge mechanism, the combination of the T-lever *d*, held in the socket of bracket *c* by the

259,027.

weight of the gate on the hinge-rod *a*, said rod tapered to fit in the tapering hole in the T-lever, as and for the purpose set forth.



2. In combination with the mechanism of an automatic gate, the T-lever *d*, gudgeon *d'*, and socket *b''*, adjustably secured to the bracket *c* by the bolt *b'*, for the purpose set forth.

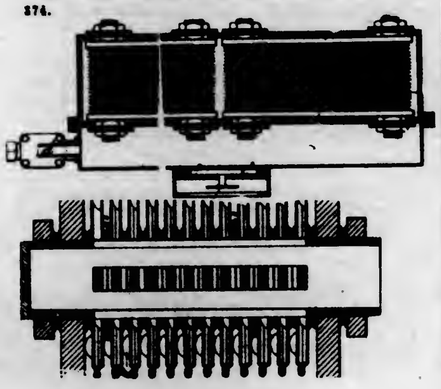
3. In a double gate, the hinge mechanism, in combination with the curved bars *b'''''* and *b''''''*, for the purpose set forth.

4. The latch *i*, in combination with the parts *i' i''* *s* and spring *u*, as shown, and for the purpose set forth.

5. In combination with the hinge-rod *a* and hinge part *c*, the U-shaped loop *c''*, gate E, and stud H, for the purpose set forth.

259,028. **REFRIGERATOR.** PAUL L. MALTHIE, Newark, N. J. Filed Mar. 25, 1882. (No model.)

Claim.—1. The combination, with the receiver D, provided with openings E and nozzles *b*, and the water-tray G, for receiving the melted ice, of the removable ice-tubes F, formed with tight bottoms, or closed by resting in close contact with the tray, and operating to cool the air of the refrigerator by the exposure of their cold outer surfaces, substantially as herein shown and described.



2. The combination, in a refrigerator, of the receiver D, provided with openings E and nozzles *b*, and the ice-tubes formed with closed bottoms *c*, substantially as shown and described.

3. The combination, in a removable ice-tube having a closed bottom, of an overflow-opening near the top and an emptying-outlet near the bottom, as and for the purpose set forth.

4. The combination, in an ice-tube having a closed bottom, of an overflow-outlet and guiding-channel, arranged and operating as described.

5. The combination, with the removable ice-tubes F and an ice-receiver, D, having openings E in the bottom for conducting the ice to the tubes when fed with crushed ice, as herein described, of the ridges A, for directing the crushed ice into the openings, substantially as shown and described.

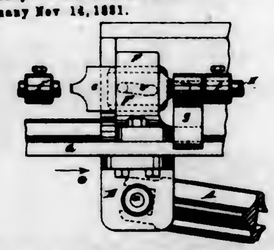
259,029. **APPARATUS FOR CONDENSING STEAM.** ROBERT HUGH MARCHANT, Clerkenwell, County of Middlesex, England, assignor of one-half to James Suter and William Frederick Lote, London, and William Downie, Southampton Buildings, Chancery Lane, County of Middlesex, England. Filed Sept. 20, 1881. (No model.) Patented in England Jan. 28, 1880, No. 374.

Claim.—1. In an apparatus for condensing steam and other vapors, a series of plates arranged in pairs and united at the edges to form chambers, said plates being provided with cups or indentations facing alternately inward and outward, the indentations which extend within the chambers serving to brace the same and the other cups or indentations serving to separate the chambers from one another.

2. In an apparatus for condensing steam and other vapors, a series of plates united at the edges in pairs, and provided with raised annular flanges surrounding the holes in said plates, said annular flanges of each pair of plates interlocking, substantially as set forth.

3. In an apparatus for condensing steam and other vapors, a series of plates united to form pairs, each pair inclosing a compartment, and the several compartments being separated by elastic packing-rings, substantially as and for the purpose set forth.

4. In an apparatus for condensing steam and other vapors, a wire screen and a shield extending below or outside of said screen and serving to protect the central part of that screen from grease, substantially as set forth.



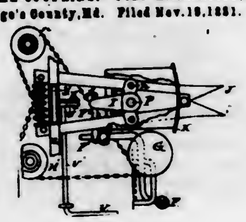
5. In an apparatus for condensing steam or other vapors, a series of plates arranged and united at the edges in pairs, as hereinbefore described, the said plates being formed with indentations or cups, and with holes having raised edges, and being threaded on slotted pipes, and made tight at the joints, all substantially as and for the purposes hereinbefore described.

259,030. **WOOD-PRESERVING COMPOSITION.** JOHN C. MARSHALL, Oakland, Cal., assignor of two-thirds to Lucien B. Jewell and William B. Frederick, both of same place. Filed Sept. 8, 1881. (No specimens.)

Brief.—Mixes in the following proportions, viz: Linseed-oil, one gallon; common salt, four ounces; saltpeter, two ounces; turpentine, one pint; and applies while hot. It is used for oiling follies, and at the same time producing tightly-fitting tires. May also be applied to buckets or casks which are to stand in the sun, to prevent shrinkage or warping.

Claim.—A composition for treating wood, consisting of linseed-oil, common salt, saltpeter, and turpentine, mixed in about the proportions set forth.

259,031. **MACHINE FOR RIFLING GUN AND PISTOL BARRELS.** PAUL HAUSER, Oberndorf-on-the-Neckar, Wurtemberg, Germany. Filed Dec. 27, 1881. (No model.) Patented in Germany Nov 16, 1881.

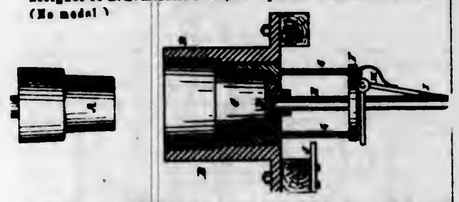


Claim—1. The combination, with the ruler A, in which the cutter-head is held, of an automatically-operated elevating and depressing means, D, attached thereto, whereby one end of the ruler is elevated or depressed, substantially as set forth.

2. The combination of the ruler A and guide D, provided with the slot *a'*, of the slide *c*, pin *d*, and tappets *f f'*, operated from the main shaft of the rifling-machine, substantially as set forth.

3. The combination, with the piece *c*, having the slot *a'* and adjusting means h, of the guide D, ruler A, and operating means, substantially as set forth.

259,032. **CAR-COUPLING.** JOHN H. HERRITH, Sarattoville, Prince George's County, Md. Filed Nov. 16, 1881. (No model.)



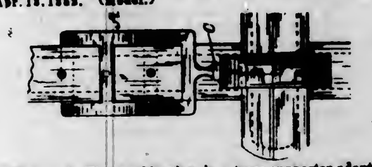
Claim.—1. In a car-coupling, the levers or bell-cranks F F' F'', in combination with staple *l* and plate I, as described, and for the purposes set forth.

2. The combination, in a car-coupling, of the levers F F' F'', hook *f*, staple *l*, and ratchet-plate E, substantially as shown and described, and for the purposes set forth.

3. A locking plate or wedge arranged to be raised and lowered between the coupling hook bars of a car-coupling, as described, and for the purposes set forth.

4. In a car-coupling, the combination of locking plate or wedge Y, operating-lever U, shaft U', arm V, link W, and casing or slide Z, substantially as shown and described, and for the purposes set forth.

259,033. **POTTERY-MOLD.** HENRY E. HERRILL, Akron, Ohio, assignor to E. H. Herrill & Co., same place. Filed Mar. 8, 1882. (No model.)



Claim.—1. In combination with the mold B, the mold C and disk D, all constructed and arranged as shown, and for the purpose specified.

2. In combination with the mold C and disk D, the collar F, rods G G, latch H, and stop I, all constructed and arranged substantially as shown, and for the purpose specified.

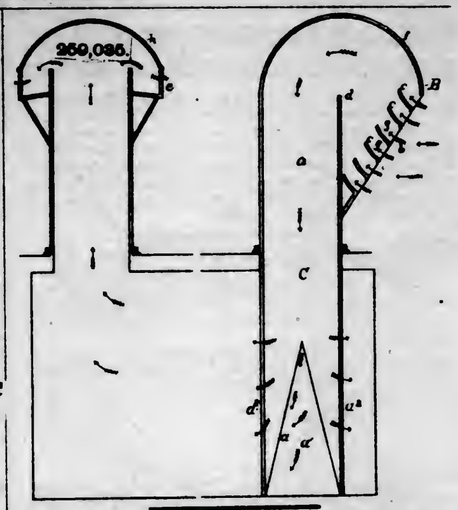
3. In combination with the disk D and shaft E, the mold C, with devices, such substantially as shown, for lifting said mold with said disk a part of the distance, and then releasing it, substantially as herein described, and for the purpose specified.

4. The herein-described pot-mold, consisting of the plunger A, molds B C, disk D, and shaft E, with devices, such substantially as shown, for raising the mold C, all constructed and arranged substantially as shown, and for the purpose herein set forth.

259,034. **TRACE-SUPPORTER.** THOMAS HEVEN, Logansport, Ind., assignor of one-half to Henry Tucker, same place. Filed Apr. 18, 1882. (Model.)

Claim.—1. The combination, in a trace-supporter adapted to be attached to the lip-strap of a harness without breeching, and in harness with breeching to a short leather stay on the same, of the frame A, having vertical parallel side bars, with four transversely-parallel bars, its lower part provided with a knob, C, having at its extreme end the axis *a'*, with the loop B, having rigid pin *b'*, tongue D, the pivot *d'*, spiral spring *c'*, the bolt E, slot *f'*, and button *f*, all substantially as described, and for the purposes specified.

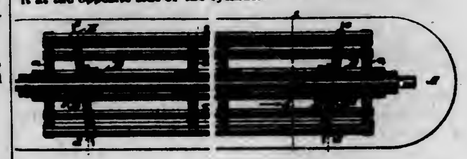
2. In a trace-supporter, the loop B, having rigid pin *b'*, and tongue D, with bolt E, adapted to be moved against spiral spring *c'* by means of the button *f* working in the slot *f'*.



259,035. **AIR-INJECTING VENTILATOR.** PATRICK HINAN, Chelsea, Mass. Filed May 23, 1881. (Model.) Patented in England Nov. 23, 1880, No. 4,855.

Claim.—1. A ventilator having a conduit, C, and a head formed as an arc of a circle, *f*, whose radius-point or center is at or near one side of said conduit, and with the air-passages arranged in the oblique line *h*, which intersects the line of said conduit and said arc, substantially as specified.

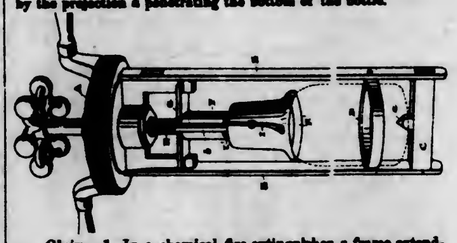
2. In a ventilator formed with the head projecting beyond the walls of the conduit, the oblique line *h*, intersecting the wall of the conduit and the arc of the head and subdivided into passages *g*, substantially as specified.



3. In a ventilator, the combination of the arc-like head B, whose radius-point or center is at or near the side of conduit C, the oblique line *h*, intersecting said arc, and the openings *g* in said oblique line subdivided by the curved partitions *e*, substantially as specified.

259,036.

259,036. **MACHINE FOR STRETCHING FABRICS.** GEORGE W. MILLER, Woonsocket, R. I. Filed Nov. 1, 1881. (No model.)



Brief.—A cylinder having its sides composed of longitudinal bars revolves upon a fixed shaft, upon which are fixed inclined arbors, upon which turn two wheels having radial arms extending through the spaces between the bars and terminating in sharp pins. The wheels are set at equal angles to the intermediate transverse plane of the cylinder, and receive the fabric at the side of the cylinder where their peripheries are nearest to each other and release it at the opposite side of the cylinder.

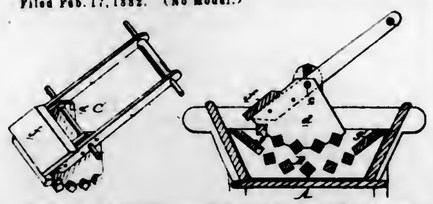
Claim.—The combination, in a stretching-machine, of a cylinder turning on a fixed shaft, A, and consisting of parallel disks *a a* and connecting longitudinal bars *b* and wheels E, turning on inclined arbors D upon the shaft, and provided with arms extending between the bars and carrying points *c*, substantially as set forth.

259,037. **FIRE-EXTINGUISHER.** WM. HORRIGAN, Toronto, Ontario, Canada. Filed Jan. 16, 1882. (No model.)

Brief.—The rest for the acid-bottle is provided with a pointed projection, *a*, and a cap bears on the bottle, so that by pressing down the bottle by means of screw H the acid will be discharged below by the projection *a* penetrating the bottom of the bottle.

Claim.—1. In a chemical fire-extinguisher, a frame extending from and rigid with the main ping, a shank, F, having feather-cleats *b*, and a sliding cap having recesses corresponding to said cleats, whereby the bottle may be inserted by sliding the cap upward and locked by partially rotating the cap after the cleats are out of engagement, as set forth.

2. In a chemical fire-annihilator, the frame B, rigid with the

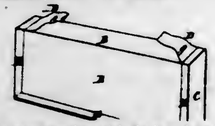


plug A, and having the cross-bar C, with point *a*, the shank F, having feather-cloats *b*, and the sliding cap E', having corresponding recesses, combined with the ring D, pivoted to the said cross-bar C, as specified.

3. In a chemical fire-extinguisher in which the acid-bottle rests upon a stationary pointed projection, an adjustable cross-head with a downwardly-projecting neck having a feather-key formed upon one side of it, in combination with a cap arranged to fit over the top of the bottle and onto the projecting neck, a slotted passage-way being made in the cap to admit the feather-key, and a spring arranged to hold the cap in its proper relative position, as and for the purpose specified.

259,038. COMPOSITION FOR PRESERVING EGGS. GEORGE W. HOWEY, Geneva, N.Y. Filed Dec. 14, 1881. (No specimens.)

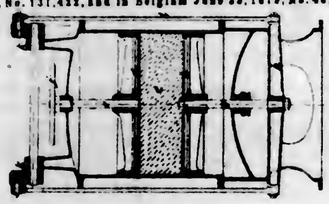
Claim.—A compound for preserving eggs, consisting in a weak solution of chloride of calcium mixed with air-slaked lime, the preparation being thoroughly dampened with water, substantially as set forth.



259,039. WASHING-MACHINE. IRA HUDSON, Wayne, Mich. Filed Feb. 17, 1882. (No model.)

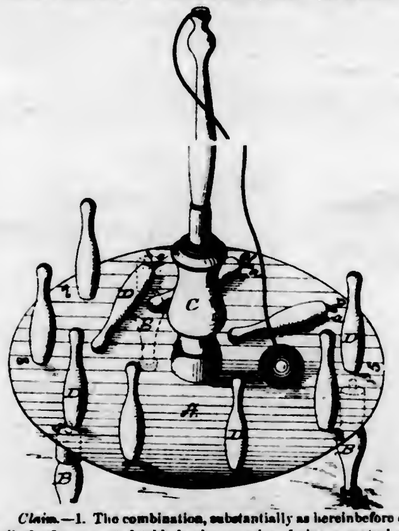
Claim.—1. The combination, with the tub A, of the frame or base D, provided with angularly-disposed ribs, the rubber C, provided with similar ribs, and the plates *f* and *g*, secured respectively to the rubber C and frame D, and having right-angle or square edges next to the angularly-disposed ribs, substantially as and for the purpose specified.

2. In combination with the tub A and the vibrating rubber C, the removable frame or tray D, and the plates *g g'* of said frame, having concave outer surfaces, substantially as and for the purpose specified.



259,040. AMMUNITION-BOX. EDWARD G. PARKHURST, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed Jan. 10, 1882. (No model.)

Claim.—1. In combination with the box A and contained cartridges, the exterior case composed of the two rectangular pasteboard parts B and C, each bent to form three sides of the box and turned with their open sides toward each other over the cartridges and box A, and the binding E, covering the corners, substantially as described.



2. In combination with the box or casing composed of two parts arranged respectively to each other as shown, the detaching-strip D, arranged between the two parts of the casing, and having a projecting portion to be grasped by the hand, as and for the purpose described.

259,041. FILTER. EDWARD PERRETT, Victoria Chambers, Westminster, England, assignor to John Eliot Hodgkin, Managing Director of the Pulsometer Engineering Company, (Limited,) London, England. Filed Nov. 8, 1881. (No model.) Patented in England Jan. 27, 1879, No. 330; in France June 26, 1879, No. 131,422, and in Belgium June 28, 1879, No. 46,813.

Claim.—The combination, in a filtering apparatus, substantially as specified, of a reciprocating device for alternately compressing and releasing the filtering material, and pipes, arranged as described, to permit a reverse current of liquid for cleaning the said material while the same is being worked.

259,042. GAME-BOARD. JUDSON S. POST, Stamford, Conn. Filed Oct. 27, 1856. Renewed Jan. 12, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a supported table having a series of pins, a central rod or lever with a suspended ball for knocking down the pins, and a connecting means for setting up the fallen pins simultaneously through the agency of the central rod or lever.

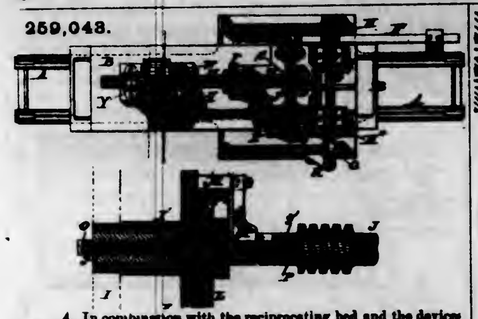
2. The combination of a table having a series of impressed or otherwise formed numbers on the upper surface of the table, a series of pins arranged over or alongside of the numbers, and a central rod with suspended ball for knocking down the pins, whereby the player is exercised in mental arithmetic—addition and subtraction—substantially as hereinbefore described.

3. In combination with a supported table, a means for connecting all the pins below the table, and a device operated by pressure from above the table for setting up all the knocked-down pins simultaneously, substantially as described.

4. In combination with a supported table having a central passage for an operating rod or lever and a series of apertures, a disk or collar having a series of loops or hooks, a series of pins, and a continuous cord connecting the disk and all the pins, substantially as described, and for the purpose set forth.

5. The combination, substantially as described, of a supported table having a central opening and a series of apertures near the circumferential edge, a series of ten-pins, a suspended disk with continuous cord, and a central lever or rod with a retracting-spring, substantially described.

6. In combination with the suspended disk, continuous cord, and pins, the central rod or lever with the coil-spring, for the purposes hereinbefore stated.



259,043. MACHINE FOR CUTTING SPIRAL GROOVES IN GRINDING-ROLLS. EDWIN REYNOLDS, Milwaukee, Wis. Filed Mar. 10, 1881. (Model.)

Claim.—1. In combination with the stationary cutter E, the reciprocating bed B, with supports for the roller X, the gear-train located upon the bed for turning the roller upon its axis, the stationary rack F, an uncoupling or disconnecting device in the driving-train, and a dog, Q, arranged to operate the disconnecting device as the bed moves in one direction only.

2. In a machine for spirally grooving grinding-rolls, the combination of the positively-driven dial-plate K, disk L, coupling-pin M, spindle O, and dog Q.

3. In a machine for cutting spiral grooves in grinding-rolls, the combination, in a train for rotating the roll, of the dial-plate K, having several circular series of holes, the disk L, and the radially-adjustable coupling device.

259,043.

4. In combination with the reciprocating bed and the devices thereon for sustaining and rotating a roll, a stationary rack arranged, substantially as shown, to operate the roll-turning devices as the bed is moved endwise.

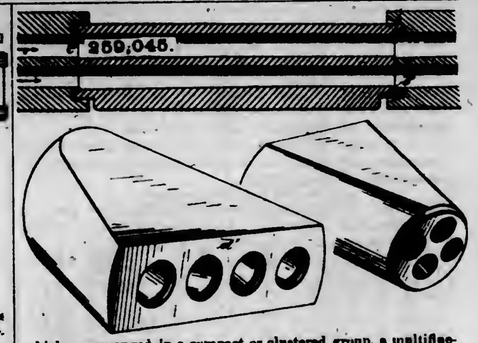
5. The combination of the rotating dial-plate K, provided with two or more circular series of holes or teeth located at different distances from the center, a driven shaft, J, the device M, adjustable radially to engage with one or the other of the series of teeth, the spindle O, and the intermittingly-acting dog Q, substantially as described, whereby the dial-plate and shaft are momentarily disconnected in order that one may change its relation to the other, substantially as described and shown.

6. In a roller-grooving machine, the combination of the reciprocating bed and roller-turning devices with the stationary operating-rack, adapted to be reversed as described, whereby the machine is adapted to cut either right or left hand spirals at will.

7. The combination of the reciprocating bed, the stationary rack, pinion F, shaft G, wheels H° and I, dial-plate K, and disk L, coupling-pin M, spindle O, and dog Q.

259,044. UNDERGROUND ELECTRIC CONDUCTOR. GEORGE RICHARDSON, Philadelphia, Pa. Filed Apr. 5, 1882. (No model.)

Claim.—1. An insulated electrical conductor consisting of the conductor proper and an insulating casing of pure hydraulic cement, substantially as before set forth.



2. The combination, substantially as set forth, of an underground conduit and a wood foundation board or plank of curved or wave-like contour.

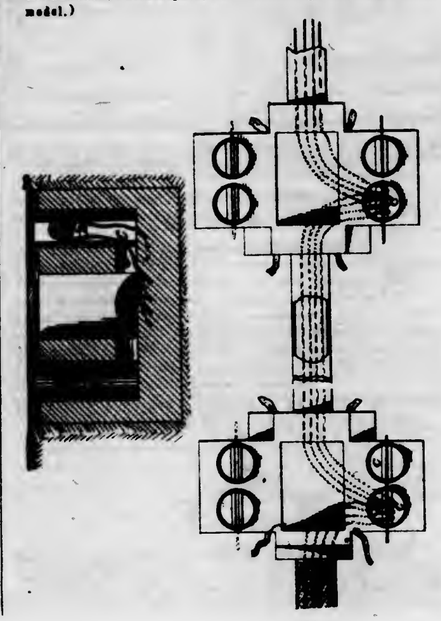
3. The combination, substantially as before set forth, of the foundation D, the wire or wires A, and the hydraulic cement in which said wire is embedded.

4. The combination, substantially as set forth, of the underground electric wire or wires, the man-hole or trap E, and the porous block F, constructed as described, and in contact with the earth.

5. The combination, substantially as before set forth, of a conduit for electrical conductors, a foundation for the same, and a man-hole or trap, said foundation being constructed with a projection or shelf around the man-hole.

259,045. UNDERGROUND CONDUIT FOR ELECTRIC CONDUCTORS. GEORGE RICHARDSON, Philadelphia, Pa. Filed Apr. 7, 1882. (No model.)

Claim.—1. A conduit for electrical conductors, composed of sections having tapering flues for the conductors, and laid with the ends of lesser bore of one section connected to the end of greater bore of the next adjacent section, substantially as before set forth.

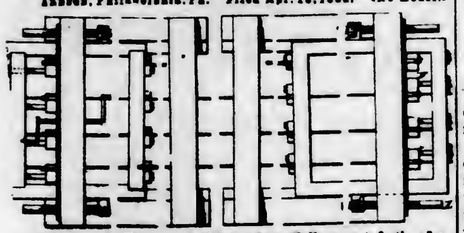


2. A multiflue coupling the flues of which are arranged, as described, so as to be in a compact or clustered group at one end and in a row at the other end, substantially as before set forth.

3. In a conduit for electrical conductors, the combination, substantially as before set forth, of a multiflue pipe the flues of which are arranged in a compact or clustered group, a multiflue coupling the flues of which change from a compact or clustered group at the end connected to said pipe to a single row at the other end, a second similarly-constructed pipe and connected coupling, and a multiflue pipe the flues of which are arranged in a row for connecting the ends of the couplings at which their flues are arranged in a row.

4. In an underground conduit for electric conductors, the combination of main sections of multiflue pipe, such sections being provided at each end with a socket or recess and having a projecting rim encircling the same, with coupling-sections of larger diameter than the main sections, and having in each end a groove surrounding the flues, of the same size as the projecting rim of the main sections, and a rim or flange exterior to said groove and tapering outward to the edge, whereby the main sections may be closely fitted into the coupling-section, the bottom of the recess in the main sections cemented against or to the corresponding face of the coupling-section, and space left between the projecting flange or rim of the latter and the outside of the main section for binding-cement, substantially as shown and described.

5. An underground conduit for electrical conductors, composed of separate lines of sectional pipes having a flat bottom and a flat top, and each section provided with tapering flues, the sections being laid with the end of lesser bore of one connected to the end of greater bore of the next adjacent one, and the lines of pipe being laid one on top of the other, substantially as before set forth.



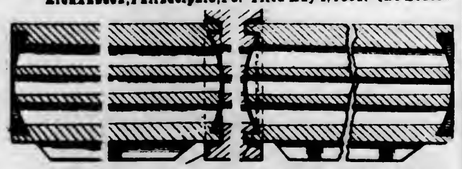
259,046. UNDERGROUND ELECTRICAL CONDUCTOR. GEO. RICHARDSON, Philadelphia, Pa. Filed Apr. 11, 1882. (No model.)

Claim.—1. The improvement of the art of laying and insulating underground electrical conductors or wires, which consists in first threading or drawing the wire or wires through a previously-constructed covered conduit or section thereof, and then insulating such wires from the ends of the conduit or section by covering them with a fluid or plastic insulating substance which will solidify around them, all substantially as before set forth.

2. A conduit for electric wires, composed of a line of pipes, intersecting vaults, and one or more lateral man-holes at each vault, substantially as before set forth.

259,047. WIRE-STRETCHING APPARATUS. GEORGE RICHARDSON, Philadelphia, Pa. Filed Apr. 13, 1882. (No model.)

Claim.—1. The combination, substantially as set forth, of a frame, the sliding sash, and a series of clamps, each composed of a pair of jaws adapted to grasp a wire sidewise at any point of its length.



2. The combination, substantially as before set forth, of a frame, the sliding sash, and an independently-movable clamp composed of a pair of jaws adapted to grasp a wire sidewise at any point of its length.

3. The combination, substantially as before set forth, of a frame, the sliding sash, a fixed clamp, and an independently-movable clamp, both clamps being adapted to grasp a wire sidewise at any point of its length.

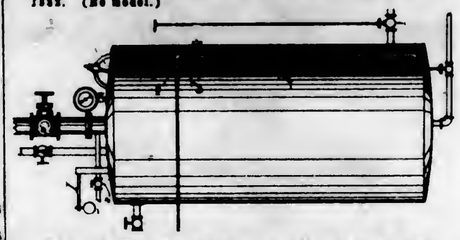
4. The combination, substantially as before set forth, of a frame, the sliding sash, an independently-movable clamp constructed with a screw-threaded rod or stem, and a nut on said screw-threaded rod.

5. The combination, substantially as before set forth, of a frame, the sliding sash, a series of fixed clamps, and a series of independently-movable clamps, all the clamps being adapted to grasp wires sidewise at any point of their length.

259,048. MULTIFLUE PIPE AND COUPLING-SECTION. OTIS RICHARDSON, Philadelphia, Pa. Filed May 4, 1882. (No model.)

Claim.—1. A multiflue pipe each end of which is constructed with a convex area and an encircling-rim, substantially as before set forth.

2. A multiflue coupling-section each end of which is constructed with a concave area surrounded by an annular recess, which is in turn encircled by a rim, substantially as before set forth.



3. The combination, substantially as before set forth, of a multiflue pipe and a multiflue coupling-section having interlocking convex and concave portions, respectively, at their ends, the pipe being also constructed with a surrounding rim and the coupling-section with a corresponding annular recess encircled by a rim.

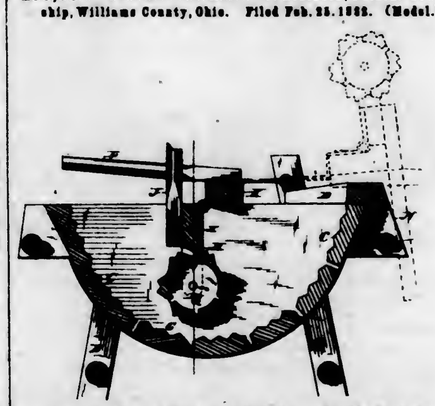
259,049. TEA-POT AND COVER. FRANCIS B. RICHARDSON, Boston, Mass. Filed Feb. 17, 1882. (No model.)

Claim.—The combination and arrangement of pot and cover shown in Fig. I, being the cover A, with the outwardly-curving flange B and the spring C, in combination with the pot and its mouth, all substantially as described and shown.

259,050. CONVERTER FOR CONVERTING STARCH INTO GLUCOSE. EDWIN ROAT, ALLEN K. MCKEE, and HARRY HAMLIN, Buffalo, N. Y., assignors to said Hamlin. Filed Apr. 24, 1882. (No model.)

Claim.—1. The combination, substantially as before set forth, of the converter, the test-pipe thereof, and the steam-pipe for cleansing said test-pipe.

2. The combination, substantially as before set forth, of the closed converter and the blow-off pipe having its lower end arranged within the converter and above the bottom of the same, whereby the contents of the converter may be discharged in an upward direction to within a short distance of the bottom of the converter.



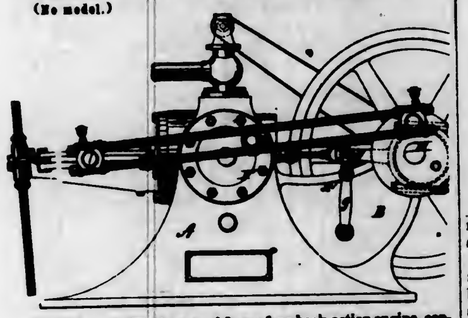
3. The combination, substantially as before set forth, of the closed converter, the blow-off pipe thereof, and the upper steam-pipe combined with said blow-off pipe.

4. The combination, substantially as before set forth, of the closed converter, the discharge-pipe thereof, and the steam-pipe, combined with the lower end of said blow-off pipe.

5. The combination, substantially as before set forth, of the closed converter, the discharge-pipe thereof, leading in an upward direction, and the blow-off tank located above the level of the converter.

6. The combination, substantially as before set forth, of the closed converter, the blow-off pipe thereof, the blow-off tank, and the guard at the discharge end of said blow-off pipe.

259,051. WASHING-MACHINE. J. ROBINSON, Pulaski Township, Williams County, Ohio. Filed Feb. 25, 1882. (Model.)

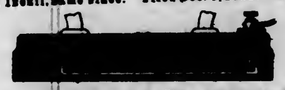


Claim.—The tub A, provided at one end with the supplemental block D, and at one side with a wringer-rest composed of legs B, cross-bar E, and inclined plate F, in combination with bar K, hinged to the tub, and bar I, hinged to bar K, and provided with fluted roller G and handle J, whereby the water is prevented from being forced over the end of the tub by the rubber and the latter can be thrown back from the wringer-rest, all substantially as set forth.

259,052. BOLT AND RIVET CLIPPER. BALTHASER SCHMIDT, Juneau, Wis., assignor of one-half to Peter Rolfler, same place. Filed Apr. 17, 1882. (Model.)

Claim.—The combination, with a lever having its end bent over and formed into a cutting-edge, and having an aperture, of a lever eccentrically pivoted to the lever aforesaid, and provided with a cutting-edge flush with its outer face and located in the same plane as the edge of the other lever, both levers being cut away to form a clearance-space back of their cutting-edges, into which the aperture aforesaid leads.

259,053. FRAME FOR STEAM AND OTHER POWER ENGINES. LOUIS SCHUTTE, Philadelphia, Pa. Filed Jan. 3, 1882. (No model.)



Claim.—1. The improved frame for a back-action engine, consisting of a flat elongated base, the central portion curving upward from the two ends of the base and gradually contracted toward its top, a horizontal cylinder mounted upon the upper end of said central portion, the cross-head guides extending from one end of the same, and the shaft-supporting arms extending from the opposite end of the same and supported directly from the base portion, as shown.

2. The engine-frame consisting of the broadened base portion, the central portion or standard, curving upward from the ends of the base and terminating above the center of the base in a contracted portion, and the shaft-supporting arms or webs B, extending upward from the base and outward from the standard, as described and shown.

3. The frame A, constructed with a broad base and contracted thence upward to the center, in combination with the cylinder and its circular supporting-shocks bolted to the top of the frame, substantially as shown and described.

4. In an engine-frame, the flat rectangular base portion, the standard, curving inward and upward from the two ends of said base and adapted to receive the cylinder at their upper ends, and the main shaft-supports B, extending upward and outward, as shown, with bearings substantially over one end of the base.

259,054. ELECTRIC FLAT-IRON. HENRY W. SEELY, New York, N. Y., assignor of two-thirds to Richard N. Dyer and Samuel Insull, same place. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination, with a flat-iron or similar utensil, of an electrical resistance located within the same, the face of said iron being heated by radiation from said resistance, substantially as set forth.

2. A chambered flat-iron or similar utensil, in combination with an electrical resistance inclosed entirely thereby, whereby all the heat radiated from such resistance will be utilized, substantially as set forth.

3. A chambered flat-iron or similar utensil, in combination with an electrical resistance inclosed thereby, and a layer of non-heat-conducting material to confine the heat to the face of the iron, substantially as set forth.

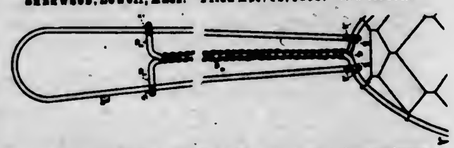
259,055. OIL-STOVE. JAS. L. SHARP, New York, N. Y. Filed Feb. 14, 1882. (No model.)

Brief.—A non-heat-conducting packing is placed between the reservoir and the supporting-frame, as shown at *a*. The wick-tubes are rigidly connected to the drum H only, and the drum D and cover C are entirely supported by the frame A.

Claim.—1. In a coal-oil stove, the combination of a supporting-frame, A, with a reservoir, B, suspended at two or more projecting points from said reservoir, and with non-conducting packing *g* between said projecting points and the supporting-frame, substantially as described.

2. The combination of the oil-reservoir B, having projecting nozzle *f*, with the surrounding supporting-frame A, having flue-like extension *g*, into which the said nozzle *f* enters, substantially as and for the purpose described.

3. The combination of the supporting-frame A, containing the suspended oil-vessel B, with the cover C, drum H, that holds the wick-tubes, and with the drum-frame E, which is hinged to the frame A, and entirely supported thereon, so that the drum and its attachments will not be supported on the cover C nor on the drum H, substantially as described.



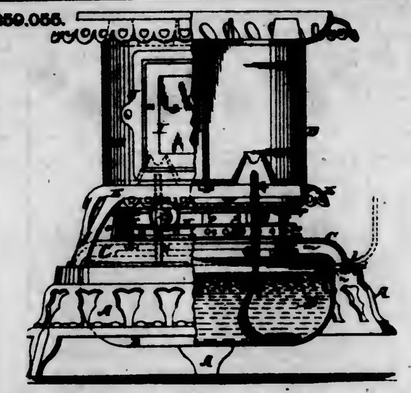
4. The combination of the supporting-frame A with the suspended oil-reservoir B, and with the cover C, having projecting hinge-piece *l*, that enters a slot in the flange of the frame A, and with the drum D, which is separately hinged to the frame A, so that by folding the drum D the cover C and the wick-tubes will be left undisturbed, substantially as specified.

5. The combination of the frame A, having air openings or apertures, with the suspended reservoir B, and with the cover C, all arranged to form an air-space, *m*, between the cover and the reservoir, and a communication, *n*, between said air-space *m* and the outer air, substantially as specified.

6. In an oil-stove, the wick tube or tubes G, carried by and fastened to a hollow drum, H, having perforated wall *s* and closed top and bottom, in combination with the annular cover C and reservoir B, the drum H resting directly on and closing the opening in said cover, substantially as specified.

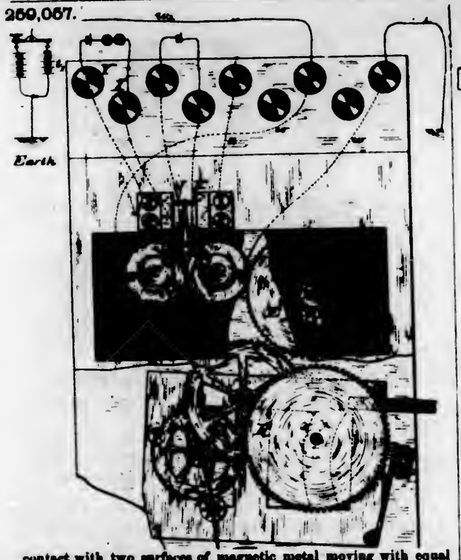
7. In an oil-stove, the combination of the annular cover C of the oil-reservoir with the ring *p*, posts *o*, diaphragm F, wick-tubes G, hollow drum H, having perforated walls and closed top and bottom, and bolts *r*, substantially as described.

259,056. HANDLE FOR WIRE-RIMMED ARTICLES. DANIEL SHERWOOD, Lowell, Mass. Filed Apr. 13, 1882. (No model.)



Claim.—1. The combination of the rim-wire A, having its two parts twisted together at *a*² and separated into the two parts *a*², which are extended at right angles to the twisted portion and clasped around the strengthening-wire B, with each wire B bent to form a loop, and having its ends *b b* clasped around the wire A near the twisted portion, substantially as described.

2. A handle for articles having a wire-supported rim formed of portions of each wire twisted together and extending out from such rim a part of the length of such handle, and then separated to form supports to a wire loop whose ends are clasped to the rim portion of such rim-wire, and which forms part of the handle, substantially as described.



259,057. TELEGRAPHIC RECEIVING-INSTRUMENT. OTIS SMITH, Astoria, N. Y. Filed Jan. 4, 1882. (No model.)

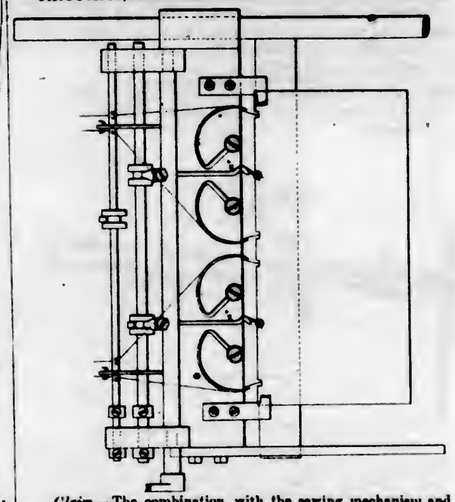
Claim.—1. The combination, substantially as hereinbefore set forth, of a polarized armature maintained in permanent frictional

259,055.

259,057.

contact with two surfaces of magnetic metal moving with equal rapidity but in opposite directions, and a magnetizing-coil which acts to induce contrary magnetic polarity in or upon said moving surfaces, respectively.

2. The combination, substantially as hereinbefore set forth, of two cylinders of magnetic metal, mechanism for rotating said cylinders simultaneously in opposite directions, magnetizing-coils acting upon said cylinders in such a manner as to induce unlike magnetic polarity in them, respectively, a polarized armature mounted in permanent magnetic contact with the moving surfaces of both cylinders and capable of receiving motion therefrom by friction, and stops for limiting the movements of said armature in each direction.



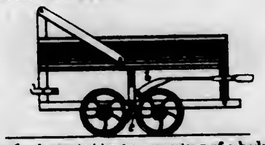
3. The combination, substantially as hereinbefore set forth, of two cylinders of magnetic metal, mechanism for rotating said cylinders simultaneously at a like speed but in opposite directions, magnetizing-coils acting upon said cylinders in such a manner as to induce unlike magnetic polarity in them, respectively, a polarized armature maintained in permanent magnetic contact with the moving surfaces of both cylinders and capable of receiving motion therefrom by friction, an electric circuit including said magnetizing-coils, and means for transmitting currents or pulsations alternately of positive and negative electricity through said circuit.

4. The combination, substantially as hereinbefore set forth, of two cylinders of magnetic metal, mechanism for rotating said cylinders simultaneously at a like speed but in opposite directions, magnetizing-coils acting upon said cylinders in such a manner as to induce unlike magnetic polarity in them, respectively, a polarized armature maintained in permanent magnetic contact with the moving surfaces of both cylinders and capable of receiving motion therefrom by friction, and an independent circuit traversed by an electric current and controlled by the movements of said armature.

5. The combination, substantially as hereinbefore set forth, of two cylinders of magnetic metal, mechanism for rotating said cylinders simultaneously at a like speed but in opposite directions, magnetizing-coils acting upon said cylinders in such a manner as to induce unlike magnetic polarity in them, respectively, a polarized armature constructed in two sections mechanically united but magnetically insulated from each other, said sections being respectively maintained in permanent magnetic contact with the moving surfaces of the rotating cylinders, so as to be capable of receiving motion therefrom by friction.

6. The combination, substantially as hereinbefore set forth, of two cylinders of magnetic metal, mechanism for rotating said cylinders simultaneously at a like speed but in opposite directions, magnetizing-coils acting upon said cylinders in such a manner as to induce unlike magnetic polarity in them, respectively, a polarized armature maintained in magnetic contact with the moving surfaces of both cylinders and capable of receiving motion therefrom by friction, and a permanent polarized stationary magnet for imparting like magnetic polarity to both sections of the polarized armature.

259,058. BOOK-SEWING. DAVID M. SMYTH, Hartford, Conn., assignor to the Smyth Manufacturing Company, same place. Filed Feb. 27, 1882. (No model.)



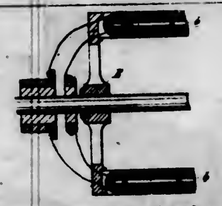
Claim.—The combination, with the sewing mechanism and sheet-holder in a book-sewing machine, of a needle occupying the channel cut in the backs of the signatures, and a projection upon such needle forming a sheet-keeper, substantially as set forth.

259,059. MANUFACTURE AND LAYING OF COMPOSITE PAVEMENTS. PETER STUART, Edinburgh, County of Mid-Lothian, Scotland. Filed Nov. 28, 1881. (No specimens.)

Claim.—1. The composition for pavements, landings, stair-steps, and other like structures, consisting of a mixture of cement or other binding material and broken or cubed granite, thoroughly cleaned to present the solid smooth faces of its crystals, the mixture being thoroughly amalgamated before application as a wearing-surface, substantially as set forth.

2. The method of making artificial stone for pavements and other structures, which consists in crushing or otherwise reducing granite to small pieces or cubes, removing therefrom the fine dust or flour resulting from this operation, so as to present the clean faces of the crystals, adding thereto a suitable quantity of cement or other binding material, thoroughly amalgamating the mixture in a pug-mill or otherwise, and molding or applying the same as a wearing-surface, substantially as and for the purpose set forth.

259,060. CAR-BRAKE. JOHN THOMPSON, Bucyrus, Ohio. Filed June 13, 1881. (No model.)



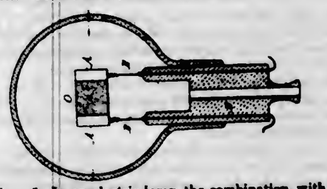
Claim.—1. A pivoted brake consisting of a body portion having a horizontal slot, to allow self-adjustment upon the pivot, and provided with an upwardly-projecting flange and reversed end heads or bearing-surfaces, in combination with a pair of car-wheels, a suitable support, and a lever fastened to the flange of the shoe, as and for the purpose set forth.

2. The combination of the spring-lever *b*, its retaining device, and fixed pivot-bolt *f* with the slotted brake-shoe carrying said lever, and a car-body, as herein set forth.

259,061. DYNAMO-ELECTRIC MACHINE. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Dec. 15, 1881. (No model.)

Brief.—The armature-sections are formed of plates of sheet-iron bent upon themselves, the conducting-wire being in layers alternating with the plates. Plates of sheet-iron are fastened to the sections to form the polar extremities of the sections and to afford means of attachment to the supporting-disks. Each armature-coil is connected at one end to a ring which is common to all, the other terminal of each coil being connected to a commutator-plate.

259,061.



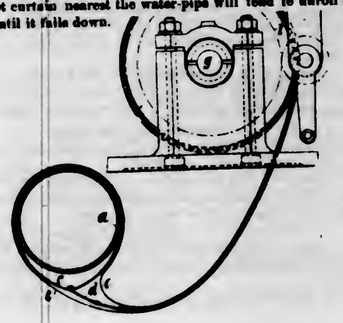
Claim.—1. In an armature, a series of sectional cores, each composed of thin sheet-iron plates folded upon themselves, in combination with layers of wire wound between said metal plates, substantially as described.

2. In an armature for a dynamo-electric machine, a magnetic section consisting of a sheet-iron core bent or doubled upon itself and secured to pole-faces of the same material and coils of wire wound upon said core, substantially as described.

3. The pole-faces *d*, in combination with the bent sheet-iron cores *b*, forming supports for the layers of wire forming the magnet-coil, substantially as described.

4. The combination, with the pole-faces *d*, having projecting ends, of the alternate bent sheet-iron cores *b* and layers of wire secured between said pole-faces, the disks B, having recesses to receive the ends of said pole-faces, the rods D, and the nuts *f*, substantially as described.

259,062. ELECTRIC LAMP. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Feb. 11, 1882. (No model.)



Claim.—1. In an electric lamp, the combination, with a confining-globe, a holding device, and conducting-wires, of a non-conducting medium connected with the wires, and provided upon its surface with small particles of finely-divided conducting medium secured close together, but not in electrical contact, substantially as described.

2. In an electric lamp, and in combination with the terminals A A, conductors B B, a confining-globe, and a suitable support, the non-conducting medium O, provided with small particles of carbon not in electrical contact, substantially as described.

3. In an electric lamp, the combination, with a non-conducting medium provided superficially with small particles of finely-divided conducting material not in electrical contact, of a glass globe inclosing said conducting and non-conducting mediums, and from which the air has been abstracted and replaced by some non-supporting gas, and suitable electrical connections leading from the mediums within the globe, substantially as described.

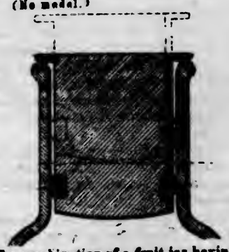
259,063. FIRE-PROOF CURTAIN FOR THEATERS. KONRAD VON FALKENHAUSEN, Wallisfarth, near Glatz, Germany. Filed Mar. 7, 1882. (No model.)

Brief.—The curtain, which is closed at the sides and open at the bottom, is secured at the upper end to a perforated water-pipe. The other end is rolled up on a roller stationed above and in front of the water-pipe, so that when the water is turned on the weight of the wet curtain nearest the water-pipe will tend to unroll the curtain until it falls down.

Claim.—1. The combination, in a fire-proof curtain for insulating the stage of theaters, of a net, *d*, attached by the rope *e* to the water-pipe *a*, with the cover of mill-cloth *c*, all substantially as set forth.

2. The combination of a fire-proof curtain for insulating the stage of theaters, composed of the net *d*, the cover *c*, and the water-pipe *a* with the roller *m*, round which the curtain may be wound, all as and for the purpose specified.

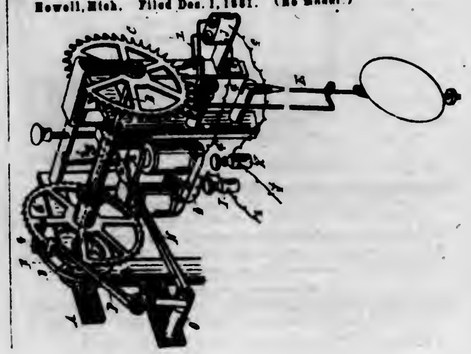
259,064. PHOTOGRAPHIC CAMERA. WILLIAM H. WALKER, Rochester, N. Y. Filed Feb. 16, 1882. (No model.)



Claim.—1. The combination of the hinged focusing-screen frame C and camera-body A, provided with side plates, J J, adapted to retain the holder in place on the camera-body, substantially as described.

2. The combination of the holder H, provided with pins I I, and the camera-body A, having side plates, J J, attached thereto, substantially as described.

3. The combination, with the camera A, provided with concave plate E, of the convex tripod-head E', provided with lugs K and pins *o*, rod *r*, nut T, and spring *s*, substantially as and for the purposes set forth.

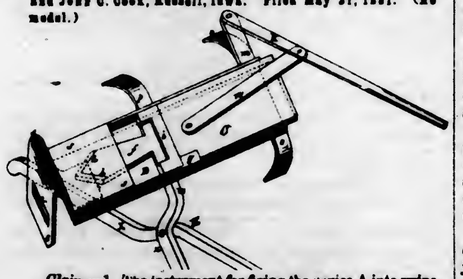


4. The camera-body A, provided with internal light-reflecting grooves, *g g*, substantially as and for the purposes set forth.

259,065. FRUIT-JAR. ALBERT C. WETHERBEE, Hammonton, N. J., Administrator of Henry B. Wetherbee, deceased. Filed Oct. 3, 1880. (No model.)

Claim.—The combination of a fruit-jar having a neck with a smooth straight and cylindrical inner surface with a stopper having a groove around the base and an elastic packing-ring embedded immovably in the groove, and having in its side a groove for a venting-pin, the stopper having a cylindrical extension above the packing-ring nearly corresponding in diameter with that of the extended neck of the jar, whereby the stopper without tipping may rise and fall within the neck of the jar as the contents expand or contract, and the jar may be vented, all as and for the purposes set forth.

259,066. ELECTRIC SPRING-CLOCK. WALTER D. WHALEN, Howell, Mich. Filed Dec. 1, 1881. (No model.)

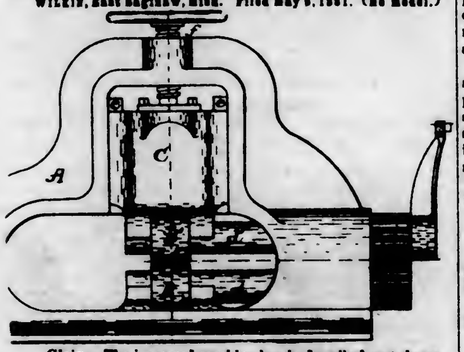


Claim.—1. The combination, with the arbor B, carrying an escapement-wheel, the spring F, the magnet H, bell-crank N, armature M, pawl P, and a circuit-breaker, of the ratchet-wheel G, mounted on a stationary sleeve, R, adapted to allow the free passage and movement of the arbor B, substantially as and for the purpose specified.

2. The combination, with the escapement C, arbor B, ratchet-wheel G, spring F, pawl P, bell-crank N, armature M, magnet H, and a circuit-breaker, of the supporting-frame A and the sleeve R, secured to the frame, said sleeve forming a bearing for the ratchet-wheel G, and forming a free passage for the arbor B, substantially as and for the purpose specified.

3. The combination, with the escapement-wheel C, of the arbor B, the ratchet-wheel G, the spring F, secured at its ends to said arbor and ratchet-wheel, the pawl P, the bell-crank and armature M N, the electro-magnet H, the verge D, the bent yoke L, connected to and moving with the verge, the double mercury-cup J, and electrical connections between the electro-magnet and the mercury-cup, substantially as described.

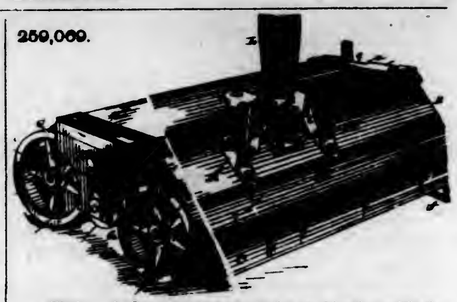
259,067. HOG-RINGING TOOL. WILLIAM H. WHITTLESEY and JOHN C. COOK, Russell, Iowa. Filed May 31, 1881. (No model.)



Claim.—1. The instrument for fixing the device A into swine-snouts, which consists of the sliding plate C, having the spear-headed chisel *f*, provided with the recessed flanges *h* and *i* and the sliding plate-lever *k*, and of the bed-plate D and the thereto rigidly-attached fulcrum-lug *m*, the curved clamps *o* and *p*, the slotted mount-piece *s*, and the clamping-tongs E, the lower tongue, *x*, of which is free and provided with a probe-point, all as and for the purpose herein specified.

2. In the instrument herein described, the clamping-tongs E, the bed-plate D, and its curved clamps *o* and *p*, in combination with the sliding plate C, its chisel *f*, and lever *k*, as and for the purpose herein specified.

3. In the instrument herein described, the chisel *f* and its recessed flanges *h* and *i*, in combination with the sliding plate-lever *k*, and the slotted mount-piece *s*, as and for the purposes herein specified.



259,068. MACHINE FOR STRETCHING SAWS. THEODORE S. WILKIN, East Saginaw, Mich. Filed May 9, 1881. (No model.)

Claim.—The improved machine herein described and shown for stretching saws, consisting essentially of the frame A, the rolls B B', the gears and crank for operating the rolls, the cross-head C, and the screw *f*, substantially as specified.

259,069. CARPET-SWEEPER. HENRY S. WISE, Ashtabula, Ohio, assignor to Jennie A. Wing, same place. Filed Jan. 7, 1882. (Model.)

259,069.

Claim.—1. In a carpet-sweeper, the combination, with the casing and the pivoted pans, of a slotted bell-crank lever connected with and adapted to dump said pans, substantially as set forth.

2. In a carpet-sweeper, the combination, with the casing and the pans, the latter having inwardly-projecting ears and lugs, of a bell-crank lever pivoted to said casing and provided with slots adapted to receive said lugs of the pans, substantially as set forth.

3. In a carpet-sweeper, the combination, with the casing, of pivoted pans and a bell-crank lever adapted to tilt the latter, and the friction-wheels mounted on journals projecting from the ends of the pans and adapted to force the latter back into operative position, substantially as set forth.

4. In a carpet-sweeper, the combination, with the casing and pivoted pans, of a slotted bell-crank lever adapted to simultaneously dump said pans, friction-rollers, and a revolving brush constructed and arranged substantially as described, whereby said pans are thrown back into operative position by weight or pressure upon the top of the sweeper, substantially as set forth.

5. In a carpet-sweeper, the combination, with the end piece of the casing, of the pivoted pans provided with outwardly-projecting studs or journals upon which are mounted friction-wheels, substantially as set forth.

6. In a carpet-sweeper, the combination, with the brush and its rollers, of a bell-crank lever pivoted to the casing and provided at its inner end with a bearing for one end of the brush-roller, substantially as set forth.

7. In a carpet-sweeper, the combination, with the casing, of a handle-socket provided with arms adapted to be secured in bearings on the casing, elastic washers surrounding the ends of said arms within the bearings, and a catch secured to the top of the casing and so arranged relative to said socket that the latter will be held thereby, substantially as set forth.

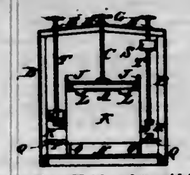
8. In a carpet-sweeper, the combination, with the casing, of the bearings M, the handle-socket L, adapted to receive a handle, and provided with arms *l*, elastic washers *m'*, catch N, and brace *n*, substantially as set forth.

9. In a carpet-sweeper, the combination, with the top brace and the brush-roller, of a bracket depending from said brace and provided with guides to receive a sliding bearing supporting one end of the brush-roller, and a sliding finger-piece having a diagonal slot within which bears a stud projecting from said bearing, substantially as set forth.

10. In a carpet-sweeper, the combination, with the top brace and the brush-roller, of a bracket depending from said brace and provided on its inner side with guides between which is supported a sliding bearing, the lower end of the latter being adapted to a slot in the lower end of the bracket, and a sliding finger-piece having a diagonal slot within which bears a projecting stud of said sliding bearing, substantially as set forth.

259,070. MEDICAL COMPOUND FOR DIPHTHERIA. HENRY WIEDEMANN, Canton, Ohio. Filed Dec. 20, 1881. (No specimens.)

Claim.—As a diphtheria medicine, the herein-described compound, consisting of white-oak bark, *Cimicifuga racemosa*, alum, borax, and water, in substantially the proportions herein named.



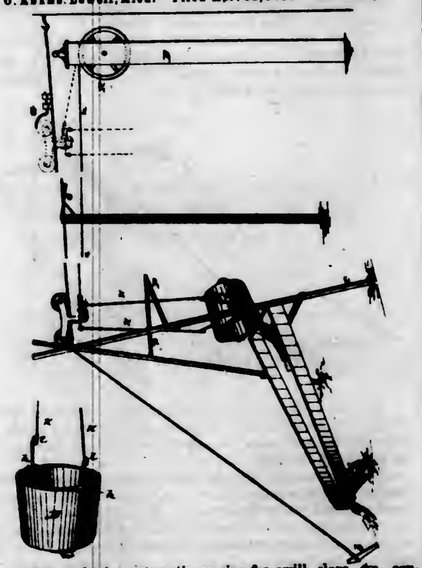
259,071. STOCK-CAR. WILLIAM T. ABBOTT, Fort Wayne Ind. Filed Apr. 13, 1882. (No model.)

Claim.—1. The combination, with a freight-car, of the vertically-adjustable frame A and partitions K, attached to the under side of said frame, substantially as described.

2. A series of doors or partitions, K, hinged to the under side of a frame, A, at intervals along the same within a freight-car, and said frame being vertically adjustable, substantially as specified.

3. The combination, with a freight-car, of vertically-adjustable frame A and partitions K, hinged to said frame, said partitions having arms P and fastening-bolts Q, to secure said partitions to the sides of the car, substantially as specified.

259,071.



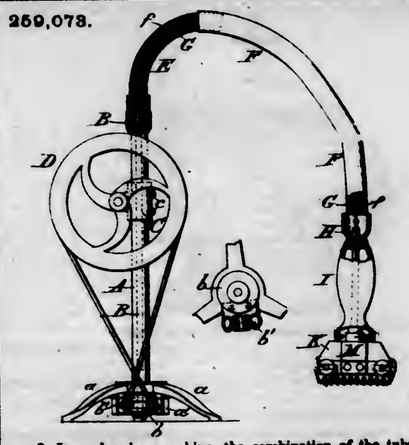
4. The combination, with a freight-car, of vertically-adjustable frame A, partitions K, hinged to said frame, and vertically-adjustable troughs S, the arrangement being such that the troughs may be let down between the partitions and the sides of the car, substantially as specified.

5. The combination, with a freight-car, of a vertically-adjustable frame, A, having partitions K suspended from the under side, and having a floor or cover, I, and sides J, substantially as specified.

6. In a series of partitions, K, hinged to the under side of a frame, A, in the upper part of a cattle-car, one of said partitions having a hinge, *a*, to fold on itself, to allow the rest to fold over it from each way, substantially as specified.

259,072. AUTOMATIC SLOP AND SWILL CARRIER. GRAIN O. ADAMS, Lowell, Mich. Filed Apr. 13, 1882. (No model.)

Claim.—1. An automatic carrier for swill, slops, &c., consisting of an inclined cable-track and its supports, a hanger-carriage, jointed suspending-rods, a bucket having notched ears or bearings at its sides and laterally pivoted to the lower ends of said suspending-rods, and an angular spreader, substantially as specified.



2. The combination, with the hanger-carriage and the inclined cable-track, the bucket, and the automatic dumping devices, of the retracting-cord, its spring and reel, the reversing-weight, its spool on the reel-shaft, and the connecting cord or tape reversely wound on said spool, substantially as specified.

3. In an automatic carrying and dumping device, the combination, with a hanger-carriage and lateral jointed rods *b*, pivoted to a bucket below said carriage, of the lateral notches or bearings *h* on said bucket, and an angular spreader, *g*, substantially as specified.

259,073. ANIMAL-SHEARS. PHILANDER ANDERSON, New York, N. Y. Filed June 23, 1881. (Model.)

Claim.—1. The combination of the tubular standard A, tube E, and flexible tube F, containing coil *f*, with the vertical rotating shaft B, flexible chain G, and hand-piece I, having shaft H, substantially as and for the purpose set forth.

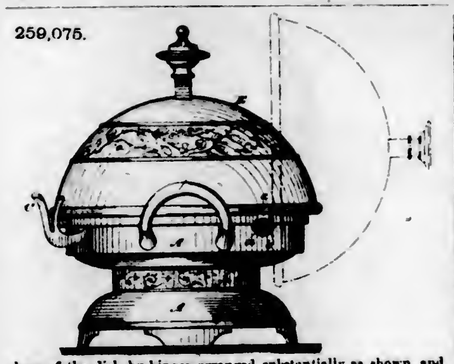
259,073.

2. In a shearing-machine, the combination of the tubular standard A, provided with vertical rotating shaft B, pulleys *b b'*, and adjustable driving-wheel D, tubes E F, flexible driving-chain G, and hand-piece I, having rotating shaft H, adapted to actuate the reciprocating plate K, substantially as and for the purpose shown and described.

3. The combination, with the tubular standard A, having feet *a a*, of the bracket *a'* and vertical shaft B, stepped in said bracket and carrying a combined pulley and fly-wheel, *b*, substantially as and for the purpose specified.

259,074. WASH BOWL AND STAND. JOHN B. ATWATER, Chicago, Ill. Filed Mar. 1, 1882. (No model.)

Claim.—1. A wash-basin which is provided with the ordinary discharge-passage leading to the sewer, and with conical valve-chamber B, conical valve C, provided with upper and lower stems, *g g'*, spring A, arranged centrally beneath the valve, and lever E, arranged inside the basin, and acting by its short arm down upon the upper stem of the valve, substantially as and for the purpose described.



2. The combination of conical valve-chamber B, attached to the under side of the basin and connected with the sewer-pipe, a conical valve, C, and a spiral spring, *h*, placed beneath the valve and shielded from trash and dirty water by the valve, this combination being such that the water and trash are directed by the valve in an oblique outward and downward direction toward the walls of the valve-chamber and discharged into the sewer-pipe without coming in direct contact with the spring, substantially as and for the purpose described.

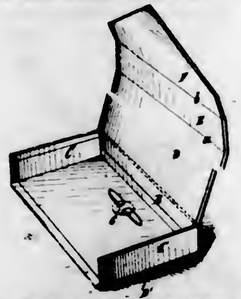
259,075. BUTTER-DISH. SETH W. BARRITT, Meriden, Conn. Filed Mar. 23, 1882. (No model.)

Claim.—1. A butter-dish having the cover hinged at one side to the main body or base of the dish, substantially as shown and specified.

2. A butter-dish having the cover pivoted to one side of the

259,075.

base of the dish by hinges arranged substantially as shown, and for the purpose described.

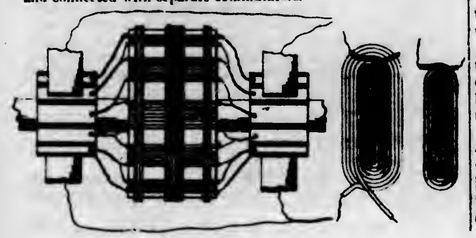


3. A butter-dish having the base A provided with lugs *a b*, and the cover E with lugs *c d*, and screws *e*, to form hinges, arranged substantially as and for the purpose set forth.

4. The butter-dish herein described, consisting of the base A, having lugs *a b*, in combination with a cover, E, provided with lugs *c d*, and the screws *e*, arranged at one side of the said dish, substantially as shown and specified.

5. In butter-dishes, the manner herein described of hinging the cover eccentrically to the base and forming a stop for the cover by the edges of the base, substantially as shown and specified.

6. In a butter-dish, the cover hinged eccentrically to the base, the edges of which form a stop for the cover when in its upright or open position, substantially as set forth.



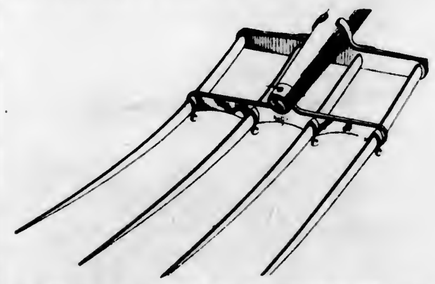
259,076. CARD-CASE. WILLIAM W. BAINBRIDGE, Brooklyn, N.Y. Filed May 2, 1882. (No model.)

Claim.—In a card-case, the combination, with the body having the bottom, back, and sides rigidly connected together, and open at the top and front, of the cover composed of the top D, front E, and flap F, and creased at *a* and *b*, and hinged to the back so that it may be turned up to expose the contents or turned down over the open top and front and made to lap the bottom of the body, substantially as and for the purpose herein described.

259,077. DYNAMO-ELECTRIC MACHINE. CHARLES E. BALL, Philadelphia, Pa. Filed Feb. 25, 1882. (No model.)

Brief.—Forms the cores of the armature of coils of insulated iron wire and winds coils of insulated copper wire upon them, the winding being parallel with the axis of the machine. The terminals of these coils are taken out at opposite ends of the armature and connected with separate commutators.

Claim.—1. An armature for dynamo-electric machines, comprising a core composed of bobbins of iron wire and an external helix or wrapping of copper wire, the wire of both the core and the helix being wound in a direction parallel with the axis on which they revolve, substantially as described.



2. A compound bobbin consisting of an internal bobbin of iron wire and an external bobbin of copper wire surrounding the internal bobbin, both said bobbins being wound in a direction at right angles to the direction of revolution, and having their terminals taken out at opposite sides of the armature, substantially as described and shown.

3. An armature composed of a cylinder of wood or other non-conducting material, and having secured thereto, substantially as set forth, a series of compound bobbins, each compound bobbin consisting of an internal or core bobbin of insulated iron wire and an external surrounding bobbin of insulated copper wire, both said bobbins having the wires of which they are composed wound in a direction at right angles to the direction of the revolution of the said armature, the ends of the bobbins being respectively connected as set forth—*i. e.*, the iron bobbins in one series and the copper bobbins in another series, both leading to a commutator or commutators, as set forth.

4. An armature having a core composed of a magnetic material which is connected to a commutator, and having a surrounding helix connected to another commutator, so as to collect separate currents from the core and from the helix, substantially as set forth.

259,078. FORK. GEORGE BARSTOW, Barre, Vt., assignor of one-half to the Stafford & Holden Manufacturing Company, same place. Filed Mar. 29, 1882. (Model.)

Brief.—Cross-bar of malleable iron with integral ferrule, screw-holding handle in ferrule, and flanged opening for the tines. Metallic head with integral clasping-arms and screw-threaded apertures for reception of shanks of tines.

Claim.—1. In a grain and hay fork, the combination, with a handle, head, and tines, of a cross-bar provided with a ferrule or socket for the reception of the end of the handle and openings for the passage of the tines.

2. In a grain or hay fork, the combination, with a handle, head, and tines, of a metallic cross-bar provided with a ferrule formed integral therewith for the reception of the end of the handle, and a pin or screw for securing the said handle therein, the said cross-bar being perforated at suitable intervals apart for the passage of the tines.

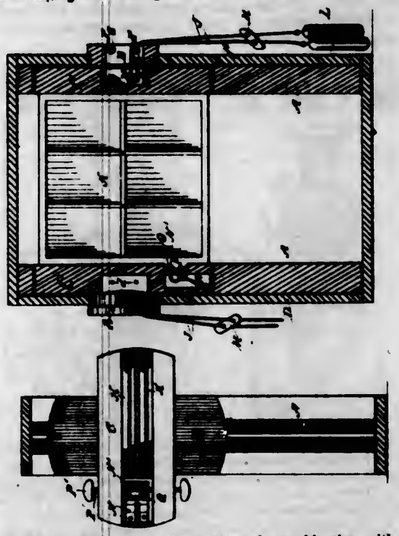
3. In a grain or hay fork, the combination, with the handle, head, and tines, of a metallic cross-bar having a socket or ferrule formed integral therewith for the reception of the end of the handle, the said cross-bar being provided with openings for the tines, and flanges formed around said openings, as described, and adapted to closely embrace the tines and hold them in position, substantially as described.

4. In a grain or hay fork, the combination, with the handle, tines, and cross-bar, of the head provided with curved arms adapted to embrace the handle and hold the same in position.

5. In a grain or hay fork, the combination, with the handle, tines, and cross-bar, of a malleable iron head provided on its upper edge with curved arms adapted to embrace the handle, the said head being perforated for the reception of the shank ends of the tines, substantially as described.

6. In a grain or hay fork, the combination, with the handle, cross-bar, and tines, of a metallic head provided on its upper edge with two curved arms adapted to closely embrace the handle and hold the head in position, and with screw-threaded apertures into which the screw-threaded ends of the tines are secured, all of the above parts constructed substantially as described.

259,079. TOOL-HANDLE. THOMAS HAYES, Janesville, Wis. Filed Nov. 26, 1881. (No model.)



Claim.—1. The jaws of a tool-holder provided with side flanges, *f f*, overlapping their main faces on opposite sides and in opposite directions, coming short of the length of the jaws and forming shoulders *d d*, as shown and described.

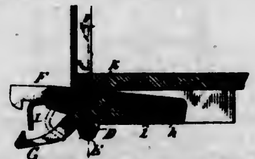
2. The combination, with the hollow handle A, the ferrule B, and the adjustable hinged jaws having shallow gutters *e e*, of the sleeve J, whereby small tools may be conveniently held, as set forth.

259,080. REVERSIBLE WINDOW. HENRY BECKER, New York, N.Y. Filed Mar. 31, 1882. (No model.)

Brief.—Swinging frames in the jambs fit recesses therein, and are mounted on hollow pivots provided with cross-pintles and rollers, over which the sash-cords pass. A spring-catch in one of the side frames, operated by a lug on a rod, engages a notch in the sashes. The cords have an apertured plate to prevent twisting. The swinging frames are grooved to receive the sashes.

Claim.—1. In a reversible window, the combination, with the window casing and sashes, of swinging frames in the window-jambs, and of hollow pivots attached to these frames and passing through or into the side standards of the window-frame, substantially as herein shown and described, and for the purpose set forth.

2. In a reversible window, the combination, with a window frame and sashes, of the swinging side frames, C, fitting in recesses E in the window-jamb, the hollow pivots B, the sash-cords I, and the weights L, substantially as herein shown and described, and for the purpose set forth.



3. In a reversible window, the combination, with the window frame and sashes, of the swinging frames C, the hollow pivots B, and the rollers or pulleys G, the sash-cords J, and the weights D, substantially as herein shown and described, and for the purpose set forth.

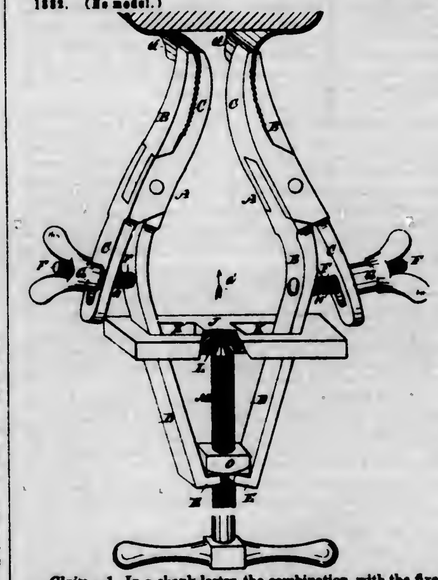
4. In a reversible window, the combination, with the window frame and sashes, of the swinging frames C, the hollow pivots B, the rollers or pulleys G, the transverse wire H, the cords J, and weights L, substantially as herein shown and described, and for the purpose set forth.

5. In a reversible window, the combination, with the window frame and sashes, of the swinging frames C, the spring N, and the shaft P, provided with a lug, Q, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with window weight-cords and weights, of an apertured plate, M, through which the cords pass, substantially as herein shown and described, and for the purpose of preventing entangling of the cords, as set forth.

259,081. CAR-COUPLING. LYMAN M. BEDFORD, Sioux Falls, Dak. Filed Feb. 6, 1882. (No model.)

Claim.—1. The coupling-head consisting of the two hooked pivoted jaws, having their hooked ends arranged to swing in different vertical planes, and means, substantially as described, for moving said jaws simultaneously in opposite directions.



2. In combination with the upwardly-moving jaw pivoted at its rear end, the lower jaw pivoted thereto at a middle point, and a bearing or fulcrum to the lower jaw, located in advance of its pivot, whereby the elevation of the upper jaw is caused to depress the lower jaw, and vice versa.

3. In combination with the hooked jaws F and G, arranged to move in opposite directions, the two eccentrics D and E, located thereunder, as shown and described.

4. In combination with the two coupling-jaws, as described, the eccentrics and the horizontal eccentric shaft, the vertical shaft connected with the horizontal shaft by chains, as described and shown.

5. In combination with the hooked jaws F and G, arranged to open in opposite directions, the finger I, pivoted to one of the jaws, and arranged to engage at its free end with the opposite jaw, as described and shown, whereby the movement of the jaws is caused to lock and unlock the finger.

259,082. SHANK-LASTING APPARATUS FOR BOOTS AND SHOES. FRANK BEYERLE, North Branch, N.Y. Filed Feb. 20, 1882. (No model.)

Claim.—1. In a shank-laster, the combination, with the fixed jaws B, of the pivoted jaws C, extended beyond the pivots and having their ends slotted, the screw-bolts F, the nuts G, and the springs H, substantially as and for the purpose set forth.

2. In a shank-laster, the combination, with the clamps A, provided with extensions D, terminating in flanges E at their ends, of the plate J, provided with apertures K, the nut O, and the screw M, substantially as herein shown and described, and for the purpose set forth.

3. In a shank-laster, the combination, with the clamps A, having end projections, E, of the plate J, provided with apertures K, having their outer edges beveled, and of the screw M, resting on said plate, substantially as herein shown and described, and for the purpose set forth.

259,083. WAX-THREAD SEWING-MACHINE. CHARLES F. BOSWORTH, Milford, Conn. Filed Apr. 24, 1882. (No model.)

Claim.—1. In a wax-thread sewing-machine, the bath containing melted wax and a rotating device working in said bath, and in the relation to the loop of needle-thread described, whereby said rotating device takes the wax from said bath and delivers it to the thread, substantially as described.

2. In a wax-thread sewing-machine, the wax-bath, with mechanism, substantially such as described, to deliver the regulated quantity of wax to said bath, and a rotating device running in said bath and in relation to the needle-thread, substantially as described, whereby the said rotating device takes the wax from the bath and delivers it to the thread, substantially as and for the purpose described.

3. In a wax-thread sewing-machine, the wax-bath, with mechanism, substantially such as described, to deliver the regulated quantity of wax to said bath, and a rotating device running in said bath and in relation to the needle-thread, substantially as described, whereby the said rotating device takes the wax from the bath and delivers it to the thread, and an adjustable scraper, *m*, substantially as and for the purpose described.

4. In a wax-thread sewing-machine, the bath containing melted wax, a rotating device working in said bath, and in the relation to the needle-thread described, whereby said rotating device takes the wax from said bath and delivers it to the thread, and mechanism, substantially such as described, to adjust the dip of the rotating device into the bath, substantially as and for the purpose described.

5. In a wax-thread sewing-machine, the reservoir containing wax in a melted state, an intermittently-rotating device arranged to dip into the wax in said reservoir, take a portion therefrom, and deliver it to a bath in connection with said reservoir, the connection between the bath and reservoir being such substantially as described, whereby a constant level is maintained in the said bath, and a correspondingly-intermittent rotating device in said bath, substantially as and for the purpose described.

6. In a wax-thread sewing-machine, the reservoir containing wax in a melted state, an intermittently-rotating device arranged to dip into the wax in said reservoir, take a portion therefrom, and deliver it to a bath in connection with said reservoir, the connection between the bath and reservoir being such substantially as described, whereby a constant level is maintained in the said bath, and a correspondingly-intermittent rotating device in said bath, with mechanism, substantially such as described, to adjust the dip of said rotating devices into the reservoir and bath, substantially as described.

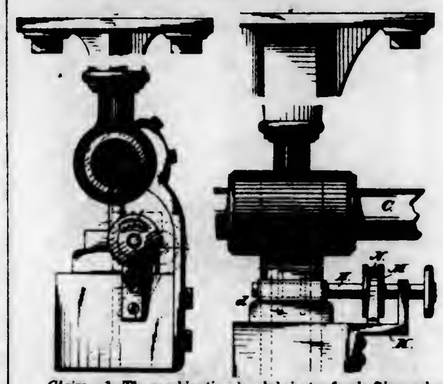
7. In a wax-thread sewing-machine, the combination of the reservoir A, bath B, shaft C, carrying the disk F in the reservoir and the disk *f* in the bath, mechanism, substantially such as described, to impart rotation to said shaft and disk, a partition, *b*, arranged to conduct the wax from the disk F into the bath, and an opening, *c*, from said bath back into the reservoir, substantially as and for the purpose described.

8. In a wax-thread sewing-machine, the combination of the reservoir A, bath B, shaft C, carrying the disk F in the reservoir and the disk *f* in the bath, mechanism, substantially such as described, to impart rotation to said shaft and disk, a partition, *b*, arranged to conduct the wax from the disk F into the bath, and an opening, *c*, from said bath back into the reservoir, and mechanism, substantially such as described, to adjust said disks, substantially as described.

9. In a wax-thread sewing-machine, the combination of the reservoir A, bath B, shaft C, carrying the disk F in the reservoir and the disk *f* in the bath, mechanism, substantially such as described, to impart rotation to said shaft and disk, a partition, *b*, arranged to conduct the wax from the disk F into the bath, and an opening, *c*, from said bath back into the reservoir with the adjustable scraper *m*, substantially as described.

10. In a wax-thread sewing-machine, the combination of the reservoir A, bath B, shaft C, carrying the disk F in the reservoir and the disk *f* in the bath, mechanism, substantially such as described, to impart rotation to said shaft and disk, a partition, *b*, arranged to conduct the wax from the disk F into the bath, and an opening, *c*, from said bath back into the reservoir, with the adjustable scraper *m*, and mechanism, substantially such as described, to adjust the elevation of the disks, substantially as and for the purpose described.

11. In a wax-thread sewing-machine, the combination of the reservoir A, bath B, shaft C, carrying the disk F in the reservoir and the disk *f* in the bath, mechanism, substantially such as described, to impart rotation to said shaft and disk, a partition, *b*, arranged to conduct the wax from the disk F into the bath, and an opening, *c*, from said bath back into the reservoir, with the scraper *r*, substantially as and for the purpose described.



259,084. CORSET-STAY. MORRIS P. BEAT, Worcester, Mass. Filed Feb. 1, 1882. (No model.)

Claim.—1. The herein-described stay for corsets, consisting of the two strips cut from the outside of reed, bamboo, or like material and their flat sides placed together and secured so as to present the natural surface on the outside, making stay elliptical in form, substantially as described.

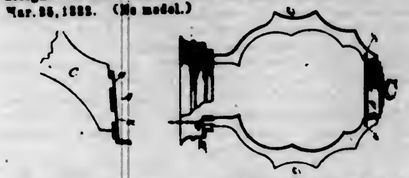
2. The herein-described stay for corsets, consisting of the two strips cut from the outside of reed, bamboo, or like material, and their flat sides placed together and secured so as to present the natural surface on the outside, making a stay elliptical in form, the stay being closed by a covering, substantially as described and shown.

259,085. LUBRICATING MECHANISM FOR JOURNALS, HANGERS, AXLES, &c. JACOB BEINKHOFF, Auburn, N. Y. Filed May 2, 1882. (No model.)

Claim.—1. The combination, in a lubricator for shafting, axles, &c., of a wick-tube connected to an oil-receptacle, a spindle provided with one or more spur-wheels or other propelling devices for feeding forward the wick, and a spring for actuating the spindle so as to cause the wick to be fed forward as it wears away.

2. The combination, in a lubricator for shafting, of a spindle provided with one or more spur-wheels or analogous devices for feeding forward the wick from the oil-receptacle to the shaft, and the pivoted bracket K, providing a bearing for the spindle and rendered adjustable, substantially as described.

3. The combination, with the bearing-box for a shaft, of the oil-receptacle suspended from said bearing-box, the wick-tube intermediate of the two, the spindle I, provided with one or more spur-wheels or other suitable propelling devices, the drum M, and the spring N, constructed and arranged substantially as described.



259,086. FIRE-ALARM-BOX APPARATUS. JAS. J. BROPHY, New York, N. Y. Filed Apr. 24, 1882. (No model.)

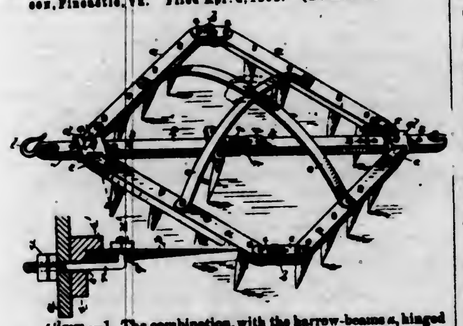
Brief.—A local alarm is arranged for each signal-box situated in such a position as to be inaccessible to any one turning in an alarm. It is mechanically connected with the signaling mechanism in such manner that when an alarm is turned in the said local mechanism operates and gives warning to all persons in the immediate neighborhood that some one is at the signal-box and has turned in an alarm.

Claim.—The combination, with a fire-alarm circuit-closer and, *a*, having arm *m*, of a suspended box containing gong *f*, trip-wheel *g*, pivoted hammer *h*, and gear-wheel *i*, having pins *k*, and the rod *l*, extending into the back of box A loosely through arm *m*, having an end button, and provided with a cross-pin, *o*, as and for the purpose specified.

259,087. HANGING LAMP. EUSEBE L. BEYAERT, Ansonia, Conn., assignor of one-half to Wallace & Benz, same place. Filed Mar. 25, 1882. (No model.)

Claim.—1. A hanging-lamp fixture consisting of the lamp-holder A and the connections C, the said connections constructed from sheet metal cut with studs or projections *a* to pass through corresponding holes in the lamp-holder and serve as rivets for securing the two parts together, the said connections also secured to the shade-ring above, substantially as described.

2. The lamp-holder A, constructed with the vertical recesses *e* upon its inside, and the connections C, constructed with studs *a*, extending through corresponding perforations in the holder and into the recesses *e* and there riveted, substantially as described.

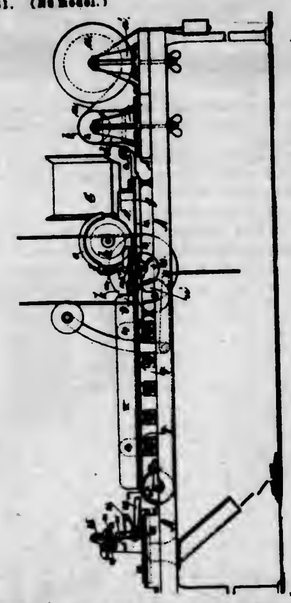


3. The lamp-holder A, constructed with the flanges *f* and radial slots *h* therein, and the sheet-metal connections C, set into the slots *h* and secured to the holder, substantially as described.

259,088. WATER-PITCHER. THOMAS L. I. BULLUSS, Birmingham, Conn. Filed Apr. 17, 1882. (No model.)

Claim.—A metallic pitcher or vessel having an inner or lining wall, D, of pressed water-proof paper, and an edge ring, B, serving to protect the margin of said wall, and as a means whereby the soldering or attachment of said wall to the outer wall is effected, substantially as specified.

259,089. HARROW. HENRY R. BURRUSS and JOSEPH B. BIRPSON, Pinesville, Va. Filed Apr. 4, 1882. (No model.)



Claim.—1. The combination, with the harrow-beams *a*, hinged together at their outer ends and hinged to the draft-bars at their inner ends, and the diagonal draft-bars *b*, hinged together at their inner ends, of the curved spring seat-supports *c c*, each secured at its ends to the middle of the opposite harrow-beams, and crossing each other at their highest points for the support of the seat, substantially as described, and for the purpose set forth.

2. The combination of the harrow-beams *a*, provided with the clevises *c c*, links *b*, slotted adjusting-plates *d d*, draft-bars *b b*, provided with draft-hooks *l*, adjusting-holes *n*, and clevises *n*, link *m*, and curved spring seat-supports *c*, all substantially as described, and for the purpose set forth.

3. The combination, with the harrow-beam *a*, and harrow-tooth *p*, provided with the hole *g*, of the plate *f*, provided with the downwardly-projecting flange *f'* and hole *s*, and angular bolt *r*, threaded at both ends and provided with the nuts *u u'*, whereby the harrow-tooth is firmly clamped between the flange of the plate and the angular bolt, substantially as described.

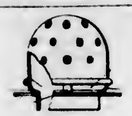
259,090. CIGARETTE-MACHINE. JAMES BURNS, Brooklyn, and ALEXANDER BUCKMAN, Schodack Depot, N. Y. Filed Aug. 8, 1881. (No model.)

Claim.—1. The combination, in a cigarette-machine, of a roll for paper, the roller *b*, and disk 2, on the same shaft as the roller *b*, the trough for adhesive material, the hopper for tobacco, the feed-wheel having pins, the guide-bar *c*, the folders 3 4, and guide-plates *c'*, substantially as specified.

2. The combination, in a cigarette-machine, of the feed-wheel A, having pins projecting all around its periphery, the former *i*, slotted for the passage of the pins, the guide-plates *c' c'*, folders 3 and 4, and the wheels 14 at each side of the trough of paper, substantially as specified.

3. The combination, in a cigarette-machine, of the feed-wheel A, having pins, the former *i*, slotted for the passage of the pins, the guide-bar *c*, guide-plates *c'*, folders 3 and 4, finger *r*, and means for supplying a strip of paper pasted near one edge, substantially as specified.

4. The combination, in a cigarette-machine, of the feed-wheel having pins, the former *i*, having slots for the pins, the folders 3 and 4, and the finger *r*, as and for the purposes set forth.



5. In a cigarette-machine, the combination, with the means for forming the paper into a tube and filling and moving the same, of the holding-bar *c*, grooved on its under surface, and the belt *u*, as and for the purposes set forth.

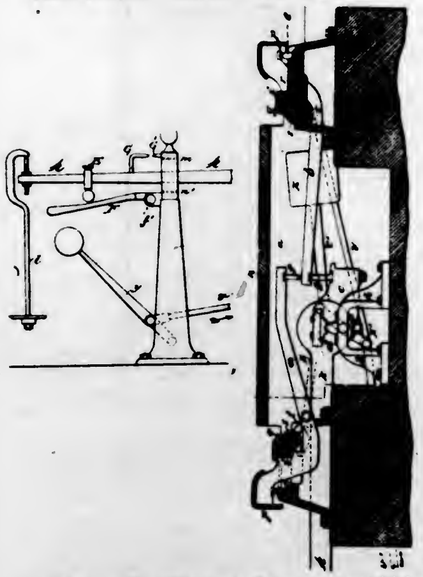
6. In a cigarette-machine, the combination, with the means for forming and filling the paper tube, of a reciprocating stock, *w*, a reciprocating knife, 21, a spring for holding up the knife on the return movement, and a cam-switch for moving the knife to cut off the cigarette, substantially as set forth.

7. In a cigarette-machine, the combination of the holding-bar *c*, elastic belt *u*, and the blocks or pieces of rubber *u'* upon its surface, for the purposes substantially as set forth.

259,091. FIRE-EXTINGUISHING NOZZLE. ABBOTT M. BURNETT, Waterbury, Conn., assignor to the A. Burritt Hardware Company, same place. Filed Mar. 17, 1883. (No model.)

259,091.

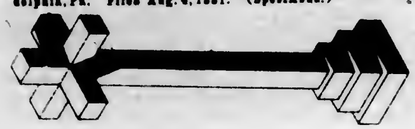
Claim.—The herein-described distributer for fire-extinguishers, consisting of the perforated rose constructed with openings at its base, combined with the perforated disk below the openings at the base, substantially as described.



259,092. AIR-CUSHION FOR BOOT AND SHOE SOLES. GEO. P. BUTTERFIELD, Stoneham, Mass. Filed Mar. 27, 1882. (No model.)

Claim.—1. An elastic outer sole, tap-sole, or heel for boots and shoes, formed hollow or with a closed air-space within it, for the purpose set forth.

2. A boot or shoe provided with a hollow imperforate rubber outer sole, tap-sole, or heel retaining a fixed amount of air within its cavity, for the purpose set forth.



259,093. RAILWAY WEIGHING-SCALES. FREDERIK CASSE, Haarlev, Denmark. Filed Feb. 1, 1882. (No model.)

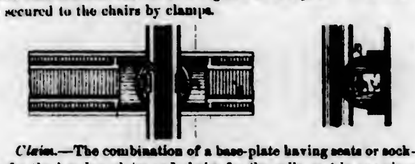
Claim.—1. The combination of the arms *a a* and *b b*, having their fulcrums at *e*, and provided with knife-edges *i i*, rocking bridge-pieces *q q*, having arms *t*, and connected by the coupling-rods *u* and *x*, double-armed lever *x'*, rod *v'*, and weighted lever *y*, substantially as and for the purpose herein shown and set forth.

2. The combination of the arms *a a* and *b b*, having their fulcrums at *e*, and provided with knife-edges *i i*, knife-edge links *f* and *g'*, and rock-shaft *d*, having arms *c c'*, and provided with the adjustable weight *z*, substantially as and for the purpose herein shown and described.

259,094. PROCESS OF MAKING PHOTOGRAPHIC COPIES OR FAC-SIMILES OF DRAWINGS, &c. SAMUEL CHADWICK, Philadelphia, Pa. Filed Aug. 4, 1881. (Specimens.)

Claim.—1. The combination, with the frame *a*, circular track *b*, horizontal on one side, and provided with the inclines *c c* and horizontal part *d*, and shaft *h*, of the radial arms *k*, arms *l*, pivoted thereto, and each provided with a rod, *n'*, projecting from its end, and caster-wheel *m*, levers *r*, rods *s*, and sliding buckets *o o*, substantially as described, and for the purpose set forth.

2. The bucket *o*, made concave on its front face, with its outer end, *o'*, bent inwardly toward the center of the wheel, its inner front side open, and its back face convex, substantially as described, and for the purpose set forth.



3. The combination, with the bucket *o*, constructed as set forth, and provided with perforated lugs *p p* on its convex side, of the square rod *n'*, on which the bucket is adapted to turn and slide, having a longitudinal twist, substantially as described, and for the purpose set forth.

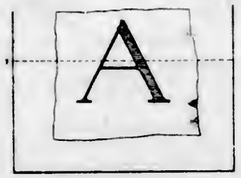
4. The combination, with the arms *l*, provided with rods *n'* on their ends and buckets *o*, suspended thereon, of the gate A and rods *s'*, secured to the buckets and gate, substantially as described, and for the purpose set forth.

5. The combination, with the frame *a*, track *b*, constructed as set forth, arms *h l*, rods *n'*, caster-wheels *m*, levers *r*, rods *s*, and sliding and turning buckets *o*, of the gate A and rods *s'*, substantially as described, and for the purpose set forth.

259,095. METALLIC RAILROAD-TIE. JOSEPH CLARK, Green Point, N. Y. Filed Mar. 16, 1882. (No model.)

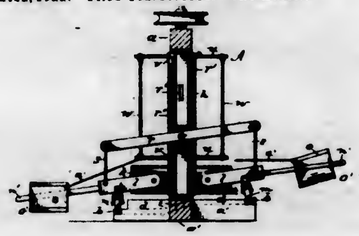
Brief.—A base-plate has seats or sockets, for the reception of arched bearing-plates provided with top recesses, and chairs, upon which rests the rail, the whole being cast in one piece. The rails are secured to the chairs by clamps.

Claim.—The combination of a base-plate having seats or sockets for the bearing-plates and chairs for the rails, cast in one piece therewith, with arched bearing-plates having top recesses for the rails, and with clamps for attaching the base of the rails to the chairs, substantially as and for the purpose set forth.



259,096. EGG-CARRIER. OLIVER P. CLARK, St. Louis, Mo. Filed Mar. 1, 1882. (No model.)

Claim.—The egg-carrier tray A, consisting of bottom C, cell part B, horizontally divided into upper and lower halves, sheet-metal strips *c*, securing the lower half of the cell part to the bottom, and the outside strips, *a*, the full height of the cell part, the upper half of the cell part being removable, as set forth.



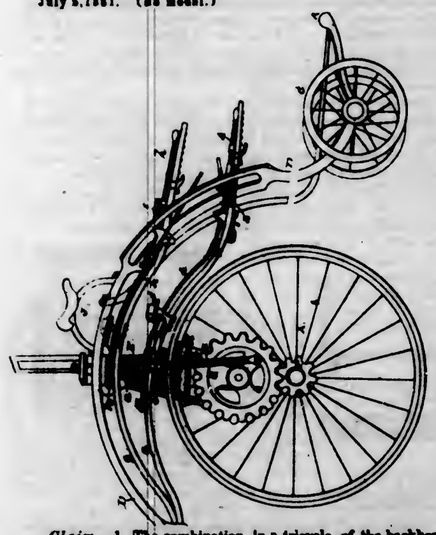
259,097. METHOD OF MAKING DEPRESSED LETTERS OR DESIGNS IN METAL FOR SIGNS. JOHN F. CLULEY, Pittsburg, Pa. Filed Jan. 26, 1882. (No model.)

Brief.—The interior portion of the character cut through the metal foil and varnish is removed before the acid is applied to the plate.

Claim.—The method of making depressed letters, characters, or designs for a sign in a metal plate, consisting in applying a varnished coating to the plate and applying a metallic foil over the varnished coating, and then cutting the design, characters, or letters through the metal foil and varnish to the plate, and then applying acid on the plate through the design, substantially as described, and for the purpose set forth.

259,098. CURRENT-WHEEL. WALTER M. COFFMAN, Elizabethton, Tenn. Filed Feb. 15, 1882. (No model.)

Claim.—1. The combination, with the frame *a*, circular track *b*, horizontal on one side, and provided with the inclines *c c* and horizontal part *d*, and shaft *h*, of the radial arms *k*, arms *l*, pivoted thereto, and each provided with a rod, *n'*, projecting from its end, and caster-wheel *m*, levers *r*, rods *s*, and sliding buckets *o o*, substantially as described, and for the purpose set forth.



2. The bucket *o*, made concave on its front face, with its outer end, *o'*, bent inwardly toward the center of the wheel, its inner front side open, and its back face convex, substantially as described, and for the purpose set forth.

3. The combination, with the bucket *o*, constructed as set forth, and provided with perforated lugs *p p* on its convex side, of the square rod *n'*, on which the bucket is adapted to turn and slide, having a longitudinal twist, substantially as described, and for the purpose set forth.

4. The combination, with the arms *l*, provided with rods *n'* on their ends and buckets *o*, suspended thereon, of the gate A and rods *s'*, secured to the buckets and gate, substantially as described, and for the purpose set forth.

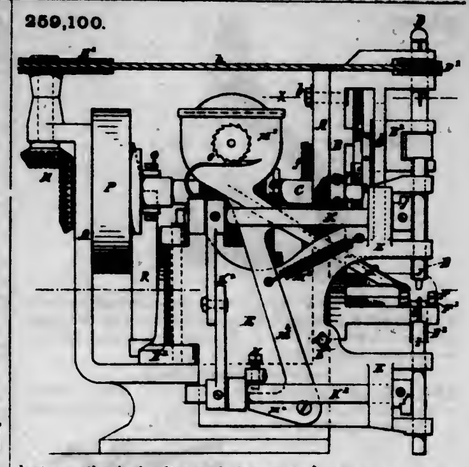
5. The combination, with the frame *a*, track *b*, constructed as set forth, arms *h l*, rods *n'*, caster-wheels *m*, levers *r*, rods *s*, and sliding and turning buckets *o*, of the gate A and rods *s'*, substantially as described, and for the purpose set forth.

259,099. TRICYCLE. PAUL E. COLLINS, Lynn, assignor of one-twentieth to Enidah J. Downing, Chelsea, Mass. Filed July 5, 1881. (No model.)

Claim.—1. The combination, in a tricycle, of the backbone D, operating-levers *e e*, driving-wheel A, and means, substantially as set forth, for connecting said levers *e e* with the driving-wheel A, substantially as and for the purposes described.

2. In combination with the driving-wheel A, fork E, and levers *e e*, the steering-rods A, arranged substantially as and for the purposes set forth.

3. In a tricycle, the arrangement of a rider's stand or platform, J, by suspending the same from rear arms, K K, to the backbone D at a point in front of or near the vertical diameter of the driving-wheel A, substantially as and for the purposes described.



4. In combination, the articulated lever *i i'*, the box 5, having an inside block adapted to rock and slide vertically, as set forth, the bent 3, and screw 4, all arranged to operate in combination, substantially as and for the purposes described.

5. In combination, the articulated lever *i i'*, the box 5, having an inside block adapted to rock and slide vertically, as set forth, the bent 3, screw 4, and means, substantially as shown, for turning the screw 4, as and for the purposes described.

259,100. EYELETING-MACHINE. CHARLES A. GORHAM, Coshituate, Mass. Filed Feb. 27, 1882. (Model.)

Claim.—1. The combination of the revolving heading and punching bar, its cutting-bed, the movable head provided with bearings for supporting and guiding said punching-bar, and an operating mechanism whereby rotating, reciprocating, and lateral vibratory action is simultaneously imparted to said punch-bar, substantially as and for the purposes set forth.

259,100.

2. In a machine for punching, heading, and eyeleting at simultaneous operations, the combination of a reciprocating revolving punch mounted on a laterally-swinging head-piece and provided with a cutting-die and headed end face, a pair of eyelet-setting dies mounted on a hinged frame adapted for side movement to allow the alternate advancement of the punch and eyelet-setting dies to a common position in relation to the work, a guiding and holding presser or jaw mechanism adapted for automatically retaining and releasing the work, and means for adjusting the relative swing or lateral movement of the parts for increasing and diminishing the spacing between the holes, substantially as set forth.

3. The combination, with the frame A and swinging head-piece B, carrying punching-dies D D^1, of the laterally-swinging frame E, carrying the eyelet-setting dies I J, and the mechanism for operating the same, substantially as set forth.

4. The combination, with the punching and eyeleting devices, arranged for operation as described, of the jaw F, with backward-extended arm F^2, the spring *f*, the depressing-lever G', and cam G, for the purposes set forth.

5. The combination of the feed-chute M, adapted for delivering eyelets with their flanged ends uppermost, the upper setting-die, J, having a central opening, and the lower setting-die, I, provided with a fixed or rigid picker or receiving pin, *i*, whereby the eyelets are delivered and set into the work from the upper side thereof, substantially as hereinbefore set forth.

6. The combination, with the eyelet-setting bars or dies I and J, of the rocker-shafts K K', connected thereto by arms I' and J', and mounted in bearings on the swinging frame E, the connecting-arms K^2 K^3, and actuating-cam L, substantially as and for the purpose set forth.

7. The combination, with the swinging head B, carrying the punching devices, and the laterally-swinging frame E, carrying the eyeleting mechanism, of the spring *a*, for retaining said head and frame in close connection, and the adjusting stop-screw E^2, for regulating the movement of said frame, as set forth.

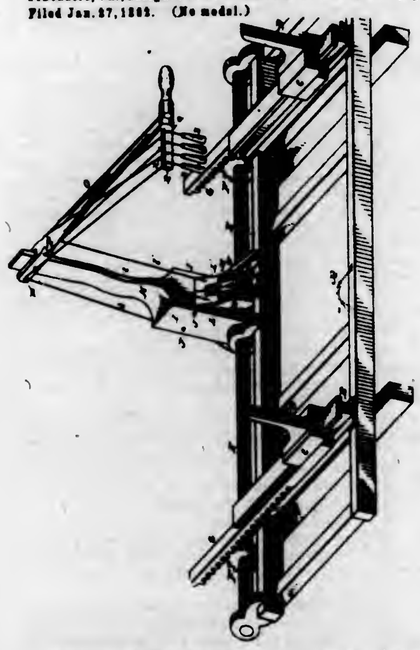
8. The combination, with the frame E and eyelet-setting dies I J, of the eyelet-hopper M' and chute M, mounted on the swinging arm M^2, the cam L, spring M^4, and adjustable stop or screw N, substantially as and for the purposes set forth.

9. The combination, with the bar L', operated by cam L, and the arm K^2, operating the rock-shafts K K', which actuate the eyelet-setting dies I J, of the adjustable connection L^2, substantially as and for the purpose set forth.

10. The combination, with the hinged frame E, carrying the eyeleting mechanism, of the hinge support or bracket E', adjustably connected to the main frame for backward or forward adjustment, as and for the purpose set forth.

11. The combination of the punch-rod D, the head B, pivoted to the main frame at *b*, and having the slotted bar B', the slide B'', pitman *c*, cam C', and revolving shaft C, as and for the purposes set forth.

259,101. SAFETY-STIRRUP. JAMES L. COX, Moore's Salt Works, Ohio. Filed Apr. 19, 1882. (No model.)

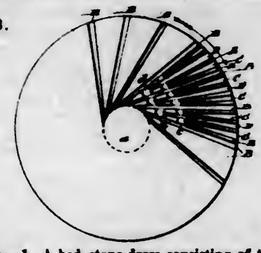


Claim.—The stirrup A, consisting of side piece, B, having

259,101.

eye P and perforation H, and foot-rest C, having flanged bracket D, provided with a perforation, M, in combination with the hinged spring-rod I, provided with an S-shaped loop, J, near its lower end, as and for the purpose set forth.

259,102. HEAD-BLOCK FOR SAW-MILLS. JOHN T. CRUSH, Pisgatic, Va., assignor of one-half to D. P. Crush, same place. Filed Jan. 27, 1882. (No model.)

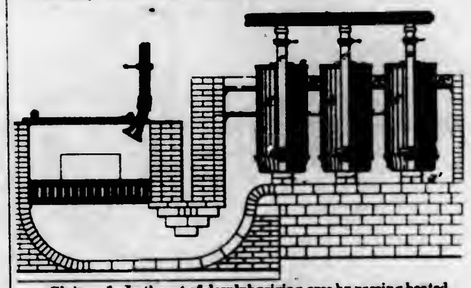


Claim.—1. The combination, with the shafts E, having gear-wheels M, of the forked lever H, the pawls or dogs K K' and L L', the springs N, the lever O, hinged to the upper end of lever H, and having eyes P and cross-bar or handle R, provided with perforations Q, and the cords *h h' l l'*, attached to the dogs or pawls K K' L L', and passed through the eyes P and perforations Q, said cords being provided with handles S, as and for the purpose set forth.

2. The combination of the shafts E, having gear-wheels M, the lever H, having pawls K K' L L', engaging said gear-wheels, the springs N, mechanism, substantially as described, for manipulating the pawls K K' L L', to release one or more of them, so that the shaft or shafts may be turned by the combined action of the lever H and the remaining pawls, and the friction blocks or cushions T, arranged to bear against the gear-wheels M, to prevent the latter and shafts E from turning when the lever H is moved back, as set forth.

259,103. MILLSTONE-DRESS. EDWARDS CURTS, Augusta, Ohio, assignor to himself and Alexander Cunningham, same place. Filed Mar. 1, 1882. (No model.)

259,103.



Claim.—1. A bed-stone dress consisting of the quarter-furrows B, tangential to the eye *a*, the furrows D, arranged midway between the quarter-furrows, extending three-fourths of the distance from the periphery to the center of stone, and connected by a transverse channel, *d*, with the quarter-furrows, and the furrows C, placed midway between the furrows B D, extending about one-half the distance from the periphery to center of the stone, and connected by channels *c* with the furrows B D, the furrows B D C successively increasing in their taper toward the periphery, as described.

2. A runner dress consisting of the quarter-furrows B^1, the tapering furrows D^1, arranged midway between the quarter-furrows, and terminating in a point extending nearly to the eye a^1, the tapering furrows C^1, arranged midway between the furrows B^1 D^1, and terminating in a point one-half the distance from the periphery to the eye a^1, and the equal lands E^1 communicating with each other, said furrows becoming gradually more shallow toward the periphery, as described.

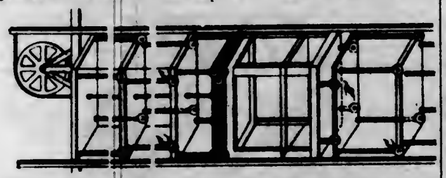
3. The combination of a bed-stone provided with intermediate furrows and transverse channels between its quarter-furrows, and a runner provided with intermediate tapering furrows between its quarter-furrows, and having the lands of each quarter communicating with each other, substantially as herein described.

259,104. TREATMENT OF ORES. APPOLO DE FIGANIÈRE, Philadelphia, Pa. Filed Jan. 16, 1881. (No model.)

Claim.—1. In the art of desulphurising ores by passing heated air through the same, the process of freeing the ore from sulphur without melting the charge, which consists in reducing the ore to a granulated state, as described, then heating such ore and passing through the same a regulated current of hot air, such current being induced by constantly exhausting the atmosphere of the vessel containing the ore, substantially as and for the purpose set forth.

2. In an apparatus for the desulphurization of ores, the combination, substantially as set forth, of a furnace, a retort heated thereby, an air-supply pipe provided with a regulating valve or gate and communicating with said retort at one end, an escape-pipe communicating with said retort at the other end, and an ore-vessel located within said retort, said vessel having a perforated bottom and cover and being interposed between the supply and escape pipes of the retort, so as to form the sole avenue of communication between the said pipes.

3. In an apparatus for the desulphurization of ores, the combination, substantially as set forth, of the retort-bottom provided with grooves in its upper edge, as described, and having a pipe or nozzle for connection to an air-supply pipe, a retort-body, and an internal ore-vessel, each fitted by a packed joint to a groove in the upper edge of the retort-bottom above its pipe or nozzle, whereby an air-supply chamber is formed in the base of the retort, as set forth.



4. In an apparatus for the desulphurization of ores, the combination, substantially as set forth, of a retort having an air-chamber, as described, an ore-vessel having a perforated bottom and being provided with a perforated cover, the said ore-vessel being placed within the retort and communicating therewith through perforations in a cap or cover, and with the supply-chamber through the perforations in the bottom, as set forth.

5. In an apparatus for the desulphurization of ores, a vessel having a shell or body, a bottom plate with a series of short open pipes or passages adjacent to its periphery, and a partition or diaphragm extending across the body adjacent to the bottom plate, said partition being imperforate around and above the pipes of said plate, and being dished or recessed to a point below the upper ends of said pipes and perforated throughout its dished portion, substantially as set forth.

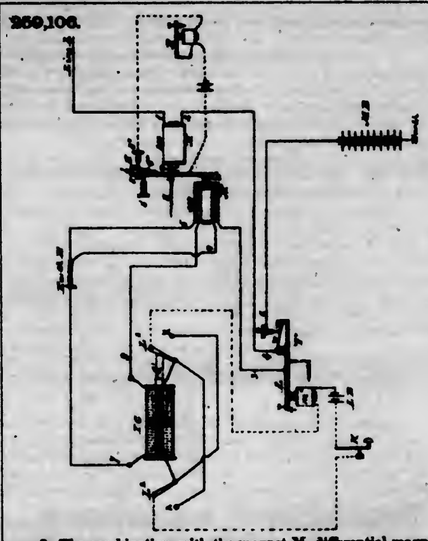
6. In an apparatus for the desulphurization of ores, a vessel having a shell or body, a bottom plate provided with an air-supply, and a chambered lid or cover constructed, as described, to receive a suitable packing, provided with a central tube, and having a series of perforations arranged in its lower plate and central tube, so as to direct the discharge of fumes from the vessel through the packing of the cover and through the central tube, substantially as set forth.

259,105. AUTOMATIC FLOOR FOR ELEVATOR-SHAFTS. ELLEN L. DEBENNET, New York, N. Y. Filed Feb. 28, 1882. (No model.)

Brief.—The hatchway-doors above and below the elevator are connected thereto and together by flexible bands, which coil into pockets in the corners of the doors by means of springs.

Claim.—1. The combination, with an elevator, of two sets of automatic adjustable floors or hatches, connected together and to the elevator or to a suitable platform with cords or bands of any flexible material, and coil-springs, substantially as described.

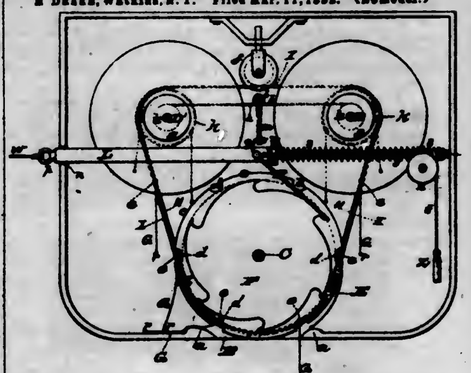
2. The combination, with an elevator, of a set of automatic floors suspended below the elevator by cords or bands of any flexible material and coil-springs, and adapted to ascend and descend with the elevator, substantially as described.



259,106. DUPLEX TELEGRAPH. BENJAMIN F. DILLON, Savannah, and JOHN W. BROWN, Augusta, Ga. Filed Aug. 28, 1881. (No model.)

Brief.—Normally no battery on line and the batteries so arranged that when both operators are transmitting both batteries are united and actuate the main-line relays M. One operator transmits by his own battery passing a current through both relays M and M' at the distant station. A device for overcoming static discharge by sending the secondary current of an induction-coil through one branch of differential relay M' in a reverse direction to that of said discharge. The static charge does not affect the home instrument, because it passes only through relay M, which is insensible to it by reason of high adjustment of its retractile spring.

Claim.—1. A duplex receiving-instrument consisting in the combination, with lever *l*, operating the sounder-circuit, of a magnet, M, arranged always in the main-line circuit, a second magnet, M', operating in unison with magnet M on the same lever, the main battery, and a transmitter, T, interposed between the main battery and the magnet M', and arranged, as described, to direct the main-line current alternately through the simple magnet M and main battery for one position of the home key, and to divert the main-line current through both the magnets M and M' for the other positions of the key, whereby the receiving-instrument is operated alternately by the conjoint effect of both batteries on one magnet, M, and then by the single effect of one battery on the two magnets M and M', as and for the purpose described.



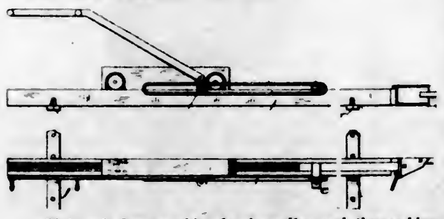
2. The combination of the common armature-lever *l*, the simple magnet M, arranged in the main line, the differential magnet M', acting in unison with the main battery, and the transmitter T, interposed between the main battery and differential magnet, and arranged to alternately divert the line-current through the main battery and the differential magnet, and an induction-coil having its primary wire in the circuit of the transmitter and its secondary wire connected with the reversely-wound coil of the differential magnet for neutralizing static discharge, as set forth.

259,106.

3. The combination, with the magnet M, differential magnet M', the common lever *l*, the main battery, and the transmitter T, of the induction-coil having its primary wire in the transmitter-circuit and its secondary wire connected to the reversely-wound coil of the differential magnet, and provided with an adjustable core, C', to regulate the secondary current to suit the amount of static discharge, as set forth.

259,107. STATION-INDICATOR. JAMES B. DRAKE and CHARLES H DRAKE, Watkins, N. Y. Filed Mar. 11, 1882. (No model.)

Claim.—1. In a station-indicator, the combination of the shaft C, having the notched-rim pulleys E, the upper shafts, D D', having the drums K, the flag-belts H, passing around all of the cylinders, and flag-rods *e* and flags G, the ends of said rods extending across the belts H and into the notches in the pulleys E, substantially as specified.



2. In a station-indicator, the combination of the shaft C, having the notched-rim pulleys E, the upper shafts, D D', having the drums K, the flag-belts H, passing around all of the cylinders, and flag-rods *e* and flags G, the ends of said rods *e* extending across the belts H and into the notches in the pulleys E, the ratchet-wheels F on the shaft C, and the spring-retracted pawl-slides L and pivoted pawls P, for operating the flags, substantially as specified.

3. In a station-indicator, the combination of the shaft C, having the notched-rim pulleys E and ratchet-wheels F, the shafts D D', having the drums K and spools *k*, the flag-belts H, passing around all of the cylinders, and carrying the flag-rods *e* and flags G, the ends of said rods *e* resting in the notches *d* of the pulleys E, the straining-cord *k*, adapted to be wound and unwound upon the spools *k*, the endless belts I, overlying the flag-belts H, and the

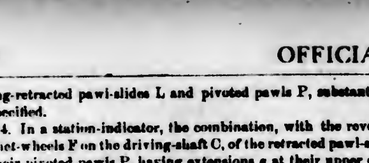
spring-retracted pawl-slides L and pivoted pawls P, substantially as specified.

4. In a station-indicator, the combination, with the reversed ratchet-wheels F on the driving-shaft C, of the retracted pawl-slides L, their pivoted pawls P, having extensions *q* at their upper ends, and the stop *v*, whereby the pawls P are disengaged from the ratchet-wheels F when the slides L are in their normal positions, substantially as specified.

259,108. COAL-MINING MACHINE. JOHN DU BOIS, Du Bois, Pa. Filed Nov. 4, 1881. (No model.)

Claim.—1. In a machine for channeling coal, the combination of the guide, a reciprocating sliding chisel adapted to be projected beyond the guide, and the reciprocating sliding ram operating said chisel, the ram and chisel being connected by means, substantially as described, permitting a limited independent motion in relation to each other.

2. The combination, in a hand channeling-machine, of a horizontal guide, a chisel reciprocating therein and capable of being projected beyond the same, a sliding ram, and a handle for operating said ram, substantially as shown.



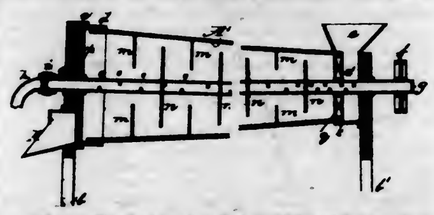
3. In a coal-mining machine, the combination of the guide, the reciprocating ram, and the ram-supporting wheels, seated in and covered by the ram and arranged to travel upon the guide, as described and shown, whereby they are protected from dust and dirt.

4. In a hand mining-machine, the combination of a reciprocating chisel or cutter and a reciprocating ram connected therewith, substantially as described, to operate with a percussive action upon the chisel in withdrawing the same from the coal.

5. In a hand mining-machine, the combination of the reciprocating chisel, the reciprocating ram, and a readily-detachable connection, substantially as shown, constructed to permit a lost motion between said parts.

6. In combination with a reciprocating channeling-tool, substantially as described, the lip or clearer pivoted thereto and arranged to swing backward out of action during the advance of the chisel, substantially as shown.

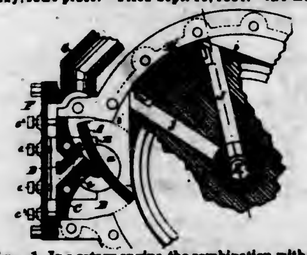
259,109. SAFETY-VALVE. WM. DUCHESNE, Boston, Mass., assignor to James W. Denihue, same place. Filed May 1, 1882. (No model.)



Claim.—1. In an automatic safety-valve, the combination of the tubular casing *a*, having the flange *b*, valve-seat *b'*, elevated above the upper side of said flange, internal recesses, *v*, located above the valve-seat, and guide or nut *d*, located at the upper end of the casing, with the valve *c*, having the stem *c'*, which passes through the guide or nut *d*, and provided with the cavity *f* and perforations *h*, and held down by a spring, *e*, all arranged and operating as and for the purpose specified.

2. The valve *c*, having the hollow perforated stem *c'*, combined with the tubular casing *a*, having the valve-seat *b'*, recesses *v*, and guide or nut *d*, and the spring *e*, arranged between the nut *d* and valve *c*, all as set forth.

3. In a safety-valve for beer-barrels, having a spring-valve, *c*, the tubular casing *a*, having the flange *b* and the valve-seat *b'* elevated above the upper side of said flange, whereby the valve and valve-seat are prevented from projecting downwardly into the barrel, as set forth.

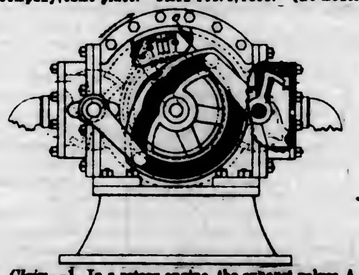


4. The combination, with a barrel or cask head, of the casing *a*, screwed into a hole in the head, and provided with the spring-valve having the hollow perforated stem, and the cap or cover *t*, screwed into the outer end of said hole, and provided with orifices *n n*, for the escape of gas and for the application of a wrench, as set forth.

259,110. MACHINE FOR WASHING CURRANTS. WILLIAM H. DUCKER, Brooklyn, N. Y. Filed Mar. 31, 1882. (No model.)

Claim.—The machine described, consisting of the cage A, revolving within collars *c c'* on the frame *b b'*, provided with a hollow perforated shaft, *g*, arranged to revolve in the opposite direction, in combination with the hopper *e* and spout K, substantially as described.

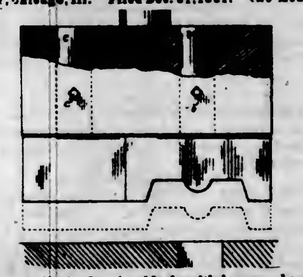
259,111. ROTARY ENGINE. GEORGE W. DUDLEY, Waynesborough, Va., assignor to the Elastic Wheel and Manufacturing Company, same place. Filed Sept. 19, 1881. (No model.)



Claim.—1. In a rotary engine, the combination, with the double exhaust-valve A, of the disk L, having solid tangential projections *i* and ports J issuing through the said projections at their highest point, and the segmental piston H, secured between said projections, substantially as shown and described, whereby an abutment shall be formed simultaneously with the opening of the exhaust-valve, as set forth.

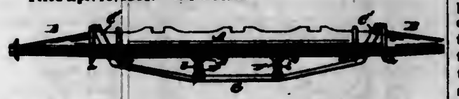
2. In a rotary engine, the combination, with the segmental exhaust-valve A, supported in the walls of its chamber, and the stationary valve-seat C, forming a knuckle-joint with the valve A, of the outer plate, F, forming a wall of the said chamber, and provided with set-screws *e e'*, and the recessed plates E, substantially as shown and described, and for the purpose set forth.

3. In a rotary engine, the combination, with the valve K, having a pin, *m*, which projects through a slot in the hollow shaft M, of the clutch-collar L, having an internal spiral groove for receiving the pin, and adapted to slide upon a feather, *l*, on the outer surface of the said shaft, substantially as shown and described.



259,112. ROTARY ENGINE. GEORGE W. DUDLEY, Waynesborough, Va., assignor to the Elastic Wheel and Manufacturing Company, same place. Filed Feb. 6, 1882. (No model.)

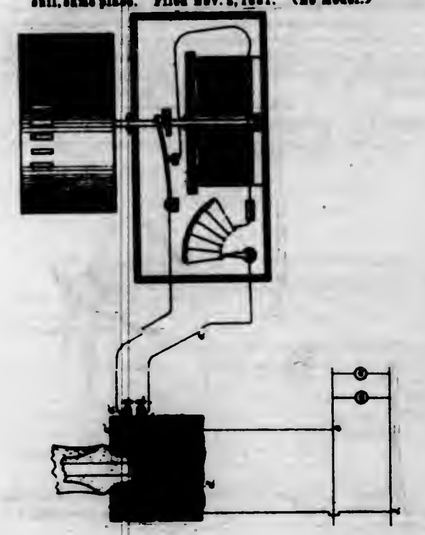
Claim.—1. In a rotary engine, the exhaust-valves A, having lips formed on the rear or outer sides of their ends, with openings at the sides for the exhaust, and adapted to form abutments across the steam-chamber, substantially as shown and described.



2. In a rotary engine, the combination, with the segmental exhaust-valves having segmental lips formed on their rear or outer sides at the ends thereof, and located in chambers having suitable passages for the exhaust at one or both ends of the valves, of a suitable cam substantially as described, which is made to rotate with the piston, and which is connected with the said valves in such manner as to insure a given movement thereof under all circumstances, substantially as shown and described.

259,113. MANUFACTURE OF BLACKSMITHS' SWAGES. JAS. F. DUFFY, Chicago, Ill. Filed Dec. 31, 1881. (No model.)

Claim.—A die for forming blacksmiths' swages, having a depression in its face consisting of side beveled walls, a plane operating-face, and a ridge semicircular in cross-section running centrally and longitudinally over said operating-face, in combination with an anvil or base having a hole or depression corresponding to the tang of a swage, and located immediately under the center of said die, substantially as and for the purpose hereinbefore described and set forth.



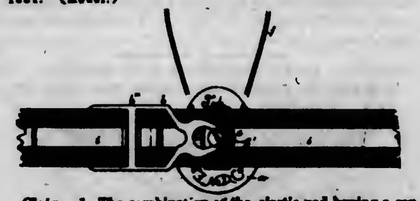
259,114. VEHICLE-AXLE. JAMES DU SHANE, South Bend, Ind. Filed Apr. 12, 1882. (No model.)

Claim.—1. The brace-rod C, provided at each end with diagonal brace-clips C' C', in combination with axle A and chains B B, said chains having collars *a a*, all constructed and arranged to operate as set forth.

2. The combination of axle A, conical washers D D, riding washers E E, nuts *b b*, and brace-rod C, having diagonal brace-clips C' C', all arranged to operate substantially as described.

259,115. ELECTRIC TOY. RICHARD H. DYER and HENRY W. SEELY, New York, N. Y., assignors of one-third to Samuel Insull, same place. Filed Nov. 8, 1881. (No model.)

Claim.—1. The combination of an electrical toy with means for removably connecting said toy with a lamp-socket of a system of electric lighting, substantially as set forth.



2. The combination of an electrical toy, means for removably connecting said toy with a lamp-socket of a system of incandescent electric lighting, and an adjustable resistance in the toy-circuit, external to said lamp-socket, substantially as set forth.

3. The combination of an electrical toy, means for removably connecting said toy with a lamp-socket of a system of incandescent electric lighting, and an incandescing electric lamp serving as a resistance and located in the mains derived or multiple-arc circuit of said system with the toy, substantially as set forth.

4. The combination, with a lamp-socket of a multiple-arc system of incandescent electric lighting, and the removable lamp, of removable connections with an external circuit, whereby each lamp and the external circuit will be both supplied through the terminals of the same socket, substantially as set forth.

5. The second socket described, adapted to be placed in a lamp-socket and to receive an electric lamp, and having connections with an external circuit, substantially as set forth.

259,116. SPUDS. JAMES ENOCH, Boston, Mass. Filed Sept. 27, 1881. (Model.)

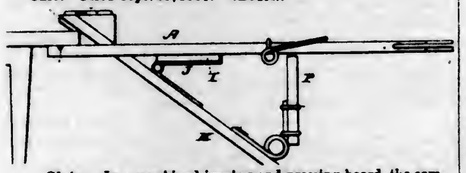
Claim.—1. The combination of the elastic pad having a central socket and an opening leading through the flat side of the pad to its said socket, with the screw-threaded pin provided upon one end with a ball received into the socket in the pad, the screw-threaded sleeve formed with a base-plate and adapted to receive the screw-threaded pin, and the clamp-plate secured by a screw to the base-plate of the screw-threaded sleeve, substantially as described.

2. The combination, in a truss, of the pad with the screw-threaded sleeve, receiving a pin for connecting the same with the pad, and the arched abdominal support *f*, secured to the base-plate of said sleeve, substantially as described.

3. The elastic pad, the inclined metal socket-piece C, with radial arms, the screw-threaded pin having its ball-shaped head received into the socket of piece C, the screw-threaded sleeve receiving the said pin and formed with a base-plate, the bolt, and the clamp-plate A, holding the bolt against the base-plate by a screw, said members being organized and formed substantially as described.

4. The elastic pad provided with internal metallic arms, serving in its center as a bearing for the ball C of the connecting-rod *c'*, and having the annular elastic holding *c'''*, for connecting the pad to the ball and to admit of its easy removal, substantially as shown and described.

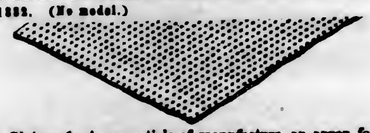
259,117. PIPE-WHEEL FOR VEHICLES. THOMAS B. ELLIS, Dayton, Wis. Filed Feb. 7, 1882. (No model.)



Claim.—1. In a fifth-wheel, the combination of the frame, the plate F, provided with the depending annular flange, the plate G, having the central cylindrical hub, and the intermediate cylindrical rolls, *g*, having their axes arranged in a vertical position and their surfaces arranged to travel around the flange and the hub on the respective plates.

2. In a vehicle, the combination of the main frame and its flanged plate F, the truck and its plate G, having a central hub, and the vertical cylindrical rolls mounted between the plates in the manner described and shown, and connected to the main plate by the pivots *d*, as shown.

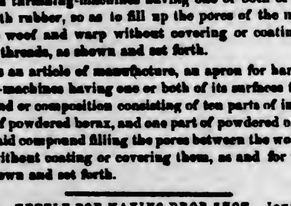
3. The combination of the plate F, provided with the depending flange *a*, and the central depending stud, J, the plate G, provided with the central recess, *c*, the cylindrical vertical rollers *g*, located between said plates, and the king-bolt E.



4. The combination of the plates F and G, constructed as described, and the vertical cylindrical rolls arranged to bear within the flange *a*, the hub *b* of the upper plate, and also against the hub *c* of the lower plate.

259,118. IRONING-BOARD. JAMES E. ELLISON, Scioteville, Ohio. Filed Sept. 19, 1881. (Model.)

Claim.—In a combined ironing and pressing board, the combination, with the board A, slotted at B, and the hinged pressing-board or brace K, of the spring-brace N, secured to the pressing-board K, and having its arm portion P extending to near the ironing-board A, substantially as and for the purposes specified.



259,119. FABRIC FOR APRONS OF HARVESTERS. JACOB B. RADLEY and CHARLES S. SMITH, Akron, Ohio. Filed Apr. 17, 1882. (No model.)

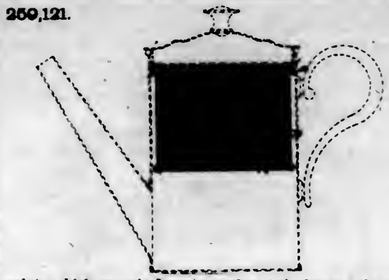
Claim.—1. As an article of manufacture, an apron for harvesters and threshing-machines having one or both of its surfaces treated with rubber, so as to fill up the pores of the material between the woof and warp without covering or coating the woof and warp threads, as shown and set forth.

2. As an article of manufacture, an apron for harvesters and threshing-machines having one or both of its surfaces treated with a compound or composition consisting of ten parts of india-rubber, one part of powdered borax, and one part of powdered oxide of magnesium, said compound filling the pores between the woof and warp threads without coating or covering them, as and for the purpose herein shown and set forth.

259,120. KETTLE FOR MAKING DROP-SHOT. JOHN FARRELL, Pittsburg, Pa. Filed May 1, 1882. (No model.)

Claim.—1. A drop-shot kettle having perforations through its bottom which are countersunk or conically enlarged on the inner side of the bottom, in combination with a filter or regulating mechanism within the kettle for retarding the flow of lead to such perforations, substantially as and for the purposes set forth.

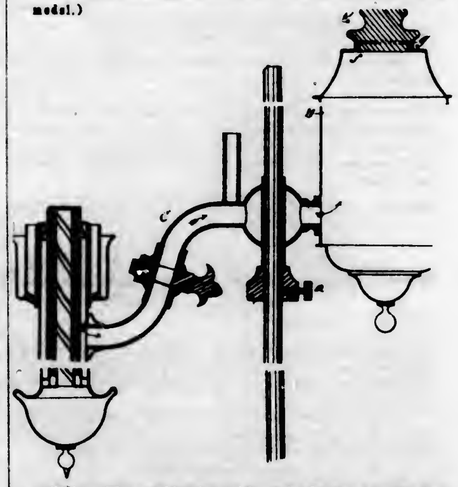
2. The combination of a kettle having a perforated bottom, an inner pan also having a perforated bottom, and one or more fine woven-wire screens between the pan and kettle-bottom for retarding and regulating the flow of lead from the perforations above to those below, substantially as set forth.



3. The kettle A, having perforations *a* in its bottom, which open into the kettle in conical or countersunk enlargements *a'*, in combination with one or more fine woven-wire screens, E, on the inner face of the kettle-bottom, and perforated pan C, bound tightly upon the screens and kettle-bottom, substantially as set forth.

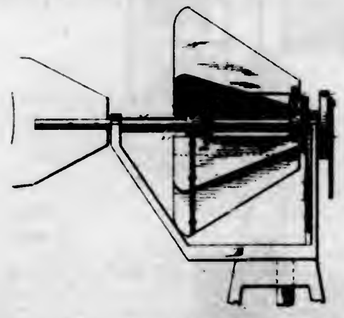
4. A kettle, A, having a perforated bottom, an inner pan, C, having a perforated bottom, the perforations in both bottoms being in line, and one or more fine woven-wire screens, E, between the two bottoms, substantially as and for the purposes set forth.

259,121. COFFEE-POT. H. CLAY PIER, Philadelphia, Pa. Filed Jan. 12, 1882. (No model.)



Claim.—The coffee-pot sack consisting of a body and a bottom formed of one piece of fabric, said piece being cut to form

259,121.



points, which are united one to another at the bottom, the contiguous edges overlapping, and rings at top and bottom of the sack, both rings being sewed to the fabric, substantially as and for the purpose set forth.

259,122. LAMP. WILLIAM B. FLEMING, Belvidere, assignor to James H. Fleming, Newark, N. J. Filed Mar. 1, 1882. (No model.)

Claim.—The combination, with a tube, B, closed at the bottom, open at the top, surrounding the wick-tube, and connected with said tube near the bottom, of a superposed air-tight oil-reservoir, D, having the removable top ping, E, and connected with the tube B above its communication with the wick-tube by a tube, C, having the cock *d*, whereby the oil may be automatically fed from the reservoir and kept at a uniform height in the tube B, as described.

259,123. WINDMILL. JOSEPH B. GALLOWAY and JAMES M. GALLOWAY, Concordia, Kans. Filed Oct. 15, 1881. (No model.)

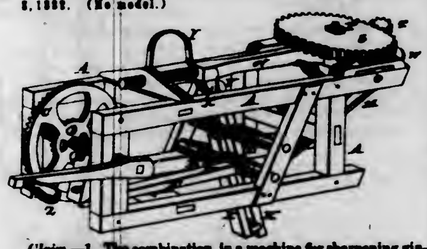
Claim.—1. In a windmill, the combination, with the driving-shaft, of the vanes connected to a disk or collar connected by a spring to the shaft, and a toothed disk or wheel connected to the opposite ends of the vanes and capable of being turned upon the shaft to adjust the relative position of the vanes to its shaft by a lever, and means for operating the same, substantially as and for the purpose set forth.

2. In a windmill, the combination, with the driving-shaft, of the vanes connected to a disk or collar connected by a spring to the shaft, a disk or wheel having a pinion and capable of turning upon the shaft, and the cogged lever having means for its operation, substantially as described.

259,124. RUFFLER FOR SEWING-MACHINES. THOMAS B. GARRETSON, Oskaloosa, Iowa, assignor to the Garretson Ruffler Company, same place. Filed Oct. 22, 1881. (No model.)

Claim.—1. In a ruffling and shirring attachment for sewing-machines, the base-plate A, having at its front end a rearward-turned lip, V, and provided near its rear end with upward-projecting clamping-brackets C, connected by a screw, D, substantially as set forth.

2. In a ruffling and shirring attachment for sewing-machines, the frame comprising the base-plate A, brackets B B' C, lip V, and lugs R, stamped or otherwise formed of a single piece of metal, substantially as shown and specified.



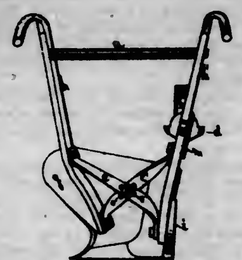
3. In a ruffling and shirring attachment for sewing-machines, the combination of the plate A, having brackets B B', the former of which is provided with lugs R, the bolt G, the pivoted carrier I, having pushing-blade J, the regulator-plate M, adjustable, as shown, in relation to the carrier I, and the spring S, coiled upon bolt G, and having one end adjustable under any one of the lugs R, and the other end hooked around carrier I, forcing the latter rearward, substantially as herein shown and specified.

4. The spring S, having hook T, and finger-piece U, when arranged in a frame having arm B, provided with lugs R, substantially as herein described, for the purpose set forth.

5. The combination, with the bolt G, having thumb-nut H, connecting the frame A B B' R C V with the pushing-blade, carrier, and regulator-plate, of the adjustable spring S, having hook T and thumb-piece U, substantially as shown and specified.

6. The combination, with a ruffling and shirring attachment constructed substantially as described, and having brackets B B', provided with slots X, of the gage Y Z A', substantially as described, for the purpose shown and specified.

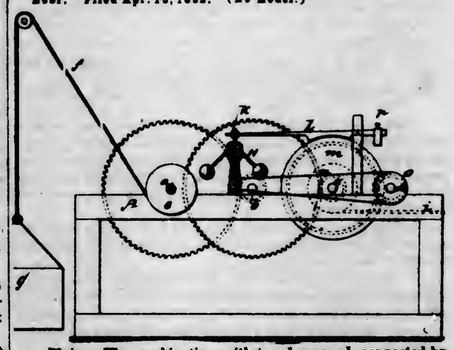
259,125. MACHINE FOR SHARPENING GIN-SAWS. ALBERT P. GATHRIGHT and ANTHONY W. POTTS, Cooper, Ga. Filed Mar. 8, 1882. (No model.)



Claim.—1. The combination, in a machine for sharpening gin-saws, of the main shaft B, having cam G, rock-shaft E, having lever F and vertically-adjustable arm I, and the rock-shaft L, having arm K, provided with a forward-extending pawl, M, substantially as set forth.

2. As an improvement in machines for sharpening gin-saws, the combination of the main shaft B, having cam G, rock-shaft E, having lever F and vertically-adjustable arm I, rock-shaft L, having arm K, provided with pawl M and arm V, the driving-shaft D, having pinion C and worm E, the slide N, having stud X, shafts P U, gear-wheel S, pinions T Q, and file W, and the spring Y, all arranged and operating substantially as set forth.

259,126. PLOW. LEWIS GIBBS, Canton, Ohio, assignor to himself, John R. Rucker, and Henry A. Cavnah. Filed Mar. 3, 1882. (No model.)

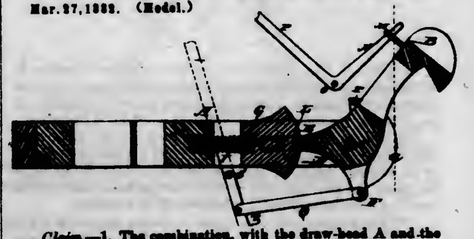


259,126.

Claim.—1. The upper handle-brace, *a*, of a trough-like shape, with the convex side downward, and formed with openings *c*, in combination with the handles *h h'*, screw-bolts *b*, and nuts *n*, the bolts having their heads within the brace and being fastened by the nuts at the outer sides of the handles, substantially as described.

2. The adjustable braces *c c'*, crossing each other, and formed with elongated holes *e*, through which they are bolted together, in combination with handles *h h'*, substantially as described.

259,127. POWER MECHANISM. THOMAS R. GIBSON, Fremont, Nebr. Filed Apr. 13, 1882. (No model.)



Claim.—The combination, with two drums, *e h*, connected by intermediate mechanism, and adapted to be operated in opposite directions alternately by power and a weight, of the brake-wheel *m* and lever *l*, the latter connected at the outer end with the stem *h* of a governor, H, as and for the purpose specified.

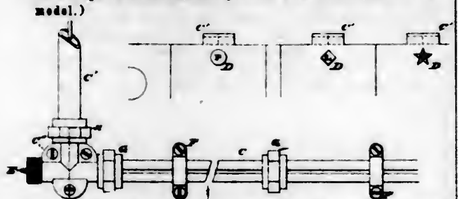
259,128. CORSET-STAY. THOMAS S. GILBERT, New Haven, Conn., assignor to Max Adler, same place. Filed Dec. 13, 1881. (Model.)

Claim.—A corset-stay composed of several fibers of tampico running longitudinally of the stay, secured together by india-rubber or adhesive material between the said fibers, substantially as described.

259,129. CAR-COUPLING. JOHN E. GLEASON, Dayton, assignor to himself and Catharine H. Gleason, Cleveland, Ohio. Filed Mar. 27, 1882. (Model.)

Claim.—1. The combination, with the draw-head A and the sliding block G, having convex forward end, of the coupling-hook B, having the concave rear end, D, substantially as and for the purpose set forth.

2. The coupling-hook B, pivoted between the cheeks of the draw-bar at C, and having concave rear end, D, and projection E, in combination with the spring-pressed sliding convex-ended block G, having cavity L, and being also arranged on the draw-bar, substantially as specified.



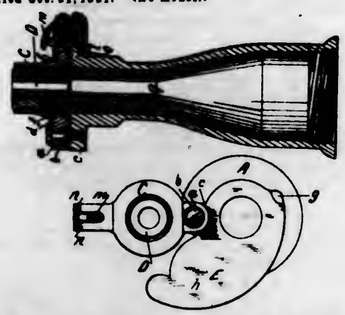
3. The combination, with the draw-bar A and the spring-held coupling-hook B, provided with the projection F at its rear end, of the lever R and the connecting-rod Q, substantially as and for the purpose set forth.

4. The combination of hook-coupler B, pivoted on the draw-bar, as described, and having projections E and F, sliding block G, spring J, and levers O and Q, substantially as specified.

5. The pressure-block G, having convex front end, and being arranged between the cheeks of the draw-bar, with projections H in guide-slots I of the said bar, in combination with hook B, substantially as specified.

6. The combination of stop-pin T with the hook B, pressure-block G, draw-bar A, and the lever N, substantially as specified.

259,130. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. CHRISTIAN H. GOEBEL, Philadelphia, Pa., assignor of one-half to George W. Bratton, same place. Filed Mar. 7, 1882. (No model.)



Claim.—1. An electric conductor or cable composed of pipes formed of separate or sectional pipes, each section containing a conductor with an inclosing insulating material, such conductor constructed with a recessed end, as described, and having its other end projecting beyond the end of the section, substantially as and for the purpose specified.

2. The pipes with inclosed wires and branches C', in combination with the conduit provided with indicators D, substantially as and for the purpose set forth.

3. The method of insulating electric wires, consisting in surrounding them with vulcanizable insulating material, inclosing this material in split pipes, and clamping said pipes together, so as to compress said material during the application of heat, substantially as set forth.

259,131. NOZZLE FOR HOSE-PIPES. THOMAS GOULD, Wakefield, assignor of one-half to Oscar I. Stowell, Lynnfield, Mass. Filed Oct. 21, 1881. (No model.)

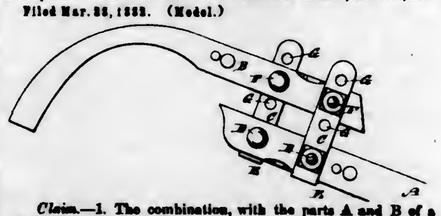
Claim.—1. The combination, with a hose pipe or nozzle, A, of the swiveled laterally-swinging nozzle C, having an open unobstructed water-passage adapted to receive a detachable thimble, D, for changing the form of the stream, substantially as described.

2. The combination, with a hose pipe or nozzle, A, provided with a laterally-projecting guard, E, having a plane outer face, A, of the swiveled nozzle C, arranged to swing laterally on the face of the guard and provided with an open water-passage constructed to receive a detachable thimble, substantially as described.

3. The combination, with a pipe or nozzle, A, provided with a laterally-projecting guard, E, having a fixed stop, g, of a swiveled laterally-swinging nozzle having a water-passage through it and adapted to strike the said stop when its water-passage is in coincidence with the passage in the pipe or nozzle, substantially as and for the purpose described.

4. A hose pipe or nozzle, A, and its part C hung to it, in combination with the lever *n* and block *k*, all substantially as described, for the purposes specified.

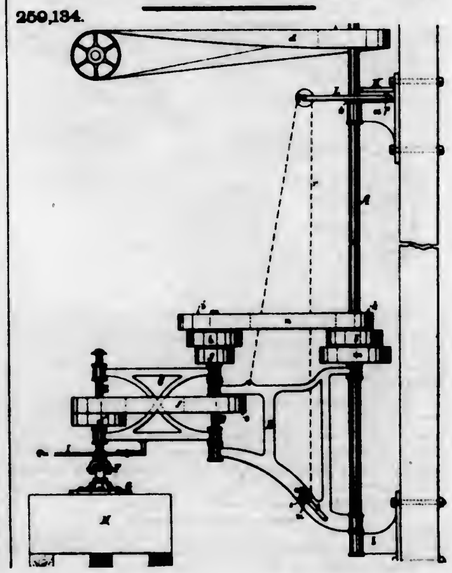
5. A hose pipe or nozzle, A, and its part C hung to it and interiorly shouldered, in combination with an exteriorly-shouldered thimble, all substantially as and for the purpose specified.



259,132. LAUNDRY-HEATER. DANIEL C. GRIFFIN, Burlington, Iowa. Filed June 1, 1880. (Model.)

Claim.—1. In a laundry-heater, the combination of a fire-box having inclined surfaces D E and surrounding rims *d a*, for supporting the sad-irons and smoothing or polishing irons, the steam-boiler F, arranged over said fire-box, vertical flue or flues *f*, passing up through said boiler, conical hood G, and smoke-stack H, substantially in the manner as and for the purpose herein shown and described.

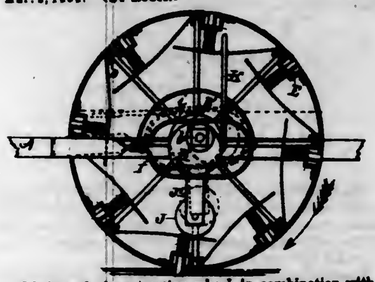
2. In a laundry-heater, the combination, with the fire-box having inclined surfaces and steam-boiler, of the dry-room I and jacket J, partially inclosing said heater, substantially as and for the purpose herein shown and described.



259,133. PLOW-HANDLE. FREDERICK HACKE, De Soto, Mo. Filed Mar. 28, 1882. (Model.)

Claim.—1. The combination, with the parts A and B of a plow-handle, of the perforated standards C, bolted respectively to the said parts, substantially as and for the purpose set forth.

2. The combination, with the parts A B of a plow-handle, of the standards C, provided with the flanges E and the perforations G, and the bolts D F, substantially as and for the purpose set forth.



259,134.

259,134. MACHINE FOR DRESSING OR POLISHING STONE. CYRUS J. HALL, Belfast, Me. Filed Apr. 14, 1882. (No model.)

Claim.—The combination of the stationary plate K and the lever L, having the grooved wheel *q*, with the shaft A and its supports, and with the frames B and C, adapted to each other and to the said shaft, and provided with the lifting-chain and with the grinder and its actuating mechanism, as explained, all being substantially as set forth.

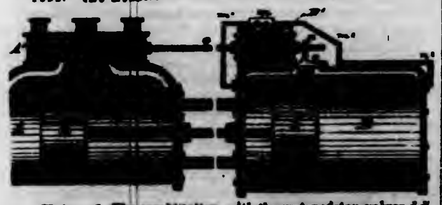
259,135. TRACTION-WHEEL. LEWIS HALL, Metamora, assignor of one-fourth to Andrew G. Scherer, Peoria, Ill. Filed Mar. 2, 1882. (No model.)

Claim.—1. In a traction-wheel, in combination with cam-tracks having reciprocating spurs, a cam-roller adapted to act on said cam-tracks successionally, substantially as and for the purpose specified.

2. In a traction-wheel, in combination with hinged cam-tracks having spurs adapted to pass outward through the rim of the wheel, springs adapted to retract the spurs, substantially as and for the purpose specified.

3. In a traction-wheel, in combination with cam-tracks having reciprocating spurs and retracting-springs, cam-roller J, and oscillating bar I, having limbs *i i'*, the eccentric H, adapted to force the cam-roller into contact with the cam-tracks and to raise it free therefrom, substantially as and for the purpose specified.

4. In a traction-engine, in combination with cam-tracks having reciprocating spurs and retracting-springs, cam-roller J, swinging bar I, having limbs *i i'*, and eccentric H, the lever K, adapted to rotate said eccentric and operate the parts, substantially as and for the purpose specified.



5. In a traction-wheel, in combination with cam-tracks having reciprocating spurs, a swinging bar having a cam-roller adapted to actuate said cam-tracks and spurs, and an eccentric adapted to actuate said swinging bar and cam-roller, substantially as and for the purpose specified.

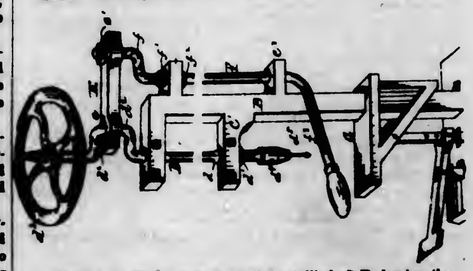
6. In combination with the swinging arm, carrying the cam-roller, and the eccentric for operating the swinging arm, the cam-tracks extended beyond their attachment to the spurs, substantially as and for the purpose specified.

7. In combination with the cam-roller and means for holding it, the cam-tracks extended beyond their points of attachment to the spurs, substantially as and for the purpose specified.

8. In a traction-wheel, in combination with a cam-roller, cam-tracks having spurs, said cam-tracks being hinged to the wheel, so as to permit of endwise movement of the cam-tracks and the use of straight spurs, substantially as and for the purpose specified.

259,136. STEAM-PUMP. HARRY R. HALL, Fair Mount, assignor of one-half to Frank W. Hall, Dahlonega, Ga. Filed Mar. 11, 1882. (No model.)

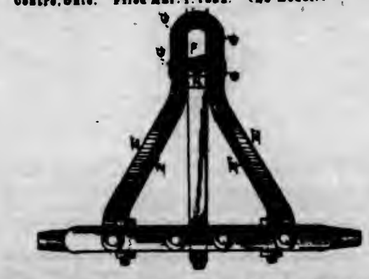
Claim.—1. The combination, with the water piston-valves *d d'*, of the steam-cylinder E', placed alongside the main steam-cylinder, and the valve *m*, adapted to be operated by the piston of the main steam-cylinder, substantially as shown and described.



2. The combination, with the main water and steam cylinders, of the rod *o*, connecting the piston-valve of the main water-cylinder with the piston *b'*, and having a longitudinal slot therein, the valve of the main steam-cylinder having a stem fitting in said slot, and the valve of the cylinder E' having arms adapted to be operated by the piston of the main steam-cylinder, substantially as shown and described, and for the purpose set forth.

259,137. BELTING. WILLIAM H. HALL, Newark, N. J. Filed Mar. 31, 1882. (No model.)

Claim.—In a belt composed of leather and metal links united together by metallic pins, the combination of the leather links *a*, having holes *a'* therein, the inner metal links, *b*, of the same length, but narrower than said leather links, and having holes *b'* therein, the outer metal links, *c*, the same size and shape as the leather links *a*, and having recesses *c' c''*, the latter recess having grooves *f* therein, and the pins *d*, extending through the holes or recesses in the links *a b c* from side to side of the belt, the heads and the nuts of said pins being tapered, and having the lugs *e* on the under side of said heads, adapted to fit in the grooves *f*, to prevent the pin from slipping, substantially as described.

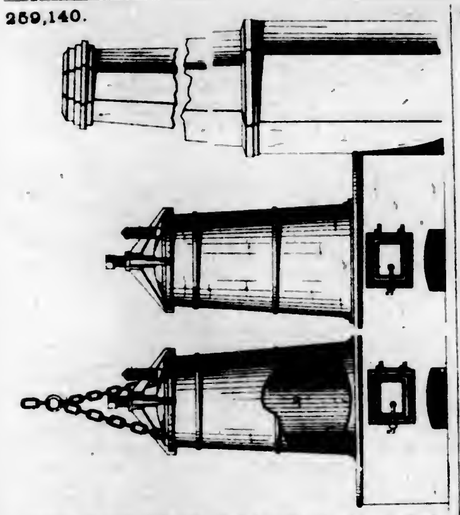


259,138. UPRIGHT DRILL. RUPHNATUS A. HAHN, Parlinville, Kans. Filed Apr. 26, 1881. (No model.)

Claim.—1. The combination of the drill-shaft D, having the crank *d*, fly-wheel *d'*, the connecting-rod E, and the shaft F, having the crank *f* and lever *f'*, substantially as shown and described.

2. The combination of shaft D, having the crank *d*, fly-wheel *d'*, rod E, shaft F, having crank *f* and lever *f'*, with the adjustable table G, substantially as shown and described.

259,139. WAGON-HOUND. WILLIAM S. HARPER, Unionville Centre, Ohio. Filed Mar. 1, 1882. (No model.)

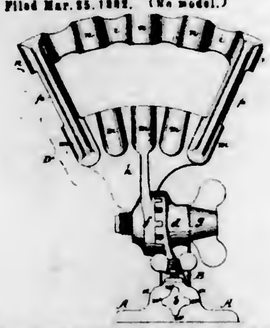


Claim.—In combination with the brace-bar E and brace-rod F, the vertical bolts G G, the sleeves H H, and brace-bar I, substantially as described, and for the purpose set forth.

259,140. MANUFACTURE OF FERTILIZING MATERIAL. FRANK L. HARRIS, Harrisonburg, Va. Filed Jan. 19, 1882. (Specimens.)

Claim.—The herein-described process of producing a fertilizer, consisting in immersing bones, horns, or hoofs in water

259,140.

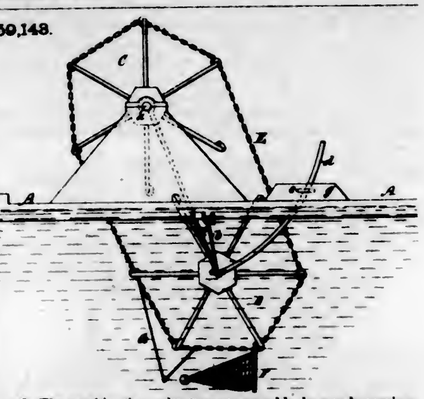


within an air-tight vessel and while so immersed and confined subjecting the article to pressure by heating the water above the boiling-point, removing and drying the charge and introducing into the same water a fresh charge and treating it in a similar manner, next allowing a quantity of the article thus treated and dried to soak in the water, so as to absorb the gelatine contained therein, and finally drying and pulverizing the article.

259,141. PROCESS OF EXTRACTING GOLD FROM ORES. WM. E. HARRIS, New York, N. Y. Filed Feb. 8, 1882. (No specimens.)

Claim.—In obtaining precious metals from ores by amalgamation, the process of protecting the mercury from the action of sulphates and chlorides, which consists in adding bromide of sodium to the ore in about the proportions stated, and then mixing the same with mercury and water, as described.

259,142. FLAG-STAFF HOLDER. WALTER HART, New York, N.Y. Filed Mar. 25, 1882. (No model.)

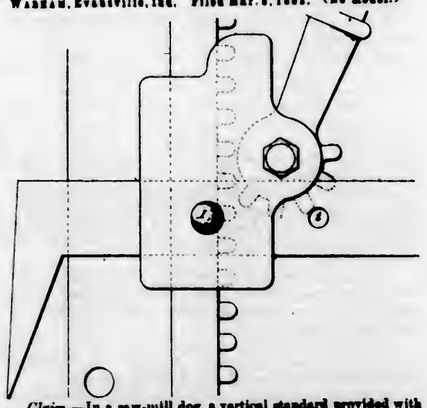


Claim.—1. The combination of the plate A, having a lug, *a*, the arm B, having a shank adapted to an opening in the lug, and a projection, *d*, with recessed face, the pole-holding frame D, having a projection, *f*, with lugs, as described, and the confining-screw *g*, as set forth.

2. The pole-holding frame D, comprising the segmental plate A, with projection *f* and radial sockets *m*, the segmental bar *i*, with radial tubes *n*, and the connecting-bars *p* at the ends of the bar *i* and plate A, as set forth.

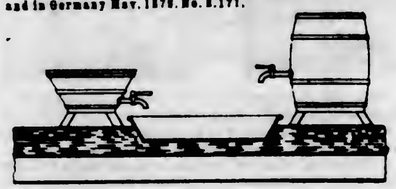
259,143. MECHANICAL DEVICE FOR CATCHING FISH. THOS. HEATON, Vancouver, Wash. Filed Jan. 17, 1882. (Model.)

Claim.—1. The combination of two endless parallel chains on two skeleton wheels and two floats supporting the same, whereby oyster-dredges, fishing-nets, or sand-elevators may be operated, as described.



259,144.

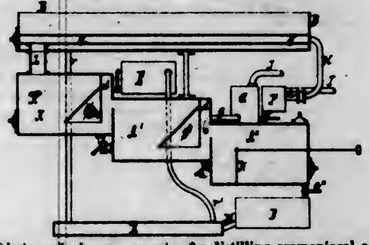
2. The combination, with beam having blocks *g* and carrying-shaft *a*, of a submerged wheel, D, having its axle suspended both from shaft *a* by the rods *f* and by hooks and eyes from the floats, and held in any desired position by the rods *d*, passing through loops *e* on said blocks *g*, as shown and described.



3. In combination with the boats or floats A A, skeleton-wheel C, journaled upon the boats, the submerged wheel D, hung on the rods *f f*, and the endless chains E, provided with the fish-nets F, the submerged wheel being adjustable by means of the braces *b b* and the rods or chains *d d*, substantially as and for the purposes described.

259,144. SAW-MILL DOG. DANIEL HEILMAN and HARRY WARHAM, Evansville, Ind. Filed Mar. 8, 1882. (No model.)

Claim.—In a saw-mill dog, a vertical standard provided with a vertical rack, a carriage capable of vertical movement on said standard, an operating-lever pivoted in the carriage and provided with a mutilated gear to engage or pass by said rack, as desired, and an adjustable dog mounted in the carriage, substantially as and for the purpose set forth.



259,145. PROCESS OF TREATING AMMONIACAL LIQUORS. HENRI JOSEPH ERNEST HENRIQUET, Anglet, and CHARLES JULY FÉLIX RAOUL DE JAUREL MENARD, Vicomte de Vauréal, Biarritz, France, assignors to the Société Anonyme des Produits Chimiques du Sud Ouest, Paris, France. Filed Nov. 9, 1881. (No specimens.) Patented in France Apr. 27, 1878, No. 124,157; in England Oct. 29, 1878, No. 4,353, and July 19, 1880, No. 3,066, and in Germany May, 1879, No. 3,171.

Claim.—1. The herein-described process of treating ammoniacal liquors by exposing said liquors to the action of the mixed chlorides of calcium and iron, decanting or collecting the resulting liquor, and evaporating or concentrating the same, substantially as and for the purpose set forth.

2. The herein-described process of treating ammoniacal liquors by exposing said liquors to the action of reagents, forming a soluble salt or salts of ammonia, decanting or collecting the liquor holding said salt or salts in solution, and evaporating or concentrating the same in a sheet-metal vessel or boiler in the presence of mixed chlorides of ammonium and lead, substantially as and for the purpose described.

259,146. APPARATUS FOR DISTILLING AMMONIA. HENRI JOSEPH ERNEST HENRIQUET, Anglet, and CHARLES JULY FÉLIX RAOUL DE JAUREL MENARD, Vicomte de Vauréal, Biarritz, France, assignors to the Société Anonyme des Produits Chimiques du Sud-Ouest, Paris, France. Filed Dec. 1, 1881. (No model.) Patented in France Jan. 16, 1879, No. 130,575, and in England July 16, 1880, No. 3,064.

Claim.—1. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, of a retort communicating with said receiver, said retort being divided into several compartments, and a condenser, C, having a tube or other means for carrying off the vapors, substantially as set forth.

2. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, and condenser C, of a retort, said retort being divided into compartments communicating with each other and provided with partitions *a'*, substantially as and for the purpose set forth.

3. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, and a condenser, C, of a retort, said retort being divided into compartments communicating with each other and provided with partitions *a'*, having inverted-bell-shaped receivers S S', substantially as set forth.

4. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, of a heating-chest, R, a retort, and a condenser, C, substantially as set forth.

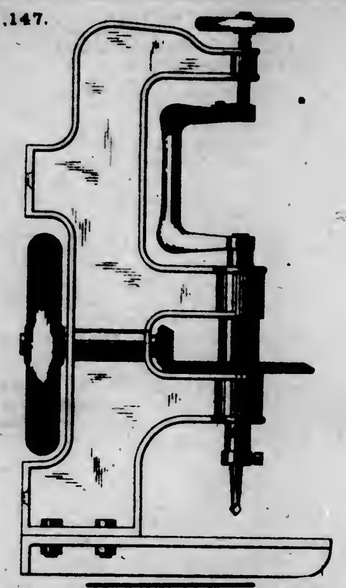
5. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, of a heating-chest, R, reservoir E, a retort communicating with said reservoir, and a condenser, C, substantially as described.

6. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, of a heating-chest, R, a retort, a cleansing apparatus, D, communicating with said retort, and a condenser, C, substantially as set forth.

7. In an apparatus for distilling ammoniacal and other liquors, the combination, with a receiver, B, and a retort communicating with said receiver, of a condenser, C, and drying-chests F G, communicating with said condenser, substantially as set forth.

8. A retort consisting of two or more compartments, A A' A'', communicating with each other, and provided with partitions *a'*, having inverted-bell-shaped receivers, substantially as described.

259,147. HAND DRILLING-MACHINE. FREDERICK LEE HUSCHKE, Rochester, N. Y. Filed Jan. 14, 1882. (No model.)



Claim.—1. In combination with the standard, the drill-spindle, hand-crank, and adjustable screw, the gear-wheel, pinion, and fly-wheel, arranged as described and shown.

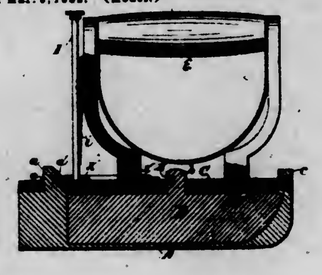
2. In a hand-drill, the combination of the drill stock or spindle, a hand-crank connected therewith, and a fly-wheel gearing directly to and driven by the spindle, as described and shown.

3. The standard A, provided with the three overhanging arms *a*, *b*, and *c*, in combination with the vertical spindle, the hand-crank, the gear-wheel, pinion, screw, and fly-wheel, said parts constructed and arranged as described and shown.

4. In a drilling-machine, the combination of the crank having the tapered seat, the screw having the grooved tapered end, arranged to bear only at its extreme point, and the plate H, applied as shown.

259,147.

259,148. BUTTER-DISH. ROWLAND HILL, Meriden, Conn. Filed Apr. 17, 1882. (No model.)



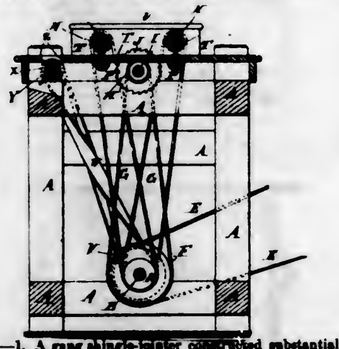
Claim.—1. The combination of the stationary body, the cover arranged between vertical guides, the said guides tubular, with a shaft across above the dish carrying a pulley in each of said guides, with weights within said guides connected with the cover over said pulleys, substantially as described.

2. A covered dish consisting of a stationary body, a cover hung and guided between uprights so as to be moved vertically up and down, combined with a device within said uprights overbalancing said cover, whereby the cover, when free, will be automatically raised, the said cover provided with a holder with a removable counterbalancing-weight, substantially as described.

3. The combination of the stationary body, the cover arranged between vertical guides, the said guides tubular, with a shaft across above the dish carrying a pulley in each of said guides, with weights within said guides connected with the cover over said pulleys, the said cover provided with a holder with a removable counterbalancing-weight, substantially as described.

259,149. SAD-IRON. WILLIAM HILTON, Agency City, Iowa. Filed Mar. 3, 1882. (Model.)

Claim.—In a smoothing-iron, the body A *a c*, cover C *c'*, and lever I, spring *i*, and bolt K, in combination with the removable heater B, having stud *b*, provided with slot *b'*, the whole constructed and operating substantially as and for the purpose set forth.

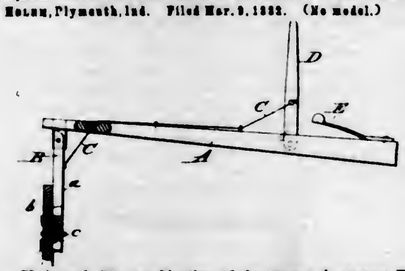


260,150. PROCESS OF OBTAINING MAGNESIUM SULPHATE FROM CRUDE MINERAL. FREDERICK HOELWEG, San Francisco, Cal. Filed July 27, 1881. (No specimens.)

Claim.—1. The process of obtaining magnesium sulphate from crude mineral—such as dolomite or magnesian silicates—by treating the powdered mineral with a solution of sodium bisulphate and separating the magnesium sulphate by crystallization, substantially as described.

2. The process of obtaining carbonate of magnesia from its crude mineral—such as dolomite or magnesian silicates—which consists in reducing the same to a fine powder and mixing with it the bisulphate of soda in solution, from which the magnesia is precipitated as carbonate in the usual manner, substantially as specified.

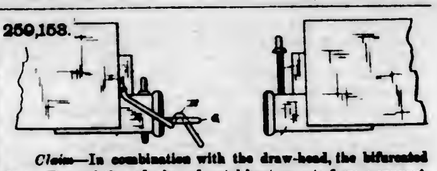
260,151. GANG SHINGLE-JOINTER. ROBERT HOLMES, Alpena, Mich., assignor to himself and Franklin E. Northup, same place. Filed Mar. 9, 1882. (No model.)



Brief.—The saws and feed-rolls are extended on both sides of the driving mechanism, the lower rolls only extending as far as the efficient portions of the upper. A shaft carrying radial arms throws the finished shingles from the machine.

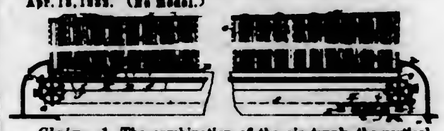
Claim.—1. A gang shingle-jointer constructed substantially as herein shown and described, and consisting of the frame A, the drive-shaft B and its pulleys, the saw-mandrel I, the saws J, the long feed-rollers N N and their pulleys, the short feed-rollers P, and rear roller, Y, having pulley X and radial arms Z, as set forth.

2. In a gang shingle-jointer, the combination, with the frame A, the table T, and the saw-mandrel I and saws J, of the long roughened upper feed-rollers, N, and the short spring-pressed lower feed-rollers, P, substantially as herein shown and described, whereby the lumber is carried through the machine, as set forth.



260,152. TONGUE-SUPPORT FOR VEHICLES. JONATHAN N. HOLM, Plymouth, Ind. Filed Mar. 9, 1882. (No model.)

Claim.—1. The combination of the tongue A, support B, hinged thereto, lever D, having pin *d*, chain C, connecting said lever and support, and the snap-catch E, for holding the lever back, substantially as described.



2. The combination, with the tongue A, of the adjustable support B, composed of the parts *a b*, connected substantially as and for the purpose described.

260,153. CAR-COUPLING. GEO. W. HOLMES, Council Bluffs, Iowa. Filed Mar. 23, 1882. (Model.)

Claim.—In combination with the draw-head, the bifurcated frame B, consisting of a bar of metal bent so as to form a support, E, for the link G, and inclined arm to guide the link to the draw-head, and the transverse block to which the frame is pivoted, the frame being provided with arms I, to limit its movement, substantially as specified.

260,154. DUST-COLLECTOR. NOAH W. HOLT, Buffalo, N. Y., assignor to Charles R. Knickerbocker, Jackson, Mich. Filed Apr. 18, 1882. (No model.)

Claim.—1. The combination of the air-trunk, the vertical cloths arranged to form stationary chambers, and traveling devices which cut the air off from the collecting-chambers successively to permit the dust to be dislodged, substantially as set forth.

2. The combination of the vertical cloths arranged to form stationary collecting-chambers, the air-trunk which supplies the dust-laden air, an intermediate chamber between the air-trunk and the collecting-chambers, and arranged to guide the air into the ends of the collecting-chambers, air-stopping devices at the ends of the collecting-chambers opposite to those ends which receive the air, and a traveling cut-off adapted to intermittently stop the air from passing through the walls of the stationary collecting-chambers, substantially as set forth.

3. The combination of the vertically-arranged stationary cloths, the air-trunk which conducts the dust-laden air to the cloths, the devices which guide the air from the trunk through the cloths, mechanism which intermittently shuts the air off from the cloths, the devices which dislodge the dust, and a traveling pocket or chamber which receives the dislodged dust and carries it away from the filtering-chamber, substantially as set forth.

4. The combination of the vertical cloths, forming substantially stationary vertical chambers, the devices which guide the air into the chambers on vertical lines, a cam or incline which moves the cloths at the lower ends, and a traveling dust-carrying device connected to and traveling with the cloth-moving mechanism, substantially as set forth.

5. The combination of the vertical cloths forming stationary vertical chambers, the devices which guide the air into the chambers on vertical lines, a traveling cam or incline for lifting the cloths at the inner ends, and a traveling dust-carrying device connected to the cloth-moving mechanism and arranged to have the cloth-moving mechanism in advance of the dust-carrying devices, substantially as set forth.

6. The combination of the main frame, the vertical cloths, the vibratable frame-pieces attached independently of each other to the cloths, devices for lifting the vibratable frame-pieces independently of each other, and a series of elastic devices respectively attached to the vibratable frame-pieces and arranged to return the cloths successively after they have been lifted, whereby the cloths are one after another snapped or jerked for dislodging the dust, substantially as set forth.

7. The combination of the air-trunk, the vertical cloths arranged to form stationary chambers, an inclosing intermediate chamber between the air-trunk and collecting-chambers, and traveling devices which cut the air off from the collecting-chambers successively to permit the collected dust to be dislodged, substantially as set forth.

8. The combination of the vertically-arranged cloths forming chambers which receive the air on vertical lines, a chamber below the collecting-chambers, into which the dislodged dust drops, the mechanism which shuts off the air from one or more chambers independently of the others, and a traveling pocket or receptacle mounted in said lower chamber below the collecting-chambers and moving from one to the other, substantially as set forth.

9. In a dust-collector, the combination of a series of collecting-chambers, an air-trunk arranged to supply air to several of the chambers simultaneously, and flexible extensions which are connected to the ends of the main collecting-chambers opposite to the air-trunk, and which permit the cloth-moving frame to be moved relatively to the main frame, but prevent the dust-laden air from escaping at points beyond said cloth-moving frame, substantially as set forth.

10. In a dust-collecting machine having a series of chambers, the combination of an air-conduit which supplies air to several chambers simultaneously, filtering-cloths arranged to form said chambers, vibratable bars or frames connected to the cloth, and flexible extensions attached to said vibratable bars or frames and situated at the ends of the chambers opposite to the air-conduit, substantially as set forth.

11. The combination, with the vertically-arranged cloths adapted to have the dust drop below them when it is dislodged, of a cam arranged to travel from chamber to chamber in horizontal planes to lift a portion of each of the cloths preparatory to dislodging the dust, substantially as set forth.

12. The combination of the frame D B E' with the vertical cloths arranged in pairs and made stationary at their outer edges, and secured at their inner edges to the vertically-movable rods D, at their upper edges to the swinging bars E', and at their lower to the swinging bars B, substantially as set forth.

13. The combination of the main frame-work, the collecting-chambers extending inwardly from both the opposite edges or sides of the main frame, and having vertically-movable supports on substantially the central line of the frame-work, and mechanism for jarring simultaneously the two opposite chambers, substantially as set forth.

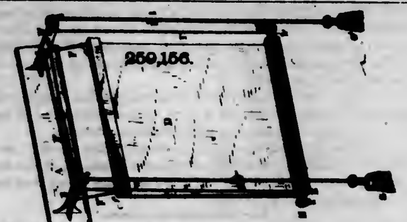
14. In a dust-collector, the combination of a series of collecting devices, each having two vertically-arranged cloths secured to a vibrating bar at the lower ends and between the cloths, an opposing vibrating bar at the upper ends, a rising and falling bar at the inner edges, connected to the top and bottom vibrating bars, and stationary supports for the outer edges of the cloth, substantially as set forth.

15. In a dust-collector, the combination of a main frame, collecting-chambers arranged in pairs, the chambers of each pair being on opposite sides of the central line of the main frame, the filtering-cloths which form the collecting-walls of said chambers, vertically-movable bars attached to the inner edges of the cloths, and cloth-lifting devices which are mounted on substantially the central line of the main frame and elevate the vertically-movable bars at the inner ends of the collecting-chambers, substantially as set forth.

16. In a dust-collector, the combination of the main frame, the chambers extending inwardly from the sides or edges of the frame and arranged in pairs, the cloths having their vertical inner edges attached to vertically-movable bars, the bottom vibrating bars, B, each attached to the lower end of two adjacent cloths, and the upper supporting-bars, B', respectively, opposite to the bars B, said bars B and B' being arranged, substantially as set forth, to have the air pass out horizontally or laterally between them.

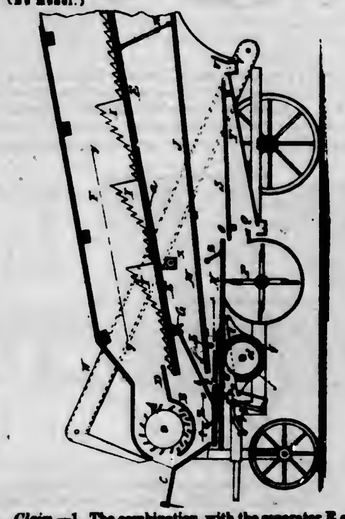
260,155. SASH-CORD PULLEY. CASSIUS HOLTON, Reading, Pa. Filed Mar. 28, 1882. (Model.)

Claim.—1. In a window-pulley, the shell provided with a shank at its rear, adapted to set in an aperture in the rear wall of the window-frame and weight-box to hold the shell in place, substantially as specified.



2. In a window-frame pulley, the shell provided with a shank adapted to set in an aperture in the window-frame and weight-box, and with longitudinal projections, substantially as and for the purpose specified.

260,156. CURTAIN-FIXTURE. TRUMAN P. HOPKINS, Milwaukee, Wis. Filed May 2, 1881. (No model.)

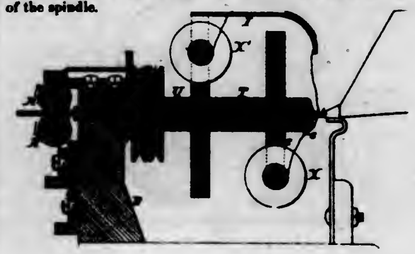


Brief.—The cords which raise and lower the shade pass through perforations and the bent outer ends of the bracket, making three rectangular frictional bends.

Claim.—1. In a curtain-fixture, the brackets B B', having bent outer ends provided with eyes *b b'*, and each bracket having three smaller perforations, *a*, *a'*, and *a²*, formed therein, as set forth.

2. In a curtain-fixture, the combination of the brackets B B', each having bent ends, with eyes *b* and *b'*, respectively, formed therein, and three smaller perforations, *a*, *a'*, and *a²*, with the described system of cords F F' and I I', the tassels G G', and a window-shade formed with top slot and bottom roller and buttons, all substantially as set forth.

260,157. GRAIN-THRASHER AND CLOVER-SEED HULLER. CHARLES H. HOSTER, Wellington, Ohio. Filed Mar. 21, 1882. (No model.)



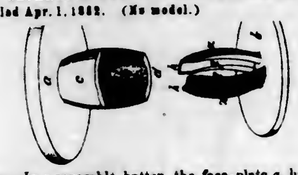
Claim.—1. The combination, with the separator E and shaker N, of the vibrating bottom J, constructed with a removable perforated section, M, as and for the purpose specified.

2. The combination, with a threshing-cylinder and concave, of the shaker N, having the ways *u*, the clover-screen *t*, mounted thereon, and the clover-huller *d f*, substantially as and for the purpose set forth.

3. The combination, with the frame, of a clover-huller, *d f*, adjustably connected therewith, a shaker, N, having an aperture, and a removable section, *e*, for covering said aperture, as shown and described.

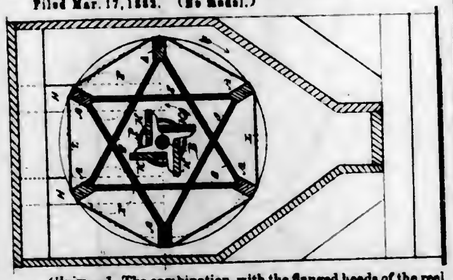
260,158. MACHINE FOR THE MANUFACTURE OF CORSET-STIFFENERS. JAMES A. HOUSE, Bridgeport, Conn., assignor to Warner Brothers, same place. Filed Feb. 16, 1881. (No model.)

Brief.—Two hollow spindles carrying bobbins are revolved in opposite directions. The threads from the bobbins are guided to the end of the outer spindle, where they are wound around the fibers, which are supplied from a trough arranged opposite the end of the spindle.



Claim.—1. The combination, with the hollow spindles carrying bobbins X X′ and driven in opposite directions, of guides for carrying both threads to the end of the outer spindle and a trough arranged opposite the end of said spindle to direct the fibers thereto, substantially as set forth.

2. The combination, with the hollow spindles carrying bobbins and devices for driving them in opposite directions, of feed-rolls arranged and operating substantially as set forth.

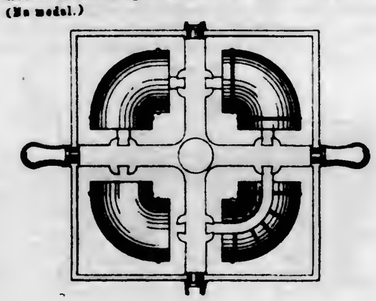


3. The combination, with the hollow spindles T and U, carrying the bobbins and revolving in opposite directions, of the feed-rolls H H′ and appliances for adjusting the same to and from each other, substantially as set forth.

259,159. SEPARABLE BUTTON. DAVID HUMPHREYS, Norfolk, Va. Filed Apr. 1, 1882. (No model.)

Claim.—In a separable button, the face-plate *a*, having the hollow convex or barrel-shaped stem *c*, open at its lower end and roughened on its interior, in combination with the back plate, *b*, provided with the outwardly-bowed prongs *g*, having converging free ends *h* and roughened exterior faces, *x*, substantially as described.

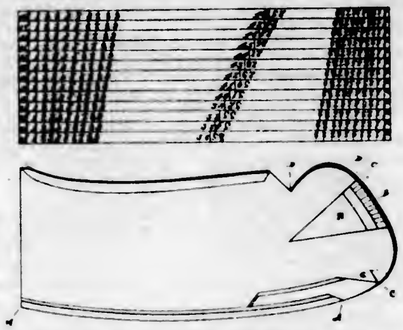
259,160. BOLTING-REEL. HOSEA ISHAM, Dadeville, Mo. Filed Mar. 17, 1882. (No model.)



Claim.—1. The combination, with the flanged heads of the reel and the reel-shaft provided with a driving-wheel, of the wheels E F and means, substantially as described, for supporting the said wheels, as and for the purpose set forth.

2. The combination, with a reel provided with the flanged head B′, and the shaft B, provided with the wheel G, of the wheels E and the links I, substantially as and for the purpose set forth.

3. The combination, with the reel-head B′, provided with the flanged rim D and the shaft B, of the wheel G, provided with the flange M, the wheels E, and the links I, substantially as and for the purpose set forth.



4. The combination, with the bars A of the reel, of the diagonal braces S, substantially as herein shown and described, whereby the reel is braced at its center without obstructing the central interior space, as set forth.

259,161. APPARATUS FOR CASTING PIPE-ELBOWS. J. HENRY ISHAM, Cuyahoga Falls, Ohio. Filed Apr. 17, 1882. (No model.)

Claim.—In combination with a molding-flask, a core-supporting frame held in position by the flask by devices such substantially as shown, and supporting the core-bars, substantially as and for the purpose hereinbefore set forth.

259,162. METHOD OF AND MEANS FOR DRAFTING AND CUTTING CLOTHING. H. AYRES JACKSON, Des Moines, Iowa. Filed Sept. 23, 1879.

Claim.—1. The process of drafting patterns for clothing by means of a series of scales bearing a uniform ratio of length to a corresponding series of bust-measures, and varying from each other in length by a uniform progression, with a common difference of about one-tenth of an inch, and each having about one-tenth of the length of the corresponding bust-measure laid off on one end of it and subdivided by parallel lines into a uniform number of equal parts, for the purpose of laying off by fixed proportions other lines and distances to determine the shape in which the material shall be cut, substantially as described.

2. In the process of cutting clothing, the mode of determining the directions of the several curves in every case by a chart combining in its outline the bust-curve, front and back arm-size curves, neck-curve, and dart-curve, each distinct from all the others, substantially as shown and described.

3. The chart or form shown in Fig. 2, presenting in combination distinct guide-lines for drawing the bust, front and back arm-size, neck and dart curves for any garment, substantially as shown and described, and for the purposes set forth.

4. The process of measuring, drafting, and cutting clothing hereinabove described, consisting in taking measurements of the bust, waist, chest, width of back, length of back, length under arm, arm-size, shoulder, circumference of neck, and neck and front in determining the length of subsidiary lines by laying off fixed parts or multiples on a scale whose length is about one-fourth the number of inches in the bust-measure, and on which about one-tenth of the length of the bust-measure is laid off and divided by parallel lines into a uniform number of equal parts, and in determining the directions of the several lines by a prescribed set of curves uniform for all shapes and sizes.

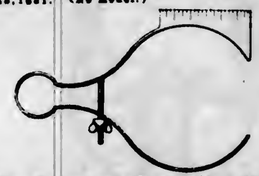
5. In the drafting of patterns for clothing, the mode hereinbefore described of distributing the surplus to be removed, which consists in constructing and locating the triangles Y 3 4, 2 O 5, and 9 10 11 and the doubly-convex figure 12 13, substantially as described and shown.

259,163. BOOT OR SHOE. ASA JOHNSON, New York, N. Y., assignor to the American Boot, Shoe, and Last Company, same place. Filed Apr. 2, 1880. (Model.)

Claim.—1. A boot or shoe having its counter made of sheet metal and the upper of flexible metallic material.

2. A boot or shoe having its counter made of sheet metal and the upper of wire-gauze.

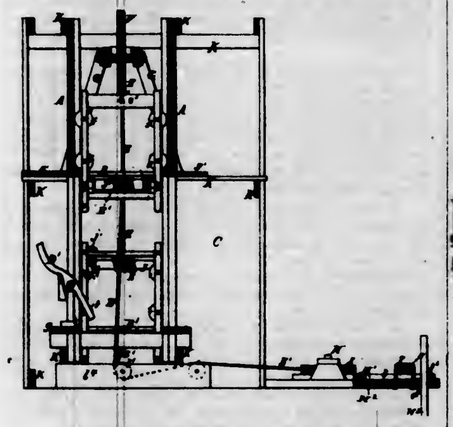
3. The combination of the wires or pins, connected by solder, in the manner described, with the filling of leather, papier-maché, or equivalent material, as and for the purpose set forth.



4. The combination of the metallic insole with the upper sole, formed of the metal-plate instep, the metallic rims, and the filling of papier-maché or equivalent material, as set forth.

5. The metallic rim or flange having the enlarged integral heel-flange N′, as set forth.

6. The combination, with the wire-gauze upper, connected to the sole by solder or equivalent means, of the sheet-metal counter and the adjustable strap, with its screw-clamp, as set forth.



7. The combination, with the wire-gauze upper, of the elastic lacing, as and for the purposes set forth.

259,164. CALIPERS. GEO. W. JONES, Meriden, Conn. Filed Nov. 28, 1881. (No model.)

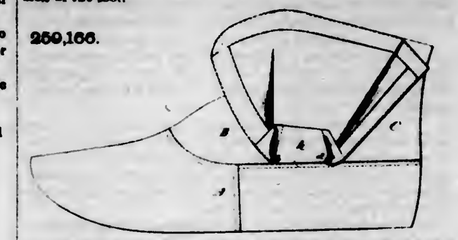
Claim.—A curved-leg caliper having a projection upon the outside of the leg presenting a straight graduated edge, substantially as described.

259,165. BRICK AND MORTAR ELEVATOR. WILLIAM A. JORDAN, New Orleans, La. Filed Apr. 5, 1882. (No model.)

Claim.—1. The combination of the pulley I, rope E′, and windlass J′, arranged as shown, platforms B B′, pulley F, rope E, and windlass J, arranged as shown, the whole operating substantially as and for the purpose described.

2. The combination of the adjustable slotted pulley-support H′, with pulley I attached, the anchoring-post H², the rope E′, and windlass J, arranged as shown, platforms B B′, rope E, and windlass J′, arranged as shown, and pulley F, attached to a portable frame, G, and the whole operating substantially as described.

3. The frames of the platforms B B′, provided with sliding slotted straps *h h* and elastic cushions *m m′*, substantially as and for the purpose described.

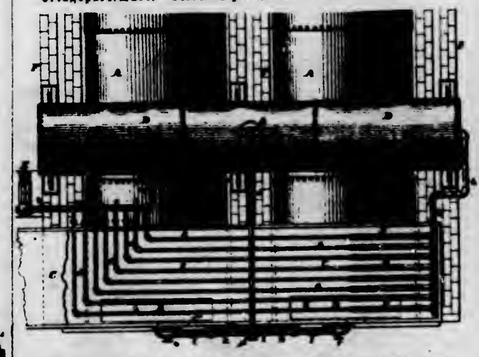


4. In combination with the platforms B B′, the stops D′, arranged partly across the passage-ways of the platforms, so as to be moved on their pivots as the platforms descend, and operating to hold the platforms down after they have descended, substantially as described.

5. In a brick and mortar elevator, the rope E′, attached to the windlass J′ of platform B, and then carried down through a cross-bar of the frame of said platform, then around the pulley I, then fastened to a cross-bar of the frame of platform B′, in combination with the cord E, attached to a cross-bar of the frame of platform B, and then passed round pulley F, then through a cross-bar of the frame of the platform B′, and fastened to windlass J, substantially as and for the purpose described.

259,166. SHOE-UPPER. JOSEPH L. JOYCE, New Haven, Conn. Filed Feb. 27, 1882. (No model.)

Brief.—The shoe is open at the side and provided with two flaps above the foxing-line, at which point they are separated some distance from each other, instead of meeting, as is usual, the change admitting of the flaps being widely opened for the admission of the foot.



259,166.

Claim.—1. A shoe provided with a side opening having the two parts or flaps B C, separated at the foxing-line and adapted to be opened respectively to the front and rear, with a tongue inside, substantially as described.

2. A shoe provided with a side opening having the two parts or flaps B C, separated at the foxing-line and adapted to be opened respectively to the front and rear, with a tongue-piece, A, extending up between the two flaps and connected at its front and rear edges to the respective edges of the said flaps and so as to fold inside the flaps, substantially as described.

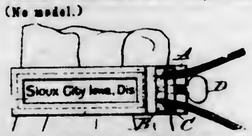
259,167. FEED-WATER HEATER. EDWARD KENDALL, Cambridgeport, Mass. Filed July 30, 1881. (No model.)

Claim.—1. The smoke-flue C, connected with a boiler and chimney, in combination with a series of water pipes arranged within said flue in positions to be acted upon by the hot gases in their passage to the chimney, a pump connected by its discharge-pipe with said series of pipes and adapted to force water through them, and a pipe or pipes leading from said series of heating-pipes to the interior of the boiler or other receptacle, substantially as described.

2. In combination with a steam-boiler, the smoke-flue C, connected with the boiler by a suitable passage, B, and provided with one or more doors, C′, a series of tubes located in said flue C and communicating with a single tube at each end located outside of said flue, a pump connected to one of said single tubes, a reservoir connected to the other of said single tubes, and a pipe leading from said reservoir to the interior of the boiler or other receptacle, substantially as described.

3. In combination with a steam-boiler, the reservoir D, the flue C, connected by a suitable passage with the boiler, a series of tubes arranged within the flue C in positions to be acted upon by the hot gases, a pump connected with and adapted to force water through said series of tubes, a pipe connecting said series of tubes with said reservoir, the pipes *i* and *k*, check-valve *l*, and globe valve or gate *o*, all arranged and adapted to operate substantially as described.

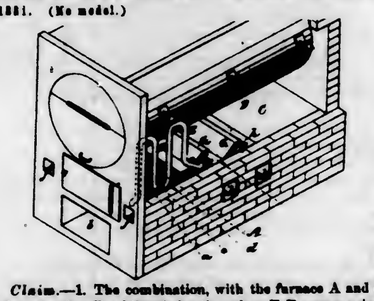
4. In combination with a steam-boiler, the flue C, connected with the boiler, a series of tubes located in said flue in positions to be acted upon by the hot gases in their passage to the chimney, a reservoir located at a higher level than the flue C, a pump connected with and adapted to force water through said series of heater-pipes, the pipes *h* and *m*, each connecting one end of said series of heater-pipes with said reservoir, and the check-valve *n*, all arranged and adapted to operate substantially as described, for the purposes specified.



5. The combination of the boiler A, flues B and C, the reservoir D, pump E, pipes *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *k*, and *m*, check-valves *l* and *n*, and globe valves or gate *j* and *o*, all arranged and adapted to operate substantially as and for the purposes described.

6. The combination of the boiler A, flues B and C, the reservoir D, pump E, pipes *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *k*, *m*, and *p*, the check-valves *l* and *n*, and the globe valves or gates *j* and *q*, all arranged and adapted to operate substantially as and for the purposes described.

7. In a feed-water heater, the combination of the flue C, a series of small tubes composed of parts *d*, *e*, and *f*, connected together by quarter-bends of elbow-pipes at right angles to each other, and suitable pipes connecting said heater-pipes with a source of water-supply and with a receptacle to receive the heated water, substantially as and for the purposes described.

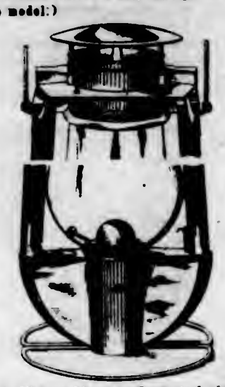


8. In a feed-water heater, the combination of a smoke-flue, a cluster or series of small tubes, each provided with one or more right-angled bends and arranged within said flue in positions to be acted upon by the hot gases in their passage to the chimney, a single supply-pipe of larger capacity connected with and adapted to supply water to each of the tubes in said cluster or series of small tubes, and a single discharge-pipe connected with and adapted to receive the water from each of said small tubes, substantially as described.

259,168. COMBINED MAIL-BAG FASTENER AND LABEL-HOLDER. JAMES L. KENNEDY, Sioux City, Iowa. Filed Feb. 16, 1882. (No model.)

Claim.—The combined tie-sack fastener and label-holder herein described, consisting of the slotted and recessed plate A, having the fixed bar or jaw B, movable jaw C, openings *f f*, formed through the plate between said jaws, set-screw D, adapted to open and close the jaws, and the perforated lug or projection E, all constructed and arranged as and for the purpose specified.

259,169. SMOKE AND GAS CONSUMING FURNACE. PETER KILBOY and JULIUS A. FLICK, Boston, Mass. Filed Dec. 23, 1881. (No model.)



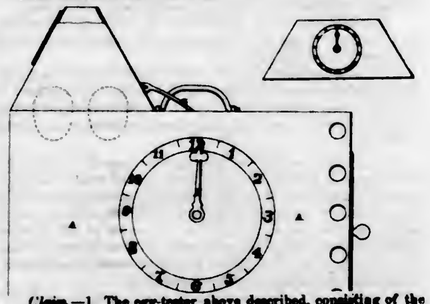
Claim.—1. The combination, with the furnace A and combustion-chamber D, of the air-heating pipes E E, communicating with the atmospheric air and arranged in a serpentine form within the furnace, and arranged on each side only thereof and in close proximity with its walls, and then extending backward in the rear thereof, and provided with transverse portions, *g*, extending across the flame-bed C, and having outlets or discharge-orifices *i*, through which the highly-heated air is emitted in jets or fine streams, so as to impinge upon and commingle with the smoke and gaseous products of combustion within the chamber D, all constructed and arranged to operate substantially in the manner and for the purpose set forth.

2. In a smoke and gas consuming furnace, the combination, with the removable air-superheating pipes E E, arranged as described, of the ledges *d*, projecting from the inner walls of the furnace A, and provided with grooves or recesses *e*, for receiving and supporting the bends of the pipes E, substantially as set forth.

3. In a smoke and gas consuming furnace, the combination, with the transverse perforated portions *g* of the pipes E, through which the superheated air is discharged into the combustion-chamber D, of the angular guards G, projecting rearwardly over the portions *g* of the pipes for the purpose of protecting them from the dust and cinders, and thereby preventing their air-apertures *i* from becoming clogged or obstructed, substantially as described.

259,170. LANTERN. CHARLES A. KIMBY, Meriden, Conn., assignor to Edward Miller & Co., same place. Filed Mar. 30, 1882. (No model.)

Claim.—1. The combination of a central wick-chamber, a surrounding air-chamber, a burner set into said wick-chamber, opening to said air-chamber, and tubes leading from above to conduct air to the said air-chamber, the space between said air-tubes and outer wall of the air-chamber inclosed to form an oil-fount at each side, communicating with the wick-chamber, substantially as described.

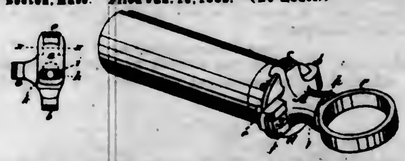


2. The combination of the central wick-chamber, surrounding air-chamber, a burner upon said wick-chamber, constructed to receive air from said chamber into the combustion-chamber and also into the chimney, and air-conducting tubes arranged to lead air from above downward and into said combustion-chamber, the space at each side between the outer wall of said air-chamber and the tubes inclosed to form an oil-fount communicating with the wick-chamber, substantially as described.

3. The combination of a central wick-chamber, a surrounding air-chamber, a burner set into said wick-chamber, and tubes leading from above to conduct air to the said air-chamber, the space between said air-tubes and outer wall of the air-chamber inclosed to form an oil-fount at each side, communicating with the wick-chamber, with an open base upon which the said parts rest, substantially as described.

4. The combination of a central wick-chamber, a surrounding air-chamber, a burner set into said wick-chamber, opening to said air-chamber, and tubes leading from above to conduct air to the said air-chamber, the space between said air-tubes and outer wall of the air-chamber inclosed to form an oil-fount at each side, communicating with the wick-chamber, with a base made from wire and upon which the parts rest, substantially as described.

5. In a lantern, the combination of the central wick-chamber, surrounding air-chamber, and tubes arranged to conduct air to the said air-chamber, with a fount constructed in wing-like projections on opposite sides of the air-chamber, substantially as described.

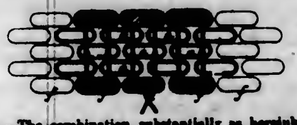


259,171. EGG-TESTER. WALLACE KIRKPATRICK, Adna, Ill. Filed Mar. 18, 1882. (Model.)

Claim.—1. The egg-tester above described, consisting of the combination of the frame having the perforated plate, upon which the eggs are placed, with a hinged dome made to close down over the eggs, and which dome has connected to it a dog and lever for operating a counting mechanism, substantially as shown.

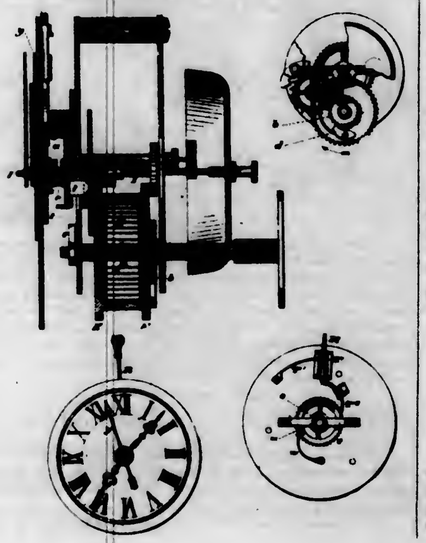
2. The egg-tester above described, consisting of the combination of the frame A, a lamp, B, a hinged dome which is to be closed down over the opening C, upon which the eggs are to be placed, a lever which is pivoted to the dome, a ratchet-wheel having connected to one end of its shaft an index-hand and at the other an arm or lever which operates the striker of the bell, substantially as described.

259,172. HAND CARTRIDGE-EXTRACTOR. DAVID KIRKWOOD, Boston, Mass. Filed Jan. 16, 1882. (No model.)



Claim.—1. In a hand cartridge-shell extractor, the combination, with one or more stationary hooked jaws, of an adjustable hooked jaw operated by an eccentric pin or projection, *i*, at the inner end of the stem *h* of the revolving handle C, working in a transverse slot in the adjustable jaw, substantially as set forth.

2. In a hand cartridge-shell extractor, the stock A, provided with a rotating handle, C, and having one or more stationary hooked jaws, in combination with the adjustable hooked jaw *e*, sliding on a guide, *g*, and having a slot, *h*, for the reception of an eccentric pin or projection, *i*, at the end of the stem *h* of the handle C, by which it is operated, substantially in the manner and for the purpose described.

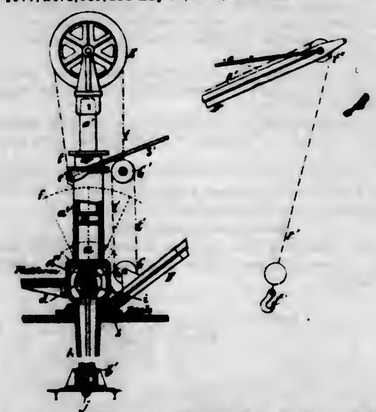


259,173. ORNAMENTAL CHAIN. HENRY KNICKMANN, East New York, N. Y. Filed Apr. 4, 1882. (No model.)

Brief.—The wires are twisted and bent into the grooves in the beads. The caps cover the beads and present a finished appearance.

Claim.—The combination, substantially as hereinbefore described, with the rings and the transverse wires for connecting said rings, of beads for retaining said wires, and of caps for covering the beads and the wires.

259,174. ALARM-CLOCK. EDMUND KUHN, New York, N. Y., assignor to the Jerome Clock Company, New Haven, Conn. Filed Jan. 9, 1882. (Model.)



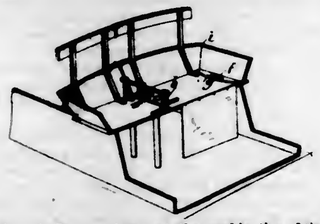
Claim.—1. In a combined time and alarm clock movement, the combination of the time main wheel and the alarm main wheel, both loose upon the main shaft, the mainspring, one end of which engages the time-wheel and the other the main shaft, a pawl and ratchet between said shaft and alarm main wheel, a stop, and mechanism, substantially such as described, between said stop and main shaft to cause said shaft to turn the said stop one point at each of the first two or more revolutions in winding, and a device to hold said stop during the completion of the winding, substantially as described.

2. In a combined time and alarm clock movement, the combination of the time main wheel and the alarm main wheel, both loose upon the main shaft, the mainspring, one end of which engages the time-wheel and the other the shaft, a pawl and ratchet between said shaft and main alarm-wheel, which permits the revolution of the shaft in one direction independent of the alarm-wheel, a finger attached to said main shaft and revolving with it, the toothed wheel *f*, constructed with a projection, *h*, and the spring-dog *i* substantially as described.

3. The combination of the toothed wheel *f*, arranged concentric with the hour-wheel and carrying the pointer, and also carrying the cam *e*, with the sliding rod R, provided with a finger, T², to engage the teeth of the wheel *f*, and mechanism, substantially such as described, between the said cam *e* and the alarm mechanism, substantially as and for the purpose described.

259,175. HYDRAULIC HOISTING MACHINERY. ALPHONSE LAPARDUS, Kensington, County of Middlesex, England. Filed May 11, 1881. (No model.) Patented in England May 25, 1877, No. 2,048, and May 25, 1880, No. 2,122.

Claim.—1. The combination, with the cylinder *a* and piston *c*, having its two sides of different area, of the valve *d*, pipes leading therefrom to said cylinder on both sides of said piston, and the valve *h* in the pipe leading to the cylinder on the side of the piston which is of smaller area, and adapted to be closed to allow liquid to escape from the cylinder on that side of the piston, or opened to permit the pressure to act on both sides of said piston, substantially as specified.



2. The combination of the cylinder *a*, the piston *c*, the extensible column *a'*, the sheave E, carried thereby, the valves *d h*, the boom or jib F, adapted to be adjusted around said column, the block G in the boom or jib, the cable *t*, passing over the sheave E, the movable block G', suspended by said cable, and the cable *t'*, rove upon the blocks G G', all substantially as specified.

259,176. GATE-HINGE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Mar. 28, 1882. (Model.)

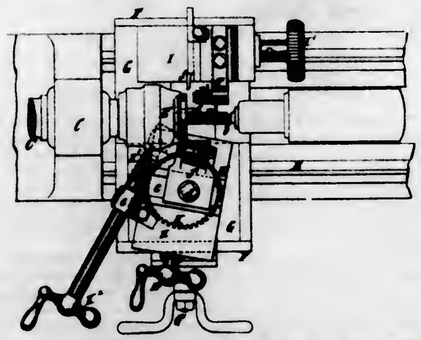
Claim.—A hinge leaf or wing consisting of a flat plate or strip of metal, having an eye adapted to set over the pintle of the opposite leaf, and two grasping-pieces, *c c*, extending at about right angles to the leaf proper and turned inwardly to grasp the batten, substantially as specified.

259,177. CARRIAGE-SEAT. PIERRE A. LARIVIERE, Ottawa Ontario, Canada. Filed Mar. 23, 1882. (No model.)

Claim.—1. In a carriage-seat, the combination of the stationary section and the movable section and connecting devices, substantially such as described, whereby the movable section is permitted to slide backward and subsequently turned upward, as set forth.

2. The combination of the stationary seat-section provided with the back-support, the movable seat-section, also provided with the back-support, and a sliding hinge-connection between the parts, substantially as shown, whereby the movable section is permitted to move backward and subsequently swing upward to a vertical position.

3. The combination of the stationary section, the sliding and swinging section, and a locking device, substantially such as shown, with which the movable section engages by a vertical motion.



4. In combination with the movable seat-section and its curtain, a lever and connecting-cords, as described and shown, whereby the curtain is automatically folded against the movable section as the latter is raised.

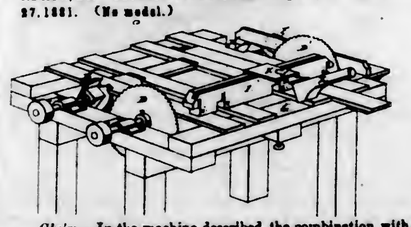
5. In combination with the stationary seat-section and the movable section, having a horizontal sliding and a vertical swinging movement, the flange or lip *i*.

6. The combination of the stationary and movable sections, arranged to operate as described, with the notched plate *g* and stud *f*.

7. In combination with the stationary section, the horizontal sliding and vertically-swinging section provided with the overlapping plate, as and for the purpose described.

259,178. MACHINE FOR FORMING SNAPS ON WATCH-COVERS. JACQUES LAURENT, Philadelphia, Pa. Filed Feb. 9, 1882. (No model.)

Claim.—1. The combination, with a chuck and spindle for holding and rotating a cover, of a compound rest carrying a roller for turning in the lip or rim of the cover, and a roller having a shoulder and a tapered portion of reduced diameter for upsetting and beveling such turned-in portion, said rest being organized so that said rollers can be separately applied to the cover, substantially as herein described.



2. The combination, with a chuck and spindle for holding and rotating a cover, of the rest G, the supplemental rests H I, the worm-wheel K and worm K', the roller J, and the roller P, all arranged and operating substantially as and for the purpose herein described.

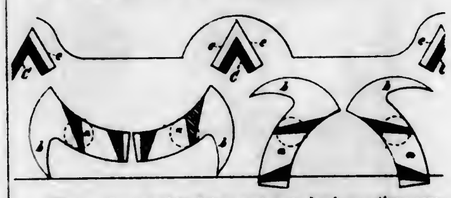
259,179. BRAKE-SHOE. SAMUEL B. LONG, Shallsburg, Pa. Filed Apr. 17, 1882. (No model.)

Claim.—The brake-shoe G, attached to the face-plate C, having pointed projections D, and brake block or beam A, by the clamp-bolts E E, united to the back plate, F, of the brake-beam, as shown and specified.

259,180. MACHINE FOR MAKING RAIL-PIECES FOR BUREAUS, &c. OSCAR LUPPERT, Williamsport, Pa. Filed Aug. 27, 1881. (No model.)

Claim.—In the machine described, the combination, with the cutter-heads E E', adjustable at any point on their mandrel, substantially as described and shown, of the saws D D', provided on each side of their centers with the elongated slots *d d*, whereby the said saws may be adjusted on the blades of said cutter-heads, substantially as described, shown, and for the purpose set forth.

259,181. ADHESIVE CEMENT FOR UNITING VENEERS AND OTHER FABRICS. WM. MARTIN, Baltimore, Md., assignor to George O. Manning and Joshua Lovering, Trustees, same place. Filed Nov. 3, 1881. (No specimens.)

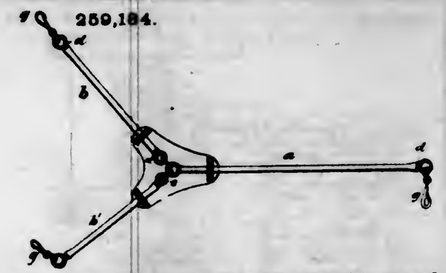


Claim.—The cement herein described, consisting of yellow-dip and tar, with or without diluents, substantially as set forth.

259,182. WATCH-OILER. WILLIAM W. MARTIN, Salem, Oreg. Filed Jan. 25, 1882. (Model.)

Claim.—A watch-oiler formed of the fountain A and hair-tube B, substantially as shown and described.

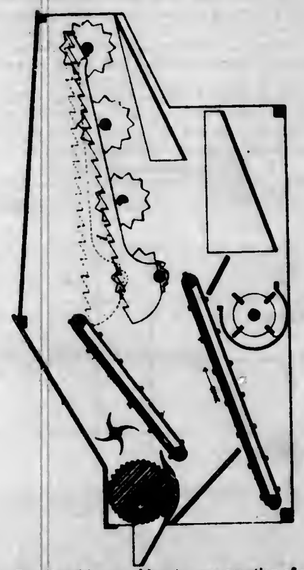
259,183. GRATE FOR RANGES. JOHN MARTIUS, Philadelphia, Pa., assignor to Charles Williams' Sons, same place. Filed Aug. 23, 1881. (No model.)



Claim.—In a combined two-part grate having sections composed of middle bars, *a*, which form a concave bed for holding the live coals, and end bars, *b*, concentric with the journals *c* of the sections, the combination, with said end bars, *b*, of intermediate cross-bars C, arranged as described, whereby as the middle bars, *a*, are turned downward for the discharge of the clinkers and are returned to their normal position the end bars turn freely under the live coals as they pass under the bars C, whereby the jamming of the coals is prevented, substantially as described.

259,184. HARNESS. CHARLES B. MATTHEWS, Newark, N. J. Filed Apr. 11, 1882. (No model.)

Claim.—1. A metallic backing-strap consisting of parts *a b b'*, adapted to be secured to the harness and to the pole-strap, and to receive a portion of the strain from the horse in the process of backing a vehicle, substantially as set forth.



2. In harness, the combination, with the pole-chain or pole and the breeching *k*, of the metallic backing-strap *a b b'*, arranged and operating substantially as set forth.

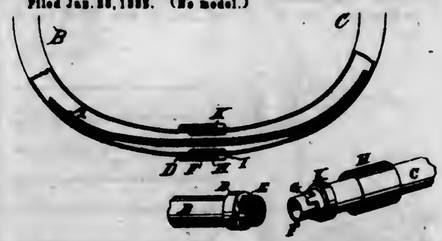
259,184.

3. As an improved article of manufacture, a backing-strap consisting of the parts *a b b'*, composed of the metallic core *d*, having a suitable covering, joined together at one end, and having means, as *g*, for securing the same to the horse's harness at the other, and having the belly-pad cover said portions, substantially as and for the purposes set forth.

259,185. THRASHING-MACHINE. HUGH W. MATTHEWS, Baltimore, Md. Filed Sept. 27, 1881. (No model.)

Claim.—In a thrashing-machine, the combination of a crank-shaft, separating-rakes, each having one end mounted on said crank-shaft, and rollers, mounted also on the crank-shaft, but concentric with the bearings of said shaft, the rakes and rollers being placed alternately, as set forth.

259,186. ELECTRIC PUSH-BUTTON. GEORGE C. MAYNARD, Washington, D. C. Filed Apr. 5, 1882. (No model.)



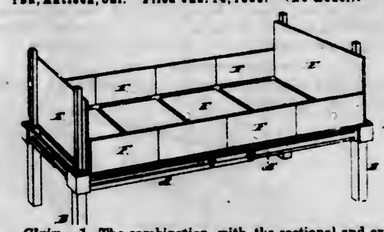
Claim.—1. The button B, countersunk centrally and on opposite sides, in combination with the core composed of the parts E G, screwed together, substantially as and for the purpose set forth.

2. In combination with the button B, constructed as described, and the core G E, made in two parts, and provided with the hollow head F, the interposed and concealed spiral spring H, having one end thereof arranged within the hollow head, substantially as and for the purpose set forth.

3. The bush A, provided with a central recess for the reception of the button B, and provided with screw-holes *b b* and wire conduits or channels *d d*, substantially as shown and described.

4. The bush A, constructed as described, in combination with the button B, adapted to cover and conceal the securing-screws of the bush, as hereinbefore set forth.

259,187. BRACELET. CHARLES MCINTIRE, Newark, N. J. Filed Jan. 28, 1882. (No model.)

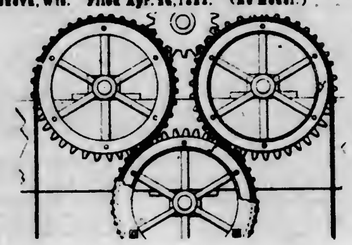


Claim.—1. In a bracelet, the combination of the section B, provided with the fixed collar D, and the section C, provided with the tube F and collar K, the spring A, and the slide H, having the flange I, adapted to slip onto the section C, so that the flange I shall engage the collar K, and the opposite end of said sleeve or slide be soldered fast to the collar K, all substantially as and for the purpose specified.

2. The combination of the section B, having the collar D and notch E, the section C, carrying the collar K and tube F, said tube supporting the stop-projection G, the slide H, with its flange I, and the spring A, all substantially as and for the purpose set forth.

259,188. HARNESS-OIL. EDGAR H. MCKIBBIN, Lathrop, Mo. Filed Apr. 19, 1882. (Specimens.)

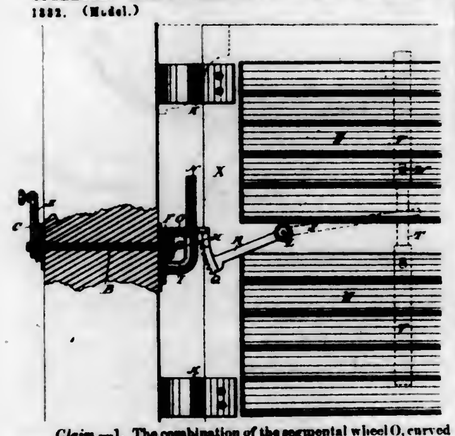
Claim.—The herein-described composition of matter to be used as a harness-oil, composed of gum-shellac, alcohol, fish-oil, West Virginia oil, lamp-black, spirits of turpentine, and coal-oil, in about the proportions as stated.



259,189. COMBINED BEDSTEAD, TABLE, &c. MARY A. MCMASTER, Antioch, Cal. Filed Jan. 14, 1882. (No model.)

Claim.—1. The combination, with the sectional and extensible legs B B' and the sectional and extensible rail-sections A A', of the rocker attachments C and the covering portion D, consisting of the main sections E, hinged together by their transverse edges, and the end sections, F, hinged to the ends of the main sections, substantially as specified.

2. The combination, with sectional and extensible leg-sections and sectional and extensible rail-sections, of the covering portion, consisting of main transverse sections hinged together and carrying hinged end sections, substantially as specified.

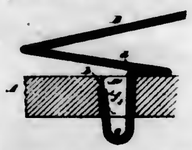


259,190. HOISTING APPARATUS. EDWARD B. MEATYARD, Geneva, Wis. Filed Apr. 24, 1882. (No model.)

Claim.—1. In hoisting machinery, in combination with a pinion and ropes, three or more friction-pulleys geared together by cog-rims, substantially as described and shown.

2. In hoisting machinery, in combination with a pinion, three or more spur-cog rims geared together and connected to friction-pulleys on one or both sides to move the ropes, substantially as set forth.

259,191. COMBINED SHUTTER-WORKER AND BLIND-SLAT OPERATOR. BELA G. MERRILL, Geneva, Wis. Filed Apr. 7, 1882. (Model.)



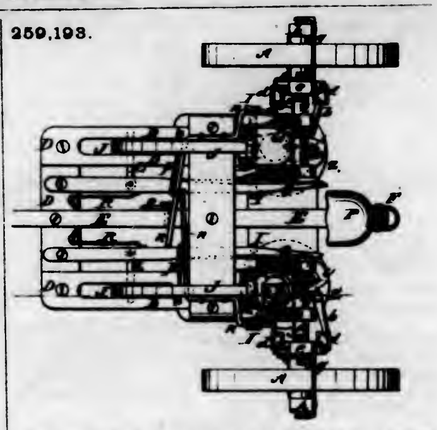
Claim.—1. The combination of the segmental wheel O, curved pintle H, toothed arc Q, slat-opening lever R S, and slat-operator T, with the blind and blind opening and closing crank C, shaft B, and pinions F G, substantially as specified.

2. The combination, with the shaft B, provided with the pinions F G, and the curved pintle H, of the sliding segmental wheel O, provided with the toothed arc Q, and the means, substantially herein shown and described, for connecting the said wheel to the blind and slats, as and for the purpose set forth.

3. The curved pintle H, having feather N, in combination with segmental wheel O, having notch P, and connected to slat-operating crank by toothed arc Q, substantially as specified.

259,192. BED-SPRING. GEORGE S. HOCK, Lebanon, Ky. Filed Apr. 24, 1882. (No model.)

Claim.—1. In combination with a bed-slat provided with a shouldered slot, a bed-spring provided with a resilient loop, having a shoulder or shoulders constructed thereon, the shoulders of the slat and loop engaging with each other and forming a lock, substantially as described.



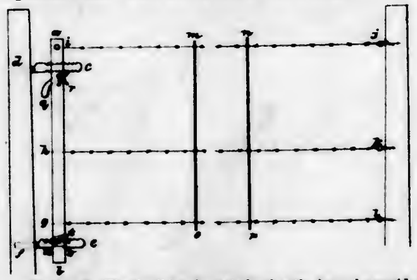
2. In combination with slat A, having slots *a* cut therein, and provided with shoulder or shoulders *b*, a bed-spring, B, having a protruding resilient loop, *c*, constructed therein, and provided with locking shoulder or shoulders *f*, substantially as described.

259,193. CHECK-ROW CORN-PLANTER. JOSEPH MORAVA, Castle Rock, Wis. Filed July 18, 1881. (Model.)

Claim.—1. In a corn-planter, the combination, with the carriage A B C D, of the tubular seed-boxes G, having flanges H, the curved bars J, having series of perforations M and N, the shoes K, the hinging-pins I, and the fastening-pins L, substantially as herein shown and described, whereby the shoes can be adjusted to plant the seed at any desired depth in the ground, and can be readily raised from the ground, as set forth.

2. In a corn-planter, the combination, with the shoes K, provided with seed-apertures S, seed-boxes G, mounted on said shoes, slides U, rings Z, spring-pressed bars Y, pivoted to the rings Z at one end and the seed-slides near their opposite ends, and arms *b*, pivoted to the bars Y, of the wheels A, cross-bars *c*, adjustable trip-

259,193.



rods *d*, catch-wheels *i*, and spring-pressed catch-levers *j*, substantially as described, and for the purpose set forth.

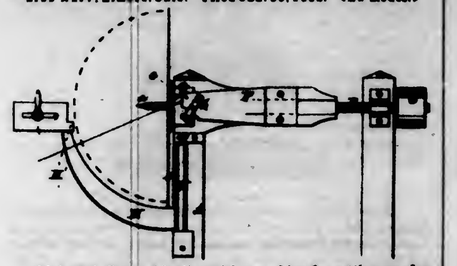
3. The combination, with the cross-bar *c*, provided with the adjustable trip-rod *d*, seed-box G, and seed-slide U, of the spring-pressed bar Y, pivoted to the seed-slide, and arm *b*, pivoted to the bar Y, and provided with a stop, *b'*, whereby the bar Y is guarded from breakage should the wheel A be turned backward, substantially as described.

4. The combination of the seed-slide U, bar Y, pivoted thereto, arm *b*, pivoted to the bar Y, and provided with the stop *b'*, cross-bar *c*, catch-wheel *i*, and catch-levers *j l*, having arms *m*, and holding-levers *n*, substantially as described, and for the purpose set forth.

259,194. FLEXIBLE WIRE GATE. ANDREW T. MORROW, Tonganoxie, Kans. Filed Feb. 20, 1882. (No model.)

Claim.—1. The flexible wire gate having the bar *a b*, provided with an upper and a lower adjustable fastening device, substantially as shown and described, whereby the upper and lower wires may be equally stretched, and expansion of the wires and change in the relative positions of the gate-posts may be corrected.

2. The combination, with the gate-post having a lower latching device, of the upper catch, *c d*, having ratchet-teeth, and the latch *r s q* and the bar *a b*, substantially as shown and described.



3. The combination, with the gate-post having an upper latching device, of the lower catch, *e f*, having retreating notches, and the stay-straps *e*, bolts *t* and *u*, and bar *a b*, substantially as shown and described.

259,195. DOOR-MAT FRAME. WILLIAM HENRY MULLER, Sowinkley, Pa. Filed Apr. 1, 1882. (No model.)

Claim.—As a new article of manufacture, a mat-frame consisting of the body A, provided with a scraper, *s*, and dirt-pan B, in combination with the inverted-V-shaped strip C, all constructed to operate substantially as and for the purpose set forth.

259,196. MACHINE FOR MAKING WOODEN BOWLS. CORNELIUS MEPP, Elmore, Ohio. Filed Jan. 23, 1882. (No model.)

Claim.—1. In combination with a machine for cutting wooden bowls, a crane provided with an arm tapering from the upper to its lower edge and carrying a cutting-tool, substantially as and for the purpose described.

2. In combination with the revolving spindle, the arm F and the arm H, provided with an adjustable brace-rest adapted to form a support for the said arm in a vertical and horizontal direction, said arms swinging from a common axis of motion, substantially as and for the purpose specified.

3. In combination with a machine for making wooden bowls, a facing-tool consisting of an arm, K, provided with a series of cutters arranged obliquely in the plane of the said arm, and having pivotal studs, whereby it is adjusted in the machine for operating in the manner as described, and for the purpose specified.

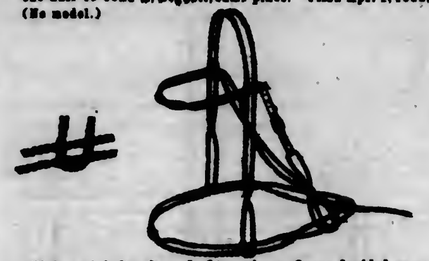
259,197. CORN-HUSKER. JACOB NIXON, Winfield, Kans. Filed Apr. 21, 1882. (No model.)

Claim.—A corn-husking implement consisting of a spiral pin, A, and the hooks B C, having flat inner surfaces, *d d*, flanges *c c*, and outwardly-bent ends *b b*, substantially as set forth.

259,198. PAPER BAG. HERBERT R. OLIVER, Baltimore, Md. Filed Mar. 22, 1882. (No model.)

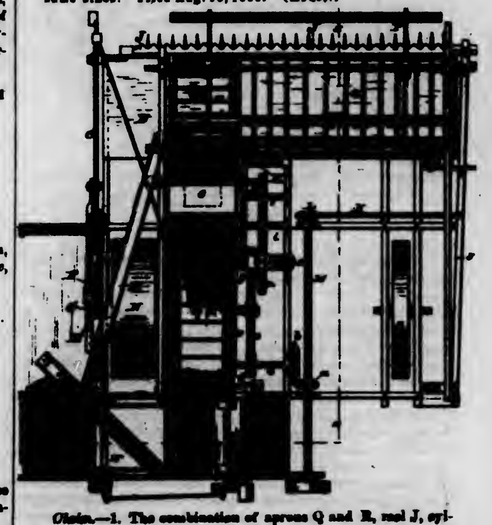
Claim.—1. A paper bag having a fastening or securing device adjustable in position with reference to the end of the bag, substantially as specified.

2. A paper bag having a longitudinal flexible guide for a fastening device, whereby the position of the said fastener may be changed to suit the quantity of material placed in the said bag, substantially as specified.



259,199. FRICTION-CLUTCH. JOHN H. OSBORN, Cleveland, Ohio. Filed May 4, 1882. (No model.)

Claim.—1. In combination with the shell A and shaft or spindle, the plate D, divided ring, and lever interposed between the ends of said ring and having its axis of vibration or fulcrum within the ring, and the contact of the ends of the ring with the lever at differential lengths from the said axis of vibration, substantially as set forth, and for the purpose specified.



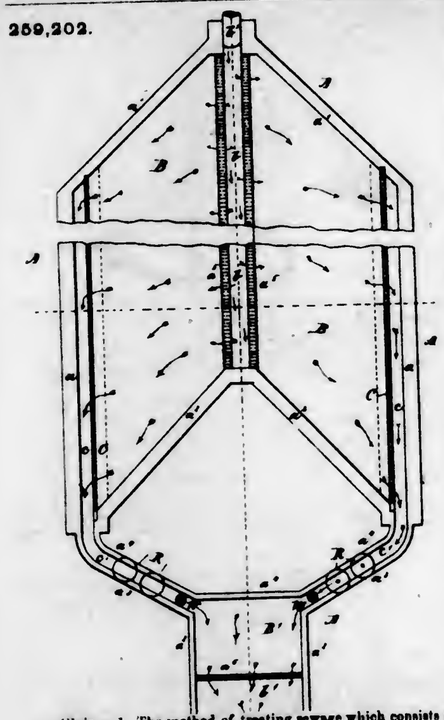
2. In a friction-clutch, a spring-ring with a lever, G, pivoted at one end and interposed between the free ends of said spring, in combination with the spring *c*, inclosed within the shell A, and plate, arranged substantially as and for the purpose set forth.

259,200. HALTER. ENOCH OSTRUM, Galva, Ill., assignor of one-half to John A. Bogsell, same place. Filed Apr. 1, 1882. (No model.)

Claim.—A halter formed of two pieces of rope doubled upon themselves and intertwined, as described and shown, to form cheek-pieces, crown-piece, brow-piece, throat-latch, and nose-piece, with rear loops passed through a loop on the throat-latch, and adapted to receive the hitching-strap, substantially as and for the purpose specified.

259,201. COMBINED HEADER AND THRASHER. WILLIAM H. PARRISH, Salem, Oreg., assignor of one-half to Geo. E. Aiken, same place. Filed Aug. 19, 1880. (Model.)

Claim.—1. The combination of aprons Q and R, reel J, cylinder O, trough I, roller H, located at one side and to the front of trough I, and grain-board A, at the other side of said trough and along the outer edge of apron R, whereby the grain is prevented from catching at the turn and is directed evenly to the cylinder O, substantially as set forth.



2. The combination of pole C, hinged to the side of the machine, the lever E F, jointed to said pole at its rear end, and provided with a spring-detent and a device for the detent to engage with, whereby the pitch of the machine may be adjusted, substantially as set forth.

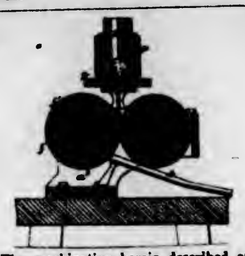
3. The combination of the pole C, lever E F, notched bar G, connected at one end to pole C, and a spring-detent to engage with said bar, substantially as and for the purpose specified.

4. The combination of trough I, a separator at the top of and at right angles to said trough, a platform, U, located in the angle formed by said trough and separator, trough V, for delivering the grain from the separator to the platform, and pole C, pivoted or hinged to the front and side of the machine, and at its rear end to lever E F, whereby the operator will be within reach of the said several parts, substantially as set forth.

259,202. METHOD OF AND MEANS FOR TREATING SEWAGE. FRIEDRICH PEVAL, Berlin, Germany. Filed Dec. 9, 1881. (No model.) Patented in Belgium Dec. 9, 1881, No. 53,644; in France Dec. 9, 1881, No. 146,370; in England Dec. 9, 1881, No. 5,899, and in Italy Dec. 31, 1881, XXVII, No. 179.

259,202.

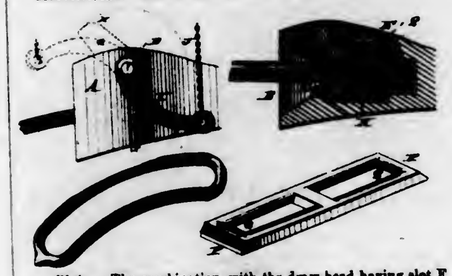
Claim.—1. The method of treating sewage which consists in the following successive steps; first, eliminating solid substances therefrom; second, passing it through a filtering and absorbent material composed of a porous or cellulose substance, such as described; third, subjecting the liquid so treated to a second filtering operation; fourth, acidulating the filtered liquid; fifth, neutralizing or eliminating the acid from the liquid; and, lastly, eliminating therefrom the neutralizing or acid-eliminating agent, substantially as described.



2. The method of treating sewage which consists in the following consecutive steps: first, eliminating therefrom the solid substances; second, passing the liquid through an absorbent filtering and antiseptic material, such as a porous or cellulose substance incorporated with antiseptic substances, as described; third, preventing fermentation of the absorbent material and binding the ammoniacal emanations by means of carbolic or analogous acid and potassium sulphate incorporated with substances such as described and applied as set forth; fourth, filtering the liquid a second time; fifth, acidulating the filtered liquid, or mixing therewith an alcohol chloride, as described; sixth, eliminating or neutralizing the acid or chloride; and, finally, eliminating the neutralizing agent by filtration, substantially as and for the purpose specified.

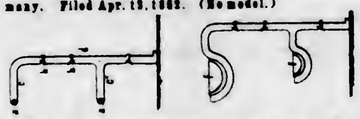
3. The herein-described plant, composed of a main basin, B, divided longitudinally by perforated walls or their equivalent to form the channel *b*, and by filter-walls C C, to form the channels *c c*, in combination with the auxiliary basin B' *b'* and channels *c' c'*, constructed and arranged for operation substantially as and for the purpose specified.

4. The combination, with the channels *c' c'* of the plant A, of the reservoirs R R, constructed and arranged for operation substantially as and for the purpose specified.



5. The combination, with the channels *c' c'* of the plant A and the reservoirs R R, of the water-wheels W W, all constructed and arranged for operation substantially as and for the purpose specified.

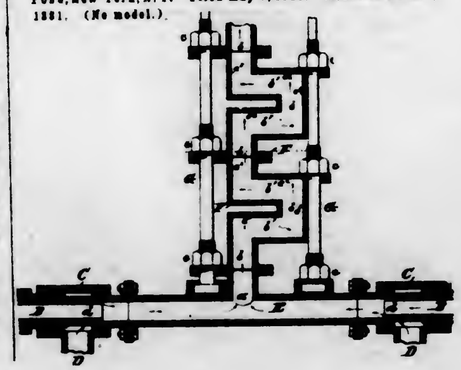
259,203.



Claim.—The combination herein described of the recessed molding-disk *f* with the plain-edged pressure-disk *g*, and with mechanism for imparting intermittent motion to said disks, as specified.

259,204. CAR-COUPLING. ALEXANDER H. PICKEL, Carpentersville, Ind. Filed Mar. 31, 1882. (No model.)

Claim.—The combination, with the draw-head having slot F and provided in its bottom with the transverse plate I, having its front and rear edges, M N, beveled downwardly, as shown, of the transverse shaft D, on which is rigidly but removably fixed the coupling-pin G, having the outwardly and rearwardly curved lever I, as shown, and for the purpose specified.



259,205. BARBED-WIRE FENCE. CARL PIEPER, Berlin, Germany. Filed Apr. 13, 1882. (No model.)

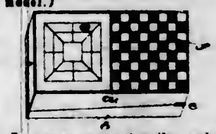
Claim.—1. The combination, with a barbed-wire fence, of one or more smooth guard-wires, *a*, fixed to an arm or arms projecting laterally from the fence-posts, substantially as and for the purpose described.

2. The combination, with a barbed-wire fence, the posts of which are provided with a laterally-projecting arm or arms carrying the wire or wires *a*, of one or more watering-troughs, *f f*, supported by the said arm or arms, as hereinbefore described.

259,206. REDUCING WOOD, &c., TO FIBER. GOLDSBURY H. PORE, New York, N. Y. Filed May 7, 1881. Renewed Nov. 17, 1881. (No model.)

259,208. APPARATUS FOR MOULDING FANCY ARTICLES IN GLASS, CRYSTAL, &c. CHAS. CASTOR PICARD, Paris, France. Filed Feb. 8, 1882. (No model.) Patented in France Dec. 23, 1881; in Belgium Jan. 10, 1882, and in England Jan. 10, 1882, No. 126.

Claim.—1. The herein-described process of disintegrating or reducing to fiber wood and other materials, which consists in forcing or impelling the materials to be disintegrated against a series of deflections or obstructions, arranged in a pipe or passage, by means of a jet of steam, the passage being so contracted as to prevent the lateral expansion of the jet, substantially as set forth.



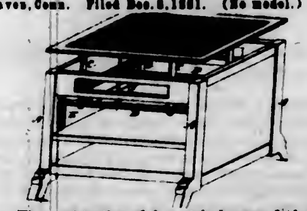
2. An apparatus for disintegrating and reducing to fiber wood and other materials, comprising a pipe with internal obstructions or deflectors and a steam-injector connected therewith, whereby the substance to be reduced is impelled with violence successively against said obstructions, the said pipe being of substantially the same size as the steam-pipe throughout, whereby lateral expansion of the steam is prevented, substantially as set forth.

3. An apparatus for disintegrating and reducing to fiber wood and other materials, comprising a pipe or tube of substantially uniform diameter throughout, and its bore made up of sections arranged at an angle to each other, so as to offer impinging and deflecting surfaces, and a steam-injector arranged to impel and force the materials through the said angular pipe or tube, substantially as set forth.

4. The combination, to form an apparatus for disintegrating and reducing to fiber wood and other materials, of a pipe, F, made up of sections forming an angular passage, *b b'*, an injector-chamber, C, connected with pipe E, a steam-jet pipe, D, connected with said chamber C, and a pipe, E, to lead the materials to the injecting-point *d*, substantially as set forth.

5. The combination, to form an apparatus for disintegrating wood and reducing it to fiber, of the hopper A, pipes B B, injector-chambers C C, steam-jet pipes D D, pipe E, having a lateral outlet, *e*, and the pipe F, provided with obstructions or deflectors, all arranged to operate substantially as and for the purposes set forth.

259,207. GAME APPARATUS. HENRY H. POOR, Franklin, Mass., assignor to James H. Mason, same place. Filed Apr. 1, 1882. (No model.)



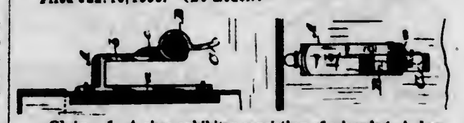
Claim.—1. In a game apparatus, the main box or case, consisting of two portions, *a b*, adapted, when opened, to form an alley, and having their sides marked with diagrams, as described, for different games, in combination with a box for containing the removable devices employed in the games, and means to secure the same in the interior of the main box or case when closed, substantially as described.

2. The main box consisting of two portions hinged together, and provided on its outside with diagrams of games to be played thereon when closed, and adapted, when opened, to form an alley, combined with removable bridge-piece *i*, pockets *l*, and the spring-gun *k*, substantially as described.

3. The alley *g*, provided with the pivotal socket, combined with the segments and elastic band *p*, and the spring-gun, adapted to be held pointing in any desired direction by the said band, substantially as described.

4. In a game apparatus, the ball-propelling gun, it consisting of the main chambered portion or barrel of the gun, with the plunger, breech-piece, and spring, and the guide-rod *v*, connected with the said breech-piece, and trigger, adapted to engage the said guide-rod, substantially as described.

259,208. ADJUSTABLE STOOL, TABLE, &c. JOHN PURSELL, New Haven, Conn. Filed Dec. 8, 1881. (No model.)



Claim.—The combination of the notched grooved plates E on the supports, the top B, and the vertical rods C C, hinged to the under side of the said top, and extending down through guides in the supports, with a stud or projection from the said rods into said notched grooves, which work up and down through the grooves, but engage with the notches, substantially as and for the purpose described.

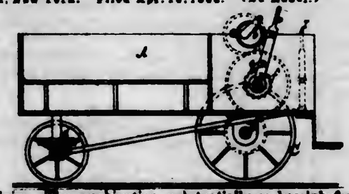
259,209. TRAVELER FOR SAILS. JACOB RAND, Boston, Mass. Filed Feb. 25, 1882. (No model.)

Claim.—The cylindrical head D, having a cylindrical projection or axle, *c*, at right angles thereto, which projection or axle is surrounded by an anti-friction collar or roller, *d*, and has arms *f* outside of said collar, for attachment to the sail, which serve as a means for retaining the collar in place, substantially as and for the purpose set forth.

259,210. SHOE-EXHIBITOR. DAVID J. REX, Pittsburg, Pa. Filed Jan. 16, 1882. (No model.)

Claim.—1. A shoe-exhibitor consisting of a bracket, A, having a bed-piece, *a*, an angular projection, *b*, with lug *c*, in combination with the cam-lever B, substantially as shown.

2. In a clamping device for exhibiting shoes, the combination, with a bracket, A, having bed-piece *a*, angular projection *b*, and lug *c*, of the cam or eccentric lever B, provided with finger-bar C, substantially as shown and herein specified.



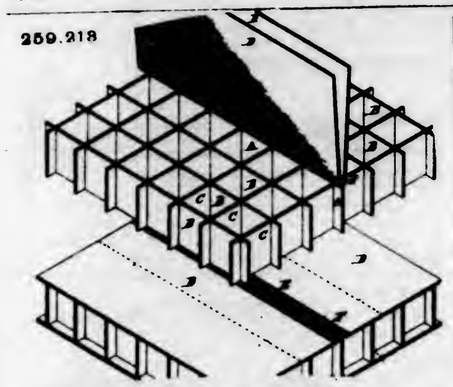
3. A clamping device for exhibiting shoes, consisting of a bracket provided with an angular projection and a lug, in combination with a cam-lever arranged substantially as specified.

259,211. WORK-BENCH ATTACHMENT. JONATHAN B. RICHARDS, Wager, Ark. Filed Mar. 14, 1882. (No model.)

Claim.—1. The combination of the frame A, having the lip *a* at its upper end, the saddle *b* at its lower end, and parallel bars having grooves *f* and teeth *g*, the sliding block B, carrying the pivoted pawl F and pins H I, and the bench D, grooved to receive lip *a*, and having rail J upwardly convexed to receive saddle *b*, as and for the purpose specified.

2. The frame A, formed with the holes *j*, in combination with the elevated support J, formed of the sleeve *k*, provided with the arm *k'*, and the adjustable T-bar *l*, substantially as described.

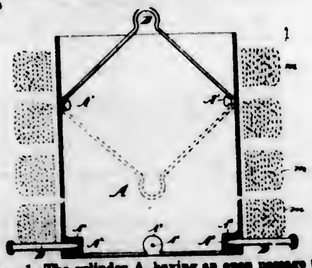
259,212. VELOCIPEDE. JULIUS RICHTER, Union Hill, N. J., assignor, by direct and mesne assignments, to George F. Freedman, New York. Filed Apr. 13, 1882. (No model.)



Claim.—The combination, substantially as hereinbefore described, of the body A, the axle D, the driving-wheels C C, mounted firmly on this axle, the crank-shaft E, which is geared together with the axle D, the eccentrics mounted on the crank-shaft, the lever-pawls detachably connected to said eccentrics, and the ratchet-wheels mounted on an intermediate shaft which is geared together with the axle D.

259,213. EGG-CARRIER. GEORGE T. RIDDLE, St. Louis, Mo. Filed Feb. 28, 1882. (No model.)

Claim.—1. An egg-carrier tray having cells open at bottom.

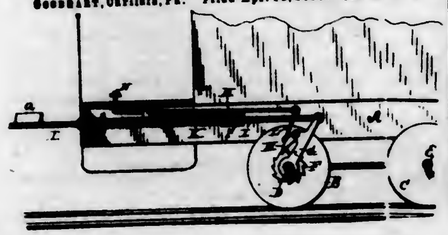


259,213

and provided with flaps D D, secured to the middle strip and adapted to form the bottom of another tray above, and when raised forming a handle by which the tray can be lifted away from the eggs, as set forth.

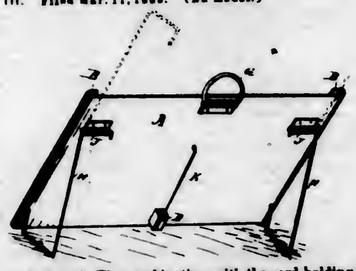
2. An egg-carrier tray consisting of strips B C, forming cells open at bottom, thick strip A, supporting the strips B C, the flaps D, and ties F, the flaps adapted to form a cover of the tray, or a bottom to another tray located thereon, and furnishing means for lifting the tray away from the eggs, as set forth, and the ties securing the flaps and strips to the thick strip A.

259,214. MEANS FOR HOLDING AND TRANSPORTING WIRE. HENRY ROBERTS, Pittsburg, Pa. Filed Apr. 27, 1882. (No model.)



Claim.—1. The cylinder A, having an open passage through its interior, a smooth exterior, and an interior ball, B, in combination with the removable support or supports D, adapted to serve relatively to each other and to the coils of wire m, substantially as and for the purposes herein specified.

2. The cylinder A, having its interior open quite through, to facilitate heating and cooling, in combination with the removable support or supports D, to receive and discharge the wire coils m, as herein specified.



3. The cylinder A, with an ample passage through its interior, internal projections, A', to engage an internal ball, hollow reinforces A^2, and internal bottom rim, A^3, in combination with a hinged ball, B, extending across the interior, and having a quick bend at its center, and with pins D, adapted for ready withdrawal, all arranged to serve relatively to each other and to a series of coils of wire, m, as herein set forth.

259,215. CAR-STARTER. JACOB B. RUDDER and ALEXANDER GOODHART, Carlisle, Pa. Filed Apr. 13, 1882. (No model.)

Claim.—The frame A, wheel B, and axle D, provided with ratchet F and lever G, in combination with the pawl H, rod I, and foot-lever M N, as and for the purpose set forth.

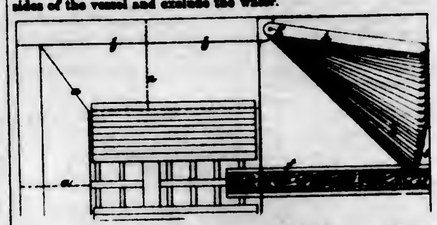
259,216. SHOW-CARD HOLDER. WILLIAM C. REED, Quincy, Ill. Filed Mar. 11, 1882. (No model.)

Claim.—1. The combination, with the card-holding frame or plate A, provided with grooved flanges B, of the loop or socket D, the standard E, and the base F, substantially as herein shown and described, for the purpose set forth.

2. The combination, with the card-holding plate or frame A, of the loop or socket D, and the pivoted bent hooks H H, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the card-holding frame A, of the loop or socket D, the pivoted hooks H, and the pin K, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the card-holding frame A, of the loop or socket D, the pivoted hooks H, the pin K, and the ring G, substantially as herein shown and described, and for the purpose set forth.

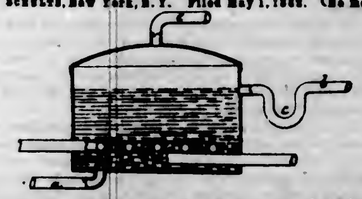


259,217. CHECKERS OR DRAUGHTS. FREDERICK SANDERSON, Friendville, Nebr. Filed Mar. 6, 1882. (No model.)

Claim.—A checker having an annular groove or recess, C, and a central knob, D, on its upper surface, and a socket, E, on its lower surface, the knob of one checker being adapted to fit closely in the socket of another, as and for the purpose described.

259,218. COFFER-DAM. RICHARD P. C. SANDERSON, New York, N. Y. Filed Feb. 4, 1882. (No model.)

Brief.—Independently-swinging arms, the outer ends of which are pivoted to the sides of the coffer-dam, serve to close against the sides of the vessel and exclude the water.

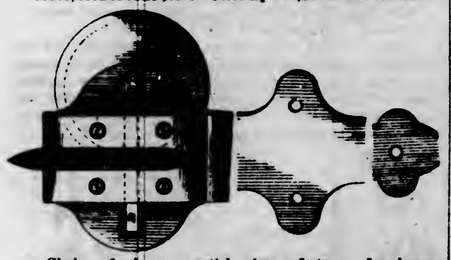


Claim.—1. The combination, with a coffer-dam adapted to receive the stem or stern of a vessel, of an upright series of arms or bars hinged at one end to the coffer-dam by an upright pivot or pivots, and adapted to be swung horizontally on their pivot or pivots independently of each other to bring their opposite ends against the side of the vessel, substantially as specified.

2. The combination, with the coffer-dam B, of two series of arms or bars, A, hinged at their outer ends to the sides of the coffer-dam, and adapted to swing horizontally independently of each other, the said arms or bars being of such length that when swung inward against the sides of a vessel they will be diagonal or oblique to the length of the vessel, substantially as and for the purpose specified.

3. The combination, with a coffer-dam adapted to receive the stem or stern of a vessel, of an upright series of separately-adjustable arms or bars arranged at each side of the coffer-dam, and adapted to have their ends brought against the sides of a vessel, and a covering of canvas, rubber, or other material applied to the outer sides of said arms or bars, substantially as and for the purpose specified.

4. The combination, with a coffer-dam comprising water-tight compartments and provided at each side with an upright series of separately-adjustable arms or bars, of valves for allowing water to flow from the inside of the coffer-dam into said compartments, substantially as and for the purpose specified.



259,219. PROCESS OF COLLECTING AND UTILIZING CARBONIC-ACID GAS FROM ACIDULOUS SPRINGS. CARL H. SCHULTZ, New York, N. Y. Filed May 1, 1882. (No model.)

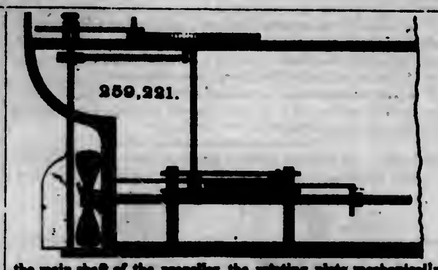
Claim.—1. The within-described process of obtaining carbonic-acid gas from acidulous mineral springs by expelling from such water the carbonic-acid gas by the action of heat and collecting such gas in a suitable gas-holder, substantially as and for the purpose set forth.

2. The within-described method of impregnating mineral waters with carbonic-acid gas, which consists in first driving out the said gas from the water either in the spring or already collected therefrom by the action of heat applied to such water, and then forcing the gas so collected into a quantity of water taken directly from the same source.

259,220. DOOR-HANGER. ALFRED L. SCRANTON, Rochelle, Ill., assignor of one-half to A. Herbert Scranton and Ada S. Jones, both of same place. Filed Apr. 13, 1882. (No model.)

Claim.—1. As a new article of manufacture, a door-hanger provided with bearing-pieces removably secured to the inner sides of the hanger, and having oblong slots therein, and a roller provided with spindles adapted to bear in said slots, substantially as set forth.

2. The combination, with a curved door-hanger, of bearing-pieces provided with oblong slots and adapted to be removably secured by screws between the opposite vertical portions of the hanger, and a roller whose spindles are adapted to bear in the slots of said bearing-pieces, substantially as set forth.



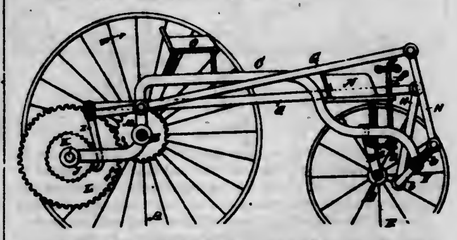
259,221. AUTOMATIC TOY. JOHN E. SELDEN, Hattenwan, N. Y. Filed Apr. 24, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the main shaft of the propeller, the rotating plate impelled thereby, and the movable arm receiving motion from the plate during a determinate portion of the revolution of the latter.

2. The combination, substantially as hereinbefore set forth, of the main shaft of the propeller, the rotating plate impelled thereby, the movable arm, and means, substantially such as described, for adjusting the length of said arm.

3. The combination, substantially as hereinbefore set forth, of the rudder, the tiller, the main shaft of the propeller, and mechanism, substantially such as described, for communicating motion from said shaft to the tiller during a determinate period.

4. The combination, substantially as hereinbefore set forth, of



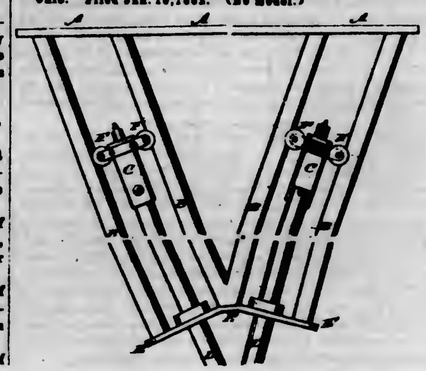
259,221.

the main shaft of the propeller, the rotating plate mechanically connected therewith, the pin or pins upon said disk, and the tiller projecting into the path of the pin or pins upon the rotating disk.

5. The combination, substantially as hereinbefore set forth, of the rudder, the tiller, and the yielding springs for restoring the tiller to its normal position after having been acted upon by the steering mechanism.

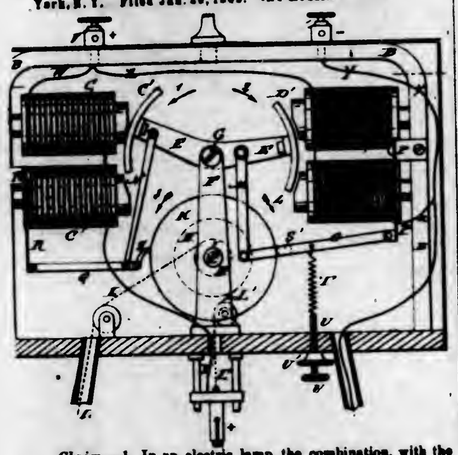
6. The combination, substantially as hereinbefore set forth, of the main shaft of the propeller, the rotating plate mechanically connected therewith, the movable pin or pins upon said plate, and the movable arm or tiller.

259,222. VELOCIPEDE. CYRUS SHELBURNE, Johnson City, Tenn. Filed Mar. 26, 1882. (No model.)



Claim.—1. In a velocipede, the combination, with the driving-wheel shaft, of cog-wheels and ratchet-wheels for rotating the same, rocking levers and pawls for acting on these ratchet and cog wheels, and a crank-shaft provided with treadles and connected with the rocking levers by means of pivoted connecting-bars, substantially as herein shown and described, and for the purpose set forth.

2. In a velocipede, the combination, with the driving-wheel shaft B, of the cog-wheels L and M, the ratchet-wheels J, the pawls I, the rocking levers G, the connecting-bars H, and the crank treadle-shaft F, substantially as herein shown and described, and for the purpose set forth.



3. In a velocipede, the combination, with the front and rear axle, D B, and the side bars, C, extended beyond the said axles, of the cog-wheels L M, the ratchet-wheels J, the pawls I, the rocking levers G, the connecting-bars H, and the crank treadle-shaft F, substantially as and for the purpose set forth.

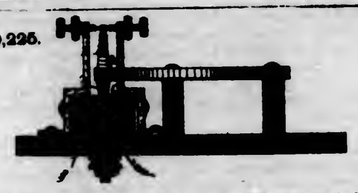
259,223. ELECTRIC LAMP. HENRY B. SHERIDAN, Cleveland, Ohio. Filed Jan. 10, 1882. (No model.)

Claim.—In an electric lamp, the combination, with the base-plate A, the inclined guides B, and the angular plate E, provided with apertures lined with insulating material, of the carbon-holders C, having the ends of their top plate slotted, and the rollers F, of non-conducting material, pivoted with the said slots, and having their faces grooved to fit upon the said guides, substantially as and for the purpose set forth.

259,224. ELECTRIC LAMP. HENRY B. SHERIDAN, Cleveland, Ohio, assignor to the Sheridan Electric Light Company, New York, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—1. In an electric lamp, the combination, with the lever E, carrying the armatures C' D', and interposed between the low-resistance coils C and the high-resistance coils D, and the toothed wheel K, rigidly connected with the cone-pulley H, carrying the carbon-supporting chains L L', of the pivoted connecting-bar M and the lever O, fulcrumed to a spring, P, and having a fixed pawl, S, substantially as herein shown and described, whereby the passage of an electric current through the coils of the low-resistance magnet will separate the carbons to form the voltaic arc, as set forth.

2. In an electric lamp, the combination, with the lever E, carrying the armatures C' D', and interposed between the low-resistance coils C and the high-resistance coils D, the toothed wheel K, rigidly connected with the cone-pulley H, carrying the carbon-supporting chains L L', the pivoted connecting-bar M, and the lever O, fulcrumed to the spring P and having fixed pawl S', of the pivoted connecting-bar N and the lever Q, pivoted to a spring, R, and having a pivoted pawl, S, substantially as herein shown and described, whereby the passage of an electric current through the coils of the high-resistance magnet will move the carbons toward each other after being separated by combustion, as set forth.



3. In an electric lamp, the combination, with the lever E, carrying the armatures C' D', and interposed between the low-resistance magnet C and the high-resistance magnet D, the connecting-bar M, and the lever O, of the spiral spring T and its adjusting-screw U, substantially as herein shown and described, whereby the resistance of the lever to the action of the electric current passing through the low-resistance coils is regulated, as set forth.

4. In an electric lamp, the curved armatures C' D', and the bent lever E, to which they are attached, in combination with the high and low resistance magnets C D, having concaved ends for operating the arc-regulating mechanism, substantially as specified.

259,225. TELEGRAPHIC RECEIVING-INSTRUMENT. GERRITT SMITH, Astoria, N. Y. Filed Feb. 20, 1882. (No model.)

Brief.—The relay-coil is in the main line, and has a core adapted to be rotated by clock-work or other mechanism. The armature-lever is made of non-magnetic material, and has attached to opposite sides a pair of small steel arms, which bear upon the face of the revolving core. These steel arms play vertically with the armature-lever in notches made in the opposite poles of a permanent magnet, and hence are permanently polarized, one plus and the other minus. As long as no current is passing through the coil there is no tendency for the armature to vibrate; but a current of one polarity attracts one of the steel arms and repels the other, and vice versa when a reverse current is sent, in which events the revolving-core carries the armature in opposite directions.

259,226.

Claim.—1. The combination, substantially as hereinbefore set forth, of a permanent magnet and two mechanically-united polarized armatures, which latter are maintained in permanent frictional contact with a moving surface of magnetic metal, and receive unlike polarity by induction from the respective poles of the permanent magnet.

2. The combination, substantially as hereinbefore set forth, of two mechanically-united polarized armatures having unlike polarity, maintained in permanent frictional contact with a surface of magnetic metal moving in opposite directions at their respective points of contact therewith, and a magnetizing-coil which acts to induce magnetic polarity in or upon said surfaces.

3. The combination, substantially as hereinbefore set forth, of a permanent magnet and two mechanically-united polarized armatures, which latter are maintained in permanent frictional contact with a surface of magnetic metal moving in opposite directions at their respective points of contact therewith, and a magnetizing-coil which acts to induce magnetic polarity in or upon said surface.

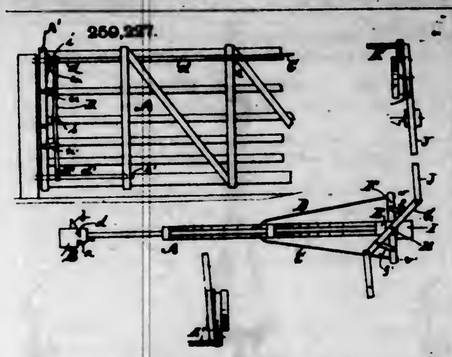
4. The combination, substantially as hereinbefore set forth, of two mechanically-united polarized armatures having unlike polarity, maintained in permanent frictional contact with a surface of magnetic metal moving in opposite directions at their respective points of contact therewith, a magnetizing-coil which acts to induce magnetic polarity in or upon said surface, an arm rigidly attached to both said armatures, and stops for limiting the movement of said arm and armatures in each direction.

5. The combination, substantially as hereinbefore set forth, with a moving surface of magnetic metal, of an armature or armatures in frictional contact therewith, and an axis for said armature or armatures movable in slotted bearings, constructed substantially as described.

259,226. AUTOMATIC TELEGRAPH. GERRITT SMITH, Astoria, N. Y., assignor to the American Rapid Telegraph Company, Boston, Mass. Filed Nov. 3, 1881. (No model.)

Brief.—When a perforation of the transmitting-strip is under the brush the larger battery is short-circuited, and a record is made at the receiving-station by the right-hand pen. When this short circuit is broken the larger battery overpowers the smaller, and a record is made on the other pen. Any polarized receiving-instrument may be substituted for the pen.

Claim.—The combination, substantially as hereinbefore set forth, of a pattern-strip having a single line of perforations, a circuit-closer brought into action by each perforation in said line in succession, two transmitting-batteries of unequal and contrary electro-motive forces, and a receiving-instrument which responds to the action of currents of alternate polarity.



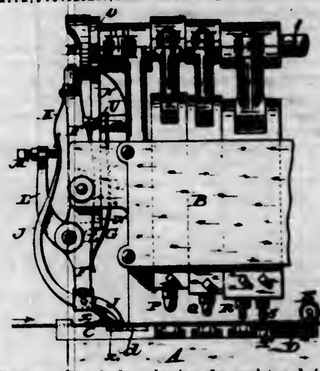
259,227. GATE. JOHN O. SMITH, Bringhurst, Ind., assignor of one-half to D. Randolph Barbour, same place. Filed May 13, 1881. (No model.)

Claim.—1. The gate A, having sliding latches *d d'*, pivoted and connected levers R R', and spring *m*, in combination with the headed rods C D and operating-bar F, the latter being adapted to slide on said rods, as and for the purpose set forth.

2. The pivoted bars F and H, having connecting-rods *f f'*, in combination with the headed and sliding rods C D, sliding latch *d*, and hinged rail E, substantially as shown and described.

3. The bar F, with holes in each end, combined with the rods C D, having heads *c c'*, and hinged rail E, as and for the purpose specified.

259,227.



259,228. READY-MADE ROOFING-FELT OR OTHER MATERIAL. OSIAS A. SMITH, Atlanta, Ga., and FREDERICK L. KANE, Brooklyn, N. Y. Filed Mar. 22, 1882. (No model.)

Claim.—A prepared or ready-made roofing consisting of sheets of felt paper or cloth, or both, cemented together solidly except at one or both of the edges of the upper layer or layers, substantially as set forth, and for the purposes described.

259,229. MACHINE FOR MAKING EYELET-STOCK. STEPHEN N. SMITH, Providence, R. I. Filed Aug. 18, 1881. (No model.)

Claim.—1. In a feed mechanism for eyelet and similar machines, the combination of a vibrating lever provided with a finger engaging beneath the stock, a second lever-finger attached thereto, engaging above the stock, an arm pivoted to the lever to force the upper finger into engagement with the stock, and an operating-cam connected by intermediate devices, substantially such as shown, with said pivoted arm.

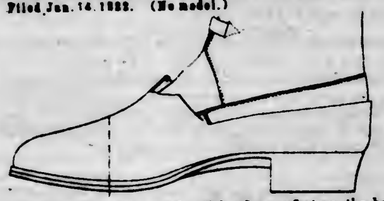
2. The combination of the vibratory lever F, feeding-fingers I and J, lever L, bar N, and cams H and O.

3. The combination of the vibratory lever F, the two feed-fingers mounted upon said lever and engaging with opposite faces of the stock, the second lever, L, pivoted upon the first-named lever, and cam O, connected with the lever L, substantially in the manner described and shown.

4. In combination with lever F, fingers I and J, and spring G, the lever L, rod N, and cams H and O.

5. In combination with the vibratory lever F, the fingers I and J, and spring K, a positively-acting device, substantially as shown, operating to force the finger J downward upon the stock during its forward movement.

6. In combination with the vibratory lever provided with the two feed-fingers, the positively-driven lever L, and the adjustable connection between said lever and the feed-finger.



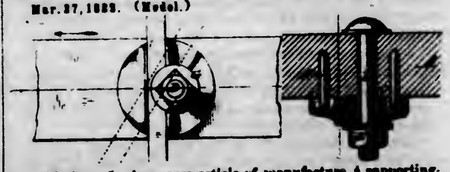
7. In a machine substantially such as described, a punch, S, constructed of angular cross-section, with cutting-edges at its lower end, as described and shown, and arranged for use in severing the tubular necks and cutting the bottoms therefrom, substantially as described and shown.

259,230. BOOT OR SHOE. ERWIN L. SPRAGUE, Boston, Mass. Filed May 22, 1881. (No model.)

Claim.—As an improved article of manufacture, a boot or shoe consisting of an upper, outer sole, and inner sole placed within the shoe above the inturned edges of the upper, the said inner sole being composed of metal and leather-board, the latter being extended at its edges beyond the edges of the metal, the sole-fastenings uniting the upper and the outer sole passing through both the metallic and leather-board portions of the inner sole, as shown and described.

259,231. BOOT OR SHOE. ERWIN L. SPRAGUE, Boston, Mass. Filed Jan. 14, 1882. (No model.)

Claim.—As an improved article of manufacture, the herein-described stiff or rigid casing, adapted to be placed over the upper to protect a part or the whole of the upper and leave an open space between the casing and upper, substantially as set forth.



259,232. BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES. BENJAMIN STALCUP and GEORGE W. STEWART, Worthington, Ind., assignors of one-third to D. A. Barrockman, same place. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a band-cutting and feeding device for thrashing-machines, the combination, with the side bars, A, provided with the bearings *a' a'* and the brackets *d'*, of the bar J, provided with the teeth *j* and the end rods, *e*, the double crank K, hinged to the lower side of the said bar, the connecting-rod *k*, and the crank-wheel L, substantially as and for the purpose set forth.

2. In a band-cutting and feeding device for thrashing-machines, the combination, with the bars *f*, perforated through from edge to edge, of the U-shaped blanks adapted to be passed through the said perforations and their ends bent at an acute angle to form teeth, substantially as shown and described.

259,233. HARROW. GEORGE STEPHENS, Moline, Ill. Filed Mar. 27, 1882. (Model.)

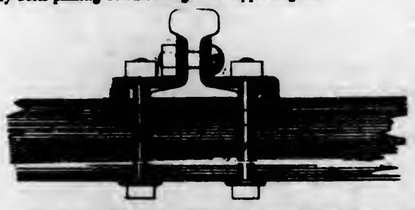
Claim.—1. As a new article of manufacture, a supporting-plate for a harrow-tooth, provided with the transverse groove, the pivot-hole, and the stop groove or grooves in the back.

2. In combination with the beam or support, the pivot-bolt, the stop-pins, the tooth, and the tooth-supporting plate provided with a groove to receive the tooth, and with the grooves or shoulders to co-operate with the stop-pins.

3. In a harrow, the combination of a pivoted tooth-supporting plate and the stop-pins to limit the motion of said plate, having their ends covered and concealed thereby, substantially as shown.

4. In a harrow, the combination of a harrow-tooth, a rotary tooth-supporting plate, and a straight pivot-bolt passing through the plate by the side of the tooth, and provided with a head or washer bearing directly upon the face of the tooth, as described and shown.

5. The combination, with the beam and the stationary stop-pins thereon, of the free rotary plate provided with a tooth-receiving groove, and with shoulders permitting a limited rotary motion to the plate, and co-operating with the stops, the pivot-bolt, and the plate or washer.



6. In a harrow, the beam A, inclined horizontally in relation to the line of travel, in combination with the plate pivoted to and having a free rotary motion to a limited extent upon the beam, said plate provided with the single tooth-receiving groove inclined sidewise in relation to the face of the plate, as set forth, whereby the tooth is permitted to swing forward and backward, but retained at all times in the line of draft.

7. In combination with a swinging harrow-tooth, a sustaining-plate located between the tooth and the beam or frame, a second plate located on the opposite or outer side of the tooth, and a clamping-bolt passed through the two plates past one side of the tooth, and serving to sustain the parts in place.

8. In a harrow, the combination of two plates, a tooth seated between said plates, and a bolt passed through the two plates and securing the same to a beam or frame.

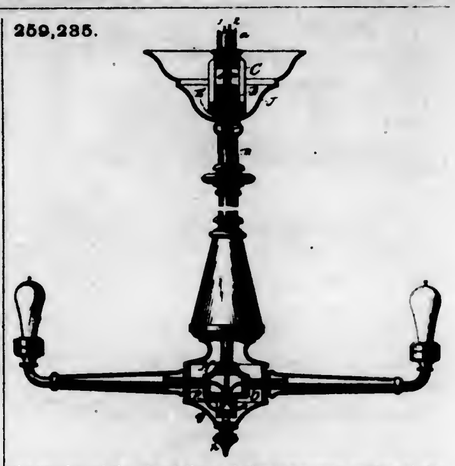
259,234. RAIL-JOINT FOR RAILWAYS. WM. J. STEVENS, New York, N.Y. Filed Oct. 21, 1881. (No model.)

Brief.—Rails rest on a chair or channel-plate having upturned flanges and having a bearing on two or more ties, and plates having a bearing on the base of the rails fit snugly between the fish-plates and the flanges of the channel-plate, and are secured thereto by bolts passing down through the supporting-ties.

Claim.—1. The combination, with the rails, the fish-plates applied thereto, the cross-ties, and a long chair or channel-plate, upon which the rails rest, and which has a bearing on two or more cross-ties, of the plates fitting snugly between the fish-plates and the adjacent sides or flanges of the chair or channel-plate, having a bearing on the base of the rails, and bolted to said chair or channel-plate, so as to secure the rails thereto, substantially as specified.

2. The combination, with the rails, the fish-plates applied thereto, the cross-ties, and a long chair or channel-plate, on which the rails rest, and which has a bearing on two or more cross-ties, of plates fitting snugly between the fish-plates and the adjacent sides or flanges of the chair or channel-plate, having a bearing on the base of the rails, and serving to hold the fish-plates tightly against the sides of the rails throughout their entire length, substantially as specified.

3. The combination, with two rails, their fish-plates, and bolts, and a long chair or channel-plate, upon which the rails rest, of plates which fit snugly between the fish-plates and the adjacent flanges or sides of the chair or channel-plate, and which pass under the nuts of the said bolts for the purpose of locking the same, substantially as specified.



259,235. ELECTRICAL FIXTURE. LUTHER STIRLINGER, New York, N. Y., assignor of two-thirds to Charles F. Hanington, same place, and Richard N. Dyer, Menlo Park, N. J. Filed Mar. 18, 1882. (No model.)

Claim.—1. A fixture for electric lights, supported from the piping of a house and electrically insulated therefrom, substantially as set forth.

2. The combination, with the piping of a house, of an electric-light chandelier pendent therefrom and a connecting-joint permitting the chandelier to hang true, substantially as set forth.

3. The combination, with a pipe-support, of an electric-light chandelier provided with internal conducting-wires, a joint connecting the chandelier and pipe-support, and means for preventing

259,235.

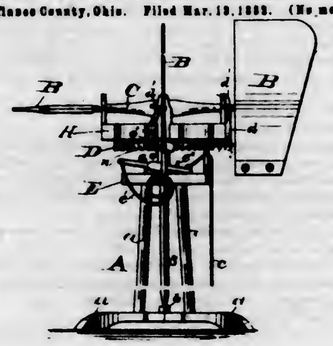
the turning of the chandelier and the consequent cutting of the conducting-wires, substantially as set forth.

4. The combination, with a pipe-support, of an electric-light fixture and an open joint or section connecting the pipe-support and fixture and permitting the ready connection of the conducting-wires, substantially as set forth.

5. The combination, with a pipe-support and an electric-light fixture, of the open connecting joint or section C, composed of rings *b c* and connecting-arms *d d*, substantially as set forth.

6. The combination, with an internally-wired electric-light fixture having an open joint at its upper or inner end and outside connections, of an ornamental shell hiding the said open joint and connections, substantially as set forth.

7. In an electric-light fixture supported from the piping, the combination of an open and insulating joint connecting the fixture and pipe-support, and an ornamental shell hiding said joint from sight, substantially as set forth.



8. In an electric-light fixture, the combination, with the main stem or arm and the distributing-body carrying the lamp-arms, of an open section, cut through the sides of which the wires are passed from the stem or from both the stem and the body, and a central support from such open section for sustaining ornamental or other parts, substantially as described.

9. In an electric-light fixture, the combination, with the main stem or arm and the distributing-body, of the open section, outside of which the main and arm wires are connected, the central support from such open section for ornamental or other parts, and an ornamental shell hiding such connections, substantially as set forth.

10. In an electric-light fixture, the combination, with the distributing-body, of the main and arm wires passing therethrough and connected outside of said body, and an ornamental shell hiding such connections, substantially as set forth.

11. In an electric-light fixture, the combination, with the main stem or arm and distributing-body, of the section P, having slots *a a*, the screw plug or collar Q, and rod R, substantially as set forth.

259,236. WIND-ENGINE. JOHN STITZEL, Delaware Township, Defiance County, Ohio. Filed Mar. 13, 1882. (No model.)

Claim.—1. A wind-engine in which one paddle is horizontal while the opposite paddle is perpendicular, substantially as shown and described.

2. A combination, in a wind-engine, of a lever and keys, whereby the wings are locked and unlocked, substantially as described and set forth.

3. In a wind-engine, the combination of the spring *d'*, lever *e*, provided with projection *d'*, and the ropes *c*, substantially as shown and described.

4. In a wind-engine, the wing-shafts C C, provided with stops *y y*, or equivalent, and having at their ends the paddles B B, one paddle at one end being perpendicular and the other paddle at the other end being horizontal, in combination with the wheel-hub H, provided with projections or bearings *x x*, substantially as described, and for the purpose set forth.

5. In a wind-engine, the wheel-hub H, provided with projections *x x* and loops *c c*, in combination with wheel D, provided with ratchet *n*, projection *d'*, the shaft S, and key *d*, substantially as shown and described.

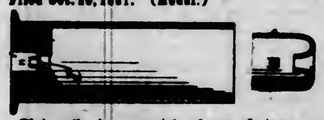
6. In a wind-engine, the combination of the key *d*, projection *d'*, projection *d'*, loop *c*, and wheel-hub H, substantially as described and shown.

7. In a wind-engine, the combination of the lever *e*, provided with projection *d'*, and cords *c*, with the wheel D, provided with ratchets *n* and projection *d'*, whereby a starting and stopping is secured, substantially as shown and described.

8. In a wind-engine, the combination of the key *d* and projection *d'*, substantially as described and shown.

9. In a wind-engine, the wheel D, provided with ratchet *n* and projection *d'*, substantially as shown and described.

10. In a wind-engine, the spring *d'*, secured at one end to frame E and at other end to lever *e*, substantially as described and shown.



11. In a wind-engine, the lever *e*, provided with projection *d'*, substantially as shown and described.

12. In a wind-engine, the shafts C C, having paddles B B, the paddle B at one end of each shaft being secured horizontally to a paddle perpendicular on the end of the same shaft, substantially as described and shown.

13. In a wind-engine, the combination of the revolving shaft S with wheel-hub H, wheel D, top frame, E, and bottom frame, *d'*, provided with bearing *b*, substantially as shown and described.

14. In a wind-engine, the combination of the frame A, composed of uprights *a a*, bottom frame, *d'*, provided with journal *b*, and top frame, E, with revolving shaft S and spring *d'*, substantially as described and shown.

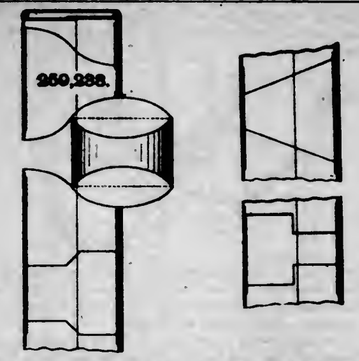
259,237. CARTRIDGE. EDGAR B. STOCKTON, Washington, D.C. Filed Oct. 20, 1881. (Model.)

Claim.—1. As an article of manufacture, a paper cartridge having an uncovered base and a metallic flange, the rear surface of which is in a common plane with the rear surface of said base, substantially as shown and described.

2. The method of attaching a cup-cent or anvil to a cartridge base or plug, which consists in simultaneously forming from the walls or sides of the cent tongues of a thickness equaling that of the walls or sides, and forcing said tongues into the base or plug, substantially as shown and described.

3. A method of attaching a flange to a cartridge, which consists in flattening it from a disk or conical shape, thereby laterally and inwardly compressing it into the body of the cartridge, substantially as and for the purpose set forth.

259,238. MANUFACTURE OF ENVELOPES. EDGAR B. STOCKTON, Washington, D.C. Filed Oct. 17, 1881. (No model.)



Claim.—1. A step in the art of making envelopes, which consists in severing a tube in or on transverse converging lines, substantially as and for the purpose set forth.

2. That improvement in the art of making envelopes which consists in forming the material into a tube and dividing said tube into blanks having oppositely-disposed outlines, substantially as and for the purpose set forth.

3. That improvement in the art of making envelopes which consists in forming the material into a tube, severing the tube in or on oppositely-disposed lines, and turning the blanks thus formed, substantially as and for the purpose set forth.

4. A method of making envelopes, which comprises the following steps: forming the material into a tube, severing the tube in

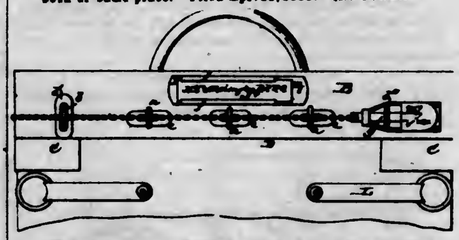
259,238.

or on oppositely-disposed lines, turning the tubular blank thus formed, and subsequently folding the same, substantially as shown and described.

5. The combination of a former and duplicated and oppositely-disposed transverse cutting mechanism, located, arranged, timed, and operating substantially as shown and described.

6. The combination of a former, feeding mechanism, transverse oppositely-disposed severing mechanism, and turning mechanism, all substantially as shown and described.

7. A laterally-curved turning-board, substantially as shown and described.



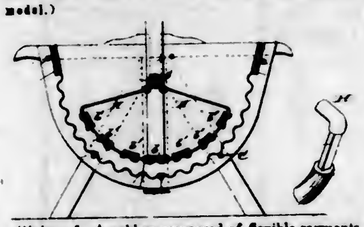
8. The combination of a laterally-curved turning-board and feeding mechanism, substantially as shown and described.

9. The combination of tube-forming mechanism, feeding mechanism, transverse oppositely-disposed severing mechanism, turning mechanism, and folding mechanism, comprising oppositely-arranged and co-operating folding devices, all substantially as shown and described.

10. The combination of tube-forming mechanism, folding mechanism arranged and operating to fold in opposite directions, with duplicate drying mechanisms, and with a deflecting-plate intermediate one of said drying mechanisms and said folding mechanism, all substantially as shown and described.

11. The combination of folding mechanism arranged and operating to fold in opposite directions, gumming mechanisms, and duplicate drying mechanisms, and a deflecting-plate arranged intermediate said folding mechanism and one of said drying mechanisms, all substantially as shown and described.

259,239. MAIL-BAG. WILLIAM J. STOWELL, Baltimore, Md., assignor to Daniel C. Heddinger of James, and J. W. Lindau, both of same place. Filed Apr. 25, 1882. (No model.)



Claim.—1. In a mail pouch or bag, the combination of the single flap B, the double-lapped corners C C, formed as described, the eyelets *a b'*, the staples *b b'*, the eyes *a* on the breast D, a chain fastening, and means for securing the chain, substantially as and for the purposes described.

2. The combination, in a mail bag or pouch, of a flap, B, the double-folding corners C C, the breast D, the edge of which is below the said flap, the staples and eyelets for the corners, intermediate swivel-eyes, a chain or flexible strap and a lock thereto, which is permanently secured to the pouch and adapted to receive through its eyes the staple *b'*, substantially in the manner and for the purposes described.

3. In a mail bag or pouch having a lock permanently secured to it, the combination of the staple *b'* and the extension of the lock, having a slot or eye through it for the passage of the staple to receive the locking-chain, substantially as described.

259,240. WASHING-MACHINE. GEORGE H. STRAIN and ALEXANDER STRAIN, Harrodsburg, Ind. Filed Feb. 20, 1882. (No model.)

Claim.—1. A rubber composed of flexible segments H, flattened and shouldered, as described; in combination with the slats or rubbing-bars having kerfs which receive the flattened portions of the segments, substantially as specified.

2. The combination of the segments H, the bars applied thereto, as described, the hook-and-eye fastenings, and the springs S, substantially as described.

259,241. WIND-ENGINE. RANSOM E. STRAIT, Galesburg, Mich. Filed Jan. 14, 1882. (No model.)

Claim.—1. In a wind-engine, the cap L, having the rim *w*, the inclined way *c*, and the upwardly-extending rim W, and the head E A, having tube P and inclined ways *x'*, in combination with the intermediate rim, D, and the conical friction-wheels *r r* above and below its faces, substantially as specified.

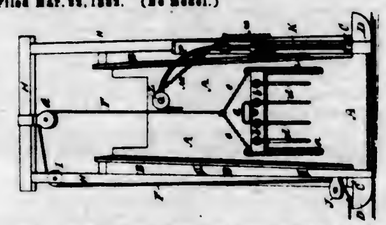
2. In a wind-engine, the combination, with the cap L, having way *x*, rim D, and conical friction-wheels *r*, of the head E A, carrying the wind-wheel, the inclined chain-wheel and chain, and the pivoted weighted lever B, geared to the rim D, substantially as specified.

3. In a wind-engine, the combination, with the head E A, provided with projection *y* and adapted to revolve independently of the rim D, of the wheel-hub provided with the friction-plate *c'*, the spring *e*, having casting *f*, pivoted at *z*, and the vane T, provided with the block *y'*, substantially as specified.

4. In a wind-engine, the wind-wheel rim, formed from the recessed section *a'*, having angle 4 and 5, and the recessed section *a''*, having angle 1, 2, and 3, in combination with the slats *a*, substantially as specified.

259,242. VETERINARY TABLE. JAMES L. SENSENEOTT, Chambersburg, Pa. Filed Mar. 9, 1882. (No model.)

Claim.—1. The above-described table C, hinged at or near its longitudinal axis, whereby it may be easily tilted to the vertical and then to the horizontal position, and provided with means for holding the heifer animal thereto while she is in a standing position, substantially in the manner and for the purpose set forth.

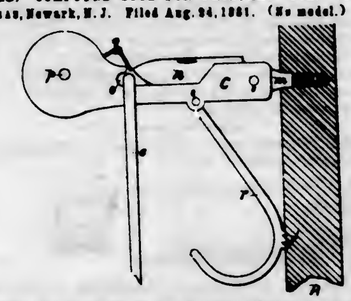


2. The hinged frame L, in combination with the tilting table C, arranged to be operated substantially as and for the purpose set forth.

259,243. SECONDARY BATTERY. JOSEPH WILSON SWAN, Newcastle-on-Tyne, County of Northumberland, England. Filed Jan. 18, 1882. (No model.) Patented in England May 24, 1881, No. 2,373.

Claim.—A perforated or cellular plate for secondary batteries, having the perforations or cells extending through the plate and the active material, or material to become active, packed in the said perforations or cells, substantially as described.

259,244. HAY-STACKER. JONAH C. TREYMAN, Wisner, Nebr. Filed Mar. 22, 1882. (No model.)



Claim.—1. The combination, with a rake, of the inclined way A, widening downwardly from the top, and the mechanism F G H I J, connected with the rake by a chain, *e*, as and for the purpose described.

2. The combination, with the way A and rake having ball Q, of the post P, crane K, chain M, and hook N, having handle O, as and for the purpose specified.

3. The rake constructed, substantially as herein shown and described, with bow-shaped rods *a*, having feet resting on the widened way and connected by a back or head, *b*, with fingers *d* attached, substantially as specified.

259,245. COMPOUND TOOL FOR PAINTERS' USE. JAMES THOMAS, Newark, N. J. Filed Aug. 24, 1881. (No model.)

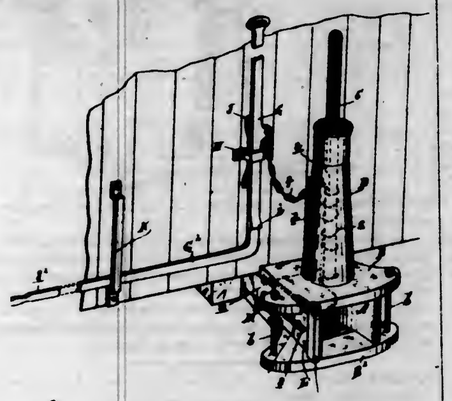
Claim.—1. An adjustable support for paint-pails, comprising a body or handle, C, having a hook or recess, *e*, therein, a toothed hook, *r r'*, and a screw, *m*, arranged and operating substantially as and for the purposes set forth and shown.

2. The combined paint-pail support, pot-hook, and knife-blade as an article of manufacture, arranged and operating substantially as and for the purposes herein set forth and shown.

3. The combined paint-pail support, pot-hook, knife-blade, and tape-measure as a compound tool, substantially as and for the purpose herein set forth and shown.

4. The combined paint-pail support, pot-hook, and tape-measure, arranged and operating in a compound tool, substantially as and for the purposes set forth and shown.

5. The combination, in an adjustable support for paint-pails, of the handle C, having a hook or recess, *e*, therein, a toothed hook, *r r'*, pivoted upon the body at *e*, a screw, *m*, and knife-blade *n*, all arranged and operating substantially as and for the purposes set forth and shown.



6. A paint-pail hook having a handle with a recess therein, adapted to receive the pail-bail, and a hook secured in said handle, adapted to engage with the rung of a ladder, substantially as and for the purposes set forth and shown.

7. A paint-pail support and pot-hook, combined and adapted to operate substantially as and for the purposes set forth and shown.

8. A paint-pail support having means thereon adapted to be secured to the vertical wood-work of a house, and an S-shaped hook, combined substantially as and for the purposes set forth and shown.

9. The combination, with the notched handle adapted to receive the pail-bail, and having means thereon adapted to be secured to the vertical wood-work of a house, of a hook having means thereon enabling said hook to brace said handle, all substantially as and for the purposes set forth.

259,246. CAR-COUPLING. THOMAS V. TUCKER, Henderson, Iowa. Filed Mar. 17, 1882. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head A and the sleeve D, provided with the longitudinal slot *d*, of the coupling-pin provided with the laterally-projecting arm *e* and the spring *d*, surrounding the said pin, substantially as and for the purpose set forth.

2. The combination, with the coupling-pin C, provided with the arm *e* and chain *f*, of the arm G, provided with the shoulder *f* and horizontal arm G', the hooper H, and the pressure-spring J, substantially as and for the purpose herein described.

3. The latch L, provided with the horizontal lip *l*, chain M, and spring *m*, in combination with the draw-head A and coupling-pin C, substantially as and for the purpose described.

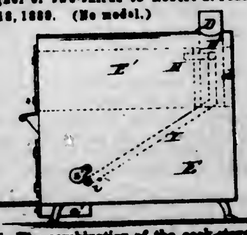
4. The link E, provided with lateral arms *r r*, in combination with the draw-head A and latch L, substantially as and for the purpose herein described.

5. The combination of a sleeve, D, provided with a slot, *d*, and lateral shoulder *d'*, and a pin, C, provided with a lug or stud, *d'*, as shown and described, for the purpose specified.

259,247. ATTACHMENT FOR WATCH-CHAINS. ALBERT HEBELE, Gmünd, Wirtemberg, Germany. Filed June 2, 1881. (Model.) Patented in Germany Feb. 13, 1881, No. 15,225; in France May 14, 1881, No. 142,253, and in Belgium May 21, 1881, No. 54,295.

Brief.—One-half the medallion contains a stamp of any desired design and the other half an ink-pad. When opened to a certain extent the parts may be separated so as to permit the part containing the stamp to be readily manipulated.

Claim.—1. An attachment for a watch-chain, consisting of a charm or locket having the two parts detachably connected together, one being provided with a suitable stamp and another with an ink-pad, substantially as specified.



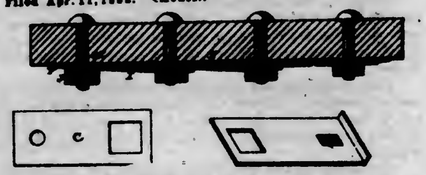
2. In combination with the halves of a locket, the pintle at one edge of one of said halves, and the barrel at the corresponding edge of the other half adapted to set upon said pintle, and the segmental ribs adapted to engage suitable grooves in the respective halves to hold the parts together and permit them to be separated when desired, substantially as specified.

259,248. DITCHING-MACHINE. WILLIAM T. WASSON, Thorntown, Ind., assignor of one-half to James A. Ball, same place. Filed Oct. 31, 1881. (No model.)

Brief.—A ditching-machine composed of a surface-smoothing plow, a gage, a mole or opener, a tile-chute, and a gravel-chute.

Claim.—1. A secondary chute or gravel-box, *j*, combined with the tile-chute of a tile-laying ditching-machine, substantially in the manner and for the purpose set forth.

259,249. PARLOR COOK-STOVE. HENLESS WATTS, Denver, Colo., assignor of two-thirds to Robert S. Platt, same place. Filed Dec. 18, 1880. (No model.)

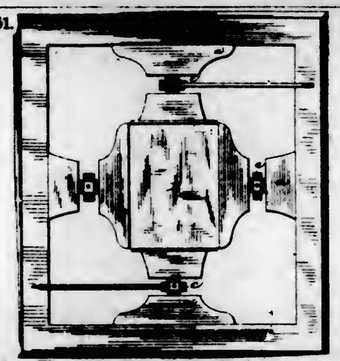


Claim.—1. The combination of the cook-stove A, as shown, with the oven B, dome F', and vent-tubes H H', as and for the purpose specified.

2. The dome F', vent-tubes H H', and vapor-tube I *i*, in combination with the flue D, as set forth, for the purposes specified.

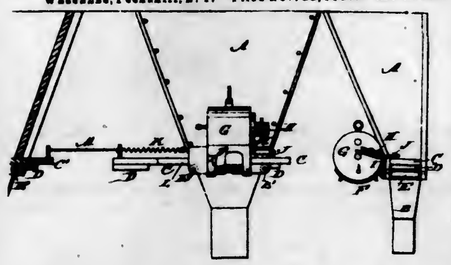
3. In cooking-stoves, the combination of the pipes or flues I, *i*, I', H', and H, the dome over the stove, and the smoke flue or pipe D, substantially as and for the purpose described.

259,250. NUT-LOCK. WILLIAM WRAVEN, Phœnixville, Pa. Filed Apr. 11, 1882. (Model.)



Claim.—In a nut-lock, the combination of the plate I, having a hole through one end to catch over a nut, and a slot through its other end to catch over a bolt, and having its slotted end turned upward so as to catch against the side of a nut, with the two bolts and their nuts, substantially as shown.

259,251. LOCKING-UP DEVICE FOR TYPE-FORMS. SAMUEL D. WEED, Washington, D. C., assignor of one-half to Hector McNeill, same place. Filed Feb. 16, 1882. (No model.)



2. The combination, with the mole-plow *b c*, of the leveling-plow *f*, the tile-chute *d*, gravel-chute *j*, and beam *a*, substantially as shown and described.

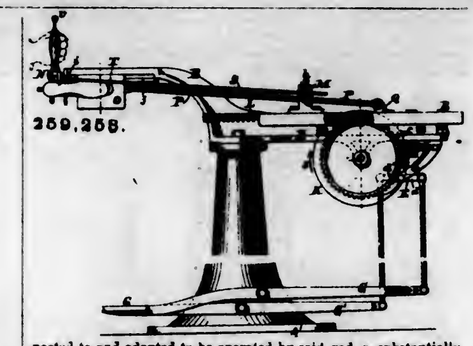
259,251.

Claim.—The combination, with the adjusting-screw in a quoin, of two blocks having two bearing-surfaces each, all of which bearing-surfaces are of different lengths, and made reversible to adapt the quoin to type-forms of different sizes, as shown and described.

259,252. TIME MECHANISM FOR FEEDING STOCK. EUGENE WHEELER, Peekskill, N. Y. Filed Nov. 22, 1881. (No model.)

Claim.—1. In an automatic feeding mechanism, the combination, with the hopper A, the clock G, provided with the key H on the winding-post of its alarm mechanism, and means for supporting the clock at the side of the hopper, of the spring-actuated sliding bottom C, provided with the pin J, and the lever I, pivoted to the side of the hopper, substantially as and for the purpose set forth.

2. In an automatic feeding mechanism, the combination, with the hoppers A A', the clock G, provided with the key H on the winding-post, and means for supporting the clock at the side of one of the hoppers, of its alarm mechanism, of the sliding bottoms C C', connected together by the rod M, the bottom C being provided with the pin J, the bent lever I, pivoted to the hopper A, and the spring K, connected to the slide G and hopper A, substantially as and for the purpose set forth.

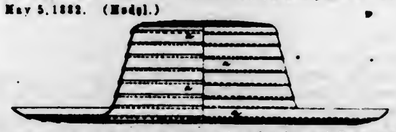


259,253. SOLE-TRIMMING MACHINE FOR BOOTS AND SHOES. BENJAMIN F. WHEELER, Malden, Mass. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination, in a sole-trimming machine, of the jack T, the carriage O, mounted and adapted to be reciprocated upon suitable slides, the spirally-grooved pulley S', and the cord U, all constructed, arranged, and adapted to operate substantially as described.

2. In a sole-trimming machine, the combination of the reciprocating carriage O, the shaft S, the spirally-grooved pulley S', the jack T, the cord U, the cam K, lever Q, and means of connecting the lever Q and the carriage O, substantially as and for the purposes described.

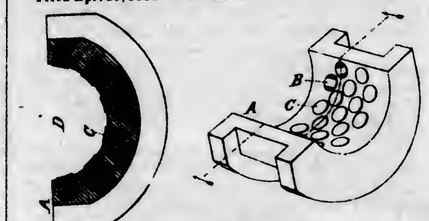
3. The combination of the movable carriage O, the spirally-grooved pulley S', the cord U, wound around said pulley and firmly secured by one end to a fixed portion of the machine, and the threaded shank U', secured to the opposite end of said cord and provided with the nut g, whereby the other end of said cord may be secured to a fixed portion of the frame and any slack therein may be taken up, substantially as described.



4. The combination, in a sole-trimming machine, of the rack L, the stand M, the ball *f*, the rod *g*, fitted to an opening through said ball, so as to be adjusted therein, and the edge-plane N, connected to and adapted to be operated by said rod *g*, substantially as described.

259,253.

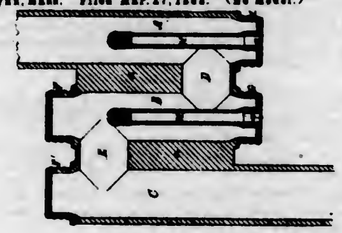
5. The combination, in a sole-trimming machine, of an edge-plane, mechanism for imparting to said plane a reciprocating motion, a jack-carrying carriage mounted upon slides, mechanism for automatically imparting to said carriage an intermittent reciprocation in a right line, and mechanism for imparting to the jack a semi-rotation during each forward or backward stroke of said carriage, substantially as and for the purposes described.



259,254. HAT. EDWARD WHITEHOUSE, Brooklyn, N. Y. Filed May 5, 1882. (Model.)

Claim.—1. A hat made of a strip or strips cut from grass-cloth, substantially in the manner above described.

2. A hat made of a strip or strips cut from grass-cloth and wound to form a spiral, one edge of the strip being folded upon itself and united to the plain edge of the succeeding coil, substantially as shown and described.



259,255. JOURNAL-BEARING. GEO. W. WILLIAMS, Winona, Minn., assignor of one-fourth to William E. Smith, same place. Filed Apr. 20, 1882. (No model.)

Claim.—1. A journal-bearing consisting of a metallic body portion, A, having the face recess or recesses B, and the asbestus filling C, compactly pressed into said recess or recesses and forming the bearing-surface D, substantially as specified.

2. A journal-bearing consisting of a recessed body portion and compressed asbestus and wire fillings, substantially as specified.

259,256. SINK OR HYDRAULIC TRAP. JOHN F. WITHEY, Lynn, Mass. Filed Mar. 27, 1882. (No model.)

Claim.—1. The three tubes A, B, and C, arranged with and joined by the tubular connections D E, as described, and having removable caps applied to them, (the said tubes,) as set forth.

2. The three tubes A, B, and C, arranged with and joined by the intervening joinings *a a*, and tubular connections D E, as described, and having removable caps applied to them, (the said tubes,) as set forth.

3. The three tubes A, B, and C, arranged with and joined by the tubular connections D E, as described, and provided with removable caps, and with elastic tubes H, closed at their upper ends and extending from the lowermost of such caps up within the tubes A and B, and open through the caps, all being substantially as and for the purposes and to operate as set forth.

259,257. FLOOR-CLOTH. JOS. H. WOOD, Akron, Ohio. Filed Mar. 2, 1882. (No specimens.)

Claim.—1. A floor-covering consisting of a layer of paper-board covered upon both sides with and adhering to a layer of woven fabric, the latter saturated with and finished in paint, substantially as hereinbefore described.

2. A floor-covering consisting of a layer of paper-board covered upon one side with and adhering to a layer of woven fabric, the latter saturated with and finished in paint, substantially as hereinbefore described.

259,258. SUPPORT AND HANDLE FOR BOOKS. EDWARD R. YOUNG, New York, N. Y. Filed Apr. 21, 1882. (No model.)

Claim.—1. The combination of the longitudinal strap A, for embracing the books, the strap B, extending from the lower edge of the embracing-strap, at right angles thereto, for supporting the books, and the handle C, having its two ends pivoted respectively to opposite portions of the embracing-strap, and of sufficient size to swing around the books when the latter are in position, substantially as and for the purpose described.

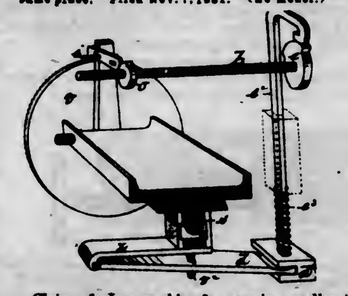
2. The combination, substantially as hereinbefore described, of the embracing-strap, the supporting-strap, and the swinging handle, all connected together by the pivots *a a*.

259,259. END-GATE FOR WAGONS. PETER YOUNG, West Charleston, Vt. Filed Apr. 3, 1882. (No model.)

Claim.—1. The wagon end-gate consisting of the laterally-hinged sections E F, their angle-hinges H, the overlapping perforated cross-bars I, and the catch-staples S, passing through the apertures or perforations of the cross-bars, substantially as specified.

2. The wagon end-gate consisting of the hinged lateral sections E F, abutting against the ends of the sides of the wagon, their angle-hinges H, the overlapping perforated cross-bars I, spring-latches N, and the notched staples S, passing through the apertures or perforations of the cross-bars, substantially as specified.

3. The combination, with the sectional laterally-hinged end-gate E F, the overlapping cross-bars I, and the loops or eyes T on the sides of the wagon, of the adjustable binding-chain Z, attached to said loops or eyes and extending around the sections of the end-gate transversely, substantially as specified.



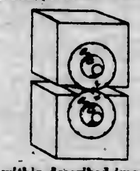
259,260. PROCESS OF MANUFACTURE OF INDIGO-BLUE. ADOLF BAEYER, Munich, Bavaria, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed May 8, 1882. (No specimens.)

Claim.—The within-described process of producing artificial indigo-blue by first producing an ether compound of orthonitrophenylpropiolic acid, then converting this ether compound into indogenic ether, then treating such indogenic ether with caustic alkalies followed by muriatic acid, and finally exposing the product obtained to an oxidizing action, substantially as set forth.

259,261. PROCESS OF MANUFACTURE OF INDIGO-BLUE. ADOLF BAEYER, Munich, Bavaria, assignor to Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed May 8, 1882. (No specimens.)

Claim.—The within-described process of producing an artificial indigo-blue by first producing an ether compound of orthonitrophenylpropiolic acid, then converting this ether compound into indogenic ether, then converting such indogenic ether into indogenic acid by treatment with caustic alkalies followed by muriatic acid, then transforming the indogenic acid into indogen by the action of heat, and finally exposing the indogen to an oxidizing action, substantially as set forth.

259,262. MACHINE FOR GROOVING NEEDLES. JOHN HENRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Nov. 7, 1881. (No model.)

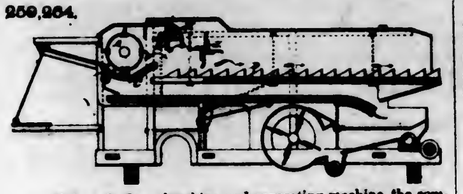


Claim.—1. In a machine for grooving needles, the combination, with the sliding bed thereof, the feed-screw actuating said bed, and the feed-nut *x*, of appliances, substantially as described, for supporting and lifting said feed-nut under said bed, the wheel *v*, connected to said feed-screw and provided with a stop-pin in its periphery, the cam-shaft *b*, cam *c*, lever *n*, and a suitable spring to force the end of said lever against said cam, all as set forth.

2. The combination, with the wheel *v*, connected to the feed-screw *e* and having the stop-pin *f* therein, of the stop-lever *n*, spring *m*, cam *c*, and shaft *b*, substantially as set forth.

3. The combination, with the feed-screw *e* and nut *x*, of lever *d*, hook *d'*, shaft *b*, cams *c* and *c*, lever *n*, spring *m*, and wheel *v*, having the stop-pin *f* therein, substantially as set forth.

259,263. DIE FOR FORGING AND SWAGING. JOHN HENRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Jan. 10, 1882. (No model.)

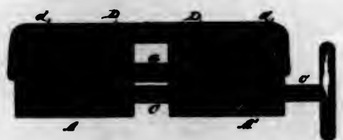


Claim.—1. The within-described improved forging die-block and supporting-case therefor, consisting of the cylindrical die-block having a series of matrices upon its peripheral surface, a die-block case enveloping nearly the entire periphery of said die-block and fitted tightly thereagainst, and an axial bolt for securing said die-blank firmly in a fixed position in said case and for turning it therein, all combined and operating substantially as set forth.

2. The within-described forging die-block and supporting-case therefor, namely: the cylindrical die-block having a series of matrices upon its peripheral surface, and a die-block case enveloping nearly the entire periphery of said die-block and fitted tightly thereagainst, they jointly operating substantially as set forth.

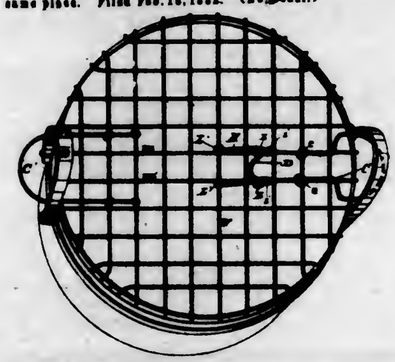
259,264. GRAIN THRASHER AND SEPARATOR. ORRIETO PERU BLISS, Springborough, assignor to Louis C. Royer, Dayton, Ohio. Filed Nov. 12, 1880. (No model.)

259,264.



Claim.—1. In a threshing and separating machine, the combination of a revolving cylinder, a concave, a grate, a revolving beater arranged sufficiently near the cylinder to deflect the straw downward, a revolving rake, and a vibrating shaker and carrier, all constructed and arranged to operate substantially as set forth,

2. In a threshing and separating machine, the combination of a threshing-cylinder, a grate, a rotary beater, a deflector, a rotary beater which also acts as a rake, and a shaker, substantially in the manner and for the purposes described.

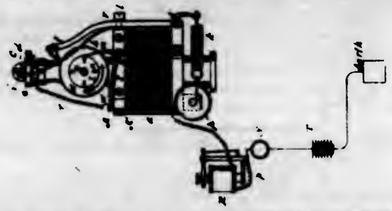


3. In a threshing-machine and separator, the combination of the following instrumentalities: a threshing-cylinder, a revolving beater directly in the rear of said cylinder, a deflector directly over said beater, a combined rake and beater directly in the rear of said deflector, and a vibrating shaker under said beater, deflector, and rake, substantially as and for the purpose specified,

259,265. MOLD FOR CARRIAGE OR BUGGY TOPS. HENRY W. BLOOD, Erie, Pa. Filed Mar. 13, 1882. (No model.)

Claim.—A mold for buggy and carriage tops, composed of two halves or sections, A and A', of the shape shown, with a concavity, D, between the parallel rounded side ribs, *d d*, and provided with the adjusting-screw C, guide-pins *a a*, and bores *b b*, to receive said guide-pins, substantially as and for the purpose set forth.

259,266. COVER FOR BASKETS. WILHELM E. BOEHREN, Chicago, Ill., assignor of one-half to Gotthold Fred Binder, same place. Filed Feb. 18, 1882. (No model.)



Claim.—1. The movable ear C, having the two ends of the wire of which it is composed bent nearly straight, and their ends bent into eyes *f* around wires *m* and guided by rings *e*, adapted to slide back and forth and fasten and unfasten the cover, substantially as described.

2. The latching device *H*, hinged to the cross-wire W by the eyes L' at one end and having the loop D and the two steps L at the other end, in combination with and adapted to lock the movable ear C in position in the handle of the containing vessel when required, substantially as described.

259,267. ELECTRIC DEVICE FOR TURNING ON, LIGHTING, AND EXTINGUISHING GAS-JETS. A. LIVINGSTON BOGART, Jamaica, N. Y., assignor to Abraham L. Bogart, same place. Filed Jan. 24, 1882. (No model.)

Brief.—The arm *m* being in contact with conductor *n* on the cock, gas is turned on by a succession of electric impulses moving the armature and pawl. This short circuit being broken by the escape of *m* from *n*, the current passes through the lighting-electrodes. Another series of impulses will shut off the gas and leave *m* in contact with *n*, as at the beginning.

Claim.—1. The magnet A', composed of the stem B of the burner and the helix *a*, said stem forming the core of the magnet, in combination with the fixed and insulated electrode *d*, the vibrating electrode *i*, secured to the armature of said magnet, as described, the pawl *f*, pivoted at the upper end of said armature, and the ratchet-wheel H, secured upon the plug *b* of the stop-cock, all as herein shown and described, for the purpose set forth.

2. In combination with the magnet A', constructed as described, and the ratchet-wheel H, attached to the plug of the cock and rotated by the pawl *f*, pivoted to the armature E, the circuit-breaker I, provided with the points *n*, the spring-arm *m*, and the wires *p*, *i*, and *r*, the whole being constructed to operate in the manner set forth for the purpose of shunting the current to the ground, and thus preventing the further movement of the plug *b* after it has reached a predetermined point in its rotation.

3. The combination, with a gas stop-cock in which the plug is rotated by means of a ratchet operated automatically by a pawl on the armature of a magnet by means of a series of electric impulses, of a circuit-breaker, I, provided with points *n*, to make contact with an insulated spring-arm, *m*, as described, an insulated fixed electrode, *d*, electrically connected with the magnet, a vibrating electrode, *i*, attached to the armature of the magnet, a battery-wire, *p*, and a shunting-wire, *t*, connecting said electrode *d* with said arm *m*, the whole being constructed as described, for the purposes set forth.

4. In a gas-burner, the plug *b*, provided with the ratchet-wheel H, operated by the pawl *f*, attached to the armature F, when said plug is set at an angle with the line of motion of said pawl, as described, for the purpose set forth.

259,268. SOAP-SHEET FOR GENERAL USE AND FOR DISINFECTING PURPOSES. HENRY BOSCHWITZ, Vienna, Austria-Hungary. Filed Jan. 24, 1882. (Specimens.) Patented in Germany Dec. 1, 1881; in England Dec. 2, 1881, No. 5,885; in Italy Dec. 3, 1881, XV, 18,803, XXVII, 143; in Austria Feb. 2, 1882, Nos. 26,770 and 26,927; in Hungary Feb. 2, 1882, Nos. 2,643 and 2,649, and in Belgium Feb. 26, 1882, No. 57,060.

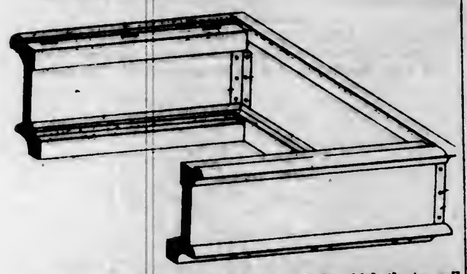
Claim.—1. The described method or process of manufacturing material as a substitute for soap, consisting in treating sheets or leaflets of paper or fibrous or textile material by steeping or coating them with a soap solution or soap emulsion and subsequently drying the same.

2. The described method or process of manufacturing a disinfecting and washing material, consisting in treating sheets or leaflets of paper or other material, as set forth, with a soap solution or soap emulsion, and also with a disinfectant.

3. As a new article of manufacture, sheets or leaflets made of paper or other fibrous or textile material treated, as above set forth, with a solution or coating of soap, and then dried ready for use.

4. As a new article of manufacture, sheets or leaflets made of paper or other fibrous or textile material treated, as above set forth, with a solution or coating of soap and carbolic acid or other disinfectant, and then dried ready for use.

259,269. SELF-ADJUSTING HEAD-BLOCK FOR HAT-PRESSES. JOHN W. CHAMBERS, Boulder, Colo., assignor of one-half to Amanda E. Campbell, same place. Filed Apr. 19, 1882. (No model.)



Claim.—1. The head-block or follower A A', composed of two parts adapted to slide upon rods or bolts, and held apart by springs, substantially as and for the purpose set forth.

2. The parts A and A' of a head-block, with the intervening spaces between them covered by guard-plates *d*, fastened only to one part, substantially as and for the purpose set forth.

259,269

259,270. BUGGY-BODY. JOS. L. DOLSON, Charlotte, Mich., assignor of one-half to Parilomer H. Thomas, same place. Filed Apr. 13, 1882. (No model.)

Claim.—A buggy or light wagon body in which the top rail is rabbeted on the bottom for receiving the panel and on the top for receiving the seat, and a panel with solid molding or bead, being part of the panel, thereby forming a solid and substantial bearing, substantially as described and set forth.

259,271. PREPARATION OF MATERIALS FOR USE IN ELECTRIC INSULATION. JOS. AMBROSE FLEMING, University College, Nottingham, County of Nottingham, England. Filed Mar. 14, 1882. (No specimens.) Patented in England Dec. 6, 1881, No. 5,899.

Claim.—The preparation of materials to be used for the purpose of electric insulation by the employment of wood or other vegetable fibrous material, as herein set forth, in a finely-divided condition, desiccated and saturated or impregnated with paraffine-wax, or with a mixture of paraffine-wax and resin, in conjunction or not with other substances, the whole being molded under pressure, all substantially as hereinbefore described.

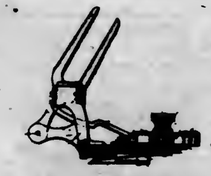
259,272. DUMPING-CAR. THADDEUS M. HALL, Cameron, Mo., assignor of one-half to William McCallum, same place. Filed Mar. 23, 1882. (No model.)

Claim.—1. A dumping-car having the transverse end beams, C, the middle longitudinal platform, H, connected thereto, the lateral reversible rock-beams F, extending parallel to the platform and pivoted to bearings in the end beams, and the reversible dumping-boxes G, firmly bolted to the lateral rock-beams, substantially as specified.

2. A dumping-car having a middle platform and reversible rock-beams and dumping-boxes, and convertible into a flat car, substantially as specified.

259,273. BILLIARD-CUE TIP. JOHN B. HOWE, Danbury, Conn., assignor to himself and Frederick A. Hall, same place. Filed Apr. 18, 1882. (No model.)

Claim.—An attachment for billiard-cues, consisting of the ferrule B, formed with a plate, *b*, and recess C, and provided with one or more fastening-screws, F, in combination with the disk D, having the flat-faced pin E, and the flat piece of leather G, cemented upon the disk by points or pins *c*, said flat leather having glued thereto the tip H, substantially as and for the purpose specified.



259,273.

259,274. PROCESS OF BRAZING. MELVIN JONES, Genesee Centre, assignor of one-half to Stephen R. Sherwood, South Livonia, N. Y. Filed Apr. 11, 1882. (No specimens.)

Claim.—The process of brazing cast-iron or steel with brass, the same consisting in first heating the parts to a red heat and applying prussiate of potash to the same; second, reheating until the prussiate of potash incorporates with the surfaces of the metal; third, applying borax to the surfaces; and, fourth, adding brass thereto and heating until the brass fuses, substantially as described.

259,275. RUFFLING ATTACHMENT FOR SEWING-MACHINES. ALLEN JOHNSTON, Ottumwa, Iowa. Filed July 26, 1881. (No model.)

Claim.—1. The combination, with a lever pivoted behind the needle, of a blade-carrier having its support wholly in front of the needle and operating-connections for moving said blade-carrier back and forth at each vibration of said lever, substantially as described.

2. The combination of a lever pivoted behind the needle, a blade-carrier supported in front of the needle, and a link extending past the needle and connecting said lever and blade-carrier, so that the latter is moved back and forth at each vibration of the lever, substantially as described.

3. A ruffler-frame provided with a socket for attaching the same to the presser-bar of a sewing-machine, in combination with a lever pivoted to said frame back of the socket, a sliding blade-carrier supported thereon directly in front of the needle, and operating-connections for communicating motion from the lever to the said carrier, substantially as described.

4. The combination of a lever pivoted back of the needle, a sliding blade-carrier supported in front of the needle, and a link jointed at the rear end to said lever and connected at the front end with the said carrier, substantially as described.

5. The combination, with an operating-lever and a blade-carrier, of a link directly connecting the said parts with each other, and adapted to impart from said lever to said blade-carrier positive motion in both directions, and adjusting means for varying at will the stroke of said blade-carrier with a uniform or constant vibration of said operating-lever, substantially as described.

6. The combination of an operating-lever, a sliding blade-carrier, and a link connecting said parts directly with each other and adapted to impart a positive back and forth motion to said sliding blade-carrier, and adjusting means for varying the stroke or throw of said carrier, substantially as described.

7. The combination, in a ruffling attachment, with a lever adapted to be operated in both directions by the needle-bar of a sewing-machine, of a link for imparting motion to the ruffler-blade, connected with said lever between the fulcrum and the point of application of the power and arranged to extend at its lower end outward away from the fulcrum, substantially as described.

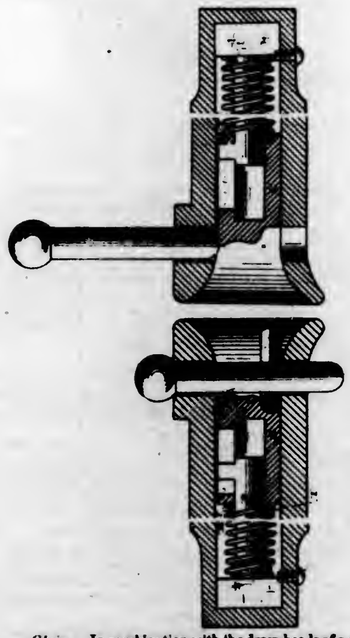
8. The combination of the sliding blade-carrier supported in front of the needle, the lever pivoted behind the needle and adapted to be operated in both directions by the needle-bar, and the link connected with the blade-carrier at the front end and jointed at the rear end to the lever between the fulcrum and the point at which power is applied, substantially as described.

9. The combination, with an operating-lever and a blade-carrier and link arranged to convey positive motion back and forth from said lever to said carrier through a slot-and-pin connection, of an adjusting device for increasing or lessening at will the lost motion of said connection, substantially as described.

10. The combination of a sliding blade-carrier, a link jointed thereto by a slot-and-pin connection, and an adjusting device for increasing or lessening the lost motion between the pin and the ends of the slot, substantially as described.

11. The combination, with a projection or extension of the ruffler-frame directly in front of the needle, of a sliding blade-carrier supported on said projection or extension, a cross-piece below said carrier, and also below said projection or extension, and a ruffler-blade attached to said cross-piece, substantially as described.

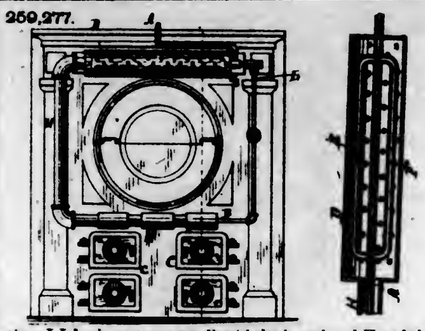
12. The sliding blade-carrier having a top plate fastened thereto, and an adjusting-cam pivoted or journaled between said carrier and top plate, substantially as described.



13. The combination of the blade-carrier, adjusting device, top plate, and set-nut, substantially as described.

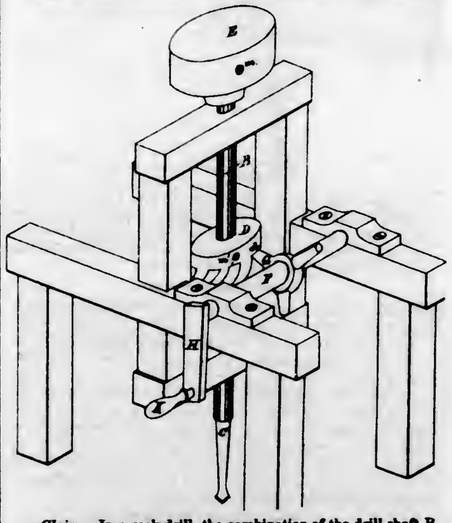
14. The combination of a blade-carrier, top plate, adjusting device, link and pin or cross-head on the link, said pin or cross-head working between the carrier and top plate and in contact with the adjusting device, substantially as described.

15. The combination of a blade-carrier, graduated top plate, adjusting device between the top plate and carrier, and pointer or indicator, substantially as described.



16. The combination, with the blade-carrier and top plate, of a link having its end movable in a slot in the top plate, and a pin or cross-head on the link working between the top plate and blade-carrier, substantially as described.

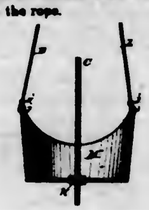
259,276. CAR-COUPLING. JESSE JORDAN and ELAM H. GILLON, Macon, Ga., assignors of one-half to Joseph E. Russell and Thomson Guernsey, same place. Filed Mar. 26, 1883. (No model.)



Claim.—In combination with the draw-heads of a car, the sliding block adapted to work upon a guide-pin located in the draw-head, and provided with a head secured by a set-screw, the key located on the guide-pin, and setting in a slot in the block to limit its movement, and the spiral spring fitting upon bosses on the block and at the base of the guide-pin, the block being provided with a shoulder and recess at its forward end to hold the pin and the link, substantially in the manner and for the purposes specified.

259,277. SMOKE-BURNER. THOMAS HURLEY, Chicago, Ill., assignor of one-half to Seneca D. Kimbark, same place. Filed Jan. 31, 1883. (No model.)

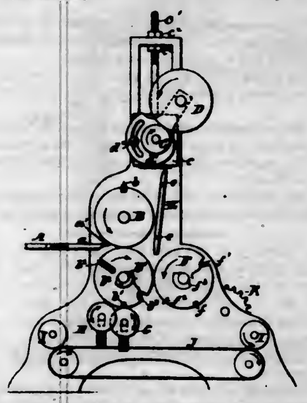
Claim.—In combination with a steam-boiler and its fire-chamber, the steam-pipes A and B, jacket-pipes H and L, and perforated drum D, all located outside of boiler, and steam-pipes I J I, the side pipes, I I, having one or more direct holes in each end K, and the central pipe, J, having one or more direct central holes and two diverging holes in end K, substantially as shown, and for the purpose described.



259,278. ROCK-DRILL. JAMES PEARSE, Bellefont, Va., assignor of three-fifths to R. D. H. Jones, same place, and George W. Dyer, Washington, D. C. Filed May 16, 1881. (No model.)

Claim.—In a rock-drill, the combination of the drill-shaft B, provided with an adjustable weight, E, and an adjustable spirally-grooved collar, D, with the shaft F, rotated by means of crank H K, and provided with tappet-wheel G, all the parts arranged and operating substantially as described and shown.

259,279. FIRE-ESCAPE. MAX L. ROSE and H. WHITFIELD SOUTH, Anderson, S. C.; said South assignor to said Rose. Filed Mar. 13, 1882. (No model.)



Brief.—Elbow-levers, to which the basket is suspended, are pivoted at the top of the frame, and have roughened edges to grasp the rope, which passes between them, down around a pulley on a shaft having handles projecting from the sides of the frame. Changing one's weight from the basket to the handles serves to relax the grip of the levers on the rope.

Claim.—1. In a fire-escape, the elbow-levers B B, having fluted and rough edges *b b*, adapted to grasp rope C, and holes *i i*, and pivoted at their upper ends in frame A, substantially as shown and described.

2. In a fire-escape, the combination, with frame A, of rope C, passing through openings E E in said frame and around pulley F on shaft G, elbow-levers B B, having fluted and rough edges adapted to grasp said rope, pivoted at their upper ends in said frame, and cords D D, attached to the outer ends of said levers and to the basket H, substantially as shown and described.

259,280. MANUFACTURE OF SATCHEL-BOTTOMED PAPER BAGS. EDGAR B. SPROUSE, Washington, D. C. Filed Oct. 25, 1881. (No model.)

Claim.—1. The method herein shown and described of forming the diamond fold by machinery, which consists in abruptly changing the direction of feed and rolling back one ply of the blank by two convergently-rotating rolls, substantially as shown and described.

2. The method herein shown and described of forming the diamond fold by machinery, which consists in feeding the tubular blank, cut substantially as described, in, on, or through a U-shaped line of feed, and by two convergently-rotating rolls rolling back one ply of said blank, substantially as shown and described.

3. The method of closing a diamond fold by machinery, which consists in reversing the direction of the feed of the rear point (the front point having been folded by suitable means) and forcing it separately from and independently of the body of the blank into the bight of convergently-rotating means, substantially as shown and described.

4. The combination of the roll C, means, substantially as described, for opening the tube, and the disk D, the latter located at about the longitudinal center of the former, and both rolls adapted by location and arrangement to be operative at their convergently-rotating peripheries, whereby a tube upon being passed between the same is opened and one of its plies is lifted and rolled back upon its body portion, all substantially as shown and described.

5. As a means for determining the fold-line of a point of the diamond fold, the rolls H H, in combination with a blank-supporting carrier or roll, B', substantially as shown and described.

6. As a means for folding a point of a diamond fold, the combination of the rolls H H and the rolls G G, substantially as shown and described.

7. In a paper-bag machine, the combination of means for folding the front point of the diamond with means for folding the rear point thereof and means for folding the body of the blank independently and separately from the rear point, and thereby reversing the direction of the movement of said rear point, and means for rolling down said point separately from the body of the blank, all substantially as shown and described.

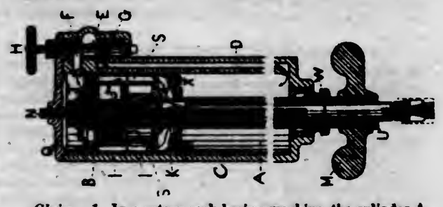
8. The combination of a former provided with a central narrow knife-edged projection with rolls provided with a transverse severing-knife having a portion at its center removed, whereby said central portion co-operates with said projection to sever one ply of a tube, and allows the other ply thereof to pass between said roll uncut thereby, substantially as shown and described.

9. The combination of the rolls B and B', the diamond-rolls C D, and the roll F, substantially as shown and described.

10. The combination of the roll B' and the roll F, the former provided with the slot *b'*, blade *b²*, and jaw *b³*, and the latter provided with the blade *f'*, jaw *f²*, and knife *f*, and provided with the cams *b⁴* and *f³*, respectively, substantially as and for the purpose set forth.

11. The combination of the roll B', provided with blade *b²*, and the rolls G H, and the roll F, provided with the jaw *f'*, substantially as shown and described.

12. The combination of the rolls B', F, G, and H and the apron or belt J and roll I, substantially as shown and described.



13. The combination of the roll B' and the adjustable rolls H H, yieldingly held against said roll B', substantially as shown and described.

14. The combination of the rolls B, B', and F with the adjustably-supported rolls C and D, substantially as shown and described.

15. The combination of the roll C, bearings *e*, rods *e'*, and nuts *e²* with the roll D, arms *d'*, slotted as shown, and the screws *d²*, as shown and described.

16. The combination of the roll B' and the rolls G H, adapted, substantially as shown and described, to be rotated in either direction, as and for the purpose set forth.

259,281. ROTARY DIAMOND ROCK-BORING MACHINE. JAS. BROWN JOHNSON, Boston, Mass. Filed Aug. 11, 1881. (No model.)

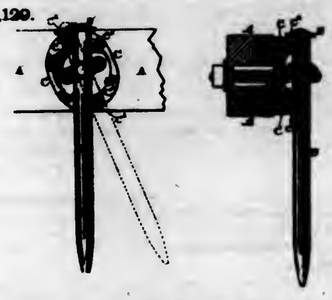
Claim.—1. In a rotary rock-boring machine, the cylinder A, constructed with the passage or port D, extending its whole length outside of its bore, entering at its lower end, and connected with its top end by the ports G and F, said passage D being enlarged at its upper end to form a seat, within which is fitted the semicircular-faced valve E, arranged to control the amount of air entering at the top or bottom of the cylinder A, all constructed substantially as described, and for the purpose set forth.

2. The piston B and the connected revolving spindle C, passing out through the lower head of the cylinder A, the piston B having a key fixed in it, working in the groove *a* in the cylinder A, to keep said piston from turning, but allow it to move freely in line of the axis of the cylinder A, the groove *b* in piston B, to allow a small portion of air to pass from its bottom to its top side, the whole so arranged that when air is at equal pressure above and below the piston B the air, acting on a larger surface above said piston B, causes the revolving spindle to be forced out through the lower head of the cylinder A, to produce feed of the boring-bit to the rock, as described and set forth.

3. In a rotary rock-boring machine constructed substantially as described, the hollow drill rod or pipe L, with its open end fixed within the hollow revolving spindle C, to receive and convey the exhaust air to the working-bit, to refrigerate said bit and to blow the reduced rock from the hole being bored, substantially as described and set forth.

4. In a rock-boring machine, the stationary water-pipe N, fixed in the back head, Q, and extending into the hollow spindle C, for the purpose set forth.

5. In a rotary rock-boring machine, the combination, with the main cylinder A, having the side passage, D, and the ports G and F, of the sliding piston B, containing the rotating device, and the revolving hollow spindle C, holding within it and revolving the hollow drill-rod L, substantially as specified and shown.



6. In a rotary rock-boring machine, the combination, with the main cylinder A, having a side passage, D, and ports F and G, of the double-faced valve E, worked by the wheel H, said valve E arranged to admit air to work the machine, regulate the pressure on the boring-bit, and withdraw it from the bore-hole, as set forth.

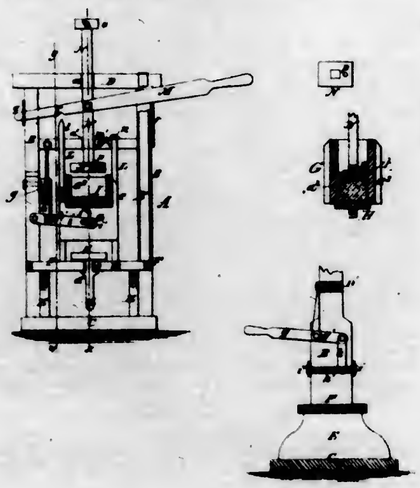
7. In a rotary rock-boring machine constructed substantially as described, the lower part of the sliding piston B, having a recessed or annular space, *d*, communicating with the holes K in the revolving spindle C, to receive from the rotating device the exhaust air and facilitate its passage to the interior of the revolving spindle, for the purpose as specified and set forth.

REISSUES.

10,129. NARROW-TEETH FASTENING. JAMES H. BARLEY and THOMAS K. BARLEY, Sedalia, Mo. Filed Oct. 31, 1881. Original No. 205,520, dated July 2, 1878.

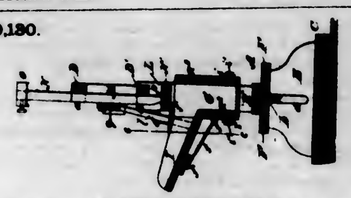
10,129.

Claim.—1. The combination of the beam A, the plate C, provided with means on its outer side to regulate the movement of the adjustable tooth, a clamping screw-bolt which passes through both plate and beam, and a harrow-tooth, the outer end of the bolt being formed into an eye or loop through which the tooth passes, and which serves as a pivot in which the tooth turns, and to clamp both tooth and plate against the side of the beam, substantially as shown.



2. The combination of the beam A, the plate C, provided with the projections C', for catching in recesses in the side of the beam, and a clamping screw-bolt which passes through both plate and beam, and serves as a pivot for the tooth to turn on, the plate being provided with stops or shoulders to allow the tooth to reverse from a vertical to a slanting position, substantially as described.

3. The combination of a harrow-tooth, the beam A, the plate C, provided with projections or lugs C', for catching in the recesses in the beam, and having the stops C², formed on its outer side to allow the tooth to be used in either a vertical or slanting position, and a pivotal clamping-bolt with its outer end formed into an eye or loop through which the tooth passes, and which bolt holds the tooth and plate against the side of the beam, substantially as specified.



4. The combination of the beam A, the plate C, provided with the projections C' and the stops C², the harrow-tooth B, and the pivotal clamping-bolt provided with the wings D², substantially as specified.

5. The holder-plate C, made with the projections C' upon one of its sides, and provided with the stops C² and the bearing-surfaces C³, the clamping-bolt made with elongated eye D', and the wings D² upon opposite sides, in combination with the tooth B and the bar A, all arranged to operate substantially as shown.

10,130. BUTTER-PRINT PRESS. LEWIS COATES and JOEL T. CALDWELL, Callamer, Pa. Filed Mar. 25, 1882. Original No. 142,838, dated Sept. 16, 1873.

10,130.

Claim.—1. The butter-press consisting of frame A, sliding box G, with mouth I, and levers *g i*, block H, guide-posts L, follower N N', and lever M, substantially as and for the purpose described.

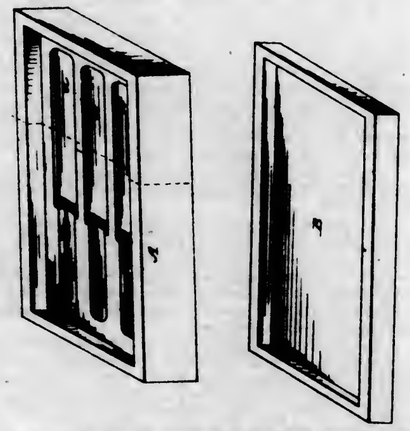
2. The combination of the printing-block H, having handle *d*, with guide-lugs *d'*, and the supporting-piece or platform F, provided with the slot *h*, as shown and described.

3. The sliding box G, having mouth I, guide-strips *e*, and lugs *i'*, the pivoted lever *g*, links *h*, rod *h'*, and levers *i*, combined as specified.

4. The combination of the follower-lever M, having notch *l'* with the upright bar *l*, and box G, as and for the purposes specified.

5. The cross-piece D, having recesses *m'* and button *n*, to lock post *L*, as described.

6. The pieces D D', with guide-recesses *a a'* and follower-shaft N, having the regulating-step *o*, combined as specified.



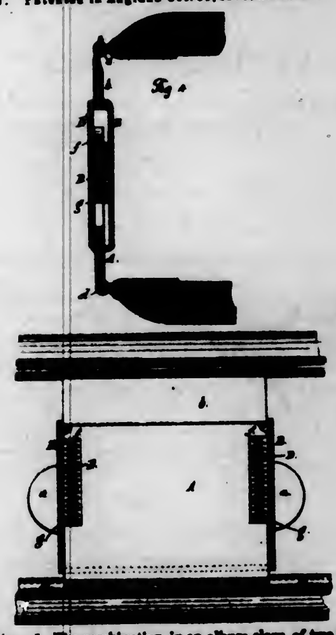
10,131. METHOD OF TREATING WOOD IN ORDER TO OBTAIN FIBER SUITABLE FOR PAPER-MAKING. CARL D. ECHAR, London, England. Filed May 11, 1882. Original No. 253,267, dated Feb. 7, 1882. Patented in England July 13, 1881, No. 3,082; in France Nov. 19, 1881, and in Belgium Nov. 19, 1881.

Claim.—1. The boiling of wood under pressure in a solution containing sulphurous acid and magnesia, substantially as hereinbefore described.

2. The boiling of wood under pressure in a solution containing sulphurous acid and magnesia, or alkaline substitutes, as specified, and discharging from time to time from the boiler during the boiling operation the sulphurous acid that is not free in the process.

3. The boiling of wood in a solution containing sulphurous acid and magnesia, or other alkaline substitutes, as specified, during successive periods in a close vessel, under pressures, which are increased for the several periods, substantially as described, until the wood is reduced to pulp-fiber, and discharging from time to time from the boiler during the boiling periods the sulphurous acid that is not free in the process, as set forth.

10,132. COMBINED BOX AND TRAY MOLDED FROM PULP. ELBERT D. LARAWAY and FRED O. ROCKWELL, Hartford, Conn.; said Laraway assignor of one-half of his right to J. Coolidge Hills, same place. Filed Oct. 21, 1881. Original No. 249,595, dated Apr. 26, 1881.



Claim.—1. A box or receptacle molded in one piece from pulp with sockets or depressions in its bottom, the contour or outline thereof being of irregular shape and varying in depth throughout their length to conform to the shape and varying thickness of the

article of table-cutlery placed therein, substantially as and for the purpose set forth.

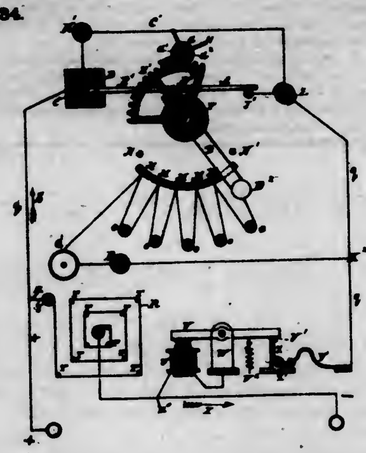
2. A box or receptacle molded from pulp, having on its bottom sockets or depressions of the form substantially as shown, for adapting them to receive and hold articles of table-cutlery, in combination with a flanged cover, also molded from pulp, and disconnected or independent of said box or receptacle, substantially as and for the purpose specified.

10,133. CLASP FOR BOOKS. JULIUS HÜLLER and EDWARD HILPERT, Berlin, Germany, assignors to Koch, Sons & Co., Brooklyn, N.Y. Filed Jan. 23, 1882. Original No. 181,992, dated June 13, 1877. Patented in England Oct. 30, 1876, No. 4,197.

Claim.—1. The combination, in an album-clasp, of two parts, A B, one part sliding within the other, and springs to move said parts and apply a pressure to keep the covers of the album closed, substantially as set forth.

2. The combination, with the hinge and the catch upon the respective book-covers, of the two-part extensible clasp, one part sliding within the other, connected with each hinge and springs between the two parts of the clasp to apply pressure to the covers of the book or album, as set forth.

3. The combination, with the two-part book-clasps, one part sliding within the other, of springs introduced between the said two parts of the clasp to apply spring-pressure to shorten the clasp and draw the book-covers toward each other, as specified.



4. In a clasp for books and albums, the combination, with the plate A, having projections *f*, of the case B, projections *g*, springs D, and hook *e*, substantially as set forth.

10,134. ELECTRIC LIGHTING SYSTEM. WILLIAM E. SAWYER, New York, and ALBON MAN, Brooklyn, assignors to the Electro Dynamic Light Company, New York, N.Y. Filed May 16, 1881. Original No. 236,568, dated June 28, 1878.

Claim.—1. In an electric lighting system, the combination of a generator of electricity which is the common source of supply for the system, two or more conductors, and two or more electric lamps in each of said conductors, or in circuits derived therefrom, substantially as described, for the purpose specified.

2. In an electric lighting system, the combination with the circuit of resistance consisting of wire having great radiating-surface and having the several coils or convolutions composing the same held apart to facilitate the access of the air and the escape of the heat, substantially as described.

10,134.

3. In an electric lighting system composed of a number of lamps connected in circuit, an automatic electric safety-switch combined in the lighting-circuit of each lamp, and through which the current of said circuit flows to the other lamps in circuit, said safety-switch being connected to its own lamp and to the other lamps in circuit to disrupt the circuit of its particular lamp in case of an excess of current therein, leaving the circuit of the remaining lamps intact.

4. With each lamp-circuit B' of an electric lighting system, the combination of a shunt, *c'*, and an electric safety-switch, the shunt and lamp-circuit each providing a closed path for the current at the same time, one through and one around the lamp, and the safety-switch operating to cut the lamp out of circuit in case of an excess of current either in the lamp or in its shunt-circuit.

5. With the lamp-circuit, the combination of a closed shunt-circuit containing a resistance at least equal to the resistance of the lamp, and an automatic electric safety-switch with each lamp, the shunt to furnish a path for the current in case of an abnormal resistance in the lamp, the resistance to keep the current in the lamp when the flow is normal, and the safety-switch to cut the lamp out of circuit in case of an excess of current therein.

6. In combination with a constantly-closed lamp-circuit, B', having resistances O combined therewith, a constantly-closed shunt-circuit, *c'*, having resistances K L, and a lighting-switch, A D, the switch consting with the two closed circuits and the resistances thereof to gradually transfer the current from one closed circuit to the other for the purpose of gradually illuminating or extinguishing the lamp, substantially as described.

7. In an electric lighting system, a lighting-circuit conductor, *a*, divided at *x x*, between which points of division the lamps are placed, one branch of said divisions provided with a resistance, R, to divert the necessary current into the other divisions forming the lighting-circuit, said lighting-circuit consisting of a lamp-circuit, B', and a shunt-circuit, *c'*, containing a resistance at least equal to the resistance of the lamp-circuit, and combined with a lighting-switch, substantially as described.

8. In an electric lighting system, an electric lamp and a lamp-lighting switch combined in a divided conductor, forming two closed circuits, *q* and *a* or *q* and *p* for the current at the same time, one through and one around the lamp, the lamp-circuit B' being also provided with a shunt-circuit, *c'*, and combined with an electric safety-switch energized by a part of the current in the system, and that cuts the lamp out when from any cause there is an excess of current in the lamp or shunt circuit, or in both.

9. In an electric lighting system, the combination, with a main-circuit conductor, *a* or *p* of a shunt-circuit *q*, divided in two sub-circuits, B' and *c'*, both of which are provided with resistances, and are constantly closed for the passage of current, and with one of which the lamp is also combined.

10. In an electric lighting system, the means substantially herein described of cutting the lamp out of circuit when from any cause there is diverted from the lighting-circuit *a* or *p* an abnormally-great current in the shunt-circuit *q*, which means consist of an electric safety-switch combined with each shunt *q* and each lamp Q', and which is called into action to cut the lamp out of circuit by

any excess of current in the shunt-circuit sufficient to increase the attracting powers of the magnet of the switch until it overcomes a given counteracting force on the armature.

11. In an electric lighting system, a lighting-circuit *n* or *p*, in which are combined a resistance, R, and a divided shunt-circuit, B′ and *c*′, having equal resistances, and an electric lamp, Q, so that the resistance R will divert a portion of the current into each division of the shunt-circuit.

12. In an electric lighting system, a lighting-circuit in which are combined a divided shunt-circuit around the lamp, a by-circuit including the lamp, and a lighting-switch, substantially as described.

13. In an electric lighting system, a lighting-circuit in which are combined a divided shunt-circuit, an electric lamp, and a safety-switch, substantially as described.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE McDOUGALL.

Decided April 24, 1882.

1. AMENDMENT OF APPLICATION—NEW MATTER—SUPPLEMENTAL OATH.

Under Rule 47 an applicant may introduce into his application by amendment a part of the invention originally made which was not incorporated into the application either as a part of the specification or claim, if he swears that the matter which he desires to introduce into his application and make a part thereof was a part of his original invention.

2. SAME—SAME—DATE OF COMPLETION OF APPLICATION CHANGED.

Under this practice, however, the Examiner will enter the date of the new oath on the face of the file-wrapper and change the date of the completion of the filing of the application to agree therewith.

TOW-BOAT.

INTERLOCUTORY appeal from the Primary Examiner.

Application filed December 24, 1881.

Messrs. Dyer & Wilber for the applicant.

MARBLE, *Commissioner:*

Appeal is taken from the action of the Examiner refusing to consider an amendment to the application as originally filed because the same contains new matter. Applicant swears that "whatever invention or claim is therein embraced (in the amendment) which was not in the invention or claim as originally presented the same was part of his invention, and was invented by him before he filed his original application." The affidavit thus made is in compliance, or supposed compliance, with Rule 47 of the Rules of Practice, which reads as follows:

> In case the applicant seeks by amendment to introduce any claim not substantially embraced in the statement of invention or claim originally presented, and therefore not covered by the original oath, he will be required to file a supplemental oath to the effect that the subject-matter of the proposed amendment was part of his invention, and was invented before he filed his original application, and such supplemental oath must be upon the same paper which contains the proposed amendment.

The Examiner in his answer says: "Rule 47 seems to have no bearing on the case, as that applies solely to new claims."

I think the construction which the Examiner places upon Rule 47 is too narrow. The rule reads: "In case the applicant seeks by amendment to introduce any claim not substantially embraced in the statement of invention," &c., he will be required to file a supplemental oath. The word "claim" there, I think, should be construed to mean not simply one of the claims which applicant may base upon his specification, but a part of the invention originally made but not incorporated into the application either as part of the specification or claims. It will be observed that the rule contemplates a case where not only matter sought to be introduced was not specifically described, but was not even substantially described, in the statement of invention. In other words, not described at all. In such a case if the applicant swears that the matter which he now desires to introduce into his application, and make it a part thereof, was a part of his original invention, then he may do it by amendment.

Rule 69, to which reference is made, seems to apply to a different class of cases. Under that rule, where a party seeks to amend either the drawing, model, or specification, or additions thereto, the amendment must conform to at least one of them—viz., either the model, the drawing, or the specification. If the matter which is sought to be incorporated into the application is not found in either, and the party cannot make oath that it was a part of his original invention, then he must embrace it in a new application. When the rule is so construed I do not think it is in conflict with Rule 47; nor do I think that it bars amendments like the one here presented. It is not alleged, nor do I find such to be the fact, that the amendment is not properly of subject-matter which might have been claimed in the original application. If the matter sought to be introduced into the application by this amendment were a part of the original invention, then I think that the applicant ought to be allowed so to introduce it at this time. In other words, he ought to be allowed to particularly describe the whole of his invention, and to claim it in one application, if it can be done before the case has passed beyond the control of the Office, and within two years from the filing of the first papers in the case. (Section 4894, Revised Statutes.)

The Examiner will, however, enter the date of the new oath on the face of the file-wrapper and change the date of completion of the filing of the case to agree therewith. With this modification, the decision of the Examiner is overruled.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

LEHNBEUTER *et al. v.* HOLTHAUS *et al.*

Decided March 6, 1882.

1. DESIGN PATENT—INFRINGEMENT.

An immaterial variation of the design—such as a slight inclination backward, hardly perceptible to the eye, of the glass constituting the front of the elevated parts of a show-case—does not relieve from the charge of infringement.

2. SAME—NOVELTY—COMPARATIVE BEAUTY.

It is immaterial to the patentability of a design whether it is more graceful or more beautiful than other designs. It is suffi-

cient if it is new and useful. The patent is *prima facie* evidence of both novelty and utility, and neither of these presumptions has been rebutted by the evidence.

APPEAL from the Circuit Court of the United States for the Eastern District of Missouri.

Mr. R. H. Parkinson for the appellants.

STATEMENT OF THE CASE.

The bill, which was filed in the circuit court by the appellants, charged infringement by defendants of Design Patent No. 8,814 for show-cases, granted to the complainants jointly, and dated November 30, 1875. The answer denied that the complainants were the first inventors of the design patented, denied its utility, and denied that the defendants infringed. To sustain these denials all the testimony offered by the defendants was directed. Upon final hearing the circuit court dismissed the bill because "said letters patent were not good and valid in law," and the complainants have brought the case to this court by appeal.

The record contained certain stipulations in respect to the evidence. These were—

That the following exhibits may be produced by either party at the hearing upon an appeal in the Supreme Court and used in evidence as a portion of the transcript herein, viz: "Defendants' Exhibit, Wiegal Catalogue," and "Defendants' Exhibit, Maw's Price Current;" also, "Design Patents Nos. 8,287, 8,813, and 8,814;" also, "Complainants' Exhibit Holthaus Circular;" that it shall be taken as admitted, for the purposes of this case, that said exhibits, "Wiegal Catalogue" and "Maw's Price Current," were issued prior to January, 1874; that the circular marked "Complainants' Exhibit Holthaus Circular" is a copy of circulars issued by the defendants in the month of July, 1877, and subsequently thereto; that the cuts therein correctly represent show-cases made and sold by the defendants in St. Louis, within said eastern district of Missouri, during and after January, 1877, and before the commencement of this suit, and still made and sold by them; also, that the circular marked "Complainants' Exhibit Claes & Co., Circular," is a copy of a publication issued and circulated by complainants in the month of September, 1875, and subsequently thereto; also, that the model marked on bottom "Complainants' Exhibit Model No. 1," under the hand of the same notary, correctly represents show-cases made and sold by defendant in said St. Louis during and after the month of January, 1877, and before the commencement of these suits.

The only witness in the case was Charles K. Pickles, who testified for the complainants that he made the original drawings from which the plates were made of the cuts 33, 34, and 36 of the Holthaus circular; that he made the drawings for Holthaus, the defendant, who gave him cuts from Claes & Co.'s circular, from which to make the plates or prints, and that there were slight changes suggested by Holthaus, which the witness followed in making the drawings.

The Wiegal catalogue, Maw's Price Current, the Holthaus circular, and the design patents, numbered respectively 8,287, 8,813, and 8,814, with their drawings, the first granted to Joseph Lehnbeuter and the other two to Lehnbeuter and Claes, the complainants, were put in evidence. The one last named was that on which this suit was brought.

Mr. Justice WOODS delivered the opinion of the Court.

A comparison of the drawing which is appended to Patent No. 8,814, with cut No. 34 of the Holthaus circular, which it is admitted represents show-cases manufactured and sold by the defendants during and since January, 1877, makes it clear that the latter is a servile copy of the former, excepting a slight inclination backward, hardly perceptible to the naked eye, of the glass constituting the front of the elevated portions of the case. We think therefore that the infringement is clearly established.

The attempt to prove that the complainants were not the first inventors of the design covered by their letters patent has entirely failed. The only evidence offered on this branch of the defense are the publications designated as "Maw's Price Current" and the "Wiegal Catalogue." The first of these bears date in 1869 and the latter in 1872. After a careful search through both we have been unable to find any design for a show-case which remotely resembles that described in the complainants' patent. The design patented by the complainants differs essentially from any other which has been called to our attention. It is not covered by the other patents which are set out in the record. Whether it is more graceful or beautiful than older designs is not for us to decide. It is sufficient if it is new and useful. The patent is *prima facie* evidence of both novelty and utility, and neither of these presumptions has been rebutted by the evidence. On the contrary, they are strengthened. No anticipation of the design is shown, although the attempt has been made to prove anticipation. The fact that it has been infringed by defendants is sufficient to establish its utility, at least as against them. (Swayne, Justice, in *Whitney* v. *Mowry*, 4 Fish., 207.)

Our conclusion is that the complainants have a valid patent, which the defendants have infringed. The decree of the circuit court dismissing their bill must, therefore, be reversed, and the cause remanded for further proceedings in conformity with this opinion.

U. S. Circuit Court—Southern District of New York.

SEARLS *v.* BOUTON *et al.*

Decided October Term, 1881.

1. REISSUED LETTERS PATENT NO. 9,297 SUSTAINED.
   Reissued Letters Patent No. 9,297, granted to Searls, for an improvement in whip-sockets, construed and sustained.
2. REISSUE—NEW MATTER—ORIGINAL PATENT NOT IN EVIDENCE.
   Where the original patent is not put in evidence there is nothing properly before the court by which to determine whether the original and the reissue are for the same invention or not. As the reissue was granted by the proper officer, the presumption is that it was properly granted, and there is nothing in the case to overcome that presumption.
3. SECTIONS 4886 AND 4920 REVISED STATUTES—PRIOR KNOWLEDGE AND USE.
   Section 4886 Revised Statutes, providing that a patent may be granted if the invention was not known or used by others, and section 4920 Revised Statutes, providing that in his notice of defenses the defendant shall state not only the names and residences of the persons alleged to have had prior knowledge of the invention, but "where and by whom it had been used," are to be construed together; and prior knowledge of an invention not accessible to the public did not defeat a patent. (*Gaylor* v. *Wilder*, 10 How., 477.)
4. WANT OF ALLEGATION IN ANSWER—AFFIRMATIVE DEFENSES.
   When the answer alleges knowledge by certain persons of a certain place, but not knowledge at that or any other place, proof cannot be received that such knowledge was at that place. Affirmative defenses, and especially this defense as provided and regulated by the statute, must be alleged as well as proved.
5. PERSONAL LICENSE NOT TRANSFERABLE.
   A license "to manufacture" at a certain place is a personal license not transferable.

Mr. J. P. Fitch for the plaintiff.

Mr. N. Davenport for the defendants.

WHEELER, *J.*:

This suit is brought upon Reissue Letters Patent No. 9,297 to the orator for an improvement in whip-sockets, and upon original Letters Patent No. 231,510 to John M. Underwood, assignor to the orator; also for an improvement in whip-sockets.

The defenses set up in the answer are to the former, that it was not properly reissued for the same invention described in the original; that the invention had been previously patented in several prior patents in

this country; that the invention was previously well known to, among others, Charles A. Fleschs, John Perpente, and E. E. Stevens, without saying that it had been used by any person, and that defendants have not infringed, and to the latter the defense is want of novelty.

Although this objection to the reissue is set up in the answer, the original patent is not put in evidence at all, and there is nothing properly before the court by which to determine whether the original and the reissue are for the same invention or not. As the reissue was granted by the proper officer, the presumption is that it was properly granted, and there is nothing in the case to overcome that presumption.

The patent is for a centrally-perforated rubber disk fitting loosely into an inner groove near the top of a whip-socket to steady the whip, and retained there by its expansive force, keeping its outer edge within the walls of the groove and permitting the insertion and withdrawal of the whip by its elasticity. The evidence shows that such disks had been for some time known and used for this purpose by being placed in the whip-socket near the top, and being clamped or held there by the outer edge placed firmly between the body and top of the socket, or between a shoulder in the socket and a closely-fitting ring, and by other similar arrangements for holding the outer edge tightly. These were patented in the prior patents set up in the answer. In the use of disks so fastened the insertion and withdrawal of the whip would bend the inner part up and down and cause it to break from the outer part at the edge of where it was firmly held. The invention of the orator obviated this breaking largely by allowing the outer edge of the disk to roll in the groove with the movement up and down of the interior. This kind of disk was not described in any of the prior patents. It could be used in a socket formed in one piece in that part, and the patent describes making its outer edge of harder rubber than its inner edge, to make it more secure in its place and still permit the insertion and withdrawal of the whip.

There are three claims. The first is of a whip-socket formed there in one piece with a groove, and such a disk inserted in it; the second is for the combination of such a disk, so held in place, with a whip-socket, and the third is for such a combination with a disk having its outer edge of harder rubber.

The second claim seems to cover the whole that the patent can be construed to cover. The whip-socket without the loosely-fitting disk in the groove would not be new, and such a fitting disk in a whip-socket would include one with a harder edge. This combination is not shown in any of the patents. The patents are all for comparatively-small differences, and this difference is small; but it exists, and is large enough to be patented.

The allegation in the answer as to knowledge without an allegation of use seems to have been made intentionally, in view of the evidence to support it, rather than inadvertently. The proof at most shows that but two sockets were made showing this invention, and that these were laid away with other specimens without the rubber disks being in the grooves. Fleschs, who made them, afterward took a patent, which is one of those set up as anticipations without this feature, and no use of them otherwise is shown. One of them, defendants' Exhibit L, is in evidence with a rubber disk made since in the groove. As so put together this exhibit does seem to show all the elements of this patent as construed. The evidence was seasonably objected to for the reason of the lack in the answer, and the question is whether such an answer supported by proof will defeat a patent. The section of the statute relating to the granting of patents provides that they may be granted if the invention was not "known or used" by others, as if either knowledge or use would prevent. (Rev. Stats., sec. 4886.) The section relating to defenses and the mode of making them provides for notice, stating not only the names and residences of the persons alleged to have had prior knowledge of the invention, but adds: "and where and by whom it had been used." In *Gaylor* v. *Wilder* (10 How., 477) it was held that these statutes were to be construed together and with others on the same subject, and that prior knowledge of an invention not accessible to the public would not defeat a patent. The knowledge might be acquired in a foreign country and the invention not be patented or described in a printed publication there, and such knowledge would not prevent or defeat a patent by another in this country.

The answer alleges knowledge by persons of New Haven, Connecticut, but not knowledge at New Haven or any other place. The proof goes beyond this and such knowledge as there was to have been at New Haven; but affirmative defenses, and especially this defense as provided and regulated by the statute, must be alleged as well as proved, and proof objected to for want of allegation will not help out the defense. (*Roome* v. *Simon*, 95 U. S., 214.) This defense cannot prevail as made.

The defense of non-infringement rests upon a license granted by the orator to John O. Merriam and Edwin Chamberlain "to manufacture" at their shop in Troy, New York, and no other place or places. This appears to be a personal license, not transferable, and a license to make only. Merriam and Chamberlain had a shop in Troy and constituted a firm. Merriam appears to have sold out to a new firm composed of Edwin Chamberlain and Perry D. Randall. Edwin Chamberlain has since died, and Edward Chamberlain has succeeded him in the firm of Chamberlain & Randall. Merriam appears to have ordered materials, or to have permitted Chamberlain & Randall to order them in his name, for use in making whip-sockets at that shop, but he does not appear to have been engaged himself in the manufacture. Sockets made under and pursuant to the license would be free to the trade, but sockets merely dealt in by the licensees would not thereby be made free. The defendants have not made it clear that the sockets they have sold, which would otherwise be an infringement, were made under and pursuant to the license. Therefore they must be adjudged to have infringed. The extent of the infringement unlawfully done must, of course, go to the master for determination.

There was some difficulty in having these rubber disks thick enough to well retain their places in the sockets and at the same time yielding enough to permit ready insertion and withdrawal of different-sized whips. Underwood invented cutting away portions of the disk at intervals around between the outer edge and the perforation, making them more yielding in the interior, whereby this difficulty was in some measure,

at least, overcome. His patent is for this improvement. The evidence of anticipating devices shows nothing like this.

As the case is made up and presented the patents must both be adjudged valid and to be infringed.

Let a decree be entered for the orator for an injunction and an account according to the prayer of the bill, with costs.

U. S. Circuit Court—District of Indiana.

HAPGOOD *et al.* *v.* HEWITT.

Decided March 22, 1882.

1. INVENTION BY EMPLOYÉ—RIGHTS OF.
   Persons are not deprived of the right to their inventions while in the service of others, unless they have been hired and paid to exercise their inventive faculties for their employers.
2. SAME—EMPLOYER NO RIGHT TO PATENT.
   A contract by which one person agrees to pay a sum of money for the time, labor, and skill of another for a given period gives the employer no right to an assignment of a patent that is issued to his employé for an invention made during the period of his employment.
3. SAME—LICENSE.
   If under such a contract of employment the employer has any right to the invention, it is a mere naked license to make and sell the patented improvement as a part of its business. This right, being a mere personal one, is not transferable, and is extinguished with the dissolution of the corporation which exercised it.

Mr. John G. Williams and *Mr. E. W. Pattison* for the plaintiffs.

Messrs. Wood & Boyd and *Messrs. Chapman & Hammond* for the defendant.

GRESHAM, *J.*:

This is a suit brought by Charles H. Hapgood, James H. Hesse, and John Parker, trustees of Hapgood & Company, a defunct corporation organized under the laws of the State of Missouri, and the Hapgood Plow Company, a corporation organized under the laws of the State of Illinois, against Horace L. Hewitt. The relief sought is a decree compelling the defendant to assign to the Hapgood Plow Company, as the successor of the Hapgood Company, or to the trustees of the last-named company, in trust for the Hapgood Plow Company, certain letters patent which the defendant caused to be issued to him for improvements in iron sulky-plows.

The bill is demurred to for want of equity. It avers, in substance, that the defendant represented to the Hapgood Company, which was organized at St. Louis, under the laws of Missouri, to manufacture and sell plows and other implements, that he had had large experience in the manufacture and sale of plows and in devising and making improvements of the same; that, if employed by the company, he would devote his time and services to getting up and perfecting plows and other goods in its line of business; that, relying upon the defendant's representations as to his skill in the manufacture of plows and in devising improvements of the same, he was given employment by the company; that after being so employed the defendant became the owner of some of the company's stock, and was made its superintendent; that in consideration of a salary of three thousand dollars a year the defendant agreed to devote his time to the service of the company and his skill in devising and making improvements in plows manufactured by it; that during his regular working hours, and with the aid of instructions, directions, and suggestions from the officers and employés of the company, the defendant succeeded in getting up an improved iron sulky-plow, the company paying for the labor and materials which were used in its construction; that the company manufactured plows after the model so gotten up by the defendant and other employés, and on the 26th of March, 1878, the defendant being no longer in the service of the company, a patent was issued to him, on his application, covering certain parts of the improved iron sulky-plow, and the defendant now claims the exclusive ownership of such patent; that after the granting of the patent to the defendant—viz., on the 1st of January, 1880—the corporation of Hapgood & Company was dissolved, and the trustees named were appointed, under the laws of Missouri, to wind up its affairs; that on the 27th of December, 1879, a corporation was organized, under the laws of Illinois, under the name of the "Hapgood Plow Company;" that in getting up said plow and the improvements which it embraced the defendant did no more than it was his duty to do under his employment, and his employer, Hapgood & Company, in equity became the owner of the right to manufacture said plow and of the right to a patent for anything which was patentable as an improvement of the same, and that the Hapgood Plow Company became the successor of the Hapgood Company and owner of all its assets of every kind and description, including its equitable right to said letters patent.

Persons are not deprived of the right to their inventions while in the service of others, unless they have been hired and paid to exercise their inventive faculties for their employers. A contract by which one person agrees to pay a sum of money for the time, labor, and skill of another for a given period gives the employer no right to an assignment of a patent that is issued to his employé for an invention made during the period of his employment. The defendant represented to Hapgood & Company that he had had large experience in the manufacture and sale of plows, and that he had a thorough knowledge of that business. It was the benefit of that knowledge and experience the defendant's employers desired and for which it contracted. The defendant was not expressly required by his contract with Hapgood & Company to exercise his inventive faculties for the benefit of the company, and there is nothing in the bill from which it can be fairly inferred that he was required or expected to do so. The bill avers that the defendant was aided and assisted by advice and suggestions from other officers and employés of the company in getting up the improved plow for which he obtained the patent. If the invention was the joint work of the defendant and his co-employés, he was not entitled to a patent as sole inventor. But, however this may have been, if Hapgood & Company had any right to the invention by virtue of the terms of the defendant's contract of employment, it was a mere naked license to make and sell the patented improvement as a part of its business. This right, if it existed, being a mere personal one, was not transferable, and it was extinguished with the dissolution of the corporation. (Curtis on Patents, 4 ed., sec. 213; *Continental Windmill Company* v. *Empire Windmill Company*, 4 Fisher's Patent Cases, 428.)

Demurrer sustained.

12,968.—FONT OF PRINTING-TYPE.—*Herman Ihlenburg*, Philadelphia, Pa., assignor to *MacKellar, Smiths & Jordan*, same place. Application filed April 11, 1882. Term of patent 14 years.

12,969.—ADVERTISING-DISK.—*Elhanan L. Meodis*, New York, N. Y., assignor of one-half to *Charles H. Gillespie*, same place. Application filed April 29, 1882. Term of patent 3½ years.

12,970.—FENCE-PICKET.—*Wilber Thomas*, Quincy, Ill. Application filed April 20, 1882. Term of patent 14 years.

12,971.—FENCE-PICKET.—*Wilber Thomas*, Quincy, Ill. Application filed April 21, 1882. Term of patent 14 years.

12,972.—FENCE-PICKET.—*Wilber Thomas*, Quincy, Ill. Application filed April 20, 1882. Term of patent 14 years.

12,973 and 12,974.—FENCE-PICKET.—*Wilber Thomas*, Quincy, Ill. Applications filed April 21, 1882. Term of patents 14 years.

12,975.—FONT OF PRINTING-TYPE.—*Henry H. Thorp*, Cleveland, Ohio, assignor to the *H. H. Thorp Manufacturing Company*, same place. Application filed April 24, 1882. Term of patent 14 years.

12,976.—CARPET.—*David G. Melville*, Medford, assignor to *The Roxbury Carpet Company*, Boston, Mass. Application filed May 1, 1882. Term of patent 3½ years.

12,977.—SPOON-HANDLE.—*Alfred W. Sperry*, Hartford, Conn. Application filed May 3, 1882. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,446.—CIGARS.—*Ramon Allones*, New York, N. Y. Application filed May 15, 1882.
"The fac-simile signature of registrant, 'RAMON ALLONES.'"

9,447.—MEN'S, YOUTHS', AND WOMEN'S SUSPENDERS AND BRACES.—*James Bowers*, Newark, N. J. Application filed May 13, 1882.
"The word-symbol 'MAGNETIC.'"

9,448.—INFANTS' FOOD.—*The Cereals Manufacturing Company*, New York, N. Y. Application filed May 22, 1882.
"The arbitrary words 'CEREAL MILK.'"

9,449.—WHISKY.—*P. W. Enge & Sons*, New York, N. Y. Application filed May 16, 1882.
"The arbitrarily-selected words 'MELLOW HORN.'"

9,450.—CUTLERY, SUCH AS SHEARS, SCISSORS, KNIVES, AND RAZORS. *Fuller Brothers*, New York, N. Y. Application filed May 11, 1882.
"The word 'PARAGON.'"

9,451.—LASTS.—*John Kimball*, Boston, Mass. Application filed February 3, 1882.
"The arbitrarily-selected letter 'N' inclosed by a circular figure, the whole forming a fanciful symbol."

9,452.—SMOKING-TOBACCO.—*Charles R. Messinger*, Toledo, Ohio. Application filed May 9, 1882.
"The arbitrarily-selected words 'OLD COMFORT.'"

9,453.—SMOKING-TOBACCO.—*Charles R. Messinger*, Toledo, Ohio. Application filed May 9, 1882.
"The letters 'F. G.'"

9,454.—MILLSTONES.—*North Carolina Mill Stone Company*, Westminster, Md. Application filed May 17, 1882.
"A pictorial representation of an eagle."

9,455.—MEDICINAL COMPOUND.—*Milton K. Paine*, Windsor, Vt. Application filed May 1, 1882.
"The pictorial representation of a celery-plant."

9,456.—CIGARS.—*Frederick Riebel*, Indianapolis Ind. Application filed May 18, 1882.
"The word and figures "No. 35.""

9,457.—DENTIFRICE.—*Rogers & Lyon*, New London, Conn. Application filed April 4, 1882.
"The word 'ODONTIQUE' and the monogram composed of the letters 'R & L.'"

9,458.—RED WINE.—*Charles Saalmann*, Egg Harbor City, N. J. Application filed May 1, 1882.
"The words 'BLACK ROSE' and the arbitrary symbol consisting of an eagle."

9,459.—MEDICINAL PLASTERS.—*Seabury & Johnson*, New York, N. Y. Application filed May 18, 1882.
"The word-symbol 'CAPCINE.'"

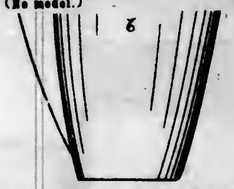
9,460.—WRITING-INKS OF ALL DESCRIPTIONS.—*Henry C. Stephens*, Finchley, county of Middlesex, England. Application filed February 1, 1882.
"The design in the shape of a truncated pyramid, within which is a frame inclosing lace-work."

9,461.—WRITING-INKS OF ALL DESCRIPTIONS.—*Henry C. Stephens*, Finchley, county of Middlesex, England. Application filed February 1, 1882.
"An oblong with bordering of spiral decoration, at the corners of which is a circle composed of engine turning."

9,462.—WRITING-INKS OF ALL DESCRIPTIONS.—*Henry C. Stephens*, Finchley, county of Middlesex, England. Application filed February 1, 1882.
"The word 'AEILYTON.'"

9,463.—CEMENT.—*Stuart & Co.*, Edinburgh, county of Mid-Lothian, Scotland. Application filed April 18, 1882.
"The fanciful word 'GRANOLITHIC.'"

9,464.—JET-GOODS OF ALL KINDS AND BUTTONS AND JEWELRY MANUFACTURED FROM JET.—*Veit & Nelson*, New York, N. Y. Application filed April 17, 1882.
"The representation of a cupid and a cornucopia."

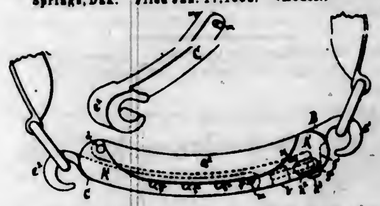


LABELS.

2,700.—Title: "JUNIPER WATER BOTTLING COMPANY."—*Ezra H. Bailey*, Plymouth, N. C. Application filed May 20, 1882.

PATENTS

GRANTED JUNE 13, 1882.



259,282. CRUCIBLE. JOHN BAVIER, Newark, N. J. Filed Mar. 14, 1882. (No model.)

Claim.—1. As an improved article of manufacture, a crucible composed of the body *b*, spout *a*, channel *c*, and semi-cover or top wall, *d*, extending horizontally part way across the top of the crucible, all the parts being homogeneous and integrant, and operating as herein described, for the purposes set forth.

2. In a crucible, the combination of the spout *a*, body *b*, channel *c*, semi-cover *d*, and open spout or spouts *e*, arranged and operating substantially as described.

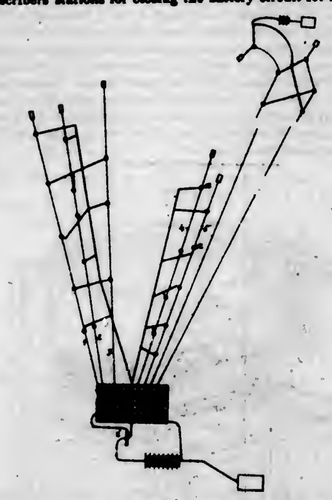
259,283. NAME-FASTENER. WILLIAM W. BELL, Valley Springs, Dak. Filed Jan. 17, 1882. (Model.)

Claim.—1. The side plates, A' A^2, each having formed therein a longitudinal groove, *i*, and notches i^2, in combination with a bar, C, having a hook, c^2, at one end, and pins *m*, extending from both its sides near the other end, and fitted between the plates, whereby the parts are adapted to operate as set forth.

2. The casing A' A^2, having slots *i* and notches i^2, and provided with ribs G' G^2, in combination with bar C, provided with hook c^2, and pins *m*, connected to plates A' A^2, as set forth, for the purposes specified.

3. The combination of casing A' A^2, having slots *i* and notches i^2, bar B, provided with hook *c'*, and catch g' g^2, bar C, provided with hook c^2, and pins *m*, spring D, and spring-dog h' h^2, the several parts being arranged to operate as set forth.

259,284. TICKET-CLASP. LEONARD J. BLAUBS, Chicago, Ill. Filed Apr. 22, 1882. (No model.)

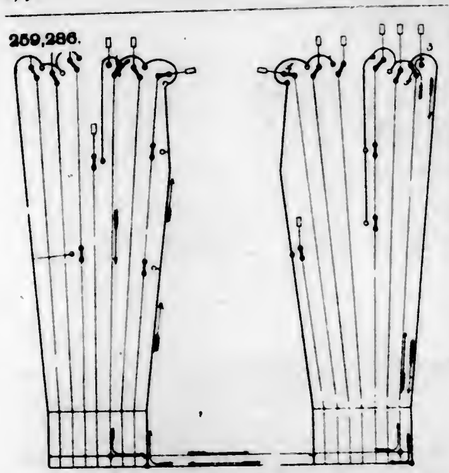


Claim.—1. An improved ticket-clasp consisting of the metal plate B, the spring or binding-piece *a*, cut from the outer edge of said plate, and the tongue C, cut from the central portion of the plate, all substantially as set forth.

2. An improved ticket-clasp composed of plate B, spring or binding-piece *a*, and tongue C, cut from the plate, and the upper projection, *s*, all substantially as set forth.

259,285. TELEPHONE SIGNALING-CIRCUIT. GEO. H. BLISS, Pittsfield, Mass. Filed Oct. 20, 1881. (No model.)

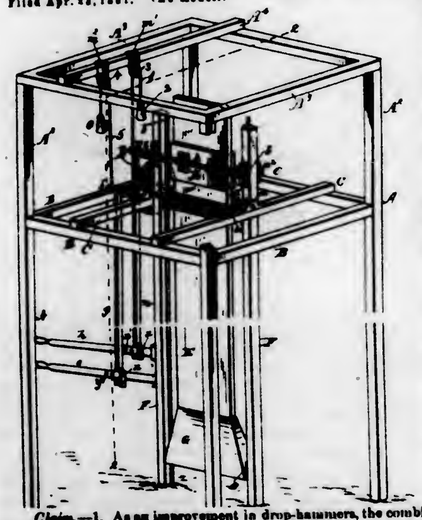
Brief.—A battery at central station has one pole connected with the switching and signaling apparatus of each subscriber's line and the other pole connected to a line from which branches extend to every subscriber's station. Means are provided at the subscribers' stations for closing the battery-circuit for signaling.



Claim.—1. In an exchange system, a series of subscribers' circuits all entering a common central office, and each passing through a signaling-instrument, and a battery having one pole normally connected through the said signaling-instruments with the said subscribers' wires, combined with a battery-wire leading in branches from the other pole of the said battery into all the stations on the said subscribers' circuits, and a device at each station for connecting the said subscriber's wire with the said branch entering the station, substantially as and for the purpose described.

2. In an exchange system, a group of subscribers' stations remote from others connected with the same central office, upon circuits entering the said office and passing through indicating-instruments to the ground, in combination with a battery located in the said group, and having one pole grounded and the other extended by normally-open branches into all the said stations, and means to connect the said branches at any station with the subscriber's wire, substantially as and for the purpose described.

259,286. TELEPHONE-CIRCUIT. GEO. H. BLISS, Pittsfield, Mass. Filed Nov. 12, 1881. (No model.)

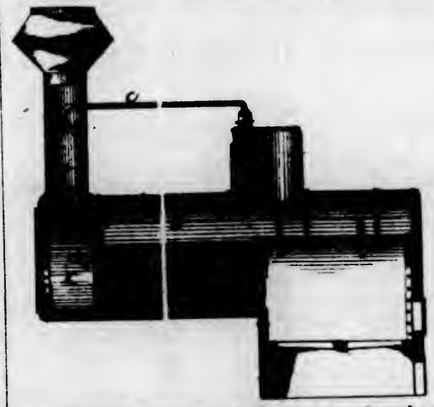


Brief.—In communication between subscribers connected with different central offices complete metallic circuits arranged to neutralize the effects of currents induced from neighboring lines. The return-wires are taken to all the subscribers' stations, and means are provided for connecting either with the return-wire or with ground.

259,286.

Claim.—In a telephone-exchange system, two central offices connected by a metallic circuit arranged to annul inductive disturbances, each office having connected with it subscribers' circuits and one or more lines extended into a large number of subscribers' stations, combined with means to connect the said line with the subscriber's circuit at the subscriber's station, and means to connect the said line and subscriber's circuit with the two portions of the metallic circuit connecting the central offices, substantially as and for the purpose described.

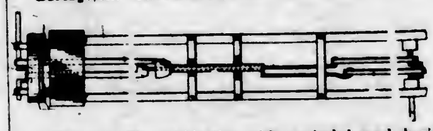
259,287. DROP-HAMMER. ABIJAH R. BURNETT, Troy, Ohio. Filed Apr. 22, 1881. (No model.)



Claim.—1. As an improvement in drop-hammers, the combination, with the strap E and hammer or die G, and suitable mechanism for imparting vertical movement thereto, of the rigid clamp-plate J, clamp-plate K, having eccentric-axle *k c'*, rod *n*, and lever *h*, crank-arm *m*, strap *m'*, cord or chain 1, weight 2, and pulley 3, substantially as and for the purpose described.

2. The frame-work A B, cross-bars C, standards F A', cross-bars A', transverse bar A', rotatable roller H, roller I, having eccentric-axle *d e*, crank-arm *f*, rod *g*, and lever *o*, the journal-boxes *s o*, strap *m'*, pulley 4, cord or chain 5, and weight 6, as and for the purpose described.

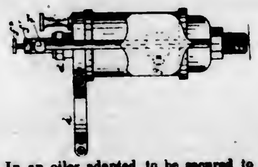
3. In a drop-hammer or press, the combination, with the strap and die or hammer, of the roller H, secured fixedly in bearings, the roller I, mounted upon an eccentric-shaft, the rigidly-fixed clamp-plate J, the clamp-plate K, secured upon eccentric-shaft *k c'*, weighted cords or chains, pulleys, and suitable rolls or levers for actuating said eccentric-shafts, and suitable mechanism for rotating the roller H, substantially as and for the purpose set forth.



4. The combination, with the strap E, rollers H I, clamps J K, eccentric-axles *d e* and *k c'*, and crank-arms *f m*, of the rods *g n*, having forked and perforated ends, and the levers *h o*, having perforations, as and for the purpose described.

259,288. STEAM-BOILER. JOHN F. CARNEY and DONALD F. TOUCEY, Minneapolis, Minn. Filed Mar. 13, 1882. (No model.)

Claim.—The steam-pipe C, leading from the safety-valve to and through an opening in the stack, and being bent downward therein, the end or nozzle of said pipe flaring outward, and having an inner beveled-edge surface, in combination with a semi-spherical plug having a flat top with beveled edge, said edge being equidistant from the beveled edge of the nozzle, the plug being suspended in the mouth of the nozzle by braces riveted through the nozzle and projecting inward and downward to the center of the flat surface of the plug, at which point they meet and are united and secured to said plug, all arranged in the manner and for the purpose specified.

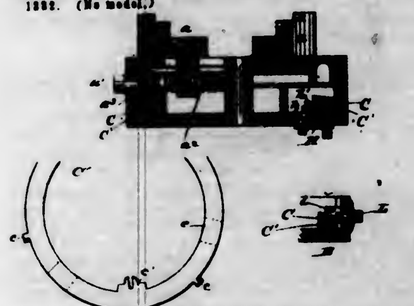


259,289. WIND-WHEEL MACHINERY. ALONZO S. CARMAN, Marengo, Ill. Filed Mar. 25, 1882. (No model.)

Claim.—1. The combination, with a swiveled crank having pitmen extending downward from the same, of the ball-and-socket joints operating on the same vertical center as said cranks, and pivoting said pitmen to the connecting-rods below, as hereinbefore fully described.

2. The combination of the two connecting-rods, the one reciprocating within the tubular upper portion of the other, and so arranged as to be pivoted to and operate the lower pitmen, which drive the transverse shaft, with the ball-and-socket joints, upper pitmen, the double cranks on the wind-wheel shaft, and the oscillating cap, substantially as and for the purpose set forth.

259,290. OILER. DANA L. COLUMBIA, Chicago, Ill. Filed Oct. 26, 1881. (No model.)

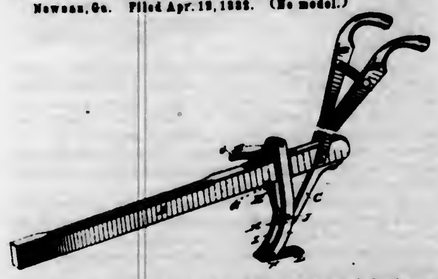


Claim.—1. In an oiler adapted to be secured to and move with the joint to be lubricated, the combination, with the valve and its stem extending through the top of the oiler, of a weighted fulcrumed lever to which said stem is jointed and by which it is raised and lowered, said lever being located outside the oiler, and being itself automatically thrown or actuated by the movement of the part to which the oiler is secured, substantially as specified.

2. The combination, with the valve-stem of an oiler, of the pivoted elbow or bent lever F, the stem being jointed to the horizontal portion of the lever, substantially as specified.

3. The oiler composed of the metal base, the cylindrical body, the metal top, the tube for uniting the top and base, the valve and its stem, and the lever for operating the valve, substantially as specified.

259,291. LATHE-CHUCK. THOMAS H. COCHRILL, Chicago, Ill., assignor of one-half to E. H. Gross, same place. Filed Feb. 27, 1882. (No model.)

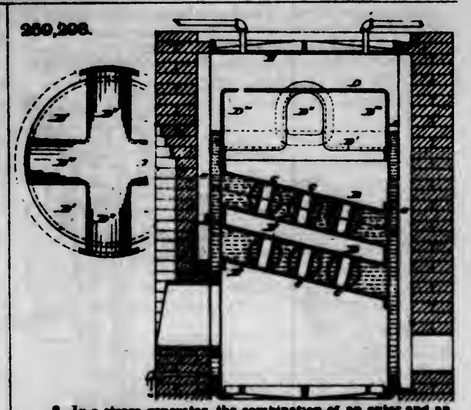


Claim.—1. The combination of the ring C', having the series of pins e upon its outer periphery, and the series of cam-slots *b* in part B as co-operating devices in the operation of forcing the circular rack C into and out of gear with pinions *a'*, substantially as described.

2. The lever H, having pin *r'* and operating upon shaft *v*, in combination with plate or part B, having holes *r r*, substantially as described.

3. The combination of the beaded pin L and its spring-disk in position over its slot in the flange of part B, and the tooth *l*, adapted to latch circular rack C in any position required or to unlatch the same at will, substantially as described.

259,292. PLOW. ANDREW S. COX and RICHARD A. JOHNSON, Newnan, Ga. Filed Apr. 19, 1882. (No model.)



Claim.—1. The combination of the plow-beam A, having segmental block I', provided with recesses Q and V-shaped bracket C, the standard H, consisting of bars I, pivoted to the sides of bracket C, and the cam-lever M, pivoted between the upper ends of the bars I, and having handle O and tooth N, engaging the recessed block I', as set forth.

2. The combination, with the plow-beam, of the bracket C, having its rear end secured permanently to said beam and its forward screw-threaded end adjusted in a recess in said beam, and provided with a nut, G, and the standard H, pivoted to said bracket, and provided at its upper end with a toothed cam-lever engaging a segmental notched block on the upper side of the beam, as and for the purpose set forth.

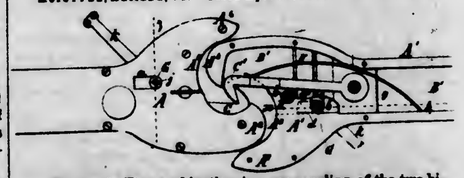
259,293. STEAM-GENERATOR. WILLIAM P. COX, Philadelphia, Pa. Filed Jan. 7, 1882. (No model.)

Claim.—1. A horizontal flue extending across the crown-sheet and communicating with the space between the inner and outer shell, in combination with said shells and crown-sheet, substantially as set forth.

259,293.

2. In a steam-generator, the combination of an outer and an inner shell, the transverse water-tubes B, and a crown-sheet having a horizontal flue extending across the same and communicating with the space between the inner and outer shell, substantially as set forth.

3. In a steam-generator, the combination of an outer and an inner shell with transverse water-tubes B, having rings B' and flues C, and a crown-sheet having a horizontal flue extending across the same and communicating with the space between the inner and outer shell, substantially as set forth.

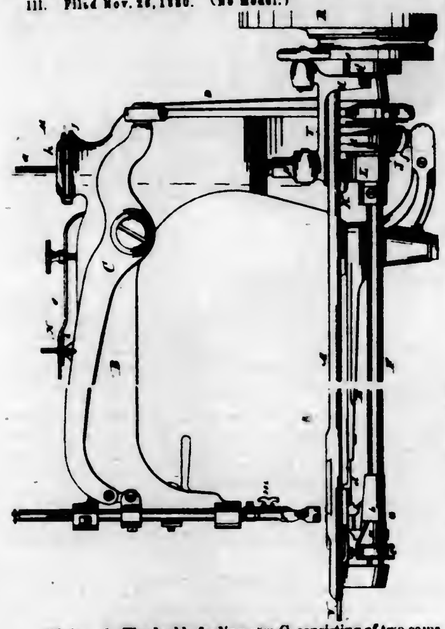


4. The horizontal flue D', having hollow lateral wings, in combination with the crown-sheet, the two shells and exterior wall having a space for the passage of air between it and the outer shell.

259,294. LOCOMOTIVE-FURNACE. ANDREW J. CROMWELL, Baltimore, Md. Filed Mar. 7, 1882. (No model.)

Claim.—In combination with the furnace having the rearwardly and upwardly inclined plates *c c'*, with draft-spaces at their horizontal edges, the air-hole *d'*, located opposite the draft-space between the plates, and adapted to supply air to the combustible gases on their escape between the plates in order to consume them in the furnace, as set forth.

259,295. CAR-COUPLING. NICHOLAS L. DAVIS and JOHN H. MCINTYRE, Rutland, Vt. Filed Apr. 17, 1882. (No model.)



Claim.—1. The combination, in a car-coupling, of the two bifurcated draw-heads A A', formed respectively as follows: that, A, having the chambered prong A^2, the solid prong A^4, and the bumper-surface A^3, and the other, A', having the chambered prong A^4, the solid prong A^2, and the bumper-surface A^3, the long pivoted and laterally-vibrating spring coupling-hooks C C', applied within the chambers B B', and the vertical rods G G, having tumblers G' G', substantially as described.

2. The vertically-sliding and horizontally-vibrating tumbler-rod G G', in combination with the vibrating hook C, and the draw-head provided with the oblong slot *a*, space *c*, step *b*, and stops I I', substantially as and for the purpose described.

3. The tumbler-rods G G, provided with tumblers G' G' and under and upper extensions, *j j j' j'*, in combination with the verti-

cally-sliding and laterally-vibrating spring-hooks C C' and with the draw-heads A A', substantially as and for the purpose described.

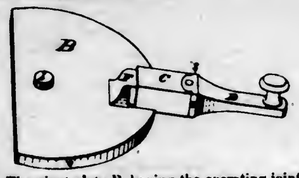
259,296. SEWING-MACHINE. CHAS. A. DEARBORN, Chicago, Ill. Filed Nov. 26, 1880. (No model.)

Claim.—1. The double feeding-cam G, consisting of two cams, *a b*, adjustable together on the driving-shaft F for the purpose of giving the feed its forward and vertical movements, and at the same time automatically regulating the extent of its vertical movement as the length of the stitch is changed, substantially as specified.

2. The combination, with the vibrating needle-lever located on the standard above the bed-plate, of the forked lever I, pivoted at its upper end, the main shaft F, located below the bed-plate A, the eccentric J upon the main shaft F, the shuttle-lever H, and connecting devices between the main shaft and the vibrating needle-lever, all constructed and operated substantially as and for the purposes specified.

3. The combination, with a vibrating arm located above the bed-plate to move the needle-bar, a main driving-shaft located horizontally beneath the bed-plate, and connecting devices for operating the arm from the shaft, of a forked lever, I, provided with an arm or extension, *f*, and pivoted at its upper end above the main shaft, and a shuttle-lever provided at its rear end with a fork to receive the said arm or extension of the forked lever, substantially as and for the purposes specified.

4. A vertical spring-shaft, K, having a crank at its lower end and located at the rear of the machine, in combination with a cam located on the main shaft and engaging the crank of the vertical shaft, and a take-up arm located at the upper end of the shaft, substantially as and for the purposes specified.



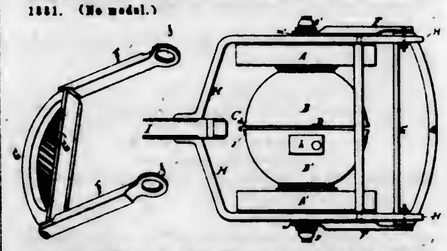
5. The tension-plate O and the disk N, in combination with a knife-like edge, k, transverse to the plate O, on which edge the disk rocks, substantially as and for the purpose specified.

6. The half-round presser-foot shank P, open upon one side, so as to fit upon a round foot-bar, and provided with an open slot, *l*, whereby the presser-foot can be adjusted laterally, and can be removed without removing the holding-screw *m*, substantially as and for the purpose specified.

7. The bobbin-winder T, provided with an arm, U, in combination with the collar Q, rigidly secured to the main shaft F, the dog W, pivoted upon the collar Q, and the fly-wheel R, placed loosely on the main shaft F, substantially as and for the purpose specified.

8. The spool-stand A, in combination with the standard *j* of the arm B, said spool-stand being located above the standard, whereby a space is provided between the two for the take-up arm, substantially as described.

259,297. TRANSOM-ADJUSTER. GILBERT J. DICKSON, Albany, N.Y. Filed Dec. 12, 1881. (Model.)



Claim.—The pivot-plate B, having the operating jointed arm F, provided with the handle-section D, and the locking-sleeve or slide C, having the toothed projection *t*, and spring k, in combination with the geared pivot-plate A, for the purpose and substantially as specified.

259,298. BUTTON. CHARLES W. EENAN, Chicago, Ill., assignor to Charles J. Cavenaugh, Medford, Mass. Filed Jan. 27, 1882. (No model.)

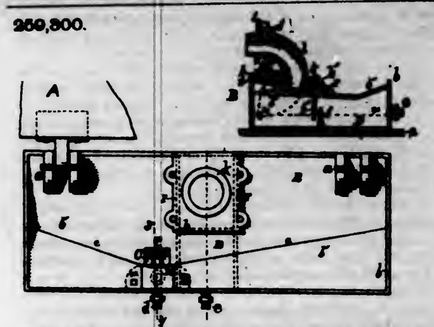
Claim.—The combination of the button A, having the slot *e* on its under side and the eye *f* near one end, and the button-holder B, having the shank *d*, with the head *c*, so arranged that the button may be fastened to one side of the garment and the button-holder to the other, and that the button, being fastened by means of the eye *f*, may be slightly raised or lifted off the cloth when it is desired to button or unbutton the garment, substantially as described, and for the purposes set forth.

259,299. COTTON-SEED PLANTER AND FERTILIZER-DISTRIBUTER. BENJAMIN S. EVANS, Acron, Ala. Filed Dec. 7, 1881. (No model.)

Claim.—1. The seed and fertilizer distributing machine herein described, consisting of the axle D, provided with radial stirring-rods E, and shoulders *e e'* on the inside of the hopper-sections, the wheels A A', provided with the hollow hemispherical sections B B' on their inner faces or sides and separated by a continuous space, *c*, and the framing-sections F and H, washers *b*, and screw-clamping caps *g g'*, all constructed and combined substantially as and for the purpose described.

2. The combination of the stationary axle D, radial stirring-rods E, revolving spaced hopper-sections B B', wheels A A', framing-sections F and H, and clamping cap-plugs *g g'*, the whole constructed substantially in the manner and for the purpose herein described.

3. The harrow having a swinging movement on the axle D, and also a swinging movement on the section F of the framing, in combination with the framing-section H, furrow-opener, wheels A A', and hopper-sections B B', substantially in the manner and for the purpose described.



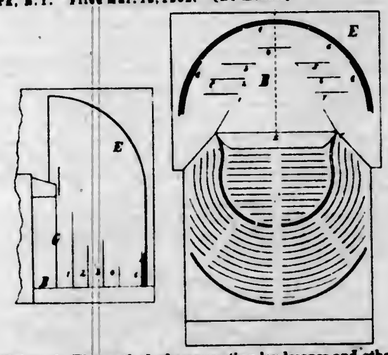
4. The furrow-opener stock *f*, made nearly in form of a skeleton triangle, in combination with the blade *j*, tongue I, framing-sections H F, wheels A A', spaced hopper-sections B B', axle D, stirrers E E, and harrow G, having covering or smoothing board G', substantially as described.

5. The cotton-seed planter provided with the two independently-hinged sections of framing H F and with the harrow G, having smoothing-board G', said harrow with smoothing-board being pivoted by horizontal pins to the section F of the framing, all substantially as and for the purpose described.

259,300. CABINET BATH-TUB. FRANKLIN H. PICKETT, Chicago, Ill. Filed Feb. 16, 1882. (No model.)

Claim.—1. In combination with a hinged and vertically-rising bath-tub provided with curved discharge-pipe *l*, a drip-pan, B, provided with trap D, substantially as specified.

259,300.



2. The combination, with a hinged bath-tub, A, provided with curved discharge-pipe *l*, of drip-pan B, provided with trap D, and the packings *j* and *k*, substantially as specified.

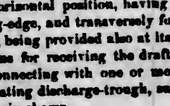
3. The drip-pan B, provided with separate traps D and C, and discharge-pipes *d* and *e*, substantially as specified.

4. In combination with a drip-pan, B, provided with traps C and D, the removable piece *n*, and valve *o*, substantially as specified.

5. In a cabinet bath-tub, the combination of the hinged bath-tub A and weight *w*, the suspending-cord *v*, and resisting-cord *v'*, arranged to operate substantially as specified.

259,301. THEATRICAL SCENERY. GEORGE F. FULLER, New York, N.Y. Filed Mar. 18, 1882. (No model.)

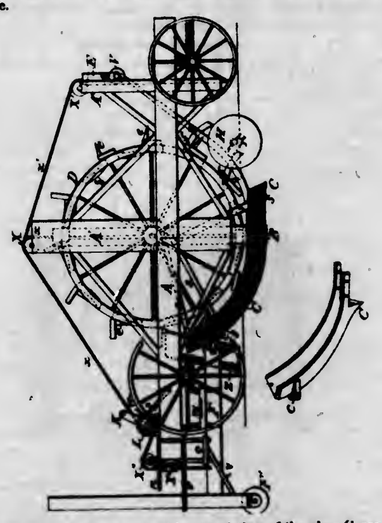
Claim.—1. The method of representing landscapes and other outdoor scenes upon the stage, herein described, which consists in dispensing with the usual suspended sky-borders, and in the employment of set scenes, or scenes having their edges trimmed to the contour of the objects painted upon them, in connection with a representation of the sky pictured upon the interior of a half-section of a rotunda surmounted by a half-section of a dome, forming a concave surface extending around the back and suitable portions of the sides of the stage, and arching over the stage from the rear and sides to a point over, or nearly over, the proscenium-opening.



2. The concave sky-frame E, forming the interior of a half-section of a rotunda surmounted by a half-section of a dome extending around the back and suitable portions of the sides of the stage B, and arching over the stage, as and for the purpose set forth.

259,302. THILL-COUPLING. ANOS GIPE, Reuss, Ind. Filed Jan. 12, 1882. (No model.)

Claim.—The combination, with slotted bearing D, of the cylinder F, having wedge-shaped T-slot vertically and entirely through it, and shank G, having vertical wedge-shaped block H, substantially as and for the purpose specified.



259,303. BUTTON. FRANK H. GOLDTHWAIT, Springfield, Mass. Filed Apr. 3, 1882. (No model.)

Claim.—The within-described improved button, consisting of the vegetable-ivory face *a*, having a projecting rim on its rear side provided with an undercut channel, *x*, and of the convex metallic back *c*, having a border to fit said channel *x*, and provided with perforations or other suitable means of attachment, substantially as set forth.

259,304. DITCHING-MACHINE. JAMES A. GRANT, THOMAS M. MCCLELLAND, and JAMES T. DRUMMOND, Mount Pleasant, Iowa. Filed Sept. 23, 1880. (No model.)

Brief.—Pivoted V-scrapers and check-braces secured on the periphery of the vertically-adjustable wheel carry the dirt out by the V-shaped plow up the curved trough. Hinged to the rear of the plow or trough is a leveler having an adjustable spirit-level, whereby to regulate the grade of the ditch. The scraper-wheel, plow, and leveler are adjustable from a windlass at the rear of the machine.

Claim.—1. A ditching-machine consisting of the plow C, segmental trough C', elevating-wheel D, provided with scrapers *e* and drop-braces *f*, pivoted to its periphery, chute Z, adjustable frame or stirrup B, adjustable draft-traveler E, connecting-bar I, pulleys X, X', X'', and X''', ropes *x*, *x'*, and *x''*, windlass L, and leveler F, in combination with a wagon having a frame, A, with upright frames A' and A'', attached thereto, all substantially as and for the purposes herein represented.

2. A plow, C, for cutting a ditch, made longitudinally in a curved form with its under part diverging near its forward or cutting edge to a horizontal position, having a dilated and slightly-drooping cutting-edge, and transversely formed in a centrally-depressed V shape, being provided also at its upper front edges with curved extensions for receiving the draft-connections and at its rear part for connecting with one or more additional segments forming an elevating discharge-trough, substantially for the purposes and as herein shown.

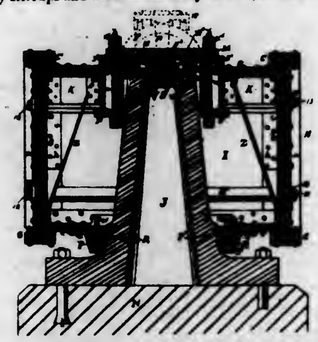
3. In combination with the plow C, forming part of an elevating discharge-trough, one or more additional detachable segments, C', as and for the purpose herein described.

4. In combination with the plow C and elevating discharge-trough C', the elevating-wheel D, having pivoted to its periphery, as herein represented, the scrapers *e* and check-braces *f*, substantially as shown, and for the purposes herein represented.

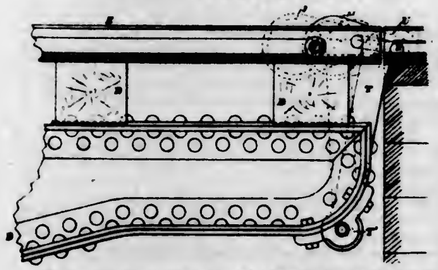
5. In combination with the wheel D, plow C, and trough C', the scrapers *e*, having an outward-projecting tapering point and forward-projecting stay or guide arms, one on each side thereof, said scrapers and arms being loosely pivoted to the periphery of the wheel D, substantially as shown, and for the purposes herein specified.

6. In combination with the wheel D, the check-braces *f*, loosely pivoted to the periphery of said wheel, substantially as and for the purpose shown.

7. In combination with the wheel D, plow C, trough C', upright frame A', rope *x*, pulley X, and windlass L, the adjustable stirrup or sliding frame B, constructed with its lower end extending under the plow, so as to serve not only as a bearing to the wheel D and the means of adjusting the height of said wheel, the plow C, and trough C', but also, by its fastenings and braces, as the adjustable center to which all of said parts are connected, supported, and held in their respective positions, substantially as herein shown.



8. The adjustable draft-traveler E, in combination with the upright frame A'', bar I, plow C, pulleys X' and X, rope *x'*, and windlass L, all substantially as and for the purpose herein specified.



9. The leveler F, as herein provided with a track-wheel, F', for traveling in a ditch as it is being formed, and with the spirit-level *w*, in combination with a graduating-scale for indicating the degree of angle or grade of the bottom of said ditch, said leveler being so constructed as to be readily attached to the rear of a ditching-plow when needed, substantially as herein shown and described.

10. The windlass L, provided with a loose section which is made to clutch fast at will by means of the shifting-lever *u*, in combination with the ropes *x*, *x'*, and *x''*, pulleys X, X', X'', and X''', and the frames A, A', and A'', all arranged as herein shown, and for the purposes substantially as specified.

259,305. TURN-TABLE. CLEMENTS A. GREENLEAF, Indianapolis, Ind. Filed Jan. 17, 1881. (No model.)

Brief.—A turn-table with its load wholly supported on the center pivot by means of a central bracing and supporting box having bearing upon the top of said pivot, and also by means of friction-balls around the base of said pivot. When receiving or discharging its load the end of the turn-table is supported and locked by stirrups and bolts actuated by lever-operated eccentrics.

Claim.—1. The combination of a turn-table, provided with mechanism for enabling it to rotate on a central pedestal, and provided with brace 20, having groove P', rollers R, and said pedestal provided with surface *j*, substantially as and for the purposes specified.

2. The combination of a turn-table provided with mechanism for enabling it to rotate on a central pedestal and provided with brace 20, having groove P' and rollers R, and locking devices, and devices for supporting the turn-table while the load is passing off or on, substantially as and for the purposes specified.

3. The combination of a non-deflectable turn-table, provided with box H, and plate M, and ring *f'*, rollers *l*, pedestal J, and ring S, and rollers R, substantially as and for the purposes specified.

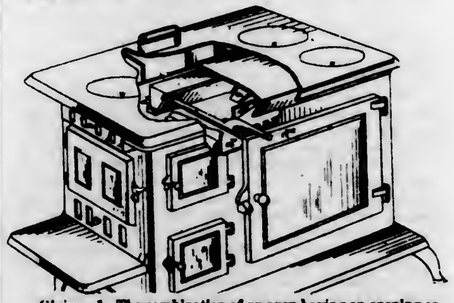
4. The combination of a non-deflectable turn-table and box H, and plate M, and ring *f'*, rollers *l*, pedestal J, and ring S, and rollers R, and devices for locking the turn-table and for supporting the turn-table while the load is passing on or off the turn-table, substantially as and for the purposes specified.

5. The device for supporting the turn-table while the load is passing on or off the latter, and consisting of the oscillating arms T, provided with projections U, mechanism for advancing and retracting said arms, and a pit provided with recesses V', substantially as and for the purposes specified.

6. The device for supporting the ends of the turn-table, consisting of the oscillating arms T, provided with projections U, pivoted at T' to the trusses B, eccentric yokes 21, eccentrics 3, shaft 4, and levers 7, substantially as and for the purposes specified.

7. The device for locking the turn-table, consisting of the oscillating arms T and locking-studs 10, substantially as and for the purposes specified.

8. In combination, the oscillating arms having projections U and locking-studs 10, mechanism for advancing and retracting said arms, and the pit provided with recesses V', substantially as and for the purposes specified.



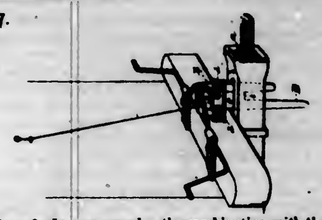
9. In combination, the oscillating arms pivoted at T' to the turn-table, and having projections U and locking-studs 10, and the eccentric yokes 21, eccentrics 3, shaft 4, and levers 7, substantially as and for the purposes specified.

10. In combination, a turn-table turning on a central pedestal, brace 20, anti-friction rollers R, and locking device consisting of the oscillating arms having projections U, and mechanism for advancing and retracting said arms, substantially as and for the purposes specified.

11. In combination, a turn-table turning on a central pedestal, brace 20, anti-friction rollers R, and device for supporting the ends of the turn-table when locked, and consisting of the oscillating arms having projections U, and mechanism for advancing and retracting said arms, substantially as and for the purposes specified.

12. In combination, a turn-table turning on a central pedestal, brace 20, anti-friction rollers R, oscillating arms T, provided with projections U, locking-studs 10, and mechanism for advancing and retracting said arms, substantially as and for the purposes specified.

259,306. STOVE. IVORY W. HARLOW, Plymouth, Mass., assignor to the Plymouth Foundry Company, same place. Filed Feb. 25, 1882. (No model.)



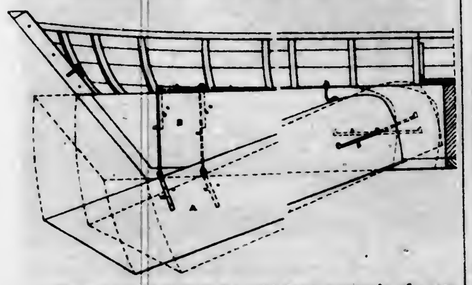
Claim.—1. The combination of an oven having an opening or flue connecting it with an escape-passage, a valve or damper controlling the same, the oven-door, and a connecting device, whereby the valve or damper is controlled as to its position by the oven-door, all substantially as and for the purposes described.

2. The combination of an oven having an opening or flue connecting it with an escape-passage, a valve or damper controlling the same, and a device for actuating it, adapted to be operated either by the oven-door or independently thereof, all as set forth.

3. The combination of an oven having an opening or flue connecting it with an escape-passage, a valve or damper controlling the same, and a device for actuating it, extended without the stove, in close proximity to the oven-door, all substantially as specified.

259,307. CAR-COUPLING. LYMAN HATFIELD, Boston, Mass. Filed Apr. 5, 1882. (No model.)

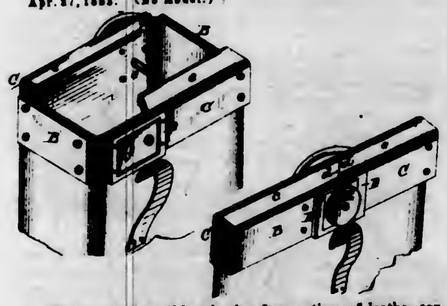
259,307.



Claim.—1. In a car-coupler, the combination, with the slotted draw-head, of a pin, B, of inverted-U shape, a carrier secured to said pin, and provided with a shoulder, *c*, and shank D, and a crank secured to the upper end of the pin and adapted to hold the pin and carrier in position for coupling, substantially as set forth.

2. In a car-coupler, the combination, with a draw-head provided with a vertical slot, of a ∩-shaped pin and a carrier adapted to extend through said slot, said carrier being keyed to the upper end of the pin and provided with a shoulder and shank, and a crank secured within an elongated opening at the upper end of the pin, substantially as set forth.

3. In a car-coupler, the combination, with a pin, B, formed ∩-shaped at its upper end and provided with key-seats *c c*, of the carrier C, also provided with key-seats and the keys *d d*, whereby the pin is secured to the carrier, substantially as described.

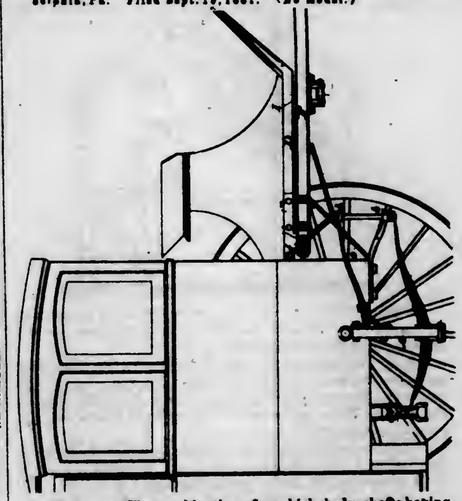


259,308. CENTER-BOARD FOR VESSELS. JOHN G. W. HAVENS, Metedeconk, N.J. Filed Feb. 21, 1882. (No model.)

Claim.—1. The combination, with boats or vessels, of a center-board so located as to extend aft beyond the dead-wood when said board is down or in use, substantially as described in Fig. 1.

2. The combination, with boats or vessels, of a center-board extending aft beyond the dead-wood, and mounted, as shown in Fig. 2, so as to be extended farther aft than the position shown in Fig. 1 by a sliding motion downward and aft by means of a slot in said board.

259,309. MAIL-BAG. WILLIAM HAWE, Knoxville, Tenn. Filed Apr. 27, 1882. (No model.)



Claim.—1. A mail-bag having four sections of leather connected to its sides around its open end, substantially as shown, whereby the material from which the bag is composed between the ends of the sections will operate as hinges in closing the bag, substantially as and for the purpose set forth.

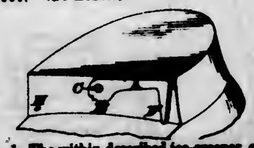
2. A mail-bag having leather sections secured around its sides at its open end, substantially as shown, the intervening spaces of the material from which the bag is composed serving as hinges in opening and closing the bag, two of the sections having overlapping flanges which cover the mouth of said bag when closed, substantially as and for the purpose specified.

3. In a mail-bag, the combination, with the leather sections B, of the leather sections C, formed with or having flanges *e* diagonally opposite and parallel with each other when opened, the sections B C being of such length and connected to the bag, as shown, that the material composing it or the leather of the bag between the ends of the sections will operate as hinges in opening and closing the bag, substantially as and for the purpose set forth.

4. In a mail-bag, the combination, with the bolt *e* and plate D, countersunk to form a guide and seat, *f*, of a suitable lock, E, removable therefrom, substantially as and for the purpose specified.

259,310. TWO-WHEELED VEHICLE. PETER HENRIC, Philadelphia, Pa. Filed Sept. 19, 1881. (No model.)

Claim.—1. The combination of a vehicle-body, shafts having pivotal connection therewith at their rear ends in advance of the axle, and the spring connecting the shafts and vehicle, substantially as and for the purpose hereinbefore set forth.



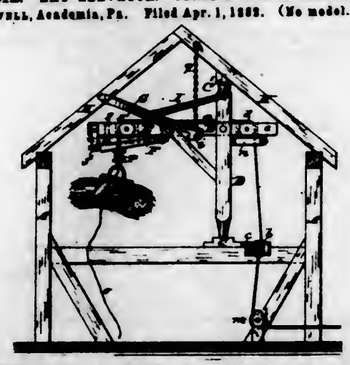
2. The combination of the axle, the springs, the body, the pivoted shafts, and the spring-connection between the vehicle and shafts in advance of the vehicle-body and shaft-pivots, substantially as and for the purpose hereinbefore set forth.

3. The combination of the vehicle-body, the seat-supporting framing, the shafts pivoted to said framing at their rear ends, and the spring connected with said framing and with the shafts in advance of their pivotal connection, substantially as and for the purpose hereinbefore set forth.

4. The combination of the shafts, the frame-beams, the lagged plates, the socketed plates, and the pivot-bolts, substantially as and for the purpose hereinbefore set forth.

5. The combination of the crambed axle, the vehicle-body, the supporting and bracing springs, the cross-bar provided with the upper and lower bearings or lugs at its end, the seat-supporting framing, the pivoted shafts, and the angle-braces pivoted to the shafts and connected with the seat-supporting framing, substantially as and for the purpose hereinbefore set forth.

259,311. ICE-CREEPER. ADOLPH HOROWITS, Cincinnati, Ohio, assignor of one-half to MARCUS SIMONTON, same place. Filed Oct. 25, 1881. (No model.)



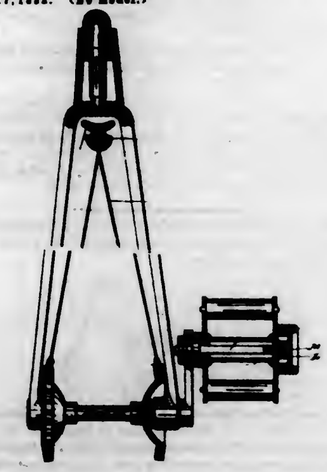
Claim.—1. The within-described ice-creeper, consisting of the lever A, provided at one end with a head, D, pivoted at B to admit a screw, C, wherewith the device is pivoted directly to the front face of a boot or shoe heel, in order that said creeper may be brought

into service when the lever is turned to one side of the heel, and may be rendered inoperative when said lever is turned to the opposite side of the heel, as set forth.

2. The within-described ice-creeper, consisting of the lever A, provided at one end with a head, D, and at the other end with a dog, F, said head being pierced at B to admit a screw, C, wherewith the device is pivoted directly to the front face of a boot or shoe heel, in order that said creeper may be brought into service when the lever is turned to one side of the heel, and may be rendered inoperative when said lever is turned to the opposite side of the heel, as set forth.

259,812. HAY-ELEVATOR. JAMES E. HOWELL and JOHN H. HOWELL, Academia, Pa. Filed Apr. 1, 1882. (No model.)

Claim.—1. In a hay-elevator, the combination of a crane with a hinged lock-bar and a pivoted latch or trap and suitable rope and pulleys, substantially as specified.



2. In a hay-elevator, the crane D, having the arm E arranged out of the perpendicular line of the crane-post, and provided with extension *e*, for obtaining sufficient leverage to revolve the crane by the obliquity of the rope *a* passing over pulleys *c d*, arranged substantially as set forth.

3. In combination with a crane, D, the hinged lock-bar G, having head *i* and notch *b* and slider *l*, and supported by a chain, *g*, all substantially as and for the purpose specified.

4. In an apparatus for elevating hay, &c., the combination of a crane, D, a hinged lock-bar, G, and pivoted latch F with pulleys *c d d'* and rope *a*, arranged substantially as shown and for the purpose set forth.

5. The combination of a crane, D, having arm E, pivoted latch F, and double-headed pin *g*, with the lock-bar G, brace I, pulleys *c d d' m*, friction-roller *n*, and rope *a*, all arranged substantially as shown and specified.

259,813. BICYCLE. THOMAS B. JEFFERY, Chicago, Ill. Filed Feb. 17, 1882. (No model.)

Claim.—1. In a metallic felly having a hollowed outer surface, a rubber tire having a corresponding hollowed outer surface of greater curvature, substantially as and for the purpose described.

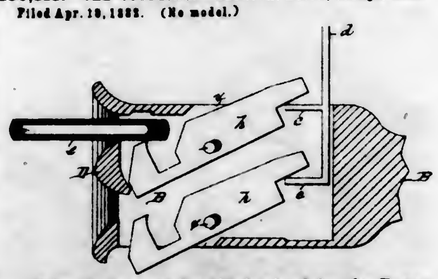
2. The rubber tire, as described, having a hollowed face or tread, a single groove on each side, and a base adapted to fit a hollowed felly, substantially as and for the purpose described.

3. In a metallic suspension-wheel for vehicles, the improved spoke, consisting of a metallic wire, of circular section, enlarged at one end to form a head and having on the other screw-threads formed, the intervening portion being compressed or flattened, and adjusted in the wheel in such a way as to present the edge of the spoke to the direction in which the wheel will roll, substantially as and for the purpose described.

4. An annular rubber cushion attached to the pedal-case and surrounding the end of the pedal-pin, but removed from it, constructed and arranged substantially as and for the purpose described.

5. In combination with a series of balls, ball-case, foot-blocks, and pedal-spindle, the adjustable sleeve L and screw M, substantially as and for the purpose described.

6. The head containing the central pivot of a bicycle, formed with a vertical division extending through the portion holding the bushing, in combination with a clamping device that compresses the divided sides and the bushing, substantially as described.

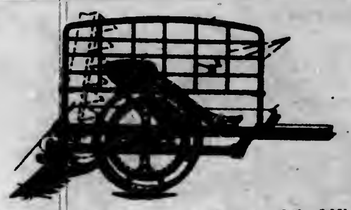


259,814. ADJUSTABLE HAMMOCK-SUPPORT. TIMOTHY L. JEFFERSON, Foxcroft, Me. Filed Mar. 23, 1882. (No model.)

Claim.—1. A hammock combined with a support or sling having knots or projections along its body portion, and provided at its ends with attaching mechanism, substantially as described, whereby the hammock can be adjusted to fixed positions.

2. An adjusting support or sling for hammocks, consisting of a rope knotted along its body portion, and provided at each end with an attaching-link whose opening is contracted at one end and expanded at the other, substantially as shown and described, for the purpose set forth.

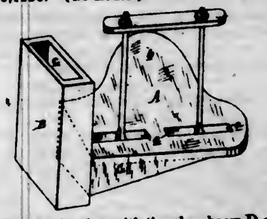
259,815. CAR-COUPLING. HENRY M. KEITH, Orange, Mass. Filed Apr. 19, 1882. (No model.)



Claim.—In a car-coupling, the chambered draw-bar B, provided with the cross-bar D, the two link-hooks *h h*, pivoted in said draw-bar, one above the other, and adapted to operate independently of each other to engage with the link, and the vertically-operating link-lifter *d*, provided with the arms *c c*, combined and operating substantially as set forth.

259,816. LIFE-GUARD FOR REAPERS AND MOWERS. RICHARD A. KELLY, Manchester, Iowa. Filed Sept. 19, 1877.

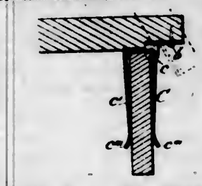
Claim.—1. In combination with a harvester-frame carrying a driver's seat and having a folding cutter-bar attached thereto, a



259,816.

life-guard located on the frame between the seat and the folding-bar, substantially as described.

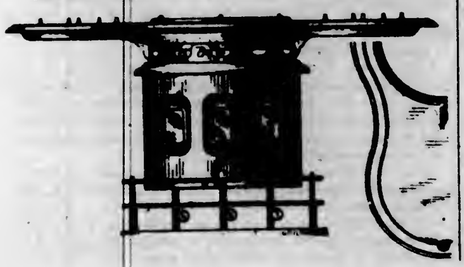
2. In combination with a harvester-frame carrying a driver's seat and having a cutter-bar attached thereto, a guard, substantially as described, adapted to serve as a hand or foot rest for the driver.



259,817. PLOW ATTACHMENT. PETER KETTERRING, Defiance, Ohio, assignor to the Defiance Machine Works, same place. Filed Mar. 28, 1882. (No model.)

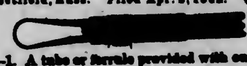
Claim.—The combination, with the plow-beam D, of the plate A, provided with transverse slots *a*, adapted to receive a bolt on each side of the plow-beam, and having a rear extension, *b*, to fit under the beam, and the socket-plate B, formed integral with and at an angle to the plate B, and strengthened by a brace, G, substantially as and for the purpose specified.

259,818. HINGE FOR BOXES OR CRATES. HENRY KIRK, Minneapolis, Minn. Filed Apr. 28, 1882. (Model.)



Brief.—One of the leaves of this hinge is made of spring metal, which permits the ready removal of the lid and hinge without removing screws or other fastening devices.

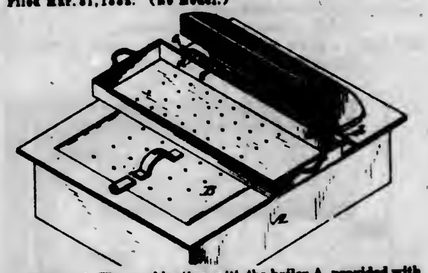
Claim.—1. A hinge formed by the combination of the wing B and the spring part C, having limbs *c' c'* and pivot-pin *c*, constructed to operate as described.



2. A hinge one wing of which is held in place upon the article to which it is attached by the force of the spring contained in the wing itself, substantially as described.

259,819. EXTENSION-TOP FOR OIL-STOVES. OSCAR H. KYLE, Florence, Mass., assignor to the Florence Machine Company, same place. Filed Mar. 30, 1882. (No model.)

Claim.—The detachable extension-top provided with the annular depending flange, in combination with the bracing-lugs projecting from the under side of the extension-top at opposite points and adjacent to said flange, substantially as described, whereby a lateral bearing is afforded against the inner and outer surfaces of a stove-turret, as set forth.



259,820. LOOP-FASTENING FOR WHIP-STOCKS. JAMES A. LAKIN, Westfield, Mass. Filed Apr. 3, 1882. (No model.)

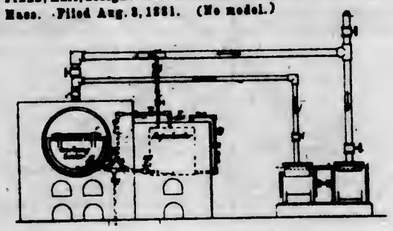
Claim.—1. A tube or ferrule provided with one or more openings on opposite sides thereof, and adapted to co-operate with a whip to secure the loop thereto, substantially as described.

2. The combination of a tube or ferrule provided with one or more openings on opposite sides thereof, a loop, and a whip-stock to receive said ferrule, substantially as set forth.

259,821. SUGAR-BOILER. THOMAS W. LARNER, Oliver, Ga. Filed Mar. 31, 1882. (No model.)

Claim.—1. The combination, with the boiler A, provided with spout E, and having seats *a* upon its interior sides, of the removably-hinged cover B, provided with flanges *b*, resting in the said seats, to support the cover, substantially as and for the purpose set forth.

2. The boiler A, of the form substantially as shown, having the rectangular opening extending across its end, and surrounded by an upright collar, *f*, in combination with the removable cover B and hinged spout E, substantially as described.



259,822. LUBRICATOR. JOHNSON LEONARD, Harrisburg, Pa. Filed Apr. 6, 1882. (No model.)

Claim.—1. In a lubricator, the reservoir or chamber to contain the lubricating material, combined with a flexible attaching-strip connected with the said reservoir, and a delivering orifice or passage, substantially as described.

2. The oil-reservoir and its flexible attaching-strip adapted to be bent into engagement with a piston-rod stuffing-box, or other mechanism to be lubricated, combined with a delivering-tube, extending from the interior of the said reservoir to the exterior thereof, provided with fibrous material to retard the flow of the lubricating material and distribute it upon the piston-rod or part to be lubricated, substantially as described.

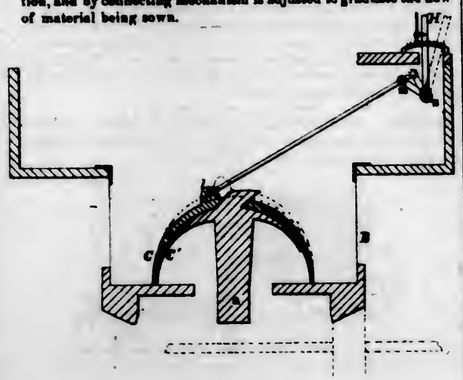
259,823. UTILIZING EXHAUST-STEAM. HARVEY T. LITCHFIELD, Hull, assignor of one-half to David Ronchaw, Cohasset, Mass. Filed Aug. 3, 1881. (No model.)

Claim.—The combination, with an apparatus for utilizing the exhaust of engines, of the branch injecting-pipes, communicating with two or more boilers and with the water-tank, and adapted to force liquid from one to the other, or to either of them, in the manner shown and described.

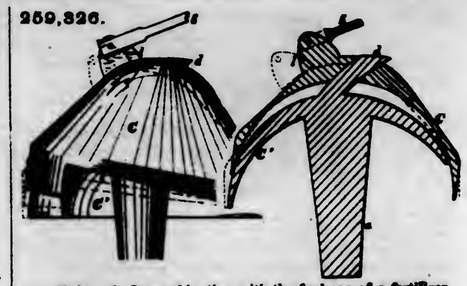
259,324. CLOAK. IGNATZ LOJBA, New York, N. Y. Filed Jan. 3, 1882. (No model.)

Claim.—In combination with a cloak, A, a vest or bodice, B, formed of two separate and distinct parts, each attached to the inside of the cloak at two points only, one at *a*, near the collar in front, and the other at *b*, near the waist, toward the back, and unattached between these two points to allow free room for the passage of the arms back and outside of the vest parts, substantially as and for the purpose herein specified.

259,325. STEAM-BOILER FURNACE. JAMES MARONY, New York, N. Y. Filed Dec. 29, 1881. (No model.)



Claim.—1. The tubes P, extending into the ash-pit, and having perforations p^3, register P', live-steam pipe *p*, and valve p', combined as shown, and arranged to deliver air and steam in controllable quantities into the combustion-chamber in small jets, with the certainty that the surplus beyond what is drawn thus divided into the combustion-chamber will be delivered into the ash-pit under the grate, all substantially as herein specified.

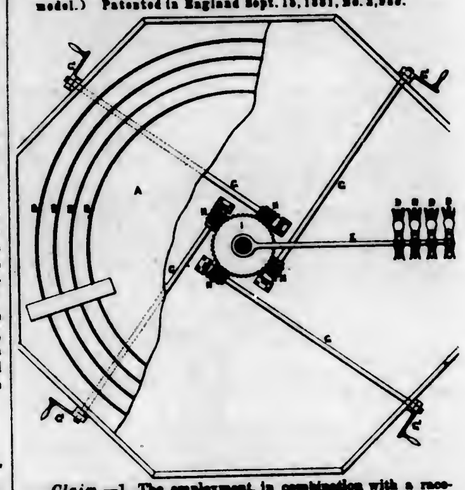


2. The combination of the masonry A^*, having the air-space *a*, and the openings A' into the ash-pit, the two fire-bridges C C', each with the shells M, connections for delivering hot air and steam therein, and the perforated pipes P p^3, with the steam-blowers and controlling means arranged for joint operation relatively to each other and to the grate B and boiler A as herein specified.

259,326. FERTILIZER-DISTRIBUTER. WALTER MARKS, Chaplaville, N. Y. Filed Mar. 16, 1881. (Model.)

Brief.—Within the hopper and over the discharge-hole is a stationary feed-shell having a projection on its top, over which is placed an adjustable shell having an orifice which fits said projection, and by connecting mechanism is adjusted to graduate the flow of material being sown.

259,326.



Claim.—1. In combination with the feed-cup of a fertilizer-distributer, the adjustable feed-shell C, substantially as and for the purposes set forth.

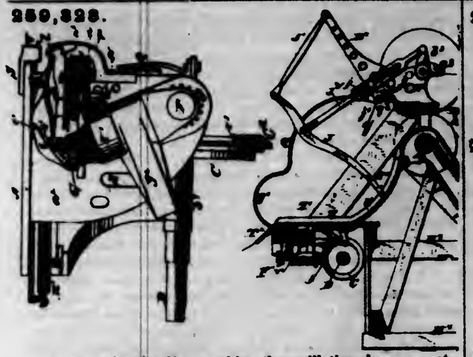
2. The combination, with the feed-cup B, of the stationary feed-shell C' and the adjustable feed-shell C, substantially as and for the purposes set forth.

3. The combination, with the adjustable feed-shell C, of the handle H and connection *g*, whereby the position of the feed-shell relatively to the bottom of the feed-cup may be controlled, substantially as and for the purposes set forth.

259,327. MECHANICAL GAME OR PARLOR RACE-COURSE. JOHN HAYFIELD, London, England. Filed Mar. 2, 1882. (No model.) Patented in England Sept. 15, 1881, No. 3,989.

Claim.—1. The employment, in combination with a race-course, of a series of figures representing equestrianism, pedestrianism, cycling, boating, hunting, or other sports, and adapted to be operated independently of each other by mechanical appliances controlled by a number of different persons or operators.

2. The combination, with the race-course A, provided with the concentric slots B, of the figure-carrying rods or arms E, attached to independent sleeves, the toothed wheels I upon the said sleeves, and the worms H and cranks or handles G', for operating the said toothed wheels independently of each other, all substantially as above set forth.



259,328. GRAIN-BINDER. LEWIS MILLER, Akron, Ohio. Filed June 30, 1879.

Claim.—1. In a harvester-binder, the combination of the needle J, its supporting-bars J' J^*, and their guides with the operating crank-shaft B', whereby the needle is caused to descend at the inner edge of the binding-table, sweep forward toward the outer edge, and rise and pass over the collecting grain in its return movement, substantially as described.

2. The sliding ejector W, its retracting-spring w^2, and swinging arm *w*, in combination with the arm *w'* upon the shaft B, substantially as described.

3. In a grain-binding machine, the combination of a shaft, F, with an oscillating sleeve containing a rotatory looping shaft or head driven by the shaft F, substantially as described.

259,328.

4. In a grain-binding machine, the oscillating sleeve or casting G and its contained shaft E, having the hooked jaw *d'*, in combination with the pivoted block or jaw I and mechanism for closing and opening said last-mentioned jaw by the rotation of the shaft E, substantially as described.

5. The combination of the oscillating casting or sleeve G, its contained shaft E, the hooked jaw *d'*, the pivoted jaw I, the stud d^2, the spring d^3, and the eccentric or cam surface I, substantially as described.

6. In a grain-binder, a rotating looper mounted in a box or casting which is pivoted to its own driving-shaft as its center of oscillation, and combined with mechanism for opening and closing its hand-gripping jaws while revolving to form the loop, substantially as described.

7. The needle J, constructed to pass down at the inner edge and sweep forward to the outer edge of the binding-table, in combination with a looping-head constructed to advance and seize the cord after the needle has swept it forward, rotate to form a loop therein, and recede to tighten the knot and slip it from the head, substantially as described.

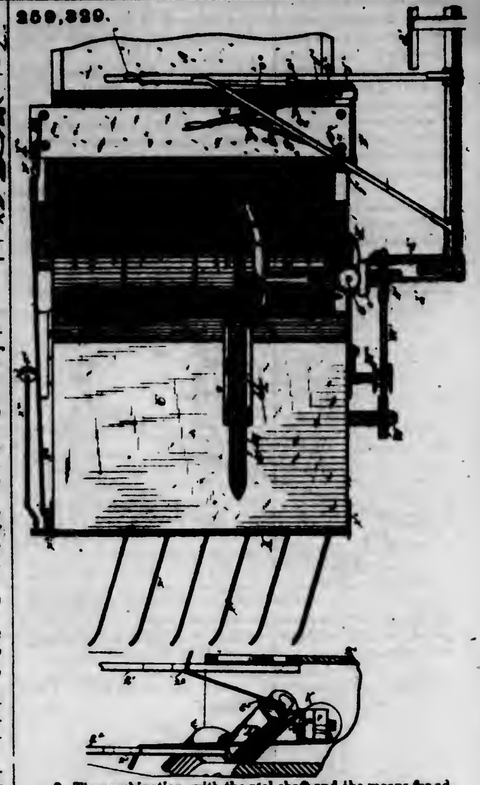
8. In a grain-binder, the combination of a rotating clamping-wheel, M, and fixed concave N with the plate L, having the oblique arm *l*, and with the curved plate P, substantially as described.

9. In a grain-binding machine, the combination of the oscillating and rotating binding-head with the tubular case G, having the arm g^3, and with the oscillating lever D', substantially as described.

10. In a grain-binding machine, the combination of the large wheel C, the shaft F, the casting G, the rotating tying-head, and the lever D', substantially as described.

11. In a grain-binding machine, the combination of the rotating and oscillating tying-head, the concave N, the clamping-wheel M, the lever D', and the oscillating plate O, having a spring-dog, *o*, for the purpose of moving the clamping-wheel simultaneously with the oscillation of the binding-head, substantially as described.

12. In a grain-binding machine, a needle which passes down at or near the inner edge of the binding-table and sweeps outward to gather the grain and advance the band to the binding-head with an intermittent wheel-clamp which receives and holds the band thus carried outward, a rotating looping-head which advances to seize the cord and form the loop therein, and recedes to form and tighten the knot, and with a cutter to sever the band immediately after the loop is formed therein, substantially as described.



13. The combination of the arm *o'*, the slide-bar S, the wheel M, and the concave N, substantially as described.

14. The combination of the clamping-wheel M, concave N, horn N', and oscillating rotating binding-head with the oblique angular arm *l*, for guiding and presenting the cord properly to the jaws of the binding-head, substantially as described.

259,329. HARVESTER-BINDER. LEWIS MILLER, Akron, Ohio. Filed Oct. 17, 1880. (Model.)

Claim.—1. The bifurcated lever E, having the reel-shaft journaled in its outer ends and pivoted centrally to the vibratory fulcrum F, in combination with said vibratory fulcrum pivoted to brackets *f f*, the toothed sector f^* on the portion f^3 of said fulcrum, and the spring-bolt e^3, for engaging with said toothed sector, the secondary lever G, the rods g g, connecting said secondary lever to the said vibratory fulcrum, and the segment and locking-bolt for securing said secondary lever, the whole arranged substantially as described.

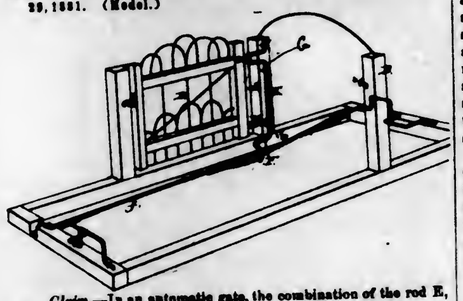
259,329.

2. The combination, with the reel-shaft and the means for adjusting it vertically and horizontally, of the sprocket-wheel rigidly secured to the end of said shaft, so as to rotate therewith, the two non-rotating arms A A, depending from the shaft on opposite sides of the sprocket-wheel, a second pair of arms, A' A', connected at one end to the first-mentioned pair by a pivotal bolt and at the other end to the casting I, the double sprocket-wheel A^*, mounted on said pivotal bolt between the arms, the sprocket-wheel A^4, connected to the bevel-wheel J and driven from the elevator-shaft, and the endless chains A^2 A^4, substantially as described, for the purpose specified.

3. In a harvester-binder, the looping and tying head, having its curved hook f^* normally projecting at substantially right angles to the movement of the horizontally-sliding bar, in combination with said horizontally-sliding bar, having the upper and lower notched arms, which move respectively above and below the looping and tying head and operate to carry the strands of cord over said head, in position for the latter to loop and tie them, substantially as described.

4. In a harvester-binder, the combination of the looping and tying head T, having the curved hook f^*, normally projecting at substantially right angles to the line of movement of the horizontally-sliding bar Z', in combination with the retracting-bar U, having the hooked end *u*, and with the said horizontally-moving bar Z', having the upper and lower notched arms, which move respectively above and below the tying-head and operate to carry both strands of the cord over the curved hook of the looping and tying head, substantially as described.

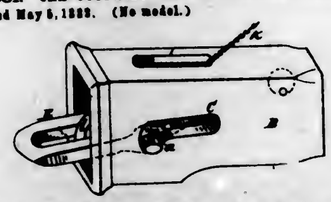
5. In a harvester-binder, the combination of the looping and tying head T, having the curved hook f^*, which normally projects at substantially right angles to the line of movement of the horizontally-sliding bar Z', in combination with the retracting-bar U, the said horizontally-moving bar Z' having the upper and lower notched arms, and with the clamp *v* V and the cutter v^2 v^3, substantially as described.



6. In a harvester-binder, the combination of the clamping-bar having the right-angled slot and carrying the cutter with the holder for said bar, the spring for retracting the bar, the crank-shaft hav-

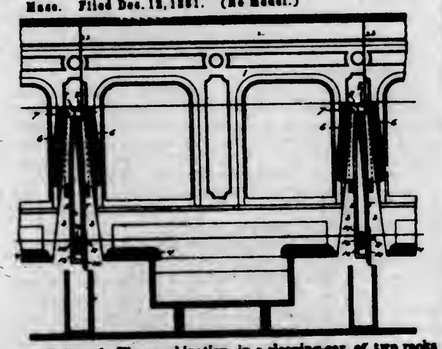
ing the arm on its upper end and the crank on its lower end, and the cam on the side of the actuating-wheels, substantially as described.

7. The combination, with the binding-table, of the rock-shaft X, having the bundle-supporting fingers x', the arm x^2, carrying the counterbalance-weight x^3, the rod x^4, connected at one end to the crank on the rock-shaft and at the other to the hand-lever X^1, and the catch x^5, for automatically locking the handle when the bundle-supporting fingers are brought back to normal position, the whole arranged for operation substantially as described.



8. The combination, with the binding-table, of the rock-shaft X, journaled in bearings at the edge of said table, and having the bundle-supporting fingers x' inclined toward the rear of the machine and curved at their extreme ends in the same direction, substantially as described.

259,330. GATE. ORLANDO J. MILLER, Piqua, Ohio. Filed Sept. 29, 1881. (Model.)

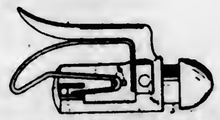


Claim.—In an automatic gate, the combination of the rod E, having the lower crank, F, and the double crank G near its upper end, forming the top hinge, with the gate, hinge-post, eyebolts, and draft-rods operated by treadles, substantially as specified.

259,331. CAR-COUPLING. MOSES MITCHELL, Boston, Mass. Filed May 5, 1882. (No model.)

Claim.—The improved car-coupler described, the same consisting of the draw-bar heads A B, links E, hooks G, pulley L, and chain K, when constructed and arranged to operate substantially as specified.

259,332. SLEEPING-CAR. WILLIAM H. PAIGE, Springfield, Mass. Filed Dec. 13, 1881. (No model.)



Claim.—1. The combination, in a sleeping-car, of two racks adapted to be moved vertically in fixed guideways between two adjacent seats, a tightening-roll located in bearings between two adjacent seats, and provided with pinions engaging with and adapted to move said racks in a vertical direction, flexible material or webbing for supporting one or more berth-beds, and adapted to be fastened at one end and connected at the other end with said racks, and a vertically-movable frame provided with a sustaining rail or bar at the upper portion to support the upper-berth webbing, whereby the webbing for the upper and the lower berths may both be supported and be tightened by the same vertical movement of the rack, substantially as described.

2. The combination, in a sleeping-car, of a frame adapted to be moved vertically in suitable guideways between two adjacent seats, two adjacent seat-backs with their upper portions detachably secured to the upper portion of said frame, and with the lower edges of said seat-backs adapted to have a bearing upon the upper portions of the end frames of the seats when said frame is raised to a position to support the upper berth, substantially as described.

3. The combination, in a sleeping-car, of a frame adapted to be moved vertically in suitable guideways between two adjacent seats, two adjacent seat-backs with their upper portions detachably secured to the upper portion of said frame, with a longitudinal space or opening between said seat-backs, and a series of bars adapted to support a flexible partition, and pivoted to the said movable frame, whereby when the said frame is in a position to support the upper berth the said bars and flexible partition may be secured to the upper portion of the car to serve as a partition between two adjacent upper berths, and when not in use may be swung down between said seat-backs, substantially as described.

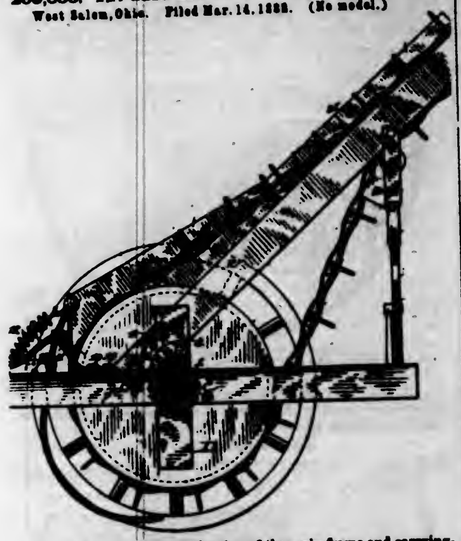
4. In a sleeping-car, the combination, with a series of frames, each adapted to be moved vertically in suitable guideways between two adjacent seats, of a guard-rail made in two parts hinged together and adapted to be extended along the side of the upper berth and secured at the ends to two adjacent frames, substantially as described.

259,333. REIN-HOLDER. L. PRUTS, Canton, Ohio, assignor to Charles L. Paar, Henry W. Wertz, and John Lahm, same place. Filed Feb. 6, 1882. (No model.)

Claim.—1. In a rein-holder, the combination, with a body-piece provided with outwardly-projecting lugs, and an arm arranged at one side of the body-piece and parallel therewith, of a spring one end of which is bent to engage with said lugs, while the remaining portion of said spring is bent upwardly, then downwardly upon itself, and finally inwardly to rest upon the body-piece, and a plate provided with projecting lugs which are adapted to enter perforations of the body-piece, substantially as set forth.

2. In a rein-holder, the combination, with a body-piece provided with lugs for engaging a spring, and with an arm arranged at one side of and parallel with said body-piece, of a spring secured at one end within said lugs, then extending upwardly, and then curved downwardly to form a V-shaped opening between said spring and arm to receive the reins, and a plate adapted to be secured to said body-piece, substantially as set forth.

259,334. TENSION FOR SEWING-MACHINE SPOOLS. JOHN G. SANFORD, Watervan, N. Y., assignor to Robert Strain, same place. Filed Mar. 14, 1882. (No model.)



Claim.—1. The combination, with the stud B, upon which the spool to be unwound is set, of the pivot F, adapted to be inserted in the upper end of said spool, the arm projecting laterally from the pivot F and having the guide-eye E, the vertical extension G, having the lower arm, H, extending under the spool and connected to the stud B, the vertically-sliding guide-eye I, and a fixed guide, D, the whole adapted to operate to unwind the spool and keep the thread under proper tension, substantially in the manner described.

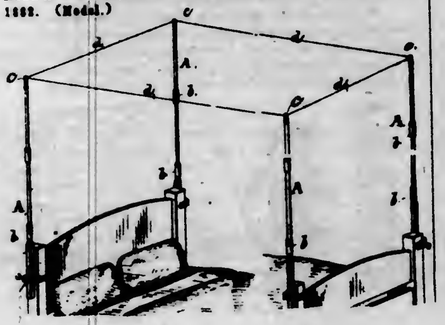
2. The combination of the stud B, the pivot F, having the arm with the guide E on it, the vertical extension G, and arm H, with

the vertically-sliding guide-eye I, and the springs J on the extension G, for arresting and limiting the movements of the guide-eye I, substantially as described.

259,335. HAY RAKE AND LOADER. THOMAS E. SHOEMAKER, West Salem, Ohio. Filed Mar. 14, 1882. (No model.)

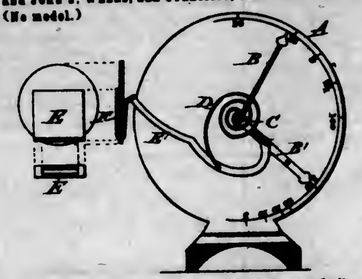
Claim.—1. The combination of the main frame and carrying-wheels, the standard 19, and the pivoted bail having the pivoted lever provided with a rack, substantially as described.

2. The combination of the main frame, of the cross-bar 10, of the independent rake-teeth mounted or pivoted thereon, of the springs 12, and of the adjustable cross-bar 11, against the lower surface of which the said teeth bear, substantially as described.



259,336. THILL-LUG. DEXTER M. SHALL, Providence, R. I. Filed Sept. 7, 1881. (Model.)

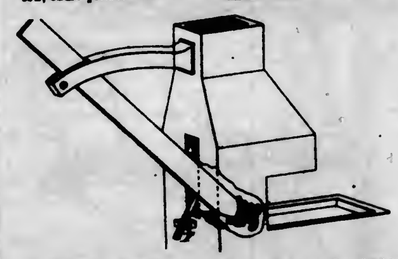
Claim.—1. A thill-lug composed of a loop for the shaft, and a buckle connected therewith by the short legs D and E, the shaft-loop being cut away at some portion to permit of their being shipped into said connection, substantially as described.



2. A thill-lug composed of a loop for the shaft, a buckle connected therewith by the short legs D and E, and a short immovable tongue for securing the back-band, all substantially as described.

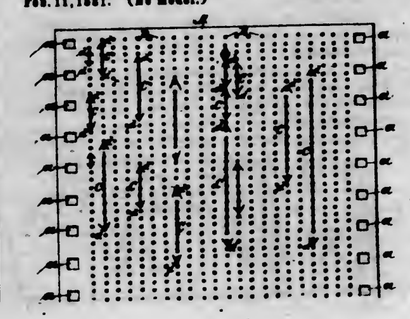
259,337. FRAME OR SUPPORT FOR MOSQUITO-NETTING. ANNA M. D. SMITH, Gloucester Court-House, Va. Filed May 2, 1882. (Model.)

Claim.—The described apparatus for supporting mosquito-netting for bedsteads, &c., consisting of a system or set of standards, A, each being composed of a series of short rods removably connected by tubes b, as set forth, and provided with an eye, c, at the top of the standards to receive a cord, d, and adapted to be held in position by a securing-clamp.



259,338. COIN TESTER AND INDICATOR. GILBERT SMITH and JOHN J. WELLS, San Francisco, Cal. Filed Nov. 14, 1881. (No model.)

Claim.—1. The dial A, provided with gold and silver numerals and scales, in combination with the hands, pointers, or indicators operated by a spring, so that when a weight or coin is placed upon the coin receiver or holder the hand will point to that numeral upon the dial that represents the value of the coin placed in the receiver or holder, substantially in the manner as herein set forth and specified.

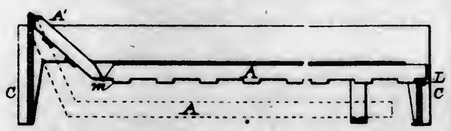


2. In a coin tester and indicator, the combination of the dial A with the hands or pointers B, spring D, and coin-holder E, constructed and operating substantially in the manner as herein set forth and specified.

259,339. DEVICE FOR HEATING LINKS. RICHARD SMITH, Cuyahoga Falls, Ohio, assignor of one-half to Myra B. Standish, same place. Filed Nov. 9, 1881. (No model.)

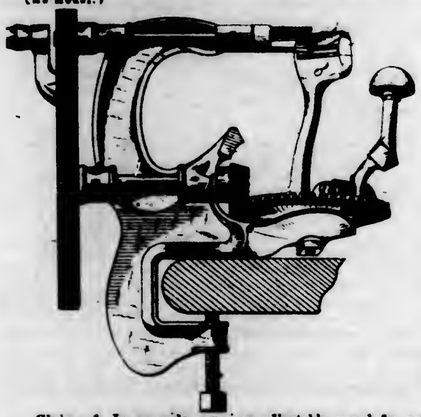
Claim.—In combination with a forge, a bar of such thickness as to permit unclosed chain-links to be placed thereon, having a width exceeding the longest internal diameter of such links, and passing through the heat escaping from the fire to the flue at such an angle as that unclosed links placed thereon will gravitate toward the fire, substantially as shown, and for the purpose specified.

259,340. ART OF PERFORATING MUSIC-PAPER FOR AUTOMATIC ORGANS. ROSWELL F. SMITH, Meeker, N. H. Filed Feb. 11, 1881. (No model.)



Claim.—1. As a new article of manufacture, a stencil-blank consisting of a sheet of suitable material having a rack cut therein and having a series of points marked upon its surface, in the manner and for the purpose set forth.

2. The stencil-blank A, having a rack, *a*, cut near its edges, and provided with a series of marked points, B, arranged in direct transverse lines and at equal intervals longitudinally, substantially as and for the purpose set forth.



3. The method herein described of preparing stencil-sheets for perforating-machines, consisting in laying off the surface of the sheet into equal spaces, indicated by dots or points arranged in the manner set forth, cutting a rack in said sheet, indicating in each series of dots the spaces to be cut by a line and brackets, the former drawn partly through the space and the latter embracing the extreme points or dots to which the cutting is to extend, and finally cutting out the spaces as indicated by a mallet and punch, substantially as and for the purpose set forth.

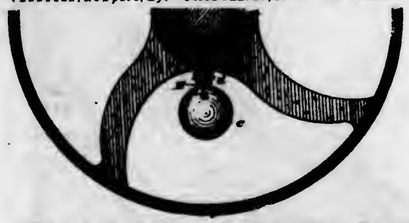
259,341. BED-LOUNGE FRAME. WILLIAM H. STICKEL and JOHN STUCKEN, Dayton, Ohio. Filed Jan. 9, 1882. (Model.)

Claim.—In combination with a lounge or sofa frame, the bed-frame consisting of two parts, said parts being joined by hinges attached to the under side of the rails, and the part A′ being hinged to the cross-piece C of the lounge-frame as the head-support, and the pin D, or equivalent, to hold the bed in an elevated position, substantially as shown and set forth.

259,342. FRUIT AND VEGETABLE PARER. HENRY A. TRIPP and WALTER TRIPP, East Williamson, N.Y. Filed Mar. 9, 1882. (No model.)

Claim.—1. In an apple-parer, an adjustable guard for protecting the knife-head, constructed and arranged to be set up after grinding to maintain an even thickness of paring, substantially as shown and described.

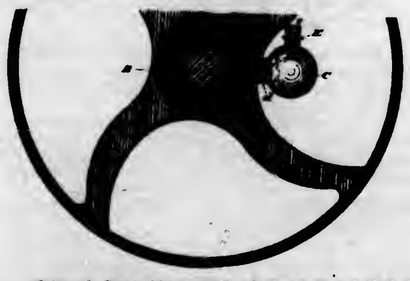
2. In a fruit or vegetable parer, a doffer provided with a revolving head for preventing bruises by friction, substantially as shown and described.



259,343. SHIPPING-TAG. WALTER S. UPSHUR, JOHN A. UPSHUR, and WILLIAM R. ROTHER, Richmond, Va. Filed Mar. 16, 1882. (Model.)

Claim.—1. A shipping-tag consisting of plates, the rear plate of contrasting colors, the front plate provided with suitable stenciled cuts or figures to designate lot, brand, quality, or shipper, and provided with suitable attaching devices, substantially as shown and described.

2. The combination of a shipping-tag consisting of a stenciled front plate and a rear plate of contrasting color with an attaching device, D, having barbs *d*, substantially as shown and described.



259,344. LUBRICATOR FOR LOOSE PULLEYS, &c. ERRA W. VANDUSEN, Newport, Ky. Filed Jan. 23, 1882. (No model.)

Claim.—1. The feeding-stem D, formed with plug E, having a filling orifice or opening, G, in the side thereof, as set forth.

2. The combined filling-plug and feeding-stem, having a filling orifice or opening, G, in the side of the plug, in combination with a shell, C, as set forth.

259,345. LUBRICATOR. ERRA W. VANDUSEN, Newport, Ky. Filed Jan. 7, 1881. (No model.)

Claim.—1. In combination with a hollow ball or shell, C, the plug E, having an opening or excavation, G, in its side, by which the oil is supplied to the chamber within the ball or shell without removing the plug, as set forth.

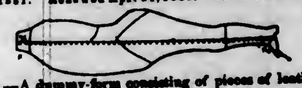
2. The combination, with a hollow ball or socket, C, having a screw-threaded orifice, of a plug having a screw-threaded hollow shank and a longitudinal filling opening or excavation, G, in its threaded portion, as set forth.

3. The plug E, formed with thumb-piece *e*, hollow inner end, *g*, and opening G through the shank, in combination with an oil-receptacle, C, as set forth.

259,346. ILLUMINATED STRUCTURE. ELIAS VENDER, New York, N.Y. Filed Mar. 20, 1882. (No model.)

Brief.—A frame has a series of openings containing detachable studs, having a head at one end and a shoulder at the other, with a washer contracted between the shoulder and the frame. The heads of the studs are flanged so as to meet and cover the face of the frame, and their shanks have a reflecting-surface.

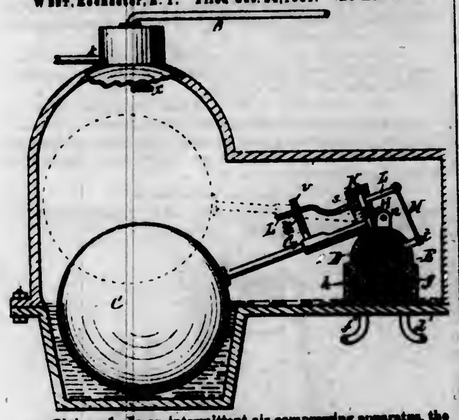
Claim.—1. In articles constructed for illuminating purposes by the transmission of light through blanks or studs set in opaque supports or frames, a reflective surface around the stem of the stud at the parts not exposed directly to the light, substantially as set forth.



2. The studs having the shanks curved outward to meet the enlarged ends, and provided with a reflecting-surface around the shank, as specified.

3. The combination, with the frame, of a series of studs set therein, and each enlarged at the end to form a flange, shaped as specified, to meet those of the other studs and cover the entire face of the frame, substantially as described.

4. The combination of a frame having a series of openings, a series of studs adapted thereto, and provided each with a head at one end and shoulder *a* at the other beyond the face of the frame, and a washer contracted between said shoulder and the frame and securing the stud detachably, substantially as set forth.



5. The combination, with a flexible continuous pliable non-transparent curtain or sheet, of transparent or translucent studs secured in openings in said sheet, substantially as set forth.

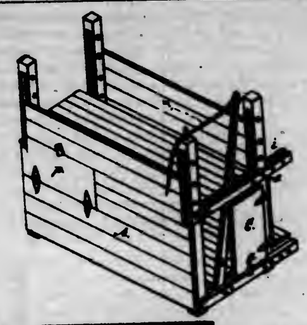
259,347. LEATHER DUMMY-FORM. ROBERT H. WEIR, Philadelphia, Pa., assignor to William Strauss, same place. Filed Aug. 3, 1881. Renewed Apr. 24, 1882. (No model.)

Claim.—A dummy-form consisting of pieces of leather having the configurations described and shown united to form a figure, substantially as and for the purpose set forth.

259,348. AIR-COMPRESSING APPARATUS. JONATHAN E. WEST, Rochester, N.Y. Filed Oct. 24, 1881. (No model.)

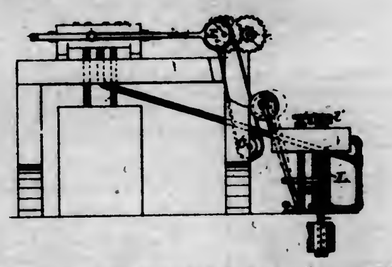
Claim.—1. In an intermittent air-compressing apparatus, the combination of the float C, the arm G, the cylinder D, and valve E, provided with the ports *g h*, and the shifting mechanism consisting of the rocker H, lever L, spring K, link M, and arm *i*, as herein shown and described.

2. The combination of the swinging arm G, provided with the slotted standard *w*, the rocker H, the lever L, resting in the slot of standard *r*, the spring K, and the link M, connecting the lever with the arm *i* of valve E, as herein shown and described.



3. The combination, with the chamber *x* in the dome, having an air-inlet below and an air-exit above the chamber, of valve-stem *q*, provided with a float, *x*, at its lower end, and the two valves *i o*, one above and the other below the port *j* of the diaphragm *c*, as shown and described, and for the purpose specified.

259,349. DEVICE FOR HOLDING ANIMALS. JOHN B. WILSON and JOHN F. MONTGOMERY, Southport, Ind. Filed Jan. 30, 1882. (No model.)



Claim.—1. In combination with pen A, lever *e*, door C, and door *p*, all arranged as shown and described, for the purpose set forth.

2. A pen for holding animals during the operation of castration or ringing, having laterally-adjustable sides and a vertically-adjustable top, substantially as described, and combined with a holding-lever, *r*, and exit-door C, substantially in the manner and for the purpose set forth.

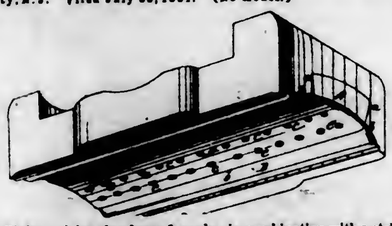
259,349.

259,350. PRESSURE-REGULATOR FOR HYDROSTATIC PRESSES. CHARLES WINDHEIM and JAMES FIRTH, Amsterdam, N.Y. Filed Feb. 28, 1882. (No model.)

Claim.—1. A pressure-regulator for hydrostatic presses, composed of an auxiliary cylinder containing a movable plunger controlled by means of a weight or spring, in combination with and operating the connecting and disconnecting devices of the pump-driving mechanism, as herein set forth, the said auxiliary cylinder being connected to the feed-pipes for the presses in such manner that the same pressure will be found in the said cylinder and feed-pipes for the purpose of maintaining the pressure in a hydrostatic press or presses at the maximum point of pressure, as herein specified.

2. The auxiliary cylinder L, provided with a weight or spring governed plunger, *l*, adapted to automatically connect and disconnect the operating mechanism of the supply-pump for hydrostatic presses, in the manner and for the purpose herein specified.

259,351. CLAMP FOR HOLDING VEHICLE DASH-FRAMES. FRANK C. AYRE, Columbus, Ohio. Filed Nov. 16, 1881. (No model.)



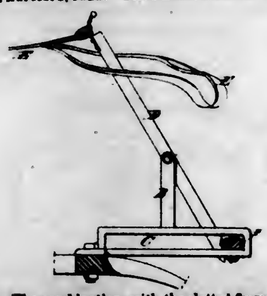
Claim.—1. The work-table having longitudinal slots and holes disposed in relation to each other, substantially as hereinbefore set forth, in combination with clamping devices operating in said slots at each end of the table for setting and holding the dash-frame thereon, holders inserted in said holes for setting and holding the cross-bars of said dash-frame in fixed relation to the table, and carrying-slides for operating the setting and holding devices upon the dash-frame to center it in relation to the cross-bars, substantially as described, for the purpose specified.

2. The combination of the work-table having longitudinal slots and holes disposed in relation to each other, substantially as hereinbefore set forth, with arms operating in said slots for setting and holding the dash-frame upon said table, pins fixed in said holes for setting and holding the cross-bars of said dash-frame in fixed relation to the table, carriers for operating the setting and holding arms against the ends of the dash-frame to center it in relation to the cross-bars, and means, substantially as described, for holding said

arms in clamping action upon the dash-frame when so centered, substantially as described, for the purpose specified.

3. In combination, the table *a*, having the longitudinal slots *c c* and holes *d*, the setting and holding right-angled arms *g g'*, their carrying-racks *h*, the cross-shafts *k k*, having gear *j j*, engaging with said racks, and gears *n n*, to give equal rotation to said shafts, the hand-wheel *s*, a brake device for the shaft of said hand-wheel, and the setting and holding pins *e e*, these several parts being constructed and arranged for use in setting and holding vehicle dash-frames and their cross-bars in the operation of fastening the same together, substantially as described.

259,852. CAR-AXLE BEARING. JACKSON R. BAKER, Jersey City, N.J. Filed July 30, 1881. (No model.)

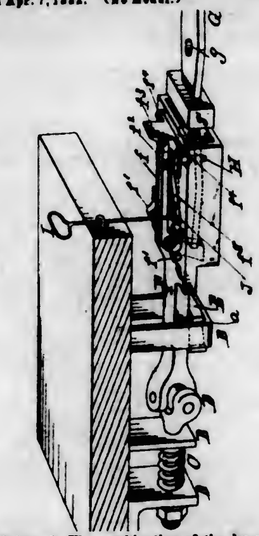


Claim.—A bearing-brass for axles, in combination with a strip of perforated soft lead soldered thereto and interposed between the axle and the crown of the bearing, the bearing on each side *b* of the leaden strip being left uncovered, substantially as and for the purpose described.

259,853. COLLAR. FREDERICK BRIGGMEISTER, Jr., Troy, N.Y. Filed Apr. 22, 1882. (No model.)

Claim.—A collar made of two or more parts or plies fastened together, and shaped to match along their upper edges and part way only across their ends, substantially as herein described, and for the purposes referred to.

259,854. VEHICLE DEVICE FOR CHECKING HORSES. EDWD. E. BOWERS, Springfield, Mass., assignor of one-half to Frank H. Adkins, Hartford, Conn. Filed Mar. 11, 1882. (No model.)

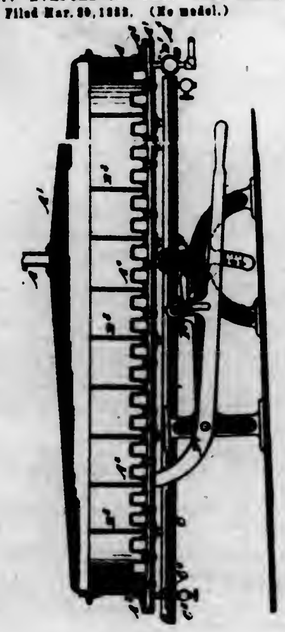


Claim.—The combination, with the slotted frame C, provided with the bearing B and secured to the whiffletree-bar, of the whiffle-tree F, held in said frame and adapted to slide therein, and the hinged lever D, arranged to have one end swing within the frame in operative contact with the whiffletree and to have its other end form a point of attachment for the reins E, provided with suitable eyes or rings to connect therewith, all operating for the purpose set forth.

259,855. INCRUSTATION-PREVENTIVE. CALEB B. BOYER, Chicago, Ill., assignor of one-half to John K. Pollard, same place. Filed Mar. 20, 1882. (No specimens.)

Claim.—A compound for cleaning steam-boilers, consisting of logwood, hemlock-bark, slippery-elm bark, sumac, and chloride of zinc, combined as and for the purpose stated.

259,856. CAR-COUPLING. SAMUEL R. BRADY, Granby, Mo. Filed Apr. 7, 1882. (No model.)



Claim.—1. The combination of the draw-bar F, pin H, lever *f*, catch *f'*, lever *f''*, rod I, and spring J with the link G, having the extended ends and central enlarged portion, *g'*, substantially as shown and described.

2. The combination of the draw-bar F, having the universal joint D, the bracket B, and the beveled mortised block R, substantially as shown and described.

3. The combination of the draw-head, the bell-crank lever, the catch-plate and the tripping-lever, the catch-plate being adapted to retain the pin in a depressed position, and the rear extension of the catch being adapted to lift the pin from the link, substantially as shown and described.

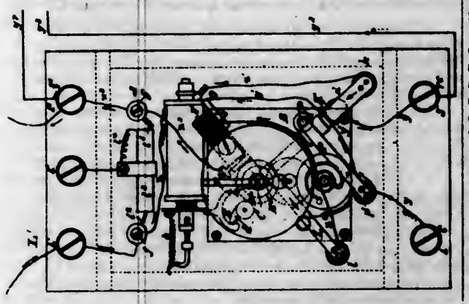
259,857. EVAPORATING PAN. ABEL BEDAL, Saugatuck, Conn. Filed Mar. 20, 1882. (No model.)

Claim.—1. The combination, with a vacuum-pan for evaporating saccharine and other substances, of an automatically-operating valve, the closing movement of which is produced by the pressure in said pan and its opening movement by the pressure of the atmosphere upon its under or outer surface, substantially as and for the purpose set forth.

2. The combination, in a vacuum-pan for evaporating saccharine and other substances, of the dividing-partitions and sliding valves or gates for dividing the evaporating-space into different compartments, substantially as and for the purpose set forth.

3. In a pan for evaporating saccharum and other substances, the combination of the heating-cups A', made of thin sheet metal, the dividing-partitions B', and valves or gates B², whereby provision is made for dividing the pan into separate and distinct compartments and heating the material in some compartments separately, substantially as set forth.

4. The combination of the evaporating-pan and the steam or air pipes for supplying steam or air thereto, the jointed pipes C', and couplings C², the parts being arranged substantially as described, whereby provision is made for tilting the pan without the use of flexible connections, or causing leakage in the pipes, substantially as described.



5. The combination, in a pan for evaporating saccharine and other substances, of a reservoir suspended at or near its center, having its tilting movement in the direction of its length, and a steam or air pipe connected therewith, arranged to tilt with the pan, substantially in the manner and for the purpose set forth.

259,858. CAR-COUPLING. JAMES E. BRESSON, Elyria, Ohio, assignor to himself, Thaddeus H. Rowland, and Frank H. Bronson, same place. Filed Mar. 1, 1881. Renewed Apr. 19, 1882. (No model.)

Claim.—The combination of the link *d* and plate *f*, the same being constructed in the manner and for the purpose substantially as described.

259,859. TELEPHONIC AND TELEGRAPHIC SIGNALING APPARATUS. ALFRED C. BROWN and HENRY A. C. SAUNDERS, London, England. Filed Feb. 2, 1882. (No model.) Patented in England July 7, 1881, No. 3,295.

Claim.—1. The combination, in a telephonic or telegraphic call apparatus, of, first, an electro-magnetic step-by-step or clock mechanism which operates step by step in response to each of a series of pulsations or breaks and makes in the line caused by direct signaling from any calling-station in the circuit; second, indicating devices, substantially such as described, to indicate any given signal or number of pulsations or makes and breaks at any distant station; third, a single key or push-button and its contacts for causing said pulsations or breaks and makes; and, fourth, locking mechanism, substantially such as described, which at the first signal or impulse from any calling-station on the circuit renders said key or button inoperative, substantially as and for the purpose set forth.

2. The combination, at a given station, of telegraphic or telephonic call apparatus, substantially such as set forth, capable of responding step by step to every signal or break and make in the line caused by direct signaling from any distant station; devices, substantially such as described, for indicating the number of such signals or breaks and makes; a single key or push-button for interrupting the circuit and producing such signals; and mechanism, such as described, which, when the given signal for the station has been received, will throw the transmitter, receiver, and call-bell into circuit, substantially as set forth.

3. The combination, substantially as set forth, at a given station, of telephonic or telegraphic call apparatus through which the main-line circuit normally passes, a receiver, a transmitter, a call-bell, a local circuit, a signaling key or button, and mechanism operated by the first movement of the signaling-button to automatically throw the receiver, transmitter, and call-bell into their respective circuits.

4. The combination, substantially as set forth, of, first, a main line; second, two or more stations thereon; third, a telephonic or telegraphic call apparatus, substantially such as described, of step-by-step or clock mechanism at each station, which apparatus is controlled step by step directly by the apparatus at any other station and moves step by step in response to each signaling pulsation or break and make in the line caused at any calling-station; fourth, a key or push-button at each station for producing such direct pulsations or breaks and makes in the line; and, fifth, locking mechanism, substantially such as described, operated by the first movement of the key or button in signaling at any station, which renders the keys at the other stations inoperative.

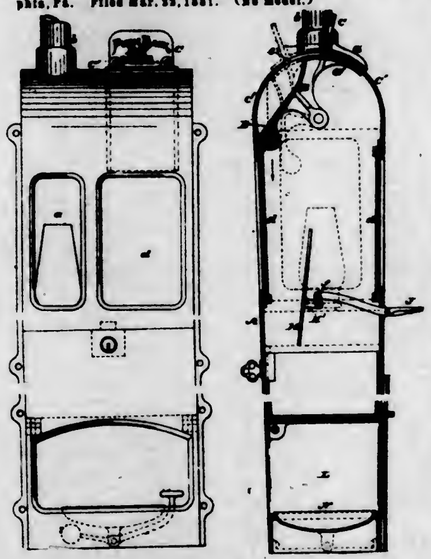
5. The combination, substantially as set forth, of a main line, and at each station thereon telephonic or telegraphic signaling apparatus capable of responding step by step to direct signals from any distant station; mechanism which automatically locks the signaling-keys at all but the calling-station at the first manipulation of the key or button at the calling-station; indicating devices at each station, which indicate step by step the number of signals made in calling at any station, and thus show that the line is in use; a receiver, transmitter, and call-bell at each station; mechanism, substantially such as described, at each station, which, when the signal from any one station to any other has been completed, will automatically complete the local circuit and sound the bell at the called station, and also throw the transmitter and receiver into their proper circuit or circuits; a signaling button or key at each station; and mechanism which at the first movement of the button automatically completes the local circuit through the call-bell and throws the transmitter and receiver into their proper circuits at the calling-station.

6. The combination, substantially as set forth, of a main line; a telephonic or telegraphic call apparatus capable of responding step by step to each signal of any series received over the line from any calling-station; a device for indicating step by step the signals received; a receiver, a transmitter, a call-bell, a local circuit, and induction-coil; mechanism, substantially such as described, which, when the given signal of the station has been received, automatically completes the local circuit through the transmitter, call-bell, and primary of induction-coil and throws the receiver and secondary of the induction-coil into the main line at the called station; and a telephone hook or switch, with its inner and outer studs or contacts, which, when in its normal position, (with the telephone thereon,) permits the local current to pass through the bell mechanism, but shunts the secondary of the induction-coil and the telephone out of the main line, and in its second position (when the telephone is removed) shunts the call-bell out of circuit and throws the secondary of induction-coil and telephone into line.

7. The combination of a main line a telephonic or telegraphic signaling apparatus capable of responding step by step, as set forth, to signals received from any distant station; a receiver, a transmitter, call-bell, and induction-coil; a button or key for signaling the other stations on the main line: mechanism operated by the manipulation of the signaling-key, which mechanism at the first manipulation of the key automatically completes the local circuit through the call-bell, transmitter, and primary of the induction-coil and throws the secondary of the induction-coil and receiver to line; and a telephone hook or switch and its studs or contacts, which in its normal position (with the telephone thereon) permits the current to pass through the call-bell, but shunts the secondary of induction-coil and receiver out of the main line, and in its second position (with the telephone removed) shunts the call-bell out of the local circuit and throws the telephone and secondary onto the main line.

8. The combination, substantially as set forth, of an electric circuit; two or more stations thereon, each of which responds to its given signal, and is capable of calling directly any other station without sounding the alarm at the other stations on the circuit; a signaling-button at the calling-station, which, when operated to call the distant station, throws its transmitter and receiver into

their proper circuits; mechanism, substantially such as described, at the receiving-station, which throws its receiver, transmitter, and call-bell into their proper circuits when the given number of signals, pulsations, or makes and breaks for that station have been received; like mechanism at the calling-station; and at the receiving-station a signaling-button and mechanism for throwing the transmitter and receiver into proper circuit when the button is used in calling the distant station, whereby any station on the circuit may call or respond to a call from any other station on the line.



9. The combination, substantially as set forth, of the main line, the contact-springs K and L, the slotted disk H, the outer face of which is insulated and the inner face in connection with the electrical circuit.

10. The combination, substantially as set forth, of the main line, the local circuit, the contact-springs K and L, the slotted disk, constructed substantially as described, the cam I, the contact-springs N and O, and the contact-screw *c*.

11. The combination, substantially as herein set forth, of the main line, the local circuit, the contact-springs K and L, the push-button, the slotted disk H, constructed substantially as described, the contact-spring P, and its contact, for the purpose set forth.

12. The combination of a local circuit, a call-bell, transmitter, and the primary of an induction-coil included in said circuit, the main line, the secondary of the induction-coil and telephone in the main line, and a telephone hook or switch, which in its normal position (with the telephone thereon) shunts the secondary of the induction-coil and the telephone out of the main line and permits the local circuit to run through the call-bell, transmitter, and primary of induction-coil, and in its second position (with the telephone removed) shunts the call-bell out of circuit, thus concentrating the local current on the transmitter, and throws the secondary of the induction-coil and telephone into the main line.

259,360. FARE-BOX. WILLIAM H. BUCKLEY, Jr., Philadelphia, Pa. Filed Mar. 23, 1881. (No model.)

Claim.—1. The fare-box having a segmental top and a throat in said top, in combination with the pivoted tray B, having a finger-piece, C, and two concentric guards, G G', the guard G' being formed with the finger-piece on the inner side of the segmental top, and the guard G being attached to said finger-piece on the upper side of the segmental top, said guards serving as a double brace for the pivot of the tray.

2. The catch-plate H, having short arm H' pivoted out of its center of gravity, in order that it may return automatically to its closed position, in combination with lever J, link *f*, and casing A, substantially as set forth.

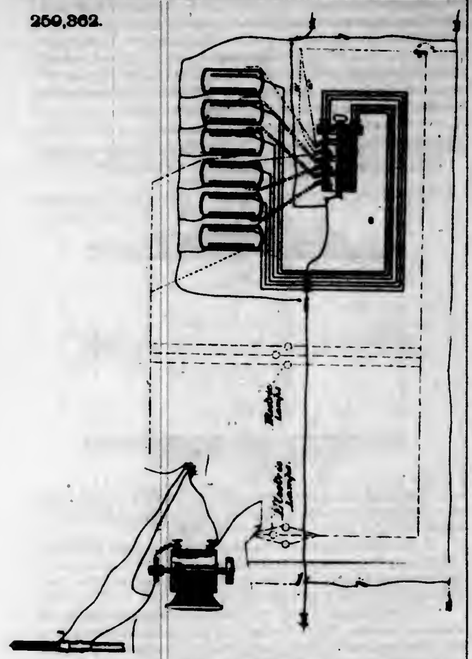
3. The inverted gong N, arranged as described, and serving both as an alarm and as a ticket and change receptacle, in combination with a hammer-lever and an open frame for the passage of change and tickets, substantially as set forth.

259,361. BREECH-LOADING FIRE-ARM. WILLIAM E. BRUCE Chatham, assignor of one-half to James Bryce, Jr., Madison, N. J. Filed June 16, 1881. (No model.)

Claim.—1. In a breech-loading fire-arm, the combination of a base-piece grooved upon its upper surface, a breech-block provided with a tongue fitting in said groove, a removable tongue fitting and secured in said groove, and a barrel or barrels having a groove fitting said removable tongue, substantially as specified.

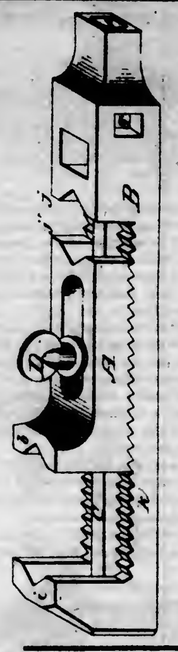
2. In a breech-loading fire-arm, the combination of the base-piece A, provided with a groove, *a*, the removable tongue *c*, fitting and secured in said groove, the screw *d'*, for adjusting said tongue, and a barrel or barrels having the groove *d*, fitting said tongue, substantially as specified.

3. In a breech-loading fire-arm, the combination of the base-piece A, provided with a groove, *a*, the removable tongue *c*, fitting in said groove and provided with a head, *c'*, the barrels C, provided with a groove, *d*, and the catch *e*, substantially as specified.



4. In a breech-loading fire-arm, the combination of the base-piece A, having in it the cavity A', in the bottom of which is the hole *h'*, the breech-block B, the lever E, and link F, for operating the breech-block, adapted to fit in the cavity A' when the breech is closed, and the horn *h*, projecting from said link and adapted to enter the hole *h'*, whereby the lever, its pivot, and the pivotal connection between said lever and link are relieved of all strain from the recoil, substantially as specified.

5. In a breech-loading fire-arm, the combination of a sliding breech-block, an extractor and indicator consisting of a lever, the movements of which are visible from the top of the breech-block, pivoted in said breech-block, so as to vibrate or tilt upward and downward, and having a hooked head, and a hammer adapted to bear upon the under side of said lever to depress its hooked head into engagement with the flanged head of a cartridge-shell and to indicate that the fire-arm is fired, substantially as specified.



6. In a breech-loading fire-arm, the combination of the breech-block B, the hammers G, the pivoted levers *n*, having inclined upper edges, and the spring-actuated sliding bolt *o*, having arms *o'*, adapted to depress said levers when the breech-block is drawn back, substantially as specified.

259,362. SYSTEM OF ELECTRIC LIGHTING FOR RAILWAY-TRAINS. CHARLES E. BUELL, New Haven, Conn. Filed Apr. 19, 1882. (No model.)

259,362.

259,363.

Claim.—1. In a system of electric lighting for railway-trains, the combination of the following elements, namely: an electrical generating-machine mounted on the engine and propelled thereby, a main charging-circuit extending from the engine through the train, with circuit-connecting devices between the engine and the several cars, means for placing the generator in the charging-circuit, two series of secondary batteries and a normally-independent lamp-circuit in each car, and switching devices in each car, adapted to place one series of secondary batteries in the charging-circuit, coupled for quantity, and to simultaneously place the other series of secondary batteries in the lamp-circuit, coupled for intensity.

2. In a system of electric lighting for railway-trains, the combination of the following-named elements in the equipment of each car, viz: electrical conductors forming part of a main charging-circuit, with means for connecting and disconnecting said conductors to and from those of an adjoining car, two series of secondary batteries and an independent lamp-circuit, and switching devices for interposing said series of secondary batteries separately alternately in the charging-circuit, coupled for quantity, and the lamp-circuit, coupled for intensity, substantially as set forth.

3. In a system of electric lighting for railway-trains, the combination of the following-named elements in the equipment of each car, viz: electrical conductors forming part of a main charging-circuit, with means for connecting and disconnecting said conductors to and from those of adjoining cars, two series of secondary batteries, an independent lamp-circuit, switching devices for alternately connecting one series of secondary batteries into the charging-circuit, coupled for quantity, and for connecting the other series of said batteries into the lamp-circuit, coupled for intensity, and other switch devices for including at will one discharging-series of secondary batteries or the independent lamp-circuit in the main charging-circuit, substantially as described.

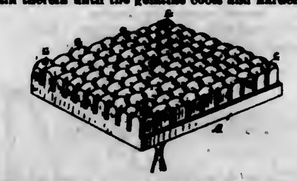
259,363. WRENCH. WILLIAM BUNDY, Vincennes, Ind. Filed Nov. 16, 1880. Renewed May 18, 1882. (Model.)

Claim.—1. In combination with the part B, having jaw *i*, guide-rib C, and serrations *h*, the slotted movable part A, having jaw *b*, serrations *h'*, and recess C', and the clamping-screw D, passing through the slotted part A and into the part B, substantially as and for the purpose set forth.

2. In combination with the part B, having guide-rib C, and jaws *i* and *j*, the slotted movable part A, having jaws *b* and *f* and recess C', and the clamping-screw D, passing through the slotted part A and into the part B, substantially as and for the purpose set forth.

259,364. PILL PACKING-BOX. FIRMAN CAUHAPÉ, Detroit, Mich. Filed Feb. 21, 1882. (No model.)

Claim.—1. A box the bottom, sides, and ends of which are lined with gelatine subdivided into separate cells by means of division-walls made of the same material, substantially as described.



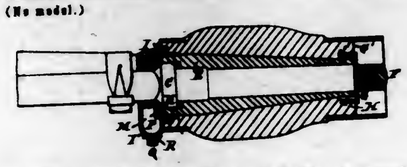
2. A box lined with soft gelatine having divisions to form cells, substantially as described.

3. A box lined with gelatine molded to form recesses and mixed with glycerine to keep it soft, substantially as described.

4. A box lined with soft gelatine molded to form separate cells having division-walls of the same height as the box, in combination with a cover, the inner side of which is also coated with soft gelatine, substantially as described.

259,365. PROCESS OF AND DIE FOR MAKING PILL-BOXES. FIRMAN CAUHAPÉ, Detroit, Mich., assignor to Fake, Davis & Co., same place. Filed Mar. 16, 1882. (Model.)

Brief.—The gelatine is run into a shallow box or mold, and while yet in a plastic condition the die is thrust into it and allowed to remain therein until the gelatine cools and hardens.



Claim.—1. The process herein described of forming the division-walls of chambers or cells of gelatinous matter in boxes by means of dies pressed into said gelatinous matter while in a soft condition, substantially as set forth.

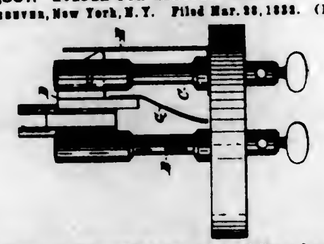
2. The combination, with dies, substantially as described, of the feet *c*, as and for the purpose specified.

3. The plate A, provided with a series of dies or formers having rounded corners and with feet *c*, substantially as and for the purpose specified.

259,366. SPINDLE-PROTECTOR FOR CARRIAGE-AXLES. CHARLES CHAMBERLIN, Lowell, Mass. Filed Feb. 17, 1881. (No model.)

Claim.—1. The protector I I', provided with a downwardly-enlarged drip-receiver, P, as and for the purpose specified.

2. The protector I I', provided with a downwardly-enlarged drip-receiver, P, and a hole, R, as and for the purpose specified.



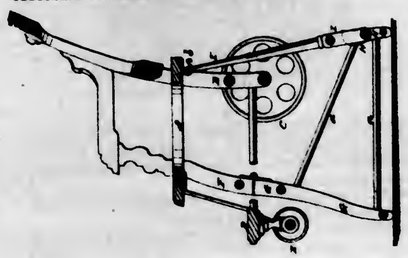
3. The protector I I', provided with a downwardly-enlarged drip-receiver, P, and a hole, R, in combination with the ping Q, as and for the purpose specified.

4. The ring M, closely fitting over the axle-box E, and provided at its inner end with an internal annular flange, N, in combination with said axle-box, as and for the purpose specified.

5. The ring M, closely fitting over the axle-box E, and provided at its inner end with an internal annuler flange, N, and an external annular flange, in combination with said axle-box and a protector, I I', provided with a downwardly-enlarged drip-receiver, P, as and for the purpose specified.

6. The ring M, provided at its inner end with an external annular flange, in combination with a protector, I I', having a downwardly-enlarged drip-receiver, P, as and for the purpose specified.

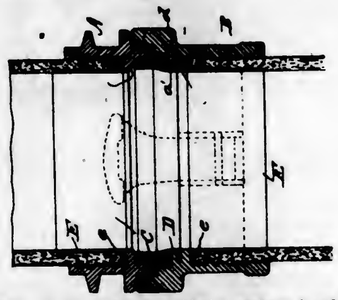
259,367. HOLDER FOR ELECTRIC CANDLES. CHARLES A. CHEEVER, New York, N. Y. Filed Mar. 30, 1882. (No model.)



Claim.—1. The combination, substantially as described, with the spring holding-clamp for an electric candle, of a circuit-closing spring connected to one side of the clamp, and arranged, as described, so as to make contact with the opposite portion of the clamp when the candle is removed.

2. The combination, substantially as described, with the spring holding-clamp for an electric candle, of a circuit-closing spring or point attached to the movable portion of the clamp, and arranged so as to make contact with the opposite portion of the clamp when the candle is removed.

3. The combination, substantially as described, with the holding-clamp for an electric candle, of a circuit-closing spring attached to the movable pivoted clamping-jaw, and arranged so as to make contact with the post carrying the fixed jaw when the candle is removed.



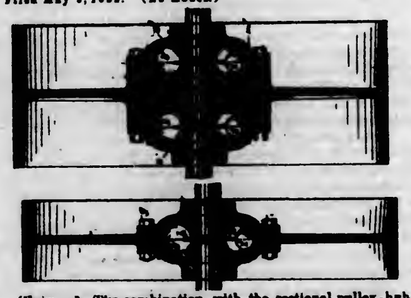
4. The combination of the fixed jaw mounted on post B, the movable pivoted jaw D, mounted on post C, and spring G, attached to the jaw D and arranged so as to come into contact with the flattened side of post B.

259,368. CONVERTIBLE CHILD'S CHAIR. LEMUEL A. CHICHESTER, Phœnicia, N. Y. Filed Feb. 24, 1882.

Claim.—In a convertible chair, the combination of the seat-frame, the projections B, the wheels C, attached directly to the lower ends of said projections, the foot-rest D, the wheels E, supported thereby, the projections F of the seat-frame, the legs G, hinged thereto, the terminals H, the braces *a*, connecting the said legs and terminals, the bowed handle I, hinged to the terminals, and catches *b c*, all constructed and arranged to operate as shown.

259,369. HOSE-COUPLER. JOHN H. CLAY and CLEMENS CLAY, Philadelphia, Pa. Filed Jan. 25, 1882. (No model.)

Claim.—1. In combination with the couplings A and B, the ring D, flanged at *d*, and a rubber or packing ring, C, beveled at *c*, substantially as and for the purpose set forth.



2. In combination with the coupling-section B and packing or rubber ring C, constructed substantially as shown and described, the seamless flanged sheet-metal ring D, formed separate from said coupling-section, substantially as set forth.

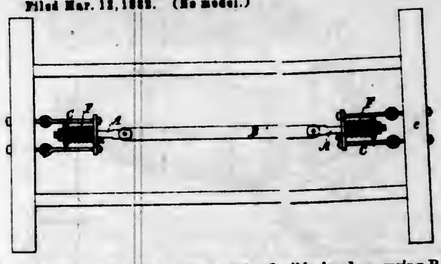
3. In combination with the coupling-sections A and B, the rubber or packing ring C, beveled at *c*, and means, substantially as set forth, for securing said ring in position within the section B, substantially as and for the purpose set forth.

4. In combination with the coupling-sections A and B, constructed substantially as shown and described, a packing or rubber ring, C, beveled at *c*, and arranged within the section B in such manner that the area of the passage-way through the coupling-sections will be equal to or greater than that through the attached hose, substantially as shown and described.

5. In combination with the coupling-sections A and B, the ring D, flanged at *d*, rubber or packing ring C, beveled at *c*, and ring E, capped at *e*, substantially as shown and described.

259,370. PULLEY. EDWARD J. F. COLEMAN, Providence, R. I. Filed May 9, 1882. (No model.)

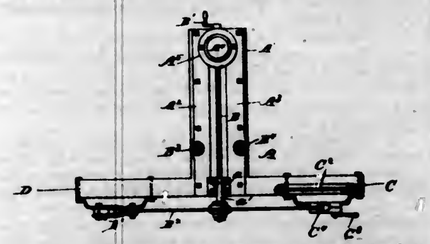
Claim.—1. The combination, with the sectional pulley-hub formed with an annular lubricant reservoir or chamber and an annular passage leading therefrom to the hub-bearing, of the agitators loose within the chamber, substantially as and for the purpose hereinbefore set forth.



2. The conveyer disk or ring, in combination with the axle or shaft and the sectional pulley-hub formed with annular lubricant-chamber and annular passage leading therefrom to the shaft, substantially as set forth.

3. The combination, with the axle or shaft and the sectional pulley-hub formed with annular lubricant chamber or reservoir and passage leading therefrom to the shaft, of the agitators loose within the chamber and the conveyer encircling the shaft and extending through the passage into the chamber, substantially as set forth.

4. The hub-sections recessed on their contiguous faces, so as to form, when put together, the chamber *b* and passage *c*, in combination with the solid rim and spokes connecting the rim to the hub, substantially as hereinbefore set forth.

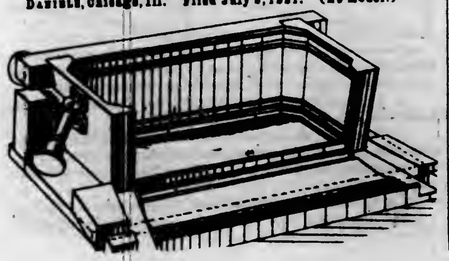


5. The pulley made substantially as shown and described with reference to Fig. 3, consisting of a central hub-section and two heads or external sections, constructed and put together substantially as specified, so as to form within the sectional hub two chambers, *b*, and passages *c*, in combination with the pulley-rim and spokes connecting the rim to the central section, substantially as set forth.

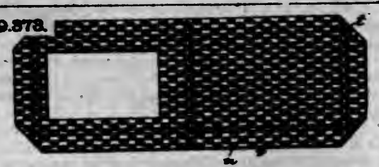
259,371. CARRIAGE-SPRING. ALFRED CORNER, Exeter, N. H. Filed Mar. 11, 1882. (No model.)

Claim.—The combination of the flexible band or spring B with the two yokes C, and with the two connection-slides A and two spiral springs, F, arranged within such yokes, as shown and described.

259,372. SAW JOINTING AND SWAGING DEVICE. HILO CAVEL, Chicago, Ill. Filed Feb. 20, 1882. (No model.)



Claim.—1. The combination, in a saw-bench, of a trunk or main part, A, with the parts C D immovably attached at right angles thereto, with the removable anvil-block, adjustable leveling-screws, and adjustable arbor, as shown and described.

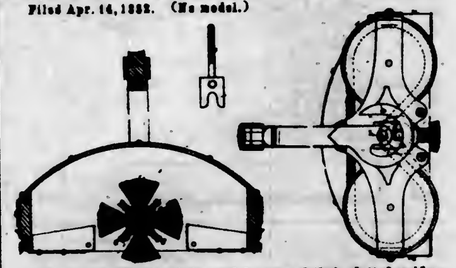


2. The combination, with the saw-bench A, as described, of the endless screw B, the traversing slide *a*, and the adjustable arbor or mandrel *a'*, pivoted thereto and adapted to hold a saw in either a vertical or horizontal position, substantially as and for the purpose set forth.

3. The combination, with arbor *a'*, of the collar a^2, provided with the sleeve a^3, the collar a^4, and the clamping-nut a^5, substantially as and for the purpose set forth.

4. The combination, with a saw-bench, as herein shown and described, of the detachable and adjustable upset *d'* and the detachable and adjustable jointer D', substantially as set forth.

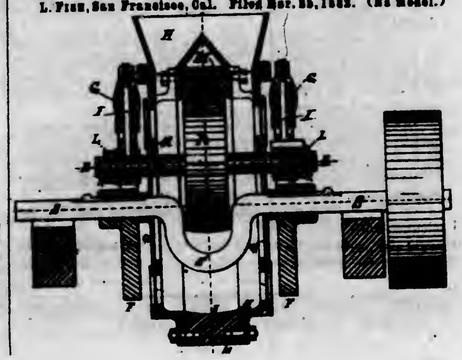
259,373. CEMENT COFFINS. TAYLOR H. DANIELS, Chicago, Ill. Filed July 8, 1881. (No model.)



Claim.—1. In an embedded frame of a molded coffin, the bottom E, formed of corrugated and perforated sheet metal, having cross-strips *f* passing through slots in said corrugations, and longitudinal strips *r* lying in the channels of said corrugations and bolted to the said cross-strips, substantially as described.

2. The method herein described of molding a cement coffin without the use of a core, which consists in forming the sides and ends over a metal frame with the walls of the mold laid down, placing the said walls together and locking them, inserting and securing to the side frame the metal frame of the bottom, coating one side of the same with cement, and finally removing the coffin from the mold and coating the other side, substantially as described.

259,374. CARPET-SWEEPER. ROBERT H. RUDY, Chicago, Ill. Filed Apr. 14, 1882. (No model.)



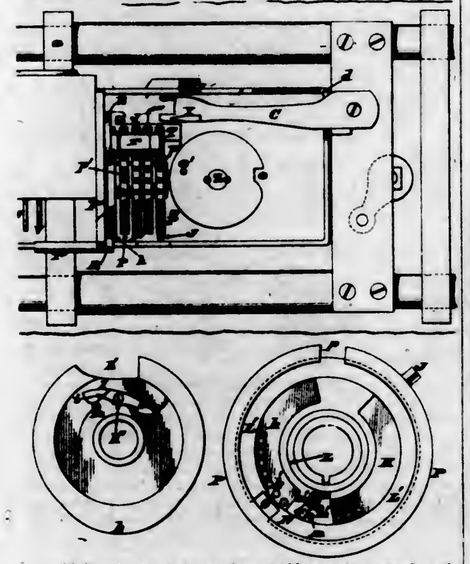
Claim.—1. The brush-journal boxes and their slotted guides or supporters, in combination with the ball pivoted to the said boxes and provided with hooks arranged therewith and to hook upon the journals of the brush, substantially as set forth.

2. The case, slotted at its ends and provided with the revolving brush and its driving-wheels and elastic belts, as set forth, in combination with the brush-journal boxes and their slotted guides or supporters, and with the ball pivoted to the said boxes and provided with hooks arranged therewith and to hook upon the journals of the brush, all being arranged and adapted substantially as set forth.

3. The combination of the adjusting-screws and nuts with the brush-journal boxes and their supporting-guides, the revolving brush, its driving-wheels and elastic belts, and with the ball pivoted to the said boxes and provided with hooks to hook upon the journals of the said brush, all being arranged with the case and adapted to operate substantially as set forth.

4. The revolving brush and its fan-blades, arranged as described, in combination with the case and its dust-receiving pans, such combined brush and fan-blades being provided with mechanism for revolving it in the case, as set forth.

259,375. MACHINE FOR PULVERIZING ORES, &c. ARTHUR L. FISH, San Francisco, Cal. Filed Mar. 25, 1882. (No model.)



Claim.—1. In a pulverizing-machine, the combination of the crushing-roller R, shaft E, slotted disks F, sliding boxes K, rods I, and springs or buffers G, as and for the purpose specified.

2. In a pulverizing-machine, the combination of a crushing-roller, shaft E, slotted disks, means for rotating the same, sliding boxes, adjusting-rods, springs or buffers, and the ring-die, substantially as set forth.

3. A pulverizing-machine comprising casing N, annular die J, band M, slotted disks F, shafts S and E, sliding boxes K, rods I, and springs G, all arranged substantially as shown and specified.

259,376. PERMUTATION-LOCK. BENJAMIN F. FLINT, Cincinnati, Ohio. Filed Oct. 18, 1881. (Model.)

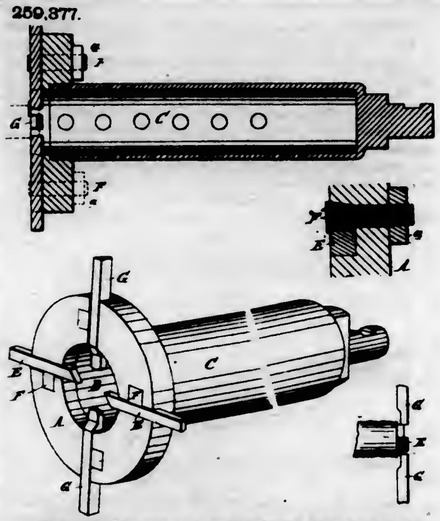
Brief.—Both sets of tumblers are operated by the same spindle, but one dog being used. The ring combination is set up first, the dog being held out of contact, then by manipulation of the spindle allowed to drop into the ring-gates. The disk combination is then set up and the dog descends into disk-gates.

Claim.—1. A gated secondary tumbler rotating around a primary tumbler, and provided with a series of sockets and a movable pin or their equivalents, whereby a combination of said secondary tumblers may be effected without shifting the primary tumblers, for the purpose described.

2. The combination, in a permutation-lock, of a gated secondary tumbler revolving around a gated primary tumbler, said primary and secondary tumblers being provided with independent combination-changing devices, as and for the purpose described.

3. A series of gated secondary tumblers arranged to rotate around a series of gated primary tumblers, said primary and secondary tumblers being provided with independent combination-changing devices and adapted to engage with a single dog, for the purpose specified.

4. In combination with a rotating lock-tumbler, the pivoted fly I *h*″, having two inclined planes, *i i*′, and a shoulder, *j*, in order that the driving-pin *n*, when moved in one direction, will actuate said tumbler, but will be inoperative when moved in the opposite direction, as herein described



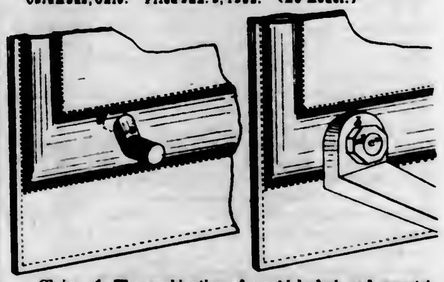
5. The combination, in a lock, of a series of gated secondary tumblers rotating around a series of gated primary tumblers, suitable devices for changing the combinations of one set of tumblers independently of the other set, a single dog for engaging with said tumblers, and a spindle to operate them, as described.

6. The combination of tongue C, lug Y, pivoted fence R *r*, and grooved dog T *t*, as specified.

7. The combination of disk-tumbler K, ring-tumbler P *p*, female threaded sockets *p*′, and screw-pin J, as and for the purpose specified.

259,377. RISING-TOOL FOR LATHES. JAMES FLOWER, Detroit, Mich. Filed Feb. 21, 1882. (No model.)

259,377.



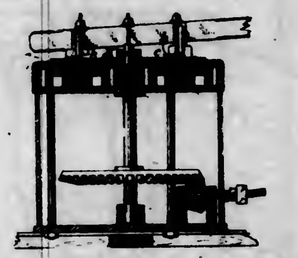
Claim.—1. The support C, provided with a face-plate, A, having recesses two of which are radial to the center and the other two one above and the other below said center, in combination with tools having cutting-edges on opposite sides to each other, and steadying-posts having smooth bearing-surfaces, both the cutters and the steadying-posts being firmly secured in the recesses in the face-plate, with the working-edges of the cutters in advance of the bearing-surfaces of the steadying-posts, substantially as and for the purpose specified.

2. The support C, having openings to allow of the escape of the turnings, in combination with the recessed face-plate A, cutters E, secured to said face-plate, and the steadying-posts G, also secured to the face-plate, and having their bearing-surfaces at the rear of the cutting-edges of the cutters E, substantially as and for the purpose specified.

3. The support C, provided with a face-plate, A, having recesses to receive the tools E G, and having a hole with one inclined side opening into each of the recesses, in combination with the tools E G, having an inclined side adjoining the holes in the face-plate, the sliding bolts F, having inclined sides to come in contact with the inclined sides of the tools and the holes adjoining the tool-recesses, and the nuts *a*, for operating said sliding bolts, substantially as and for the purpose specified.

259,378. VEHICLE-DASH ATTACHMENT. MARTIN P. FOSS, Columbus, Ohio. Filed Jan. 6, 1882. (No model.)

Claim.—1. The combination of a vehicle-dash and eccentrically-adjustable attachments, whereby the same may be connected to the fixed foot-irons of vehicle-bodies of different widths.



2. A vehicle-dash or dash-frame having adjustable eccentric screw-stems, for the purpose stated.

3. The combination of a vehicle-dash, independent or separate dash foot-irons, and an eccentric fastening device adapted for lateral adjustment in relation to each of the fixed foot-irons, for the purpose stated.

4. The combination substantially hereinbefore set forth of a dash, independent dash foot-irons, an eccentrically-adjustable attaching device for each foot-iron, and a fastening-nut for each attaching device, for the purpose described.

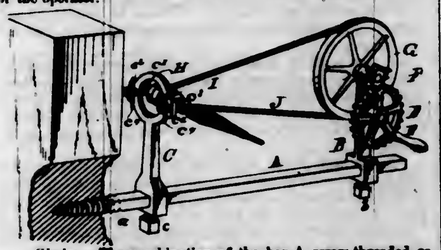
5. The particular fastening attachment for vehicle-dashes herein described, consisting of a bent stem screw-threaded at each end and adapted to be screwed into the dash-frame, the recessed dash foot-iron, and the screw-nut, substantially as and for the purpose set forth.

259,379. HORSE-POWER. WILLIAM O. FROST, Le Roy, N. Y. Filed Apr. 11, 1882. (No model.)

Claim.—1. The combination of the top plate, the planet-wheel having the central recess or socket, and the hub on the top plate having the oil-duct through it, and on which the planet-wheel turns, substantially as and for the purpose set forth.

2. The combination of the top plate, the sweep, the rests, and the movable cap which fits over the rests, substantially as and for the purpose set forth.

3. The combination of the top plate, the sweep, the rests or sockets on the plate for the sweep, and clamping devices for securing the sweep so as to permit its endwise adjustment, substantially as set forth.



4. The combination of the top plate, the sweep, the brackets which hold the sweep, and the clamping straps or loops which embrace the outsides of the brackets and clamp the sweep in place, substantially as set forth.

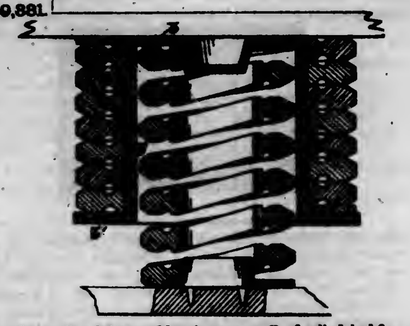
5. In a horse-power, the combination of the top plate, the sweep, and clamping devices which bind the sweep to the plate, for the purpose set forth.

6. The combination of the top plate, the sweep, the rests or sockets for the sweep, and a clamping-strap between the rests for securing the sweep in place, substantially as set forth.

259,380. DOMESTIC SPINNING-MACHINE. JAS. P. GAINES, Kuttawa, Ky. Filed Mar. 27, 1882. (No model.)

Brief.—A bar adapted to sustain two adjustable standards, one of the same capable of sustaining the driving-wheel which meshes with a pinion upon the belt-wheel and the other sustaining bearings for the spindle driven by a band from said belt-wheel, is screw-threaded, so that the machine as a whole may be secured to the wall at different heights from the floor at the convenience of the operator.

Claim.—The combination of the bar A, screw-threaded, as shown, the standards B and C, adjustable thereon, the gear D, pinion F, belt-wheel G, and spindle H, and bearings *c*′, secured in the annular head *c*′, substantially as shown and described.



259,381. CAR-SPRING. GEORGE F. GODLEY, Philadelphia, Pa. Filed Dec. 16, 1881. (No model.)

Claim.—1. A railroad-car spring composed of edge-coiled springs, one within the other, and an interposed bearing between two opposite ends of such springs, whereby one of such springs is adapted and designed to carry the empty car and the other to carry the loaded car.

2. A railroad-car spring composed of coiled springs, one within the other, and an interposed bearing or case, B, of cylindrical form, flanged at *b*′, one of said springs being of a greater or different carrying capacity than that of the remaining spring or springs, substantially as and for the purpose set forth.

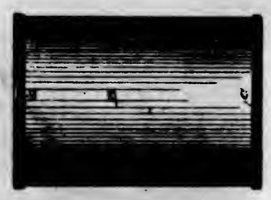
3. The cylindrical bearing or case B for railroad-springs, having flange *b*′, closed top *b*, and pin F, formed of two sections, *f f*′, of different diameters, each such section being of the same diameter or area throughout its length, substantially as shown and described.

259,381.

259,382. SPIKE. WILLIAM GOLDIE, West Bay City, Mich. Filed May 4, 1881. (No model.)

Claim.—A spike wherein the upper portion, near the head, is square and larger in cross-sections in area than the lower portion, and provided with a central web, beginning with said large portion and ending in a beveled lower end, said central web being provided on each side with two flanges having their outer sides parallel and their inner sides inclined toward each other and extending outward to the full width of the enlarged portion of the spike, substantially as shown, and for the purpose specified.

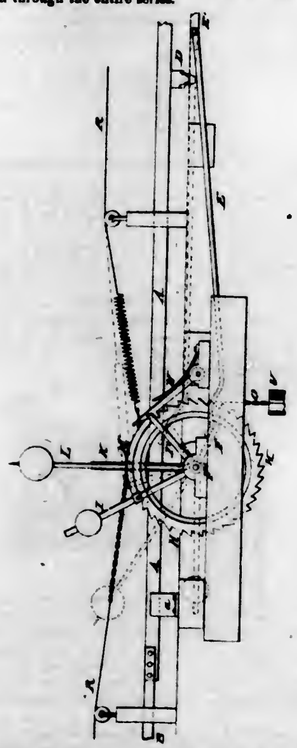
259,383. BOBBIN-WINDER FOR SEWING-MACHINES. JULIUS C. GOODWIN, Kalamazoo, Mich., assignor of one-half to William Notop, same place. Filed Mar. 21, 1882. (No model.)



Claim.—1. In a sewing-machine, the combination, with the recessed pulley-shaft provided with the collar and locking-slide, the belt-pulley having the recesses to receive the locking-slide, and the bobbin-winder provided with the cam-lever, of the pivoted lever having the right-angled extension, bearing a spring, and slotted to receive said cam-lever, the upper end of said pivoted lever being adapted to operate the sliding lock, all substantially as set forth.

2. In a mechanism for causing the movements of the bobbin-winder to lock and unlock the belt-pulley, the combination, with the pulley-shaft having the recess in which the locking-slide is located, and the locking-slide having the end projections, of the shaft-supporting arm, provided with the recess in which said projections play when the shaft revolves, substantially as described and shown.

259,384. LINING FOR PRESERVING-CANS. WM. GOSSELIN, Biloxi, Miss., assignor to Lopez, Elmer & Co., same place. Filed Apr. 8, 1882. (No model.)

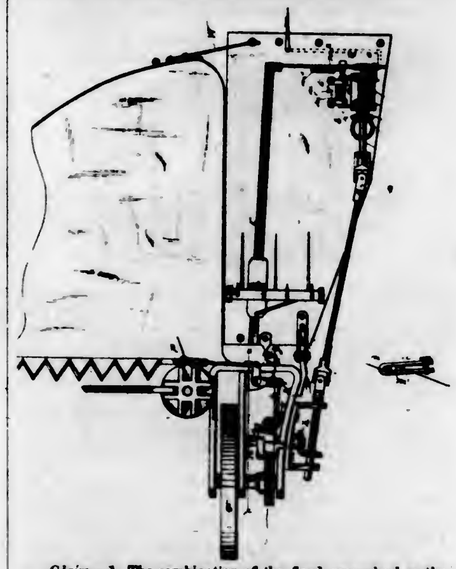


Claim.—The herein-described lining for preserving and shipping cans, consisting of wood treated with salt and soda, as and for the purpose herein specified.

259,384.

259,385. SIGNALING APPARATUS FOR RAILWAYS. EMANUEL GUNDRY, Cavaillon, France. Filed Nov. 16, 1880. (No model.) Patented in France Apr. 20, 1880, No. 136,263; in Germany Sept. 26, 1880; in Russia Oct. 9, 1880; in England Oct. 12, 1880, No. 4,134; in Italy Oct. 18, 1880; in Austria-Hungary Dec. 1, 1880; in Norway Apr. 1, 1881; in Spain Apr. 2, 1881; in Denmark Apr. 18, 1881; in Sweden June 10, 1881, and in Belgium Oct. 15, 1881.

Brief.—A block system operated through spring-held depression-levers, which elevate their respective signals to view when depressed, each signaling apparatus being connected to the next in advance by a yielding wire connection, whereby the setting of the third apparatus retains the second in position but releases the first, and so on through the entire series.



Claim.—1. In a series of signal-stations, the combination of the setting mechanism, the signaling devices, the locking mechanism for each apparatus, and the tension-wire, which is connected by a spring to a pawl of one station and is attached to a weighted chain of the sprocket-wheel of the next succeeding station, the said devices being arranged substantially as described, whereby the setting of the third apparatus releases the signaling devices of the first, the setting of the signals of the fourth those of the second apparatus, and so on.

2. The combination of the setting mechanism A B D E F and the axial turning shaft F', carrying the signaling devices I K L, with a loosely-sliding ratchet-wheel, H, pawls M N, and radial arm I', substantially as and for the purpose set forth.

3. The combination, with the shaft F', having the signaling devices I K L, ratchet-wheel H, having a side sprocket-wheel, H', and pawls M N, with a connecting-wire, R, said wire being provided with a compensatory weight, U, at one end and with a tension-spring, P, at the distant end, substantially as specified.

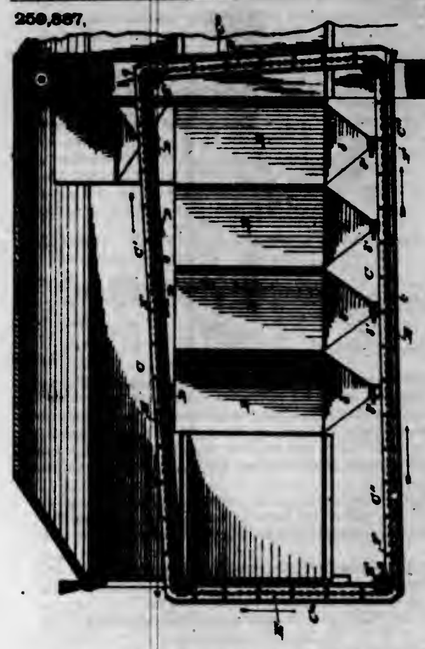
259,386. HARVESTER-BINDER. WILLIAM P. HALE, Brookport, N.Y. Filed Feb. 23, 1882. (No model.)

Claim.—1. The combination of the fixed gear-wheel on the main axle of the harvester, the loose gear-wheel on the counter-shaft, the lever-arm and spring for locking the loose gear-wheel to the counter-shaft, and the rocking cam for automatically throwing the lever-arm and spring out of connection with the loose wheel to stop the motion of the counter-shaft and arrest the operation of the binding mechanism, substantially as described.

2. The combination of the trip-lever P, operated from the harvester-rake, with the rocking cam, means for connecting the trip-lever to the rocking cam, the fixed gear, the loose gear, the lever-arm and spring, and the counter-shaft, substantially as described, for the purpose specified.

3. The combination of the slotted draft-bar on the harvester-frame, the bracket on the binding truck or carriage, and the cross-bolt passed through said bracket and working in the slot of the draft-bar, with the adjusting-chain and hook for holding the end of the truck at the desired elevation, substantially as described, for the purpose specified.

4. The hooks W, fastened to the binding-truck, in combination with the series of eyes or staples on the harvester-platform, whereby the rear end of the binding-truck is enabled to be brought nearer to or carried farther away from the harvester-platform, according to the length of grain to be bound, substantially as described.



5. A tension device consisting of two substantially parallel rods arranged so as to allow the band to pass freely between them while the band-carrying arm is being elevated, and to be rotated to form a kink or bend in the band while the band-carrying arm is descending, whereby to take up the slack in the band and produce the requisite tension, substantially as described.

6. The combination, substantially as herein described, of the band-spool, the rod m, mounted in bearings in the arms a a, the movable frame carrying the rod m', and means for rocking said frame to create the tension on the band passing between said rods m and m', substantially as described.

7. The combination of the band-spool, the rod m, the movable frame carrying the rod m', the arm m' on the projecting end of rod m, and the cam-flange m^2 on the side of the band-carrying arm, substantially as described.

259,387. GRAIN-CONVEYER. HENRY HARRISON, Burlington, Iowa, assignor of one-half to Lewis R. Pix, same place. Filed Apr. 5, 1881. (No model.)

259,387.

Claim.—1. In combination with a series of grain-bins, a trough having a V-shaped bottom located above said bins, through which grain may be forced for delivery to the bins, and a similarly-constructed trough located below the bins for receiving grain therefrom to be forced through said trough to the delivery or to a receiver, substantially as and for the purpose specified.

2. In combination with a series of grain-bins, a trough located above said bins, through which grain may be forced by push-plates on an endless belt for delivery to said grain-bins, and a trough located below the bins for receiving grain therefrom, through which trough the grain is forced also by push-plates on an endless belt to the delivery or to a receiver, substantially as and for the purpose specified.

3. The combination, with a series of grain-bins, a trough located above said bins, and a trough located below said bins, of an endless belt passing lengthwise through both of said troughs, provided with push-plates adapted to force the grain forward through one trough for delivery to the bins and through the other trough for removal from the bins, substantially as and for the purpose specified.

4. In a grain-conveyer, the combination, with a series of bins, of an upper trough adapted to deliver the grain to the bins, a lower trough adapted to receive the grain from the bins, an endless belt provided with push-plates for forcing the grain through both of said troughs, and pulleys or sprocket-wheels adapted to guide and drive the endless belt through the troughs, substantially as and for the purpose specified.

5. The trough C', extending over the bins B and provided with openings which register with said bins, and trough C'', extending below said bins, provided with valved openings in their bottoms, in combination with an endless belt, E, provided with push-plates F, adapted to propel the grain forward in the troughs, substantially as and for the purpose specified.

6. In combination with the troughs C' C'', endless belt with push-plates for propelling the grain forward in the troughs, and sprocket-wheels driving and changing direction of the belt, the bucket-elevator and hopper-scale adapted to deliver grain to the trough C', substantially as and for the purpose specified.

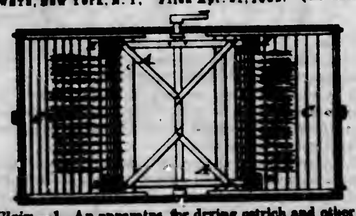
7. In a conveyer apparatus, the combination, with the upper and lower troughs and a carrier-belt passing through said troughs, of push-plates having the belt arranged through the middle of each, and having the opposite edges of each the same in contour, whereby not only is the belt carried clear of the troughs, but the push-plates rendered capable of working in either the upper or lower trough with equal facility.

8. The combination, with the belt of a conveyer apparatus, of push-plates projecting at both sides of the belt and having V-shaped working-edges, substantially as set forth.

9. In combination with a grain-conveyer trough above the series of grain-bins and a trough below said bins, said troughs having bottoms lowest at their central parts in their cross-sections, an endless belt provided with push-plates adapted to traverse both of said troughs, and which project from both sides of said belt and conform to the shape of the bottom of the troughs in their cross-section.

10. Diamond-shaped push-plates for propelling grain through conveyer-troughs.

11. A chain belt provided at intervals with diamond-shaped push-plates for propelling grain through conveyer-troughs.



12. A belt provided at intervals with diamond-shaped push-plates connected with said belt in such manner that both top and bottom sides of the push-plate project from the belt, so as to adapt either side for use, substantially as and for the purpose specified.

13. In combination with an upper and lower trough, C' C'', and passing through both of said troughs, an endless belt having diamond-shaped push-plates attached thereto in such manner that they project from both the upper and lower sides of the belt, and are thereby adapted to push the grain forward in one direction in the upper trough and in an opposite direction in the lower trough, substantially as and for the purpose specified.

14. The troughs C' C'' and endless belt E, having diamond-shaped push-plates F, in combination with the pulleys or sprocket-wheels for changing the direction of the belt and driving it, and with grain-bins B, substantially as and for the purpose specified.

15. In combination with an endless belt having diamond-shaped push-plates attached thereto so as to project from the belt, pulleys or sprocket-wheels over which the belt runs, having depressions or grooves which receive the projecting sides of the push-plates as they pass around the pulleys, substantially as and for the purpose specified.

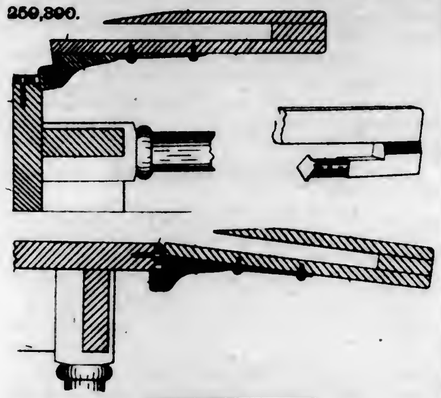
259,388. MACHINE FOR DRYING FEATHERS. JOHN HAWLOWATH, New York, N.Y. Filed Apr. 21, 1882. (No model.)

Claim.—1. An apparatus for drying ostrich and other feathers, consisting of a tightly-closed drying-chamber, fixed interior wire frames arranged at a suitable angle of inclination, and of intermediate oscillating beater-frames provided with means to attach the feathers to their opposite ends, substantially as set forth.

2. The combination of a closed drying-chamber having fixed interior wire frames, the latter being provided with rubber cushions, with oscillating beater-frames having means to attach the feathers to their opposite ends, substantially as set forth.

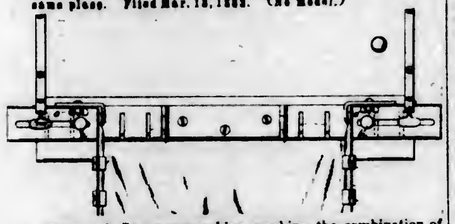
3. In an apparatus for drying ostrich and other feathers, a beater-frame, A, having transverse retaining-wires *a a* at opposite ends, and transverse binding-strings *b*, applied to the frame back of the retaining-wires, substantially as described.

259,389. DETERGENT COMPOUND. EDWARD HUDDLESON, New York, N.Y. Filed Apr. 26, 1882. (Specimens.)



Brief.—The dried Yucca is crushed and the fiber separated from the powder, which latter is mixed with glycerine in equal proportions of each, and to each pound of the mixture four grains of boracic acid is added.

Claim.—The manufacture or composition formed of the extract from the cells of Yucca plants of saponin, sugar, and gum, together with a suitable menstruum or substance with which it may be incorporated or diffused, together with boracic acid, the whole being a new manufacture or composition, as hereinbefore described.



259,390. WRITER'S HAND-SUPPORT. GEORGE W. HESSLEY, Lawrence, Ind. Filed Mar. 7, 1882. (No model.)

Claim.—As a new article of manufacture, a hand-rest adapted to be secured to a writing table or desk, provided with an opening between the two parts thereof, into which the paper or other writing material may be inserted, and from which it will glide as the writing progresses, while the writer's hand rests upon the top of the top part of the rest, substantially as set forth.

259,890.

259,891. PAPER-MAKING MACHINE. BENJAMIN A. HICKOX, Windsor Locks, Conn., assignor of one-half to Arthur L. Beals, same place. Filed Mar. 18, 1882. (No model.)

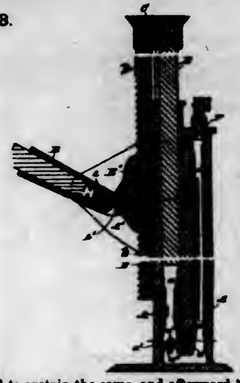
Claim.—1. In a paper-making machine, the combination of the apron, the shoe, and an adjustable clamp-plate, substantially as described, and for the purpose specified.

2. In a paper-making machine, the combination of the shoe, the transversely-slotted clamp-plate, and mechanism for fastening and unfastening said plate upon the shoe, substantially as described, and for the purpose specified.

3. In a paper-making machine, the combination of the shoe, the clamp-plate having a solid middle portion and slotted end portions hinged thereto, the side slips, and mechanism for fastening and unfastening the said end portions and side slips, substantially as described, and for the purpose specified.

4. In a paper-making machine, the combination of the side slips and the adjustable angle-plate clamps *n n*, substantially as described, and for the purpose specified.

259,892. BALANCED VALVE. DANIEL HOGAN, Tomlinson, Ark. Filed Mar. 25, 1882. (No model.)



Claim.—1. The combination, with the steam-chest having transverse dovetailed cleats B, of the removable valve-seat C, having beveled sides, as set forth.

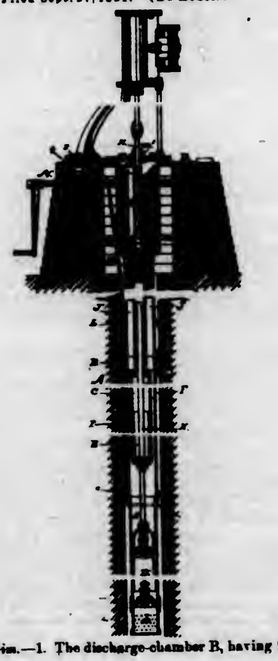
2. The combination of the steam-chest having dovetailed cleats B, the removable valve-seat C, the valve D, the shell or cap L, and suitable packing interposed between said valve and shell, as and for the purpose set forth.

259,893. LIFTING-JACK. ISRAEL HOGELAND, Indianapolis, Ind., assignor of one-half to George P. Anderson, same place. Filed Oct. 31, 1881. (No model.)

Claim.—1. In the main casting of a lifting-jack, a cylinder in which a piston moves, a second cylinder or receptacle containing a liquid, a check-valve located in the bottom of the first, or between the two cylinders, an orifice between said two cylinders above the valve, and a cock whereby said orifice may be either opened or closed, whereby when the piston is raised the liquid may

259,893.

be caused to sustain the same, and afterward by opening the cock the piston may be allowed to descend, substantially as set forth.



2. The combination of the two cylinders, the liquid contained therein, the valve, the cock, the piston, the rack-bar connected at the top to said piston, and the lever whereby said rack-bar may be forced upward, substantially as described, and for the purpose specified.

3. The combination of the casting A, the cylinders *a a'*, the valve *a²*, the cock *a³*, the piston B, head C, rack-bar D, lever E, and head E', substantially as described, and for the purposes specified.

4. In a lifting-jack, the piston B, adapted to be lifted by a lever and sustained or let down by the use of a liquid, substantially as described, and for the purpose specified.

5. In a lifting-jack, the combination, with the casting A, having wings A' A', of a lever, E, supported by a pivot, *e*, resting in elongated bearings in said wings, a head, E', having a recess into which the end of said lever enters, and a rack-bar connected with the lifting-head of the jack, with which said head E' engages, all substantially as shown and described, and for the purposes specified.

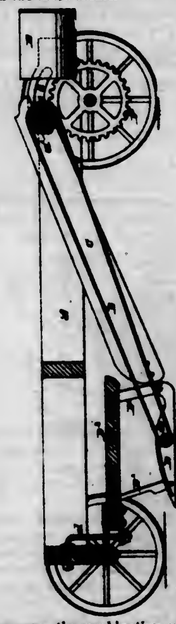
259,894. DEEP-WELL PUMP. WILLIAM D. HOOKER, Oakland, Cal. Filed Sept. 27, 1881. (No model.)

Claim.—1. The discharge-chamber B, having the rim *f* to re-

ceive the outer cylinder, F, and the flange *h* for the plunger-cylinder C, with the water-way *e* between them, the central socket, *g*, for the pump-rod, and the two sockets *h h* for the ends of the discharge-pipes.

2. The submerged bucket-plunger pump, the barrel of which is formed of the two cylinders A F, inclosing the valve-bucket D and plunger, and providing the water-way *e* between them, having the two separate discharge-pipes leading vertically upward from the water-way of the barrel to the surface, and connected with the air-chamber I at the top, and the yoke J, connecting or tying the said discharge-pipe at intervals, and having guide-apertures for the pump-rod, and the pump-rod H, supported and guided in and by the guide-sockets *g h'*, substantially as set forth.

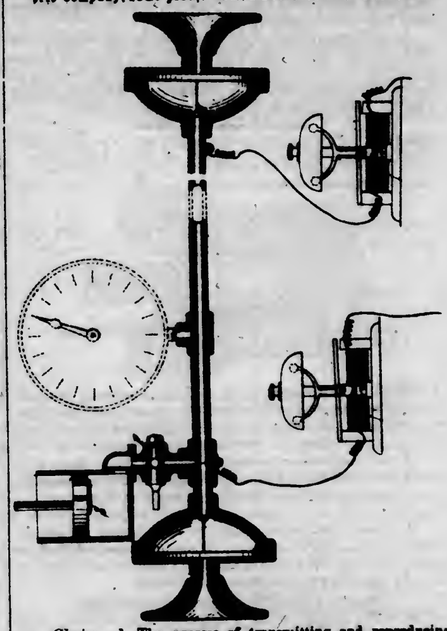
259,895. BED-SPRING. WILLIAM A. HORSALL, Washington, Ind. Filed May 13, 1882. (No model.)



Claim.—1. A connection for bed-springs, comprising four coils arranged to form a rectangular supporting-surface between the springs, as set forth.

2. The herein-described connection for bed-springs, consisting in continuing the wire of one upright coil over to form a small coil, B, thence across to form an adjoining coil, C, from whence it is continued diagonally across to form corresponding coils, E F, and over to form the next upright spring, as set forth, and for the purpose specified.

3. The cross-slat on which the springs are adapted to rest or be hooked under, provided on one or more of its surfaces with a metallic plate or facing adapted to prevent injury to the slat by movement of the spring, as set forth.



259,896. EXCAVATOR. SAMUEL P. HUNTER, Wellington, Ill. Filed July 19, 1881. (No model.)

Brief.—The plow-beam is vertically-adjustable upon a bolt at the front of the main frame, the lower end of elevator-frame being pivoted to the rear of the plow and its upper end being adjustable in a curved slot in the main frame.

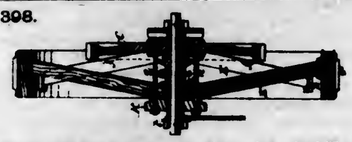
Claim.—In an excavator, the combination, with the side pieces or frame, C, having the carrier B, the shaft of the upper roll thereof having a pinion, *b*, gearing with wheel F on the driving-wheel shaft, of the frame A, having curved slots *c*, and the plow D, connected by arms D' to a beam, D², adapted to move vertically upon a depending bolt, *d*, at the front end of the frame A, substantially as and for the purpose specified.

259,897. APPARATUS FOR TRANSMITTING AND REPRODUCING SPEECH. CHARLES A. HUSSEY, New York, N. Y., assignor, by direct and mesne assignments, to the Hussey Electric Company, same place. Filed Dec. 17, 1880. (No model.)

Claim.—1. The process of transmitting and reproducing speech, consisting in establishing and maintaining a pressure of air, gas, or other fluid in excess of the atmospheric pressure in a constantly-closed tube or conduit, in imparting to said air, gas, or fluid impulses from sound-waves, and in utilizing said impulses for reproducing sound-waves at a distant place, substantially as specified.

2. The combination of a tube, means for establishing and maintaining a pressure of air or other gas or fluid in excess of atmospheric pressure in the tube, and a diaphragm capable of a vibratory motion for transmitting impulses imparted to it through the tube to a receiver for reproducing the same, substantially as and for the purpose specified.

3. The combination, with a tube of electric conducting material, of a diaphragm capable of a vibratory motion for transmitting the impulses from sound-waves through the same, and an electric telegraphic apparatus connected with the tube and utilizing it as a line-conductor, substantially as and for the purpose specified.

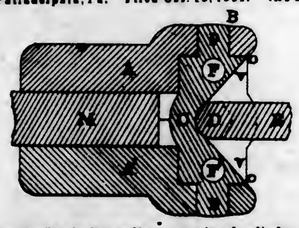


4. The combination of a tube for the transmission of impulses from sound-waves, diaphragms for transmitting the impulses from sound-waves through the same, and concentrators attached to the diaphragms for concentrating the effect of the sound-waves on the center of the diaphragms, substantially as and for the purpose specified.

5. The combination of a tube for the transmission of impulses for sound-waves, means for establishing and maintaining a pressure of air, gas, or fluid in excess of atmospheric pressure in the same, diaphragms for transmitting the impulses imparted to them, and a gage for indicating the pressure in the tube, substantially as specified.

259,898. DRIVING AND SUPPORTING WHEEL OF HARVESTERS. JOHN A. JOHNSON, Madison, Wis., assignor to Walter A. Wood Mowing and Reaping Machine Company, Hoosick Falls, N. Y. Filed July 14, 1879.

Claim.—1. The combination of the wheel, wooden rim, staggered metallic cup-like spoke-sockets secured thereto, staggered spokes, gear-wheel C, and projections *f* upon its rim to bear against

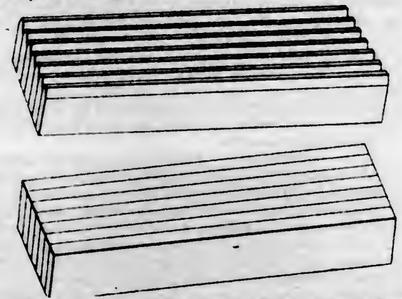


259,398.

the spokes, with central tube, A, and sprocket-wheel K, substantially as and for the purpose described.

2. The combination of the wheel, wooden rim, staggered metallic cup-like spoke-sockets secured thereto, staggered spokes, gear-wheel C, and projections *f* upon its rim to bear against the spokes, with central tube, A, its polygonal sleeve G, and sprocket-wheel K, substantially as and for the purpose described.

259,399. UNIVERSAL-JOINT COUPLING. WILLIAM JOHNSTON, Philadelphia, Pa. Filed Oct. 18, 1881. (No model.)



Claim.—1. In shaft-coupling, a sectional cylinder, in combination with a smaller cylinder which it incloses, and a head having a flaring mouth within which said cylinders turn in planes at right angles to one another, for the purpose set forth.

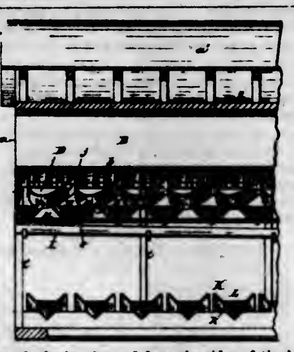
2. In combination with head B and shaft E, a cylinder, D, to which said shaft is attached, and a larger cylinder inclosing the same, said larger cylinder having a flaring or V-shaped opening to allow the play of said shaft, substantially as set forth.

3. A shaft and coupling head, the latter having a V-shaped opening, in combination with two or more cylinders, which form connections between them and allow said shaft to be inclined in as many different planes as there are cylinders.

259,400. ROOF. OSCAR W. KENDALL, Olmsted Ohio. Filed Mar. 3, 1882. (No model.)

Brief.—The edges of the roofing-boards are secured together side by side with their edges to the weather, and are then covered with a plastic coating.

Claim.—1. A sheathing or covering for a roof, consisting of thin narrow boards secured together, side to side, with their edges presented to the weather, substantially as described.



2. A roof-sheathing adapted to receive a plastic coating, consisting of thin narrow boards laid and secured side to side with their edges to the weather, and when so secured presenting grooves to receive and retain the coating, substantially as described.

259,401. REFRIGERATING-BUILDING. JOSEPH W. KEPLER, Chicago, Ill. Filed Apr. 10, 1882. (No model.)

Claim.—1. In a refrigerating structure, a tight ice-floor, above which the ice is located, in combination with a series of troughs containing a deliquescent arranged underneath the entire surface of the ice-floor, with open spaces between the several troughs and between the series and the ice-floor for the free circulation of air, substantially as and for the purposes set forth.

2. In a refrigerating structure, the ice-floor B, composed of

259,401.

two sections, *b*, sloping inward from the sides of the building, in combination with the troughs E, containing a deliquescent, arranged in separate series underneath and a little below the ice-floor sections and sloping inward to correspond with the inclination of said ice-floor, substantially as described.

3. In a refrigerating structure, the tight ice-floor, in combination with troughs containing deliquescent material arranged in series a little below the ice-floor and separated from each other, and drip-troughs arranged above the deliquescent-troughs and alternating therewith so as to cover the open spaces between them, substantially as and for the purposes set forth.

4. In a refrigerating structure, the tight ice-floor B, in combination with the series of deliquescent-troughs E and a series of drip-troughs, J, all arranged and operating substantially as described.

5. In a refrigerating structure, the troughs E, for holding a deliquescent, provided with a perforated false bottom, F, on which the deliquescent rests, substantially as and for the purposes set forth.

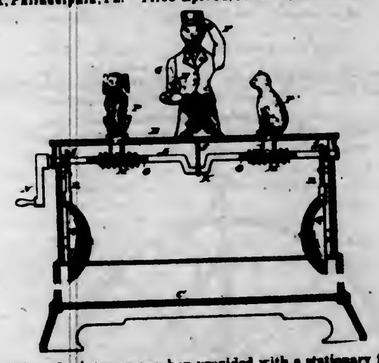
6. The deliquescent-troughs E, provided with offsets *e* in their sides, in combination with the perforated false bottoms F, substantially as and for the purposes set forth.

7. The troughs E, in combination with perforated false bottoms F, on which the deliquescent is placed, and the waste trough or troughs I, substantially as and for the purposes set forth.

8. The ice-floor B, in combination with the deliquescent-troughs E, drip-troughs J, and waste-troughs I, all arranged and operating substantially as described.

9. In a refrigerating structure, a tight ice-floor, B, in combination with a series of deliquescent-troughs E, arranged in the upper portion of the store-room and extending underneath the ice-floor, a series of similar deliquescent-troughs, K, arranged at the bottom of the room, a series of drip-troughs, J, and waste-troughs arranged to catch the waste and drip from the several series of troughs, substantially as and for the purposes set forth.

259,402. REVERSING-GEAR FOR ENGINES. GEORGE KNAYS, Evansville, Ind. Filed Feb. 27, 1882. (No model.)



Claim.—1. In a reversing-gear in which the eccentric is shifted across the shaft, the combination, with a shaft provided with a key-way, of an eccentric having a suitable key, elongated slot, and toothed segment, constructed and arranged to operate substantially as and for the purpose set forth.

2. The sleeve C, having connected thereto the shifting-lever B, and carrying friction-roller A, in combination with the shaft A, sleeve D, having spiral slot *b* and teeth *c*, and the toothed eccentric E, arranged substantially as shown, whereby the eccentric is shifted across the shaft, substantially as and for the purpose described.

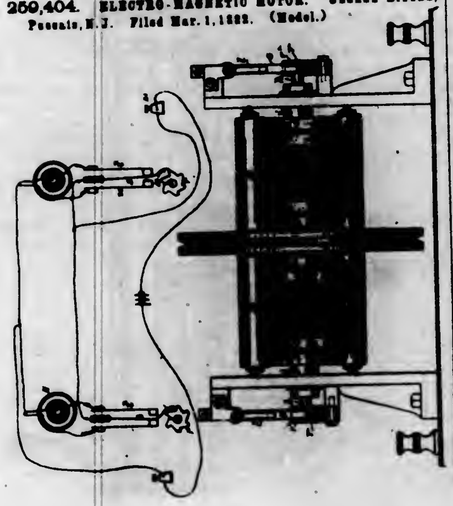
3. The sleeve D, having spiral slot *b* and cogs *c*, in combination with the eccentric E, having toothed segment *e*, and elongated slot or opening *d*, whereby the eccentric is shifted across the engine-shaft, substantially as and for the purpose set forth.

4. The shaft A, having keyway *k*, and the sleeve D, having spiral slot *b* and cogs *c*, in combination with the sleeve C, and eccentric E, having slot or opening *d*, key *i*, and toothed segment *e*, substantially as and for the purpose set forth.

259,403. TOY MONEY-BOX. LOUIS KYSER and ALFRED C. RUX, Philadelphia, Pa. Filed Apr. 15, 1882. (No model.)

Claim.—1. A toy money-box provided with a stationary figure having a movable hand and adapted to deposit the money through a slot in the box, and one or more figures which do not change their position upon the box but which move thereon, in combination with means to move the arm of said stationary figure to deposit the money and also move the other figure or figures, substantially as and for the purpose specified.

2. A toy money-box provided with a figure adapted to deposit the money, one or more figures supported upon said box and adapted to rotate, means to emit musical sounds upon operating the figures, and operating mechanism, substantially as set forth.



3. In a toy money-box, a receptacle or box provided with a slot, D, in combination with shaft L, provided with crank K, worms M, and pins S, worm-wheels O, figures P, P', and E, pivoted arms F G, crank I, rod J, hammers R, and balls Q, as set forth.

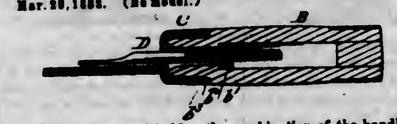
4. In a toy money-box, the combination of shaft L, provided with worms M, worm-wheels O, provided with figures P P', and the receptacle or box in which the money is deposited, as set forth.

5. In a toy money-box, the combination of shaft L, provided with worms M and pins S, worm-wheels O, figures P P', hammers R, and balls Q, substantially as set forth.

6. In a toy money-box, the box provided with a slot, D, in combination with figures E, provided with pivoted arms F and G, one of which holds a plate, H, and the other a bat, crank I, rod J, shaft L, provided with crank K, and pins S, hammers R, and balls Q, substantially as shown.

259,404. ELECTRO-MAGNETIC MOTOR. GEORGE LITTLE, Passaic, N. J. Filed Mar. 1, 1882. (Model.)

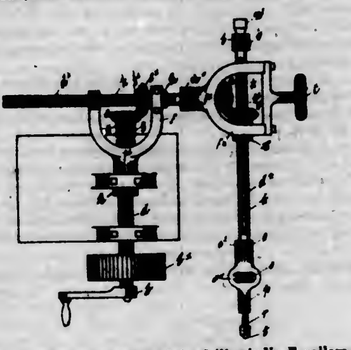
Claim.—1. The combination, with the magnet having heads and pole-faces, of a revolving armature the surface of which rolls in contact with the pole-faces and circuit-changing connections, substantially as specified, whereby reverse currents are employed to neutralize residual magnetism, substantially as specified.



2. In an electro-magnet having circular ends, the V-shaped segmental pole-faces of such circular ends, in combination with the revolving cylindrical armatures, substantially as set forth.

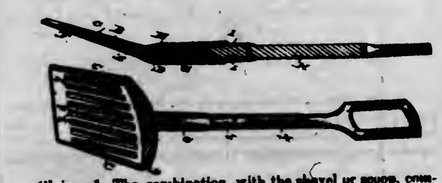
3. In combination with the electro-magnets having circular ends and segmental pole-faces, the springs *s t u*, and wheel *r*, and circuit-connections, substantially as set forth.

4. In an electro-magnetic engine, the helix having circuit-connections to its ends and to an intermediate loop, in combination with circuit-closing springs and connections, substantially as set forth, whereby the residual magnetism is neutralized by a current passed in reverse direction through part of the helix, substantially as set forth.



5. The combination, with the rolling armature and the magnet-heads with pole-faces, of the rings of brass or other non-magnetic metal surrounding the magnet-heads, substantially as specified.

259,405. TOOL-HOLDER. ALEXANDER LONG, Bairdstown, assignor of one-half to Andrew D. McClure, Gilboa, Ohio. Filed Mar. 29, 1882. (No model.)

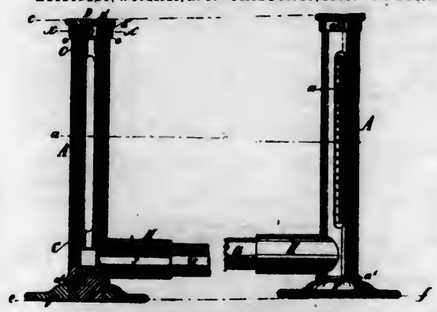


Claim.—In a tool-holder, the combination of the handles B, provided with fixed nuts *b'*, movable notched conical ferrule C, fixed conical ferrule *b'*, having the shoulder *b''*, and jointed connecting-rod D, substantially as shown and described.

259,406. TAPPING AND DRILLING MACHINE. GEORGE W. LONGMAN, Paterson, N. J. Filed Mar. 24, 1882. (No model.)

Claim.—The combination of the drill-spindle *d''*, collars *e*, set screws *e'*, sleeve *p*, screw *r*, and head *t*, substantially as described, and for the purpose shown and set forth.

259,407. SCOOP OR SHOVEL. W. CLAY LUTZ, Bedford, assignor of one-half to John Du Bois, Everett, Pa. Filed Apr. 19, 1882. (No model.)



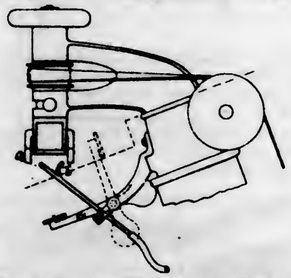
Claim.—1. The combination, with the shovel or scoop, comprising a plate having a back provided with a cylindrical socket, of the handle provided at its connecting end on opposite sides with flat springs adapted to bear against the posterior sides of the socket when the handle is inserted therein, as and for the purpose specified.

2. The combination, with the body or blade A of the shovel

comprising a flat plate, B, having forwardly-converging sides C C and rearwardly-curved back D, provided with auxiliary curved back E and cylindrical socket G, of the separable handle H, provided at its connecting end with flat springs I I, as and for the purpose specified.

259,408. HYDROSTATIC LEVELING-INSTRUMENT. JAMES MACDONALD, Woodside, N. Y. Filed Feb. 18, 1882. (No model.)

Claim.—1. A leveling-instrument consisting of the combination, with the flexible tube G, of standards formed of tubes A, capped at their upper end and provided with the foot-plate F, and the lateral tubular projection *f*, substantially as and for the purpose set forth.



2. In a leveling-instrument, the standard formed of the combination of the tube A, having the tubular side projection *f*, the glass tube B, contracted at its ends and provided with the packing C, the perforated cap D, and the ring-valve E, provided with the perforation *e*, substantially as and for the purpose set forth.

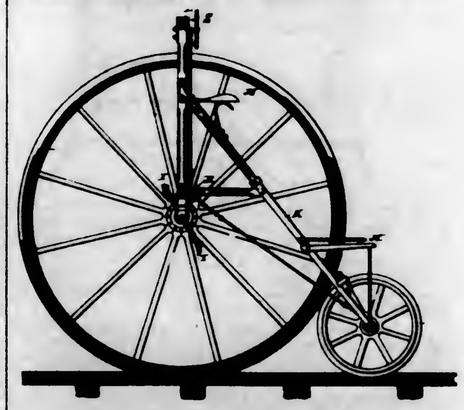
3. In the standard of a leveling-instrument, the tube A, threaded outside at its lower end and inside at its upper end, and provided with a shoulder, *a'*, in combination with the detachable threaded foot-plate F and the screw-cap D, and adapted to apply above as well as below the points to be leveled, substantially as specified.

4. The tube A, having the lateral tubular projection *f*, grooved or threaded upon its outer surface, in combination with a flexible tube, G, and the exterior tightening-sleeve, H, as and for the purpose set forth.

5. In the standard of a leveling-instrument, the tube A, provided with the exterior circumferential rabbet *e*, in combination with a milled and perforated tubular screw-cap, D, and the perforated ring-valve E, fitted in the said rabbet below the head of the said screw-cap, for the purpose of preventing leakage and admitting air from and to the interior of said standard, as set forth.

259,409. SOLE-EDGE-BURNISHING MACHINE. JAMES W. HALEY, Somerville, Mass. Filed Apr. 6, 1882. (No model.)

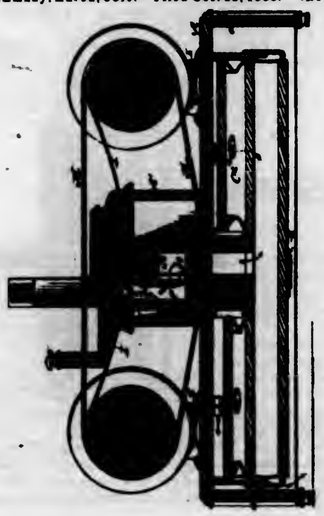
Claim.—The combination, with the frame supporting a burnishing-tool, of a rest pivoted to a part of the frame at one side thereof, and adapted to be turned down to a horizontal position for use and to a vertical position out of the way, substantially as set forth.



259,410. MAIL BUDGET OR POUCH. WILLIAM C. HARRADENE, Potomac Mills, Va. Filed Sept. 13, 1881. (Model.)

Claim.—A mail-package consisting of a suitable backing, having attached thereto a series of pockets to receive mail-matter, said pockets being arranged, as described, with alternate wide and narrow spaces between them, and the backing having side and end

flaps and fastening devices, the whole adapted to be folded and secured substantially in the manner and for the purpose specified.



259,411. VELOCIPEDE. PAUL MCCOMBS, Beaumont, Tex. Filed Jan. 17, 1882. (No model.)

Claim.—1. The above-described construction and arrangement of skeleton frame, having the upright C and cross-bar E, and the four braces F and G, all having bearings on the driving-axle H, with the driver's seat M directly above the treadles I, or nearly so, substantially as and for the purpose set forth.

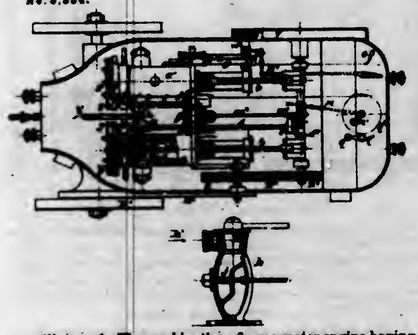
2. The arrangement of the brake in connection with the hind wheels, with the chains P and pulleys Q, in combination with the windlass-wheel S, above the driver's seat, substantially as and for the purpose set forth.

259,412. MECHANICAL MUSICAL INSTRUMENT. JOHN MCTAMMANY, Jr., Worcester, Mass., assignor to Alexander McTammany, Akron, Ohio. Filed Dec. 23, 1880. (No model.)

Claim.—1. In combination with a reservoir-bellows and two supply-bellows arranged above the latter, a reed-board having its bottom inclined and arranged on said reservoir-bellows and between the other two, substantially as set forth.

2. The recessed top of table A, in combination with the lower roll and its shaft, which bears on the top of said table, substantially as set forth.

3. In an automatic musical instrument, the combination of a casing top or table provided with openings to adapt it for operation with a traveling perforated music-sheet, and a reed-board arranged below said table and sheet, with a movable set of organ-pipes supported by the table and pressing said sheet down upon the latter by its weight, substantially as set forth.



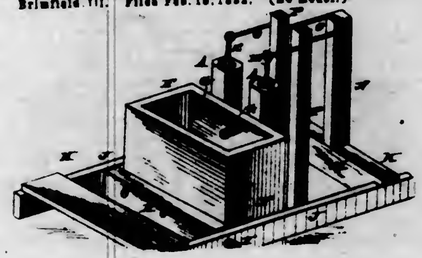
4. In an automatic musical instrument, the combination of a casing top or table provided with openings to adapt it for operation with a traveling perforated music-sheet, and a reed-board arranged below said table and sheet, with a movable set of organ-pipes supported by said table, and pressing said sheet down upon the latter by its weight, said pipes being provided with a spring or springs to aid in said pressure, substantially as set forth.

5. A pair of winding-rolls for a music-sheet, in combination with an endless elastic belt which passes around said sheet and said rolls, substantially as set forth.

6. A pair of winding-rolls provided with a belt which passes around said rolls and the music-sheet, said belt being provided with a buckle or equivalent tightening device, for the purpose set forth.

7. A pair of winding-rolls, in combination with bearings L, having L-shaped slots *l*, and elastic belt M, substantially as set forth.

259,413. GAS-LOCOMOTOR FOR VEHICLES, &c. J. H. ARMAND MONTCLAIR, Paris, France. Filed Feb. 15, 1882. (No model.) Patented in France Dec. 10, 1881, No. 146,290; in Belgium Dec. 15, 1881, No. 56,598, and in England Dec. 17, 1881, No. 5,586.

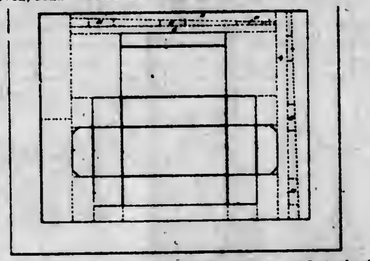


Claim.—1. The combination of a gas-motor engine having one or more cylinders, *a a'*, and main crank-shaft, with which the pistons of said cylinders connect, with an air-pump operated by the said crank-shaft to assist in starting the motor and adapted to operate the same, and with valve mechanism *i*, *j*, *j'*, and h^3, substantially as specified.

2. The gas-receiver *h*, having valves *j j'*, and combined with pipes *l l'*, substantially as and for the purpose specified.

3. The combination of the cylinders *a a'* of a gas-engine with a receiver, m^3, valves *j j'*, and pipes *l l'*, vessel *h*, and with cause *h'*, and valves h^3 and *r*, substantially as specified.

259,414. STOCK-WATERING TROUGH. SAMUEL H. MOORE, Brimfield, Ill. Filed Feb. 10, 1882. (No model.)



Claim.—In a device for watering stock, the combination of the tile drain or ditch B, having section C, provided with valves D D, with the cylinders A, having spouts G, the trough F, valve-rods E, swinging frame K, having platform L and upright N, and the brackets or uprights P, having lever O, connected to said upright N and to the valve-rods E, all arranged and operating substantially as and for the purpose shown and specified.

259,415. SAFE. ENOCH E. MORSE, Somerville, and FRANK H. CHARTER, Boston, Mass. Filed Nov. 9, 1881. (No model.)

Claim.—In combination, the door of a safe, provided with a cavity, *c*, the handle *b* of the bolt-throwing spindle located therein, and the auxiliary door A, for concealing and protecting said handle, substantially as set forth.

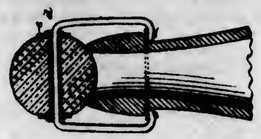
259,416. MANUFACTURE OF BOXES FROM PAPER, CARD-BOARD, &c. EDWARD B. MORSE and HARVEY B. MORSE, New Haven, Conn. Filed Mar. 22, 1882. (No model.)

Claim.—1. The improvement in the art of manufacturing box-blanks, the same consisting in simultaneously cutting the lines dividing the material into proper form and embossing their lines of ultimate folding, by pressing the same between a die composed of sharp cutting and blunt embossing-rules and a coacting counter-die, all substantially as described.

2. A die for forming box-blanks, constructed of cutting-rules disposed at various angles conforming to the direction of cuts required, and of similarly-disposed blunt embossing-rules for producing the necessary folding-lines, which rules are secured in a chase or frame by holding-blocks, all substantially as described.

3. A counter-die for forming box-blanks, consisting of a metal or other hard base and creasing or embossing channels the edges of which are raised above the plane of the hard base, substantially as described.

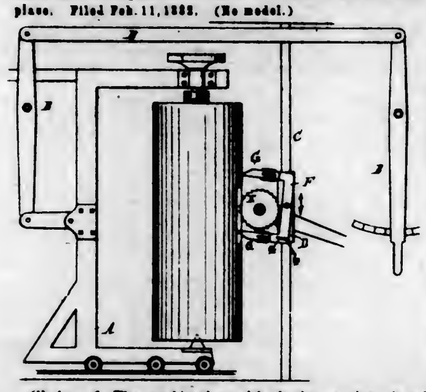
4. In the manufacture of paper-box blanks, a counter-die adapted to be removed from and adjusted upon the platen of a press, constructed of a sheet of metal or similar material affording a suitably-hard cutting-base, to the face of which is secured a covering or packing of paper or equivalent material to receive the embossing-rules of the coacting die, substantially as described.



5. In the manufacture of box-blanks, the combination, with a die consisting essentially of cutting and creasing rules, of a counter-die having a hard cutting-base and embossing-channels above said base, whereby the material is simultaneously cut upon some lines and upset or creased upon other lines, which latter are stretched or conformed so as to readily bend in the folding operation, all substantially as described.

259,417. CAR-COUPLING. JAMES H. MURPHY, Port Jervis, N. Y. Filed Feb. 8, 1882. (Model.)

Claim.—The arrangement of the draw-head A, the coupling-bars B B, the hooks C C, the bolts *e e*, the grooves *o o*, the springs E E, the cam F, the crank H, with the block D and arms *d d*, and the brace K, substantially as described.

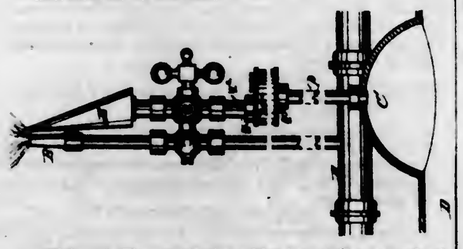


259,418. BOTTLE-STOPPER. WILLIAM W. MORRIS, (deceased,) Baltimore, Md.; Mary E. Morris, Administratrix. Filed Apr. 7, 1880. (No model.)

Claim.—1. The combination of a rubber ball, an internal tubular sleeve, *d*, and the yoke of a bottle-stopper passing through said sleeve, substantially as and for the purpose described.

2. The combination of a yielding elastic ball, an internal tubular sleeve, *d*, collars *e* upon the ends of said sleeve, and the yoke of a bottle-stopper, passing through said sleeve and collars, substantially as described.

259,419. HOOP-CUTTING MACHINE. WALTER B. MOYER, Saginaw, Mich., assignor of one-half to Willis E. Bender, same place. Filed Feb. 11, 1882. (No model.)

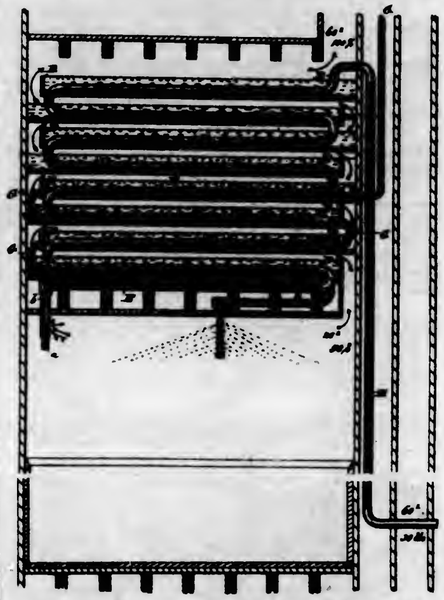


Claim.—1. The combination, with the log-carriage A and suitable devices for operating it, of a traveling cross-head or frame and a rotary cutter, E, and two independent cutters, G G, secured to said cross-head or frame, the independent cutters being adapted to cut alternately into the log at each reciprocation of the rotary cutter, substantially as and for the purpose specified.

2. The combination, with the log-carriage A, suitable devices for operating it, and the rotary cutter E, journaled in a cross-head constructed to travel longitudinally along the log, of the independent cutters G, each secured to a holder pivoted to the cross-head, and adapted to move on the pivotal point of the holder to and from the log as the cross-head reciprocates, substantially as described.

3. The combination, with the log-carriage A and suitable devices for operating it, of the reciprocating cross-head D, the rotary cutter E, and the yoke F, pivoted to said cross-head and carrying a knife, G, at each end, substantially as described.

259,420. APPARATUS FOR CONSUMING SEWER-GAS. WM. H. OGILVIE and WILLIAM L. RENSEN, Brooklyn, N. Y. Filed Mar. 18, 1882. (No model.)

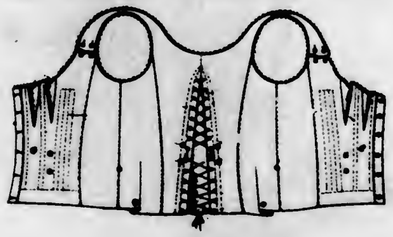


Claim.—1. The combination, with a burner, B, vacuum-head E, and supply-pipe of a sewer-gas-consuming device, of an impregnating or carbonizing chamber, W, substantially as and for the purposes as shown and described.

2. The combination, with a burner and a vacuum-head, E, of a sewer-gas-consuming device, of a chamber, W, provided with a diaphragm, W', filled with sponge or other analogous material impregnated with hydrocarbon or other suitable liquid, substantially as and for the purpose described.

3. The combination, substantially as described, of the sewer or drain pipe D, dome C', pipe P, impregnating or carbonizing chamber W, and a gas-consuming device, substantially as and for the purposes described.

259,421. METHOD OF COOLING AIR FOR MAKING ICE AND COOLING IN GENERAL. ORIN PARKER, Washington, D. C. Filed Nov. 21, 1881. (No model.)



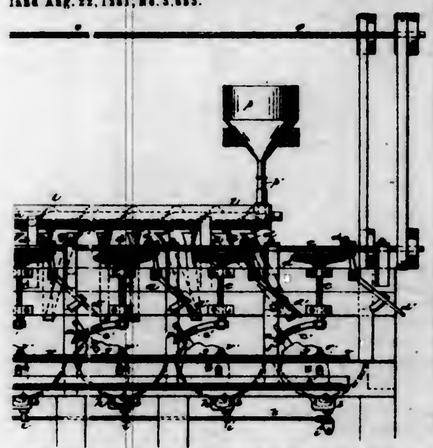
Claim.—1. In the process of cooling by expanding compressed air, the method of conserving waste energy, which consists in passing the expanded air from the freezing or cooling room over evaporating-surfaces to produce a reduction of temperature to be utilized for the purpose of lowering the temperature of the compressed air before expansion or for reducing the temperature of the water to be frozen, or for both, substantially as described.

2. The combination, with a freezing or cooling room, of the alternating tanks or evaporating-troughs D, filled with an evaporating-liquid, the compressed-air pipe E, immersed in said tanks and terminating in a pressure-regulator in the freezing-room, and the water-pipe G, also immersed in said evaporating-tanks, and terminating in the freezing-room in spray-orifices, as described.

3. A compressed-air-expanding device consisting of a pipe having an opening in its sides, a sliding plug arranged within the pipe and adapted to close the opening, and a spiral spring, also arranged within the pipe and connected to the plug, as described.

259,422. UNDERWAIST. EMMELINE W. PHILBROOK, Boston, Mass. Filed Jan. 16, 1881. (Model.)

Claim.—1. An underwaist of the character described, comprising an outer portion with a continuous lining, and having lacing applied to the outer portion, which is suitably cut away, and the lining formed full beneath the lacing, substantially as set forth.



2. In an underwaist having lacing applied to the outer portion and a lining made full beneath the lacing, the bone-pockets on the inside of the laps or free edges of the lacing portion, between the same and the lining, substantially as described.

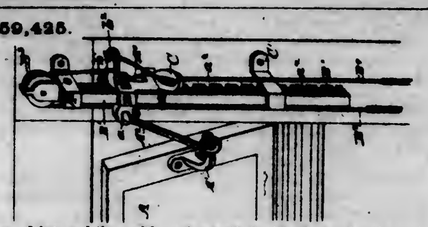
259,423. SAW-SWAGE. JAMES L. PITTS, Grand Rapids, Mich. Filed Jan. 11, 1882. (No model.)

Claim.—As a new article of manufacture, the saw-swage constructed of the part H H, provided with grooves *a a a*, and keyed swage-plate K, all constructed as and for the purposes described.

259,424. ORE GRINDING AND AMALGAMATING MACHINE. THOMAS A. READWIN, Bloomsbury Square, County of Middlesex, England. Filed Mar. 6, 1882. (No model.) Patented in England Aug. 22, 1881, No. 3,653.

Claim.—1. In a machine for grinding and amalgamating ore, the combination of the rotating pestle, the removable and adjustable pestle-axis *f*, the hooked slotted arm *d'*, and the vertical spindle, substantially as described.

2. In a machine for grinding and amalgamating ore, a pan formed with an internal recess at its bottom, in combination with a hard-metal cup to contain mercury for use in the amalgamating process, said cup being such as can be easily removed and renewed, substantially as described, and for the purpose specified.



3. In a machine for grinding and amalgamating ore, a hard-metal cup to contain the mercury, provided with a tapping-hole for withdrawing matters from said cup, and suitable means, such as described, for closing said hole, in combination with the fastening device to secure said cup against unauthorized withdrawal of its contents, substantially as described.

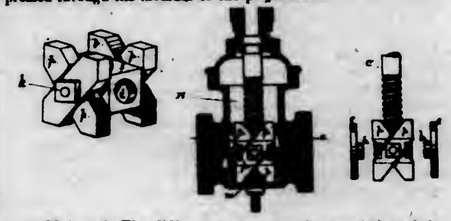
4. In a machine for grinding and amalgamating ore, the combination, with pans *b*, pestles *g*, and means for operating the same, of a trough, *l*, screw-feeder *m*, chutes or spouts *q*, and means for regulating the quantity of ore delivered in a given time to each pan, substantially as described, and for the purpose specified.

5. In a machine for grinding and amalgamating ore, the combination of the trough *l*, screw-feeder *m*, chutes or spouts *q*, sliding shutters *r*, and overflow-pipes *s*, substantially as described.

259,425. TRANSOM AND SKYLIGHT LIFTER. FRANK A. EDSON, Chicago, Ill. Filed May 9, 1882. (No model.)

Claim—1. In a transom or skylight lifter, as described, the adjustable slide or block B, having the perforated lugs *a* and *b'*

formed integral therewith, and provided with the perforations *a'* and *a²*, substantially as and for the purpose set forth.



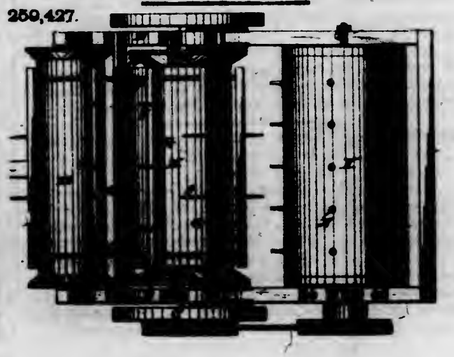
2. The combination, with the slide B, of the locking-bar B', provided with the notches *a'*, the rod A', the spring *b'*, the locking pin or catch *a'*, and the handle C, substantially as set forth.

3. The combination, with a transom or other part to which the appliance may be attached, of the connecting-rod A', the sleeve D, the slide B, and the locking-bar B', substantially as set forth.

4. The combination, with the slide B, of the locking-bar B', the cords B² B², the sheave or pulley B³, the handle C, the rod A', the locking-pin *a'*, and the spring *b'*, substantially as set forth.

259,426. STOP-VALVE. JOSEPH ROYLANCE, San Francisco, Cal. Filed Jan. 18, 1882. (No model.)

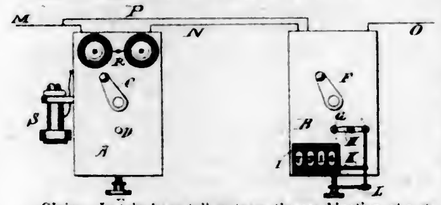
Brief.—The valves *e* are loosely connected to the block *f*, through which the operating-stem *c* passes. The ends of the cross-levers *p* (which levers are also pivoted to the block) bear against the valve-disks *e* and insure the closing of the valves when depressed through the medium of the projection *m*.



Claim.—1. The sliding gate or stop-valve consisting of the block *f*, traveling on and adapted to be moved by the valve-stem, the crossed levers carried by and pivoted to the said block, the disks or bearing-surfaces *e e*, having the ends of the said levers resting against and bearing on their inner faces, and means for spreading apart or extending the said levers when the gate or valve is in position between the valve-seats of the valve-chamber, substantially as described, to operate as set forth.

2. The combination, with the disks or bearing-surfaces *e e*, attached to the traveling block *f*, of the crossed levers *p p*, pivoted to the sides of the said block, and the wedge or projection *m*, adapted to spread apart and extend the said levers by the movement of the block *f*, substantially as described.

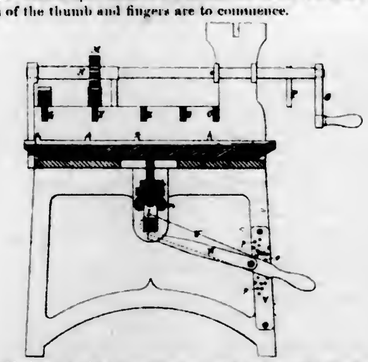
3. The improved valve consisting of the body A, with the way or passage having the seats *g*, the valve-stem, the block *f*, operated by said stem, as described, the disks or bearing-surfaces *e e*, loosely attached to and carried by said block, and the crossed levers *p* and the fixed stop or projection *m* within the chamber, forming the means for moving the bearing-surfaces against and holding them to the valve-seats *g*.



259,427.

259,427. COMBINED HAY RAKER AND LOADER. LEVI B. SAMPLE, Marseilles, Ill. Filed Dec. 8, 1881. (No model.)

Claim.—The herein-described improved rake-cylinder, provided with openings at regular intervals, and journaled at one end in a bearing on the supporting-frame, and having a rigid crank-shaft, on which are loosely mounted suitable teeth separated into series corresponding with the openings in the cylinder by washers, substantially as and for the purpose specified.

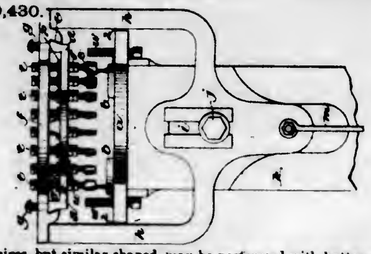


259,428. TELEPHONE CALL-REGISTER. JAS. W. SEE, Hamilton, Ohio, assignor to the Yale Lock Manufacturing Company, Stamford, Conn. Filed Oct. 22, 1881. (No model.)

Claim.—In telephone toll systems, the combination, at a station on a line, of a calling device having a register or counter attached, and an answering and ringing-off device independent of said register or counter, substantially as and for the purpose specified.

259,429. KNITTING-MACHINE. HERBERT C. SHAW, Needham, Mass., assignor to the Shaw Glove Company, of Massachusetts. Filed Mar. 20, 1882. (No model.)

Brief.—The improvement has reference to mechanism described in Letters Patent No. 241,162, dated May 10, 1881. Novel mechanism is provided by which the needle-carriers of the sets of needles may be moved simultaneously a like distance forward or backward to regulate the length of stitch. Furthermore, the needles are provided with additional studs or heels, and cams are constructed and arranged to operate thereupon when it is desired, by which the proper needles may be actuated, and a "marking-thread" be laid upon them and knit into the fabric where the knittings of the thumb and fingers are to commence.

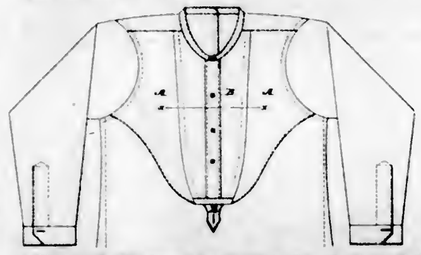


Claim.—1. The combination, with the needle-carriers, of mechanism, substantially as described, for effecting simultaneous and equal movements of them in order to vary the length of stitch, as set forth.

2. In combination with the needles and their main operative cam-bars and studs, the auxiliary studs and cam bar or bars, arranged and to operate substantially as set forth, to aid in effecting the knitting into the fabric of marking-threads, as explained.

259,430. BUTTON-HOLE CUTTER. DANIEL S. SMITH, Rockland, assignor of one-half to Maria W. Thayer, Boston, Mass. Filed Mar. 31, 1882. (No model.)

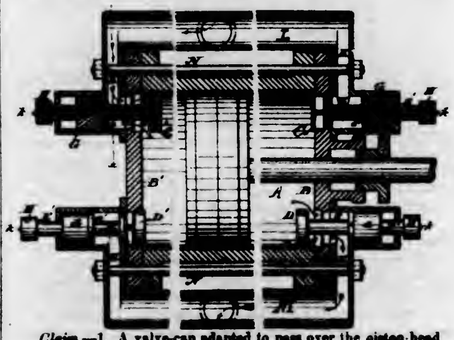
Claim.—1. The bed-plate to receive the leather being cut, combined with the platen and die-holding plate adjustably connected therewith, and provided with a series of dies independently adjustable in the said plate, substantially as and for the purpose set forth.



2. The die-plate curved to correspond with leather being cut, provided with a series of dies adjustable in lines substantially radial to the curvature of the said plate, the said dies being frictionally held in adjusted position in the said slots, whereby pieces of different sizes, but similar shaped, may be perforated with button-holes uniformly spaced, substantially as described.

3. The die-plate provided with a series of slots, combined with the dies, provided with stems passing through the said slots, and springs to retain the said dies in adjusted position until positively moved therefrom, substantially as described.

4. The die-plates provided with slots, combined with a series of dies movable in the said slots, and holding-arms rigidly connected to the said dies and adapted to be engaged by the said die-plate to positively retain the said dies in adjusted position, substantially as described.



259,431. SHIRT. SAMUEL STRAUSSBURGER, Philadelphia, Pa. Filed May 1, 1882. (No model.)

Claim.—1. The bosom connected to the side pieces of the body by the rows of stitches *a* and the rows of stitches *d*, which latter are within the line of the former, producing the sprung-out sides of the bosom, the front edges, *c*, whereof are folded and formed of the material of the bosom, and the rear folded edges are formed of the material of the side pieces, the latter material backing the sprung-out sides of the bosom, substantially as and for the purpose set forth.

2. The sprung-out sides having the folded edges *c c'*, the front edges, *c*, overlapping the rear edges, *c'*, substantially as and for the purpose set forth.

259,432. VALVE AND VALVE-GEAR. WILLIAM W. ST. JOHN, St. Louis, Mo. Filed Nov. 18, 1881. (No model.)

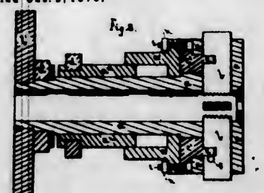
Claim.—1. A valve-cap adapted to pass over the piston-head of a valve at intervals, as and for the purpose set forth.

2. A piston-valve having a cap provided with a stem projecting through the valve and adapted to pass over the piston-head at certain intervals, as described, and for the purpose specified.

3. A valve-cap having a stem projecting through the body of a piston-valve and arranged to receive the inner head of the valve when it is moved forward into the cylinder, substantially as and for the purpose described.

4. A valve-cap having an annular flange to embrace a piston-head with packing as said head moves into the cylinder at certain intervals, as and for the purpose set forth.

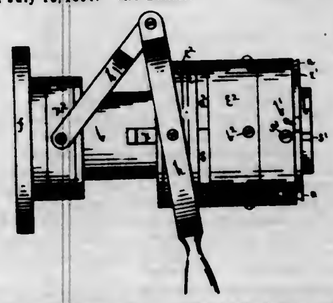
5. A valve-cap having an annular flange, which embraces a piston-head provided with packing as said head is moved into the cylinder, and returns with it until released by striking against a shoulder in the cylinder-head, substantially as and for the purpose described.



6. A valve consisting of a piston-head, *a*, embraced at proper intervals by a flanged cap, having a stem extending through the body of the valve, and a piston-head, *a'*, secured to the head *a* by a sleeve, E, substantially as specified.

7. The valve herein described, consisting of the piston-heads *a a'*, connected by a sleeve, E, containing a spring, F, the cap I, having stem *k*, and the extension E', for attachment to an operating-arm, all substantially as shown and specified.

8. In valve-gear, the combination of the piston-valves C C' D D', provided with caps I, the casings G, and pipes K L M, with operating valve-gear, substantially as specified, and for the purpose set forth.



9. In valve-gear, the steam-valves C C' and exhaust-valves D D', the caps I, and the casings G, in combination with the rods P P', arms H, cross-bar O, journal-boxes *h*, and suitable rock-shaft, or equivalent means, substantially as and for the purpose set forth.

259,433. SCREW-THREADING MACHINE. LEVI W. STOCKWELL, Cleveland, Ohio, assignor to William H. Price, same place. Filed Oct. 9, 1876.

Claim.—The cutter-head *a*, provided with scroll *a'*, having a rotary motion to open and close the dies, and ring *a'*, formed with a cam-slot, a^3, a part of which is parallel with the axis of the cutter-head for the purpose of arresting the rotary motion of the scroll, in combination with the sliding collar a^2, having pin *f*, substantially as described.

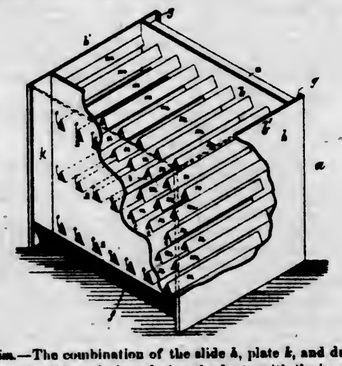
259,434. SCREW-CUTTING MACHINE. LEVI W. STOCKWELL, Cleveland, Ohio, assignor to William H. Price, same place. Filed July 13, 1881. (No model.)

Claim.—1. The stock *b*, having the inclined grooves *c' c'*, in combination with collar a^2, levers a^3 a^3, grooved collar *b'*, and dies *a*, substantially as described.

2. The ring c^3, wedges *c c*, levers a^3 a^3, and springs *s s*, in combination with collars c^2 *b'*, dies *a*, and stock *b*, having the inclined grooves *c' c'*, substantially as described.

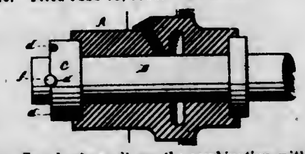
3. The collar c^2, having the rods *x x*, levers a^3 a^3, and springs *s s*, and the ring c^3, having the wedges *c c*, in combination with collar *b'*, having the inclined grooves *c' c'*, the dies *a*, and stock *b*, having the inclined grooves *c' c'*, substantially as described.

4. The stock *b*, formed with slots *s' s'*, of unequal length, in combination with collar *b'*, pins c^2 *s'*, and the cutting-dies, substantially as described.



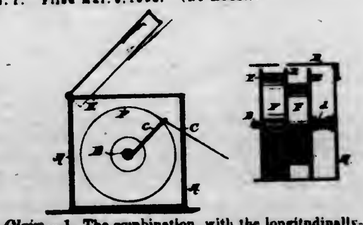
259,435. CAR-COUPLING. ALEXANDER STORY, Washington, Iowa. Filed Apr. 10, 1882. (No model.)

Claim.—1. The draw-head having a rectangular mortise in its top, with an undercut recess, *i*, and lugs *c*, in combination with the latch B, having projecting flanges upon its sides and rear, lip *b*, and side extensions, *b'*, substantially as described.



2. The lifting-rod *d*, step *k*, and cross-rod *e*, in combination with the keepers *g f*, pin *l*, and latch B, substantially as described.

259,436. GRAIN-DRIER. EDWARD THOMPSON, Hokah, Minn. Filed Mar. 3, 1882. (No model.)



Claim.—The combination of the slide *h*, plate *k*, and ducts *p* and *q*, the said slide and plate closing the ducts, with the inverted-V-shaped tubes *m* and *n*, leading alternately into the ducts *p* and *q*, all arranged as set forth.

259,437. COLLAR FOR CAR-AXLES. JOHN THOMPSON, Bucyrus, Ohio. Filed June 13, 1881. (No model.)

Claim.—In a bank or pit car, the combination, with the axle and wheel, of a collar or washer between the linchpin and the face of the wheel, provided with notches or grooves of varying depth, substantially as and for the purposes set forth and described.

259,438. SNOW-BOX. WALTER C. THOMPSON, Williamsburg, N. Y. Filed Mar. 8, 1882. (No model.)

Claim.—1. The combination, with the longitudinally-slotted box, of the removable rod D and the brake or tension device, substantially as described.

2. The combination, with the longitudinally-slotted box, of

the removable rod D, carrying the loose plates or disks E, and the tension device or brake, substantially as described.

3. The combination, with the longitudinally-slotted box, of the loose removable rod D, carrying and supported by the loose plates E, and the spiral spring d, substantially as described.

259,439. SEWING-MACHINE SHUTTLE. JAMES THIPP and JOHN E. OSBORN, Cleveland, Ohio. Filed Apr. 7, 1882. (Model.)

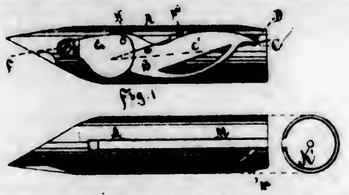


Fig. 1

Claim.—1. In shuttles for sewing-machines, a detachable bobbin-holder consisting of two heads connected together by a bar arranged to slide in a longitudinal slot in the shuttle-shell, and provided with pivotal bearings for said bobbin in the heads of the holder, substantially as and for the purpose set forth.

2. In combination with a sewing-machine shuttle-case and bobbin, a holder having a slotted and a pivotal head for carrying the said bobbin, and connected together by a bar, J, adjusted to the longitudinal slot in the case, arranged substantially as and for the purpose set forth.

3. The shell or case A, provided with a longitudinal slot, M, and spiral slot N, in combination with the bobbin and holder J, substantially as and for the purpose set forth.

4. In sewing-machine shuttles, the spring B, provided with a point, *e*, and opening *d*, in combination with the protector-plate G, having an indentation, *f*, for the said point, substantially as and for the purpose set forth.

5. A sewing-machine shuttle having a spiral slot, N, for the bobbin-thread, in combination with the spring B and protector-plate G, connected with the shell, substantially as and for the purpose set forth.

6. A sewing-machine shuttle consisting of the shell A, with a longitudinal and spiral slot therein, the bobbin and holder arranged within said shell, in combination with the spring B and protection-plate, substantially as and for the purpose set forth.

259,440. METALLIC SKIPPING-HOOP. WILLIAM F. TURNBULL, Hamston, Va. Filed Apr. 25, 1882. (No model.)

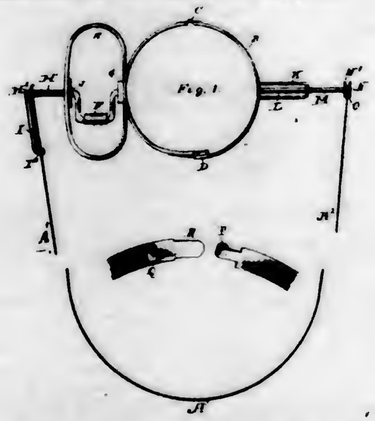

Fig. 1

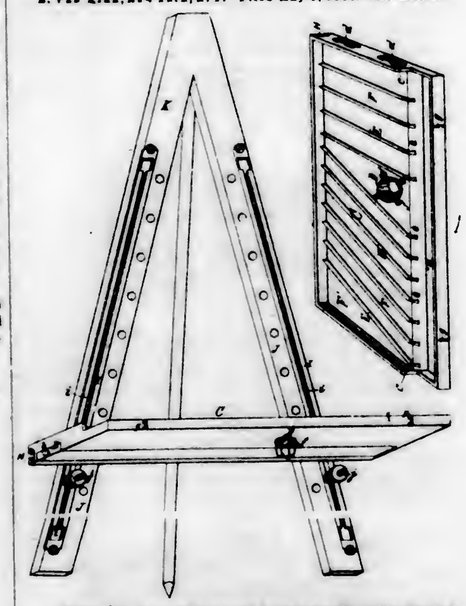
Claim.—1. In a child's skipping-hoop, the belt B, provided with a hinge and clasp, the elliptical frame E, rigidly fixed to one side of said belt, and the rectangular frame K, rigidly attached to the opposite side, substantially as described, and for the purposes set forth.

2. In a child's skipping-hoop as herein specified, the combination of the belt B and frames E and K, the fixed rod L, having shoulders N' and N, the revolving rod H, with eye H', arm I, loop I', and crank F, all arranged in the manner and for the purposes set forth.

3. The hoop A, in combination with the side rods, H and M, the rod H having eye H', arm I, and loop I', the supporting-frames E and K, the crank F, and belt B, substantially as specified, and for the purposes set forth.



4. In combination with the belt B and strip G, the elliptical frame E, rigidly connected to said belt, the crank F, with inside axle working in a slot in strip G, the shoulder J, and rod H, said rod having an eye working in a slot in the outside rim of the frame, also the arm I and loop I', substantially as set forth, and for the purposes specified.

5. The combination of the belt B, frame K, rod L, with projection M, and shoulders N' N, all rigidly connected in the manner and for the purposes set forth.

6. The clasp D, consisting of the hook P, loop Q, and tongue R, arranged in the manner and for the purposes specified.

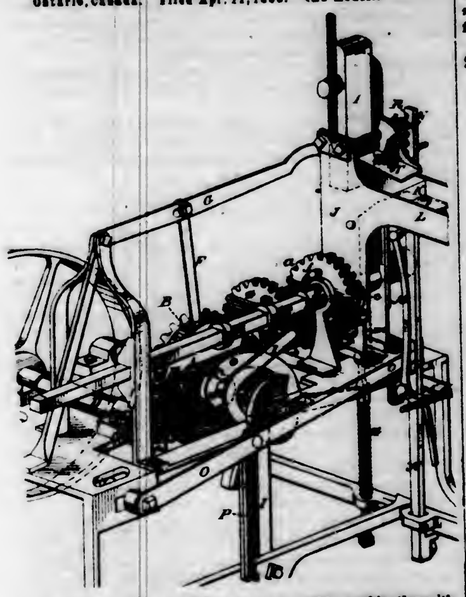
7. The belt, frames, and crank, as herein specified, in combination with the hoop A, having loop O, secured to and arranged to revolve around rod M between its shoulders N' and N, the hoop at the opposite side being adjustably attached to rod H by means of the eye in said rod, the arm I, and loop I', substantially as described, and for the purposes set forth.

259,441. COMBINED ARTIST'S CASE AND EASEL. AGNES E. VAN KIRK, New York, N. Y. Filed May 3, 1881. (No model.)

Claim.—1. An artist's case adapted to be adjustably attached to an easel, consisting of the color-board C, the trough G, and drawer B, substantially as described, and for the purpose set forth.

2. In combination with an easel, the color-board C, divided into spaces by the removable slats E E for the purpose of supporting the painting materials, substantially as described.

3. The combination of the color-board C, having dovetailed parallel grooves, and the adjustable slats E E, dovetailed to fit said grooves, dividing the board into sections, and longitudinally removable, substantially as described.



4. The combination of an easel and a case or board for supporting painting materials, the board being adjustable laterally and vertically, substantially as described.

5. In combination with an easel having the grooves *i i*, and slide *k*, an artist's case having the groove H and the slide A, the slides being connected to enable a lateral and vertical adjustment of the case, substantially as and for the purpose set forth.

6. The combination of the dovetailed grooves *i i* in an easel and the slides *k k*, having the thumb-screws *j j*, for securing an artist's case or board at any desired height, substantially as described.

7. An artist's case consisting of the color-board C, trough G, drawer B, and lid A, which, when closed, will hold the painting materials and may be carried.

259,442. CAN-FILLING APPARATUS. WM. WEST, Keene, Ontario, Canada. Filed Apr. 11, 1882. (No model.)

Claim.—1. In a can-filling apparatus, and in combination with the vertical fish-receiving chute J and the vertically-reciprocating plunger I, guided as shown, the cam E, adjustable upon the driving-shaft, the vertical rod F, the lever-arm G, and the connecting rod or link H, substantially as and for the purpose herein described.

2. The horizontal trough L, opening into the upper part of the chute J, in combination with the reciprocating carrier K, moving in said trough, so as to transfer the fish into the vertical chute, substantially as herein described.

3. In combination with the carrier K, moving in the trough L, the lever-arm M, connected with the carrier by a link, and having the fork or notch M', in combination with the vertically-reciprocating bar N, substantially as herein described.

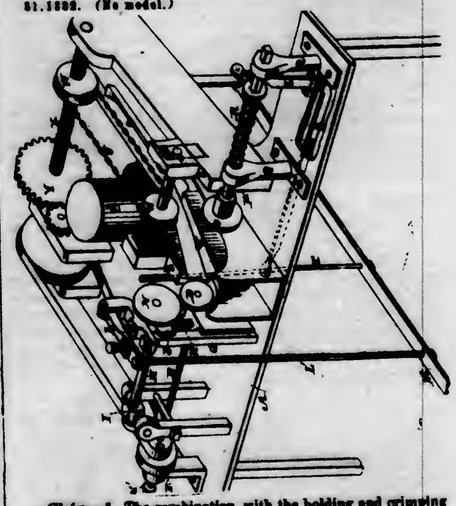
4. The hinged swinging gate T, opening or closing the passage between the trough L and chute J, and having the toothed segment S, in combination with the reciprocating bar N, with its rack R engaging said segment, substantially as herein described.

5. The bar F, moving in guides, as shown, in combination with the lever O, cam Q, and spring P, substantially as and for the purpose herein described.

6. The cylindrical receiver having one side open and the edge forming a knife, V, so that a supply of fish may be forced through the opening from the chute J and cut off and formed to enter the can by the rotation of the knife, substantially as herein described.

7. The cylindrical knife and shaper V, turning within the chute J, and provided with the notched flange W, in combination with the curved lever Z and rotating gear-wheel *a*, substantially as herein described.

8. In combination with the cylindrical knife and shaper V with its notched flange W and curved operating-lever Z, the disk *i*, supporting the lever, and adjustable upon the gear *a* by slots and screws *f*, so as to regulate the movements of the knife, substantially as herein described.

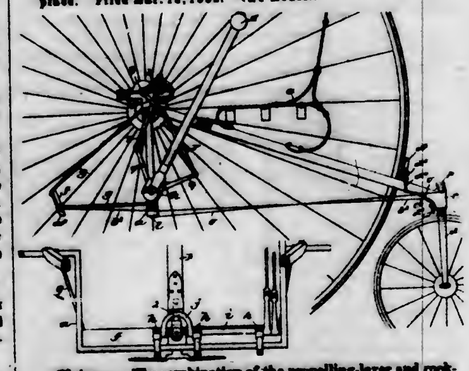


9. The cylindrical knife and shaper V, with its notched flange, and the curved pivoted lever Z and spring *h*, rotated by the gear-wheel *a*, in combination with the stationary pin *c*, whereby the pawl *y* is disengaged at each semi-revolution of the knife, substantially as herein described.

10. In combination with the hollow rotating knife and former V, operating within the chute J, as shown, the eccentric gears *a a'*, meshing with each other to drive the knife with a variable speed, substantially as herein described.

11. In combination with the hollow intermittently-rotating cylindrical knife and former V and the eccentric driving-gears *a a'*, the piston *g*, reciprocating through the cylindrical knife and the sleeve upon which the gear *a* turns, and the stem or extension *h*, operating lever and cam, substantially as herein described.

12. The hinged swinging gate T, toothed segments S, and vertically-moving bar N and rack R, in combination with the latch *r* and the arm *t*, connected with the plunger, substantially as and for the purpose herein described.



259,443. APPARATUS FOR CRIMPING THE ENDS UPON CIRCULAR CANS. WM. WEST, Keene, Ontario, Canada. Filed Jan. 31, 1882. (No model.)

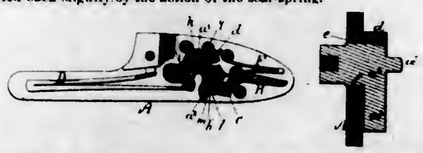
Claim.—1. The combination, with the holding and crimping dicks, as shown, of the inclined track or ways U and the acid-trough *e*, through which the crimped joint may pass, substantially as herein described.

2. In combination with the way or track U and the endless chain moving above the track upon pulleys W, the boxes *a* of the shaft Z, having the vertically-movable elastic supports *b*, substantially as and for the purpose herein described.

259,444. VELOCIPEDE. FREDERICK WHITE, Westborough, Mass., assignor of five-twelfths to Charles B. Rogers, same place. Filed Mar. 18, 1882. (No model.)

Claim.—1. The combination of the propelling-lever and rock-shaft connected therewith, the cranks mounted on the said rock-shaft, the driving-wheel and shaft adapted to be operatively connected therewith, the cranks loose on the said shaft, and having a ratchet-and-pawl connection therewith, and also being connected with the cranks upon the rock-shaft, substantially as described.

2. In a tricycle, the combination of the driving-wheel, a shaft operatively connected therewith and having a series or cone of gears of different diameters, a second shaft, means to actuate it, and a series of gears loose thereon, meshing with the first-mentioned series, and a series of independent clutches splined on said shaft, and independent shippers therefor, whereby any of the said gears may be connected with the said shaft to propel the wheel substantially as described.

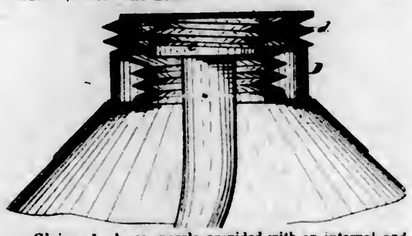


3. In a tricycle, a shaft having a series of gears loose thereon and a series of clutches splined thereon, combined with a series of independent shippers for said clutches, locking devices for retaining the said shippers with the clutches disengaged, and means to automatically throw the said clutches into engagement when released by their locking devices, substantially as described.

4. The actuating-lever and rock-shaft connected to oscillate therewith, the said lever being pivoted to have an axial rotary movement, combined with a spindle connected with the said lever by a universal joint, and also connected with the steering-wheel, whereby the said wheel is turned by the rotary movement of the said lever when at any position in its oscillating movement, substantially as described.

5. The propelling-lever and rock-shaft connected therewith, combined with the driving-wheel of the tricycle, the shaft adapted to be operatively connected therewith, and devices having a ratchet-and-pawl connection with the said shaft, operated by the said propelling-lever and rock-shaft, substantially as described.

259,445. LOCK FOR FIRE-ARMS. ANDREW E. WHITMORE, East Boston, Mass. Filed Mar. 18, 1880. Renewed Mar. 20, 1882. (No model.)



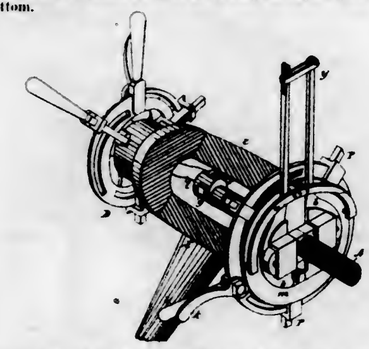
Brief.—A piece, denominated a "carrier," is pivoted in the lock-plate concentrically with the tumbler. It has shoulders on opposite sides of the tumbler so disposed as to allow the carrier to have slight independent movement in the carrier. The mainspring is attached to the carrier, and when the latter is arrested, just before the hammer completes its stroke, the hammer is carried forward by its own momentum, and after making the stroke is carried back slightly by the action of the sear-spring.

Claim.—1. In combination with a mainspring, tumbler, and sear, a plate or carrier pivoted concentrically with said tumbler and inclosing the same, said carrier having a flaring recess to allow the independent movement of said tumbler, substantially as set forth.

2. In combination with mainspring D, sear H, sear-spring F, and tumbler *h*, having an inclined face beyond the safety-notch, the carrier *d*, pivoted concentrically with said tumbler and inclosing the same, said carrier being provided with a projection, *i*, and stopped by a post, *q*, said devices causing the independent forward action of said tumbler and the immediate rebound thereof to the safety position, substantially as set forth.

259,446. CAN-SPOUT. F. CORYEZ WILSON, Chicago, Ill. Filed Mar. 18, 1881. (No model.)

Claim.—1. A can-nozzle provided with an internal and an external screw-thread, in combination with a reversible spout threaded to fit the internal thread of the nozzle, and a cap threaded to fit the external thread of the nozzle to close the can and protect the end of the reversed spout, substantially as described.



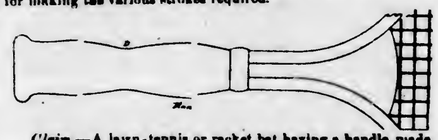
2. A can-top, in combination with a nozzle provided with threaded sections of unequal size and adapted to receive and inclose the enlarged end of the spout when reversed, a reversible spout provided with a threaded enlarged base fitting the smaller section of the nozzle, and a threaded cap adapted to the larger section of the nozzle, substantially as described.

3. The can-top A, in combination with the nozzle B, having two threaded sections, *b b'*, of different size but made of a single piece of metal, the spout C, provided with the threaded enlargement *c*, and the cap D, provided with the threaded section *d*, substantially as described.

4. A can-nozzle, in combination with a removable and reversible spout provided with a hollow enlargement at its base, in the upper and lower sides of which are vent-holes, whereby a chamber is provided at the base of the spout, closed except the vent-holes, and outside drip is prevented, substantially as described.

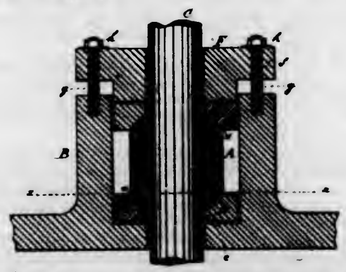
259,447. MACHINE FOR BORING AXLE-HOLES IN HUBS, &c. WILLIAM R. WOOD and SAMUEL BARR, Butler, Iowa. Filed Aug. 30, 1881. (No model.)

Brief.—The screw-shaft, which carries and advances the tool, is provided with an extension, which is bent to correspond with the form to be given to the hole, passing through a guide at the bottom.



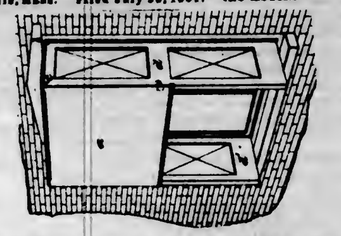
Claim.—1. In a machine for enlarging tubular borings, a guide-plate operating on a form-rod and feed-shaft, having a cutting-tool attached thereto, substantially as described, in combination with mechanism, substantially as described, for actuating the shaft and mechanism.

2. In combination with the feeding-shaft, the collars *b b*, having the followers *w w*, of wood, the latter being capable of adjustment to compensate for wear, substantially as described.



259,448. HANDLE FOR RACKETS OR LAWN-TENNIS BATS. OTWAY E. WOODHOUSE, 20 Upper Phillimore Gardens, Kensington, County of Middlesex, England. Filed May 8, 1882. (No model.) Patented in England Feb. 16, 1881, No. 668.

Brief.—The handle is made with three bulges, to enable the player to change the position of his hand with greater accuracy for making the various strokes required.

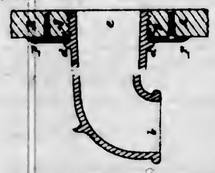


Claim.—A lawn-tennis or racket bat having a handle made in the form substantially as described, for the purposes set forth.

259,449. PISTON AND VALVE ROD PACKING. HENRY WOODBURN and NORCH C. COATS, Waverly, Iowa. Filed Apr. 1, 1882. (No model.)

Claim.—The combination, with the stuffing-box B and the gland F, of the diagonally-split ring A, having both ends conical, and the two split rings D E, each having a conical recess to receive the conical ends of the ring A, whereby the pressure of the gland F will contract the split ring A and expand both of the split rings D E, substantially as specified.

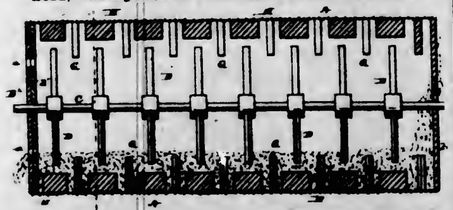
259,450. AWNING FOR WINDOWS. ALFRED WOODS, Granteville, Mass. Filed July 25, 1881. (No model.)



Claim.—1. The awning consisting of a flexible strip, *a*, and the stiffening-pieces *b c*, connected therewith, as described, and provided with sockets to engage the upper, inner, and outward corners of the window blinds or shutters with which it is to be used, substantially as described.

2. The awning to be used in connection with blinds or shutters, consisting of a flexible strip, combined with stiffening-pieces at one end to engage the upper and inner corners of the blind and stiffening-piece at its other end to engage the front or outer edge of the blinds, and an intermediate stiffening-piece to engage the upper and outer corner of the blinds, the said stiffening-pieces at the ends of the flexible strip being provided with fastening devices to attach them to the blinds, substantially as described.

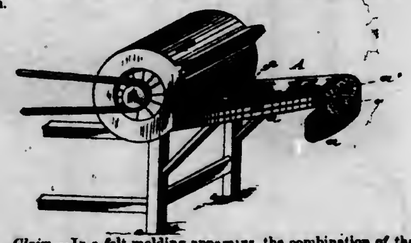
3. The combination, with the hinged blinds or shutters, of the flexible strip provided with suitable stiffening-pieces to engage the upper, inner, and outward corners of the said blinds, and having a portion extended down the front edges of the said blinds and adapted to be fastened thereto near its lower ends, substantially as described.



259,451. PUMP-SPOUT. S. JARVIS ADAMS, Pittsburg, Pa. Filed Apr. 5, 1882. (No model.)

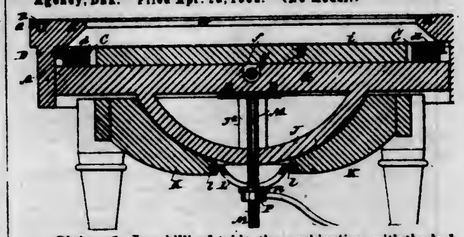
Claim.—1. In combination with a pump-spout having an annular extension at the back thereof, an annular bracing-plate adapted to be secured from the back on the extension of the spout and be attached to the pump-body, substantially as and for the purposes set forth.

2. In combination with a pump-spout having at the back thereof an annular extension and shoulder, an annular bracing-plate adapted to screw from the back over the extension against the shoulder and be attached to the pump-body, substantially as and for the purposes set forth.



259,452. PROCESS OF DECORTICATING GRAIN. WILSON ABEL, Washington, D. C. Filed Apr. 24, 1882. (No model.)

Claim.—A process of decorticating grain, which consists in first subjecting the horizontally moving and rolling mass of grain contained in a suitable receptacle to the action of rasping or abrasive beaters; second, in maintaining a mass of grain in the receptacle or cylinder by a uniform feed and discharge that will make the weight of the mass a factor for keeping the grain against the abrading and beating surfaces with sufficient pressure to cause the removal of the impurities; and, third, in the withdrawal of the impurities by air-currents, substantially in the manner and for the purposes described.



259,453. MOLD FOR MAKING ARTICLES OF FELT. SAMUEL G. ALEXANDER, Caro, Mich. Filed Apr. 7, 1882. (No model.)

Brief.—The invention is designed for the manufacture of felt head, hand, foot wear, &c., from fibrous feltable material. The fiber is thrown by an air-blast into the perforated former, which is provided with sectional lids, the one on the extreme end being raised first, so that the material may be conveyed by the blast to that part of the former, after which the other lids are opened in turn.

Claim.—In a felt-molding apparatus, the combination of the foraminated flanged plates *a a'*, provided with the hinged doors B and core-piece C, provided with the wires *b*, adapting said core-piece to be held in place between the flanged plates *a a'* by clamping the ends of the wires between the meeting flanges of the plates, as shown and set forth.

259,454. BILLIARD-TABLE. CHARLES W. ALLEN, Pine Ridge Agency, Dak. Filed Apr. 19, 1882. (No model.)

Claim.—1. In a billiard-table, the combination, with the bed B and cloth *i*, of the cleats C, provided with rabbets, and arranged as herein shown and described.

2. The combination, with the bed B, cloth *i*, and cleats C, of the cloth-covered bars D and screws *d*, substantially as and for the purpose herein described.

3. The combination, with the cleats C, provided with the screw-threaded lugs *f*, and the base G, provided with the groove *g*, of the rod H, provided with a right-hand and a left-hand thread, substantially as and for the purpose herein described.

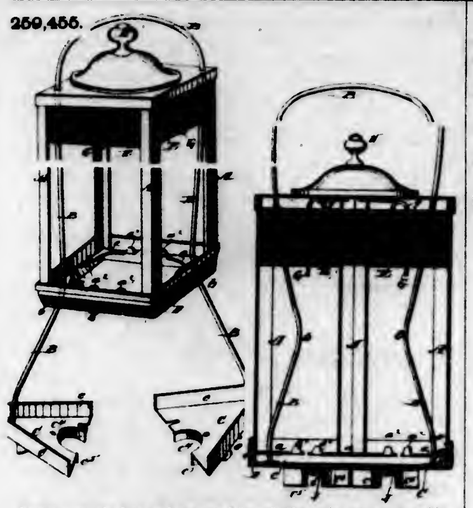
4. The end cloth-holding cleats adapted for lateral movement, and provided with diagonally-placed brace-bars adapted to set in grooves of the side cloth-holding cleats, whereby both side and end cleats may be simultaneously spread to stretch the cloth over the bed, substantially as shown and described.

5. The end cleats, C, provided with screw-threaded lugs *f* and diagonally-placed brace-bars E, and side cleats, C, having seats *e* to receive the bars E, and the right and left screw H, combined for operation substantially as shown and described.

6. The combination, with the frame A and bed B, and the devices connected therewith, of the base G, provided with the semicircular bars J J', substantially as herein described.

7. The combination, with the semicircular bars J J', of the arc-shaped arms K K', substantially as herein described.

8. The combination, with the arms K K', having grooves in their ends, of the spherical segment or bowl-shaped skeleton frame L, provided with the flange *l*, as herein shown and described.



9. The combination, with the base G, bars J J', arms K K', and skeleton frame or bowl L, of the rod M, washer *n*, and nut P, substantially as and for the purpose herein described.

259,455. LANTERN. CHARLES F. ADDERSON, Bay City, Mich. Filed Mar. 3, 1882. (No model.)

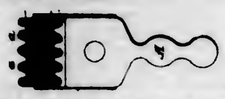
Brief.—Produces a lantern in which any ordinary lamp can be used. The bottom is bisected, and to each half is pivoted a plate having rims to fit a lamp-collar. The bottom is connected to the frame by the bail, which also brings the parts together to clasp the lamp-collar.

Claim.—1. A lantern frame or body provided with a bisected

259,455.

bottom attached to and operated by a bail passing through guide-braces at the bottom of said frame, so as to separate said bisected bottom to allow it to grasp the collar of a lamp, substantially as herein described.

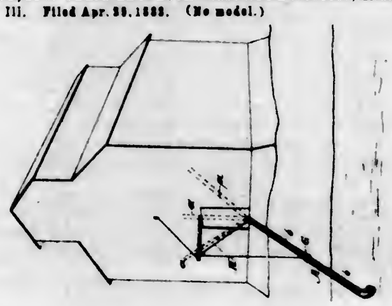
2. The combination, with the frame A, provided with the corner-braces *a*, of the bail B, bent as shown at *b b*, and the bisected bottom C, attached to and operated by said bail, substantially as and for the purposes herein described.



3. The combination, with the bisected bottom C, constructed as described, of the revolving plates *c*, provided with notches c^1 c^1 and rims c^2 c^2, substantially as herein described.

4. The combination, with the bottom C and revolving plate *c*, of the spring J, attached to said plate and bottom by the rivet or pivot *i*, substantially as and for the purpose shown and described.

5. The combination of the frame or body A, having the beveled bottom D, and the bisected bottom C, having the turned-up edges *e*, substantially as and for the purpose shown and described.

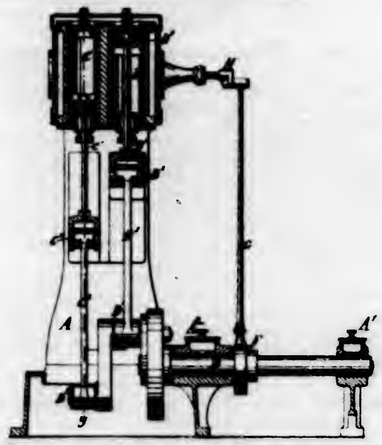


6. The combination, with the frame or body A, of the netting E, spring G, and lugs a^3, for holding the glass sides in place, substantially as shown and described.

259,456. APPARATUS FOR SELF-MASSAGE OR FLESH-KNEADING. CARL ARNDT ANDERSEN, Stockholm, Sweden. Filed Apr. 10, 1882. (No model.) Patented in Germany Aug. 15, 1881, No. 16,984; in England, Sept. 5, 1881, No. 3,850, and in Sweden Oct. 26, 1881, No. 880.

Claim.—An apparatus for massage treatment or flesh-kneading composed of a suitably-constructed handle, upon which is mounted one or more rollers having circumferential ribs or ridges *a*, as shown and set forth.

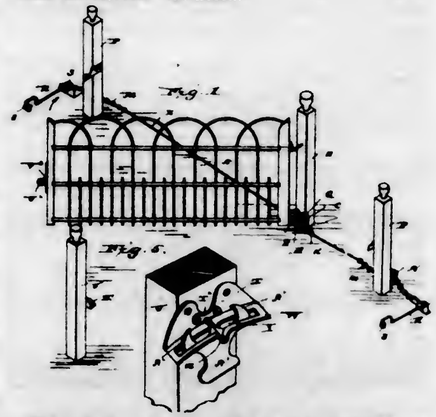
259,457. GRAIN-ELEVATOR. HEZEKIAH ARMINGTON, Atlanta, Ill. Filed Apr. 30, 1882. (No model.)



Claim.—1. The combination of sections having right-angular slots *e* and bolts *f*, substantially as shown, and for the purpose described.

2. The combination of the sections, bolts *f*, and swivel-jointed elbow C, substantially as shown, and for the purpose described.

3. The combination of the swivel-jointed elbow C, band G, and sections, substantially as shown, and for the purpose described.

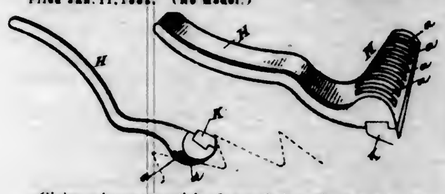


4. The combination of the sections *b b*, band G, and ring M, substantially as shown, and for the purpose described.

259,458. BALANCED STEAM-ENGINE. JAMES O. SAIRD, Brooklyn, N. Y. Filed Jan. 28, 1882. (No model.)

Claim.—An engine having two cylinders of unequal areas, with alternately-working pistons that have independent connections with the crank-shaft, said cylinders being constructed of such relative proportions that the pressures on their crank-pins are in inverse ratios to the distances of said crank-pins from the outboard-bearing, substantially as and for the purpose described, whereby the crank-shaft may be reversed without uneven motion, as set forth.

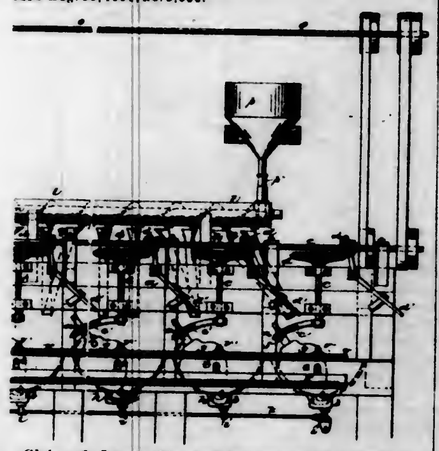
259,459. GATE. HARVEY C. BAKER, West Alexandria, Ohio. Filed Mar. 14, 1882. (No model.)



Claim.—1. In combination with the bracket C, provided with an angular slot, E, having rounded pintle-bearings F, and a pintle-bearing at the apex of the slot, the pintle secured to the gate, and the link pivoted to said pintle, and the connecting-bars, chains, and levers, all constructed and arranged to operate substantially as specified.

2. In combination with the gate and gate-post, the bracket secured to the post, provided with a shelf inclined in opposite directions, a slot and central bearing, and the double-weighted pawl

Claim.—1. An underwaist of the character described, comprising an outer portion with a continuous lining, and having lacing applied to the outer portion, which is suitably cut away, and the lining formed full beneath the lacing, substantially as set forth.



2. In an underwaist having lacing applied to the outer portion and a lining made full beneath the lacing, the bone-pockets on the inside of the flaps or free edges of the lacing portion, between the same and the lining, substantially as described.

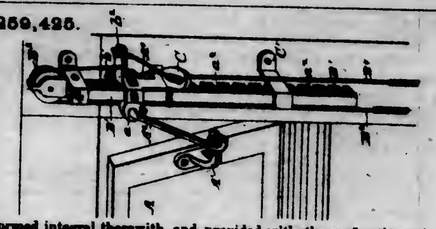
259,423. SAW-SWAGE. JAMES L. PITTS, Grand Rapids, Mich. Filed Jan. 11, 1882. (No model.)

Claim.—As a new article of manufacture, the saw-swage constructed of the part H H, provided with grooves *a a a*, and keyed swage-plate K, all constructed as and for the purposes described.

259,424. ORE GRINDING AND AMALGAMATING MACHINE. THOMAS A. READWIN, Bloomsbury Square, County of Middlesex, England. Filed Mar. 6, 1882. (No model.) Patented in England Aug. 22, 1881, No. 3,653.

Claim.—1. In a machine for grinding and amalgamating ore, the combination of the rotating pestle, the removable and adjustable pestle-axis *f*, the hooked slotted arm *c'*, and the vertical spindle, substantially as described.

2. In a machine for grinding and amalgamating ore, a pan formed with an internal recess at its bottom, in combination with a hard-metal cup to contain mercury for use in the amalgamating process, said cup being such as can be easily removed and renewed, substantially as described, and for the purpose specified.



3. In a machine for grinding and amalgamating ore, a hard-metal cup to contain the mercury, provided with a tapping hole for withdrawing matters from said cup, and suitable means, such as described, for closing said hole, in combination with the fastening device to secure said cup against unauthorized withdrawal of its contents, substantially as described.

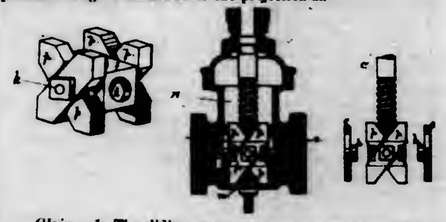
4. In a machine for grinding and amalgamating ore, the combination, with pans *b*, pestles *g*, and means for operating the same, of a trough, *l*, screw-feeder *m*, chutes or spouts *q*, and means for regulating the quantity of ore delivered in a given time to each pan, substantially as described, and for the purpose specified.

5. In a machine for grinding and amalgamating ore, the combination of the trough *l*, screw-feeder *m*, chutes or spouts *q*, sliding shutters *r*, and overflow-pipes *s*, substantially as described.

259,425. TRANSOM AND SKYLIGHT LIFTER. FRANK A. REDNA, Chicago, Ill. Filed May 3, 1881. (No model.)

Claim.—1. In a transom or skylight lifter, as described, the adjustable slide or block B, having the perforated lugs *a* and *b'*

formed integral therewith, and provided with the perforations *a'* and *a''*, substantially as and for the purpose set forth.



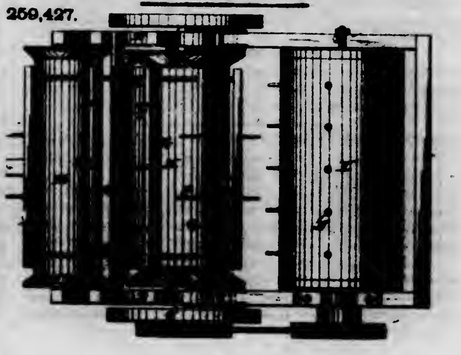
2. The combination, with the slide B, of the locking-bar B', provided with the notches *a''*, the rod A^1, the spring *b'*, the locking pin or catch *a'*, and the handle C, substantially as set forth.

3. The combination, with a transom or other part to which the appliance may be attached, of the connecting-rod A^1, the sleeve D, the slide B, and the locking-bar B', substantially as set forth.

4. The combination, with the slide B, of the locking-bar B', the cords B^2 B^3, the sheave or pulley B^2, the handle C, the rod A^1, the locking-pin *a'*, and the spring *b'*, substantially as set forth.

259,426. STOP-VALVE. JOSEPH ROYLANCE, San Francisco, Cal. Filed Jan. 18, 1882. (No model.)

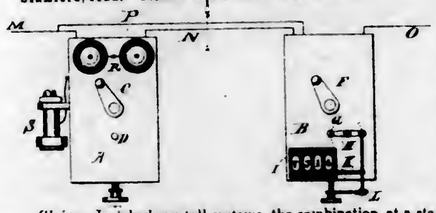
Brief.—The valves *e* are loosely connected to the block *f*, through which the operating-stem *e* passes. The ends of the cross-levers *p* (which levers are also pivoted to the block) bear against the valve-disks *e* and insure the closing of the valves when depressed through the medium of the projection *m*.



Claim.—1. The sliding gate or stop-valve consisting of the block *f*, traveling on and adapted to be moved by the valve-stem, the crossed levers carried by and pivoted to the said block, the disks or bearing-surfaces *e e*, having the ends of the said levers resting against and bearing on their inner faces, and means for spreading apart or extending the said levers when the gate or valve is in position between the valve-seats of the valve-chamber, substantially as described, to operate as set forth.

2. The combination, with the disks or bearing-surfaces *e e*, attached to the traveling block *f*, of the crossed levers *p p*, pivoted to the sides of the said block, and the wedge or projection *m*, adapted to spread apart and extend the said levers by the movement of the block *f*, substantially as described.

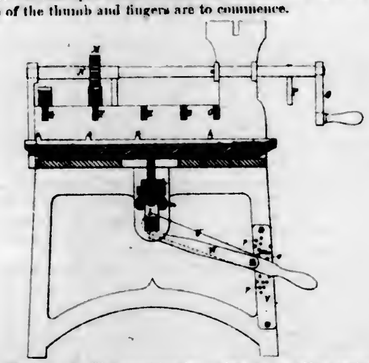
3. The improved valve consisting of the body *A*, with the way or passage having the seats *g*, the valve-stem, the block *f*, operated by said stem, as described, the disks or bearing-surfaces *e e*, loosely attached to and carried by said block, and the crossed levers *p* and the fixed stop or projection *m* within the chamber, forming the means for moving the bearing-surfaces against and holding them to the valve-seats *g*.



259,427.

259,427. COMBINED HAY RAKER AND LOADER. LEVI E. SAMPLE, Marseilles, Ill. Filed Dec. 3, 1881. (No model.)

Claim.—The herein-described improved rake-cylinder, provided with openings at regular intervals, and journaled at one end in a bearing on the supporting-frame, and having a rigid crank-shaft, on which are loosely mounted suitable teeth separated into series corresponding with the openings in the cylinder by washers, substantially as and for the purpose specified.

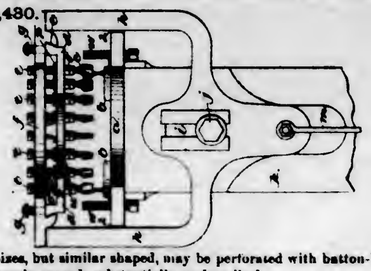


259,428. TELEPHONE CALL-REGISTER. JAS. W. SEE, Hamilton, Ohio, assignor to the Yale Lock Manufacturing Company, Stamford, Conn. Filed Oct. 22, 1881. (No model.)

Claim.—In telephone toll systems, the combination, at a station on a line, of a calling device having a register or counter attached, and an answering and ringing-off device independent of said register or counter, substantially as and for the purpose specified.

259,429. KNITTING-MACHINE. HERBERT C. SHAW, Needham, Mass., assignor to the Shaw Glove Company, of Massachusetts. Filed Mar. 20, 1882. (No model.)

Brief.—The improvement has reference to mechanism described in Letters Patent No. 241,162, dated May 10, 1881. Novel mechanism is provided by which the needle-carriers of the sets of needles may be moved simultaneously a like distance forward or backward to regulate the length of stitch. Furthermore, the needles are provided with additional studs or heels, and cams are constructed and arranged to operate thereupon when it is desired, by which the proper needles may be actuated, and a "marking-thread" be laid upon them and knit into the fabric where the knittings of the thumb and fingers are to commence.

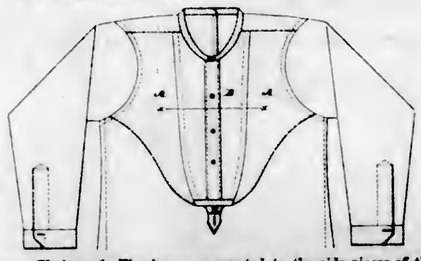


Claim.—1. The combination, with the needle-carriers, of mechanism, substantially as described, for effecting simultaneous and equal movements of them in order to vary the length of stitch, as set forth.

2. In combination with the needles and their main operative cam-bars and studs, the auxiliary studs and cam bar or bars, arranged and to operate substantially as set forth, to aid in effecting the knitting into the fabric of marking-threads, as explained.

259,430. BUTTON-HOLE CUTTER. DANIEL S. SMITH, Rockland, assignor of one-half to Maria W. Thayer, Boston, Mass. Filed Mar. 31, 1882. (No model.)

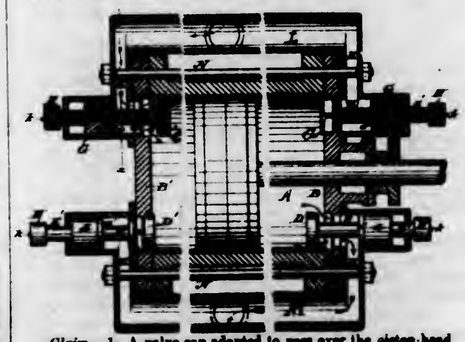
Claim.—1. The bed-plate to receive the leather being cut, combined with the platen and die-holding plate adjustably connected therewith, and provided with a series of dies independently adjustable in the said plate, substantially as and for the purpose set forth.



2. The die-plate curved to correspond with leather being cut, provided with a series of dies adjustable in lines substantially radial to the curvature of the said plate, the said dies being frictionally held in adjusted position in the said slots, whereby pieces of different sizes, but similar shaped, may be perforated with button-holes uniformly spaced, substantially as described.

3. The die-plate provided with a series of slots, combined with the dies, provided with stems passing through the said slots, and springs to retain the said dies in adjusted position until positively moved therefrom, substantially as described.

4. The die-plates provided with slots, combined with a series of dies movable in the said slots, and holding-arms rigidly connected to the said dies and adapted to be engaged by the said die-plate to positively retain the said dies in adjusted position, substantially as described.



259,431. SHIRT. SAMUEL STERNBERGER, Philadelphia, Pa. Filed May 1, 1882. (No model.)

Claim.—1. The bosom connected to the side pieces of the body by the rows of stitches *a* and the rows of stitches *d*, which latter are within the line of the former, producing the sprung-out sides of the bosom, the front edges, *c*, whereof are folded and formed of the material of the bosom, and the rear folded edges are formed of the material of the side pieces, the latter material backing the sprung-out sides of the bosom, substantially as and for the purpose set forth.

2. The sprung-out sides having the folded edges *c'*, the front edges, *c*, overlapping the rear edges, *c'*, substantially as and for the purpose set forth.

259,432. VALVE AND VALVE-GEAR. WILLIAM W. ST. JOHN, St. Louis, Mo. Filed Nov. 19, 1881. (No model.)

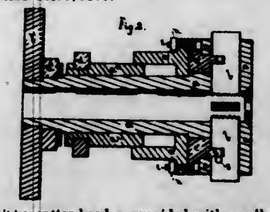
Claim.—1. A valve-cap adapted to pass over the piston-head of a valve at intervals, as and for the purpose set forth.

2. A piston-valve having a cap provided with a stem projecting through the valve and adapted to pass over the piston-head at certain intervals, as described, and for the purpose specified.

3. A valve-cap having a stem projecting through the body of a piston-valve and arranged to receive the inner head of the valve when it is moved forward into the cylinder, substantially as and for the purpose described.

4. A valve-cap having an annular flange to embrace a piston-head with packing as said head moves into the cylinder at certain intervals, as and for the purpose set forth.

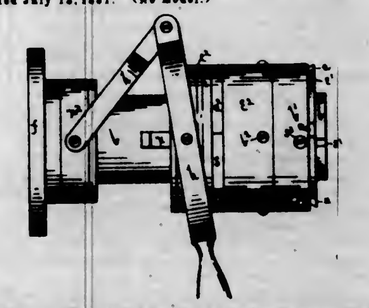
5. A valve-cap having an annular flange, which embraces a piston-head provided with packing as said head is moved into the cylinder, and returns with it until released by striking against a shoulder in the cylinder-head, substantially as and for the purpose described.



6. A valve consisting of a piston-head, *a*, embraced at proper intervals by a flanged cap, having a stem extending through the body of the valve, and a piston-head, *a'*, secured to the head *a* by a sleeve, E, substantially as specified.

7. The valve herein described, consisting of the piston-heads *a a'*, connected by a sleeve, E, containing a spring, F, the cap I, having stem *h*, and the extension E', for attachment to an operating-arm, all substantially as shown and specified.

8. In valve-gear, the combination of the piston-valves C C' D D', provided with caps I, the casings G, and pipes K L M, with operating valve-gear, substantially as specified, and for the purpose set forth.



9. In valve-gear, the steam-valves C C' and exhaust-valves D D', the caps I, and the casings G, in combination with the rods P P', arms H, cross-bar O, journal-boxes *h*, and suitable rock-shaft, or equivalent means, substantially as and for the purpose set forth.

259,433. SCREW-THREADING MACHINE. LEVI W. BROCKWELL, Cleveland, Ohio, assignor to William B. Price, same place. Filed Oct. 9, 1879.

Claim.—The cutter-head *a*, provided with scroll *a'*, having a rotary motion to open and close the dies, and ring *a''*, formed with a cam-slot, *c'*, a part of which is parallel with the axis of the cutter-head for the purpose of arresting the rotary motion of the scroll, in combination with the sliding collar *a''*, having pin *f*, substantially as described.

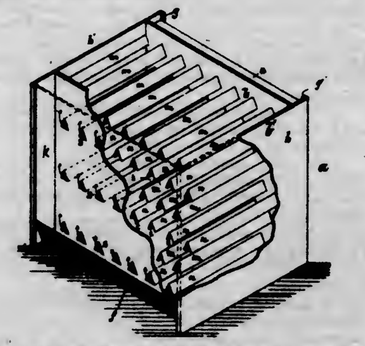
259,434. SCREW-CUTTING MACHINE. LEVI W. STOCKWELL, Cleveland, Ohio, assignor to William B. Price, same place. Filed July 13, 1881. (No model.)

Claim.—1. The stock *b*, having the inclined grooves *c' c'*, in combination with collar *c''*, levers *a'' a''*, grooved collar *b'*, and dies *a*, substantially as described.

2. The ring *c''*, wedges *e e*, levers *a'' a''*, and springs *s s*, in combination with collars *c'' b'*, dies *a*, and stock *b*, having the inclined grooves *c' c'*, substantially as described.

3. The collar *c''*, having the rods *x x*, levers *a'' a''*, and springs *s s*, and the ring *c''*, having the wedges *e e*, in combination with collar *b'*, having the inclined grooves *c' c'*, the dies *a*, and stock *b*, having the inclined grooves *c' c'*, substantially as described.

4. The stock *b*, formed with slots *c' c''*, of unequal length, in combination with collar *b'*, pins *s' s'*, and the cutting-dies, substantially as described.

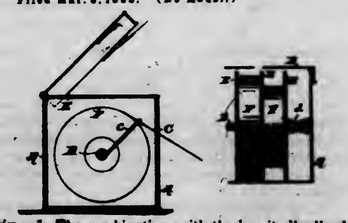


259,435. CAR-COUPLING. ALEXANDER STURY, Washington, Iowa. Filed Apr. 10, 1882. (No model.)

Claim.—1. The draw-head having a rectangular mortise in its top, with an undercut recess, *i*, and lugs *e*, in combination with the latch B, having projecting flanges upon its sides and rear, lip *b*, and side extensions, *b'*, substantially as described.

2. The lifting-rod *d*, step *k*, and cross-rod *a*, in combination with the keepers *g f*, pin *l*, and latch B, substantially as described.

259,436. GRAIN-DRIER. EDWARD THOMPSON, Hokah, Minn. Filed Mar. 3, 1882. (No model.)



Claim.—The combination of the slide *h*, plate *k*, and ducts *p* and *q*, the said slide and plate closing the ducts, with the inverted-V-shaped tubes *m* and *n*, leading alternately into the ducts *p* and *q*, all arranged as set forth.

259,437. COLLAR FOR CAR-AXLES. JOHN THOMPSON, Bucyrus, Ohio. Filed June 13, 1881. (No model.)

Claim.—In a bank or pit car, the combination, with the axle and wheel, of a collar or washer between the linchpin and the face of the wheel, provided with notches or grooves of varying depth, substantially as and for the purposes set forth and described.

259,438. SHOW-BOX. WALTER C. THOMPSON, Williamsburg, N. Y. Filed Mar. 3, 1882. (No model.)

Claim.—1. The combination, with the longitudinally-slotted box, of the removable rod D and the brake or tension device, substantially as described.

2. The combination, with the longitudinally-slotted box, of

the removable rod D, carrying the loose plates or disks E, and the tension device or brake, substantially as described.

3. The combination, with the longitudinally-slotted box, of the loose removable rod D, carrying and supported by the loose plates E, and the spiral spring *d*, substantially as described.

259,439. SEWING-MACHINE SHUTTLE. JAMES TRIPP and JOHN H. OSBORN, Cleveland, Ohio. Filed Apr. 7, 1882. (Model.)

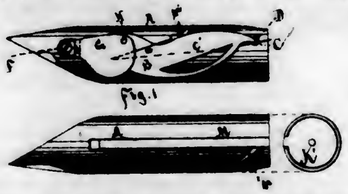


Fig. 1.

Claim.—1. In shuttles for sewing-machines, a detachable bobbin-holder consisting of two heads connected together by a bar arranged to slide in a longitudinal slot in the shuttle-shell, and provided with pivotal bearings for said bobbin in the heads of the holder, substantially as and for the purpose set forth.

2. In combination with a sewing-machine shuttle-case and bobbin, a holder having a slotted and a pivotal head for carrying the said bobbin, and connected together by a bar, J, adjusted to the longitudinal slot in the case, arranged substantially as and for the purpose set forth.

3. The shell or case A, provided with a longitudinal slot, M, and spiral slot N, in combination with the bobbin and holder J, substantially as and for the purpose set forth.

4. In sewing-machine shuttles, the spring B, provided with a point, *c*, and opening *d*, in combination with the protector-plate G, having an indentation, *f*, for the said point, substantially as and for the purpose set forth.

5. A sewing-machine shuttle having a spiral slot, N, for the bobbin-thread, in combination with the spring B and protector-plate G, connected with the shell, substantially as and for the purpose set forth.

6. A sewing-machine shuttle consisting of the shell A, with a longitudinal and spiral slot therein, the bobbin and holder arranged within said shell, in combination with the spring B and protection-plate, substantially as and for the purpose set forth.

259,440. METALLIC SKIPPING-HOOP. WILLIAM F. TURNBULL, Hampton, Va. Filed Apr. 25, 1882. (No model.)

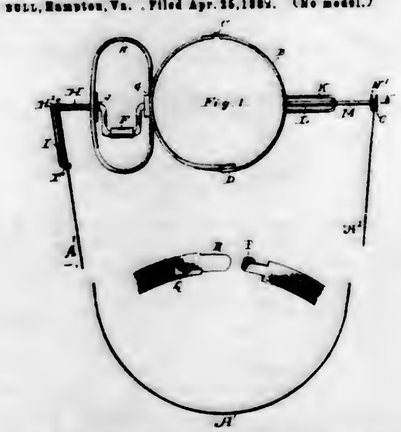

Fig. 1.

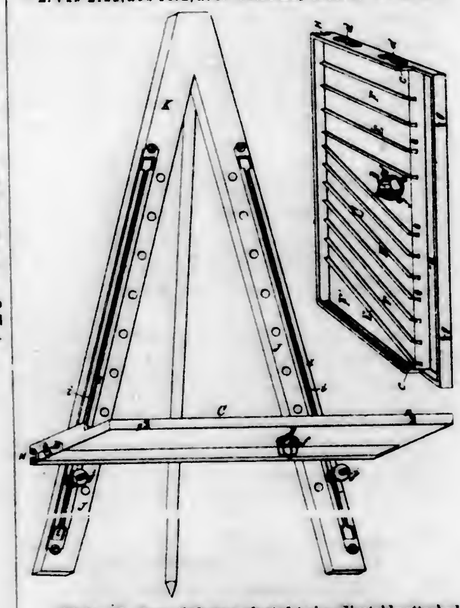
Claim.—1. In a child's skipping-hoop, the belt B, provided with a hinge and clasp, the elliptical frame E, rigidly fixed to one side of said belt, and the rectangular frame K, rigidly attached to the opposite side, substantially as described, and for the purposes set forth.

2. In a child's skipping-hoop as herein specified, the combination of the belt B and frames E and K, the fixed rod L, having shoulders N' and N, the revolving rod H, with eye H', arm I, loop I', and crank F, all arranged in the manner and for the purposes set forth.

3. The hoop A, in combination with the side rods, H and M, the rod H having eye H', arm I, and loop I', the supporting-frames E and K, the crank F, and belt B, substantially as specified, and for the purposes set forth.



4. In combination with the belt B and strip G, the elliptical frame E, rigidly connected to said belt, the crank F, with inside axle working in a slot in strip G, the shoulder J, and rod H, said rod having an eye working in a slot in the outside rim of the frame, also the arm I and loop I', substantially as set forth, and for the purposes specified.

5. The combination of the belt B, frame K, rod L, with projection M, and shoulders N' N, all rigidly connected in the manner and for the purposes set forth.

6. The clasp D, consisting of the hook P, loop Q, and tongue R, arranged in the manner and for the purposes specified.

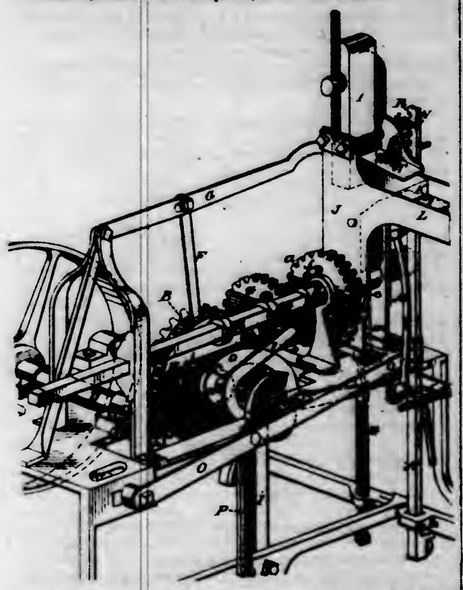
7. The belt, frames, and crank, as herein specified, in combination with the hoop A, having loop O, secured to and arranged to revolve around rod M between its shoulders N' and N, the hoop at the opposite side being adjustably attached to rod H by means of the eye in said rod, the arm I, and loop I', substantially as described, and for the purposes set forth.

259,441. COMBINED ARTIST'S CASE AND EASEL. AGNES E. VAN KIRK, New York, N. Y. Filed May 3, 1881. (No model.)

Claim.—1. An artist's case adapted to be adjustably attached to an easel, consisting of the color-board C, the trough G, and drawer B, substantially as described, and for the purpose set forth.

2. In combination with an easel, the color-board C, divided into spaces by the removable slats E E for the purpose of supporting the painting materials, substantially as described.

3. The combination of the color-board C, having dovetailed parallel grooves, and the adjustable slats E E, dovetailed to fit said grooves, dividing the board into sections, and longitudinally removable, substantially as described.



4. The combination of an easel and a case or board for supporting painting materials, the board being adjustable laterally and vertically, substantially as described.

5. In combination with an easel having the grooves *i i*, and slide *k*, an artist's case having the groove H and the slide k, the slides being connected to enable a lateral and vertical adjustment of the case, substantially as and for the purpose set forth.

6. The combination of the dovetailed grooves *i i* in an easel and the slides *k k*, having the thumb-screws *j j*, for securing an artist's case or board at any desired height, substantially as described.

7. An artist's case consisting of the color-board C, trough G, drawer B, and lid A, which, when closed, will hold the painting materials and may be carried.

259,442. CAN-FILLING APPARATUS. WM. WEST, Keene, Ontario, Canada. Filed Apr. 11, 1882. (No model.)

Claim.—1. In a can-filling apparatus, and in combination with the vertical fish-receiving chute J and the vertically-reciprocating plunger I, guided as shown, the cam E, adjustable upon the driving-shaft, the vertical rod F, the lever-arm G, and the connecting rod or link H, substantially as and for the purpose herein described.

2. The horizontal trough L, opening into the upper part of the chute J, in combination with the reciprocating carrier K, moving in said trough, so as to transfer the fish into the vertical chute, substantially as herein described.

3. In combination with the carrier K, moving in the trough L, the lever-arm M, connected with the carrier by a link, and having the fork or notch M', in combination with the vertically-reciprocating bar N, substantially as herein described.

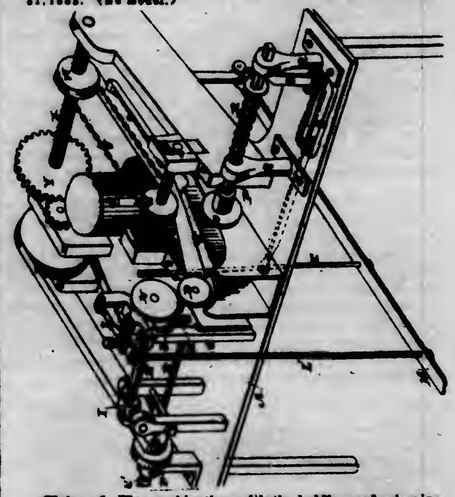
4. The hinged swinging gate T, opening or closing the passage between the trough L and chute J, and having the toothed segment S, in combination with the reciprocating bar N, with its rack R engaging said segment, substantially as herein described.

5. The bar N, moving in guides, as shown, in combination with the lever O, cam Q, and spring P, substantially as and for the purpose herein described.

6. The cylindrical receiver having one side open and the edge forming a knife, V, so that a supply of fish may be forced through the opening from the chute J and cut off and formed to enter the can by the rotation of the knife, substantially as herein described.

7. The cylindrical knife and shaper V, turning within the chute J, and provided with the notched flange W, in combination with the curved lever Z and rotating gear-wheel *a*, substantially as herein described.

8. In combination with the cylindrical knife and shaper V with its notched flange W and curved operating-lever Z, the disk *i*, supporting the lever, and adjustable upon the gear *a* by slots and screws *f*, so as to regulate the movements of the knife, substantially as herein described.

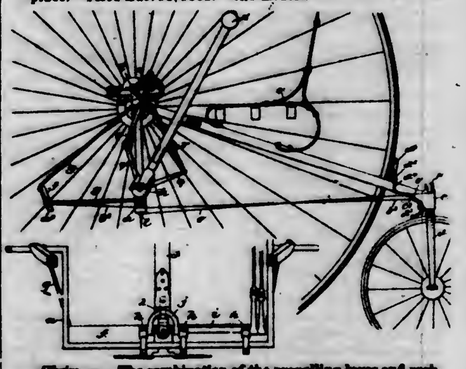


9. The cylindrical knife and shaper V, with its notched flange, and the curved pivoted lever Z and spring h, rotated by the gear-wheel *a*, in combination with the stationary pin *o*, whereby the pawl *y* is disengaged at each semi-revolution of the knife, substantially as herein described.

10. In combination with the hollow rotating knife and former V, operating within the chute J, as shown, the segments *a a'*, meshing with each other to drive the knife with a variable speed, substantially as herein described.

11. In combination with the hollow intermittently-rotating cylindrical knife and former V and the eccentric driving-gears *a a'*, the piston *g*, reciprocating through the cylindrical knife and the sleeve upon which the gear *a* turns, and the stem or extension h, operating lever and cam, substantially as herein described.

12. The hinged swinging gate T, toothed segments S, and vertically-moving bar N and rack R, in combination with the latch *r* and the arm *t*, connected with the plunger, substantially as and for the purpose herein described.



259,443. APPARATUS FOR CRIMPING THE ENDS UPON CIRCULAR CANS. WM. WEST, Keene, Ontario, Canada. Filed Jan. 31, 1882. (No model.)

Claim.—1. The combination, with the holding and crimping disks, as shown, of the inclined track or ways U and the solid trough *c*, through which the crimped joint may pass, substantially as herein described.

2. In combination with the way or track U and the endless chain moving above the track upon pulleys W, the boxes *a* of the shaft Z, having the vertically-movable elastic supports *b*, substantially as and for the purpose herein described.

259,444. VELOCIPEDE. FREDERICK WHITE, Westborough, Mass., assignor of five-twelfths to Charles E. Rogers, same place. Filed Mar. 16, 1882. (No model.)

Claim.—1. The combination of the propelling-lever and rock-shaft connected therewith, the cranks mounted on the said rock-shaft, the driving-wheel and shaft adapted to be operatively connected therewith, the cranks loose on the said shaft, and having a ratchet-and-pawl connection therewith, and also being connected with the cranks upon the rock-shaft, substantially as described.

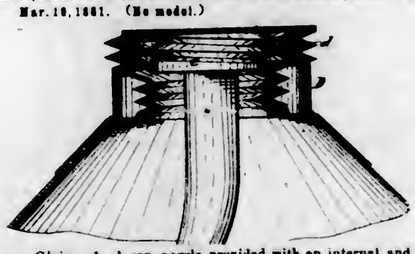
2. In a tricycle, the combination of the driving-wheel, a shaft operatively connected therewith and having a series or cone of gears of different diameters, a second shaft, means to actuate it, and a series of gears loose thereon, meshing with the first-mentioned series, and a series of independent clutches splined on said shaft, and independent shippers therefor, whereby any of the said gears may be connected with the said shaft to propel the wheel substantially as described.

3. In a tricycle, a shaft having a series of gears loose thereon and a series of clutches splined thereon, combined with a series of independent shippers for said clutches, locking devices for retaining the said shippers with the clutches disengaged, and means to automatically throw the said clutches into engagement when released by their locking devices, substantially as described.

4. The actuating-lever and rock-shaft connected to oscillate therewith, the said lever being pivoted to have an axial rotary movement, combined with a spindle connected with the said lever by a universal joint, and also connected with the steering-wheel, whereby the said wheel is turned by the rotary movement of the said lever when at any position in its oscillating movement, substantially as described.

5. The propelling-lever and rock-shaft connected therewith, combined with the driving-wheel of the tricycle, the shaft adapted to be operatively connected therewith, and devices having a ratchet-and-pawl connection with the said shaft, operated by the said propelling-lever and rock-shaft, substantially as described.

259,445. LOCK FOR FIRE-ARMS. ANDREW E. WHITMORE, East Boston, Mass. Filed Mar. 18, 1880. Renewed Mar. 20, 1882. (No model.)



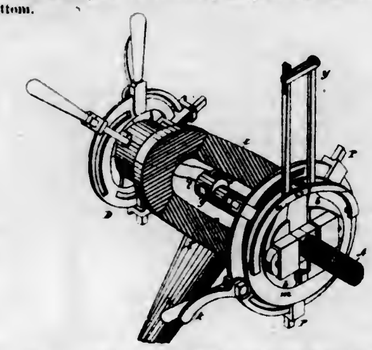
Brief.—A piece, denominated a "carrier," is pivoted in the lock-plate concentrically with the tumbler. It has shoulders on opposite sides of the tumbler so disposed as to allow the carrier to have slight independent movement in the carrier. The mainspring is attached to the carrier, and when the latter is arrested, just before the hammer completes its stroke, the hammer is carried forward by its own momentum, and after making the stroke is carried back slightly by the action of the sear-spring.

Claim.—1. In combination with a mainspring, tumbler, and sear, a plate or carrier pivoted concentrically with said tumbler and inclosing the same, said carrier having a flaring recess to allow the independent movement of said tumbler, substantially as set forth.

2. In combination with mainspring D, sear H, sear-spring F, and tumbler *h*, having an inclined face beyond the safety-notch, the carrier *d*, pivoted concentrically with said tumbler and inclosing the same, said carrier being provided with a projection, *i*, and stopped by a post, *q*, said devices causing the independent forward action of said tumbler and the immediate rebound thereof to the safety position, substantially as set forth.

259,446. CAN-SPOUT. F. CURTIS WILSON, Chicago, Ill. Filed Mar. 18, 1881. (No model.)

Claim.—1. A can-nozzle provided with an internal and an external screw-thread, in combination with a reversible spout threaded to fit the internal thread of the nozzle, and a cap threaded to fit the external thread of the nozzle to close the can and protect the end of the reversed spout, substantially as described.



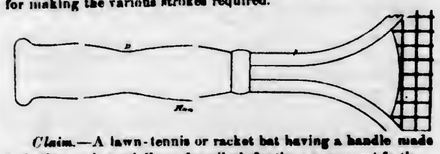
2. A can-top, in combination with a nozzle provided with threaded sections of unequal size and adapted to receive and inclose the enlarged end of the spout when reversed, a reversible spout provided with a threaded enlarged base fitting the smaller section of the nozzle, and a threaded cap adapted to the larger section of the nozzle, substantially as described.

3. The can-top A, in combination with the nozzle B, having two threaded sections, *b b'*, of different size but made of a single piece of metal, the spout C, provided with the threaded enlargement *c*, and the cap D, provided with the threaded section *d*, substantially as described.

4. A can-nozzle, in combination with a removable and reversible spout provided with a hollow enlargement at its base, in the upper and lower sides of which are vent-holes, whereby a chamber is provided at the base of the spout, closed except the vent-holes, and outside drip is prevented, substantially as described.

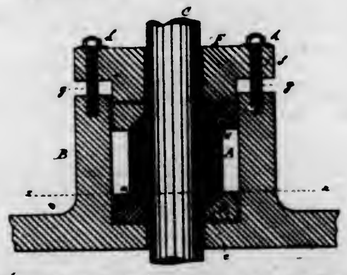
259,447. MACHINE FOR BORING AXLE-HOLES IN HUBS, &c. WILLIAM R. WOOD and SAMUEL BARR, Butler, Iowa. Filed Aug. 30, 1881. (No model.)

Brief.—The screw-shaft, which carries and advances the tool, is provided with an extension, which is bent to correspond with the form to be given to the hole, passing through a guide at the bottom.



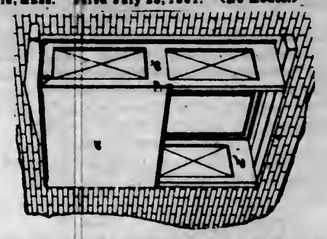
Claim.—1. In a machine for enlarging tubular borings, a guide-plate operating on a form-rod and feed-shaft, having a cutting-tool attached thereto, substantially as described, in combination with mechanism, substantially as described, for actuating the shaft and mechanism.

2. In combination with the feeding-shaft, the collars *b b*, having the followers *w w*, of wood, the latter being capable of adjustment to compensate for wear, substantially as described.



259,448. HANDLE FOR RACKETS OR LAWN-TENNIS BATS. OTWAY E. WOODHOUSE, 50 Upper Phillimore Gardens, Kensington, County of Middlesex, England. Filed May 8, 1882. (No model.) Patented in England Feb. 16, 1881, No. 662.

Brief.—The handle is made with three bulges, to enable the player to change the position of his hand with greater accuracy for making the various strokes required.

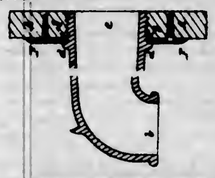


Claim.—A lawn-tennis or racket bat having a handle made in the form substantially as described, for the purposes set forth.

259,449. PISTON AND VALVE ROD PACKING. HENRY WOODRUFF and MOYCE C. COATS, Waverly, Iowa. Filed Apr. 1, 1882. (No model.)

Claim.—The combination, with the stuffing-box B and the gland F, of the diagonally-split ring A, having both ends conical, and the two split rings D E, each having a conical recess to receive the conical ends of the ring A, whereby the pressure of the gland F will contract the split ring A and expand both of the split rings D E, substantially as specified.

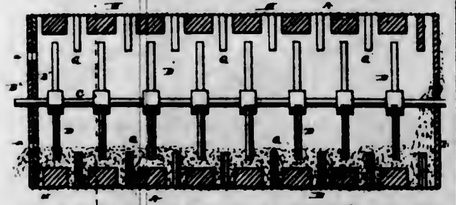
259,450. AWNING FOR WINDOWS. ALFRED WOODS, Graniteville, Mass. Filed July 25, 1881. (No model.)



Claim.—1. The awning consisting of a flexible strip, *a*, and the stiffening-pieces *b c*, connected therewith, as described, and provided with sockets to engage the upper, inner, and outward corners of the window blinds or shutters with which it is to be used, substantially as described.

2. The awning to be used in connection with blinds or shutters, consisting of a flexible strip, combined with stiffening-pieces at one end to engage the upper and inner corners of the blind and stiffening-piece at its other end to engage the front or outer edge of the blinds, and an intermediate stiffening-piece to engage the upper and outer corner of the blinds, the said stiffening-pieces at the ends of the flexible strip being provided with fastening devices to attach them to the blinds, substantially as described.

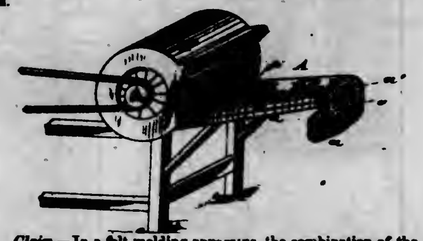
3. The combination, with the hinged blinds or shutters, of the flexible strip provided with suitable stiffening-pieces to engage the upper, inner, and outward corners of the said blinds, and having a portion extended down the front edges of the said blinds and adapted to be fastened thereto near its lower ends, substantially as described.



259,451. PUMP-SPOUT. S. JARVIS ADAMS, Pittsburg, Pa. Filed Apr. 5, 1882. (No model.)

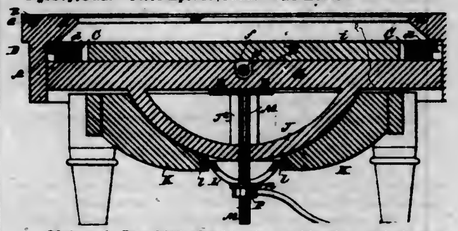
Claim.—1. In combination with a pump-spout having an annular extension at the back thereof, an annular bracing-plate adapted to be secured from the back on the extension of the spout and be attached to the pump-body, substantially as and for the purposes set forth.

2. In combination with a pump-spout having at the back thereof an annular extension and shoulder, an annular bracing-plate adapted to screw from the back over the extension against the shoulder and be attached to the pump-body, substantially as and for the purposes set forth.



259,452. PROCESS OF DECORTICATING GRAIN. WILSON AGEE, Washington, D. C. Filed Apr. 24, 1882. (No model.)

Claim.—A process of decorticating grain, which consists in first subjecting the horizontally moving and rolling mass of grain contained in a suitable receptacle to the action of rasping or abrasive beaters; second, in maintaining a mass of grain in the receptacle or cylinder by a uniform feed and discharge that will make the weight of the mass a factor for keeping the grain against the abrading and beating surfaces with sufficient pressure to cause the removal of the impurities; and, third, in the withdrawal of the impurities by air-currents, substantially in the manner and for the purposes described.



259,453. MOLD FOR MAKING ARTICLES OF FELT. SAMUEL S. ALEXANDER, Caro, Mich. Filed Apr. 7, 1882. (No model.)

Brief.—The invention is designed for the manufacture of felt hood, hand, foot wear, &c., from fibrous foldable material. The fiber is thrown by an air-blast into the perforated former, which is provided with sectional lids, the one on the extreme end being raised first, so that the material may be conveyed by the blast to that part of the former, after which the other lids are opened in turn.

Claim.—In a felt-molding apparatus, the combination of the foraminated flanged plates *a a'*, provided with the hinged doors B and core-piece C, provided with the wires *b*, adapting said core-piece to be held in place between the flanged plates *a a'* by clamping the ends of the wires between the meeting flanges of the plates, as shown and set forth.

259,454. BILLIARD-TABLE. CHARLES W. ALLEN, Pine Ridge Agency, Dak. Filed Apr. 19, 1882. (No model.)

Claim.—1. In a billiard-table, the combination, with the bed B and cloth *i*, of the cleats C, provided with rabbets, and arranged as herein shown and described.

2. The combination, with the bed B, cloth *i*, and cleats C, of the cloth-covered bars D and screws *d*, substantially as and for the purpose herein described.

3. The combination, with the cleats C, provided with the screw-threaded lugs *f*, and the base G, provided with the groove *g*, of the rod H, provided with a right-hand and a left-hand thread, substantially as and for the purpose herein described.

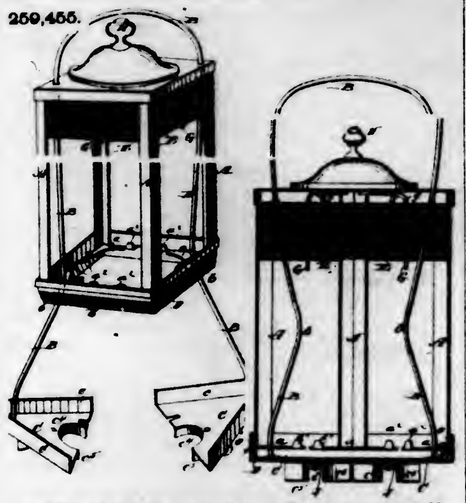
4. The end cloth-holding cleats adapted for lateral movement, and provided with diagonally-placed brace-bars adapted to act in grooves of the side cloth-holding cleats, whereby both side and end cleats may be simultaneously spread to stretch the cloth over the bed, substantially as shown and described.

5. The end cleats, C, provided with screw-threaded lugs *f* and diagonally-placed brace-bars E, and side cleats, C, having seats *e* to receive the bars E, and the right and left screw H, combined for operation substantially as shown and described.

6. The combination, with the frame A and bed B, and the devices connected therewith, of the base G, provided with the semicircular bars J J^1, substantially as herein described.

7. The combination, with the semicircular bars J J^1, of the arc-shaped arms K K^2, substantially as herein described.

8. The combination, with the arms K K^2, having grooves in their ends, of the spherical segment or bowl-shaped skeleton frame L, provided with the flange *l*, as herein shown and described.



9. The combination, with the base G, bars J J^1, arms K K^2, and skeleton frame or bowl L, of the rod M, washer *n*, and nut P, substantially as and for the purpose herein described.

259,455. LANTERN. CHARLES F. ANDERSON, Bay City, Mich. Filed Mar. 8, 1882. (No model.)

Brief.—Produces a lantern in which any ordinary lamp can be used. The bottom is bisected, and to each half is pivoted a plate having rims to fit a lamp-collar. The bottom is connected to the frame by the bail, which also brings the parts together to clasp the lamp-collar.

Claim.—1. A lantern frame or body provided with a bisected

259,455.

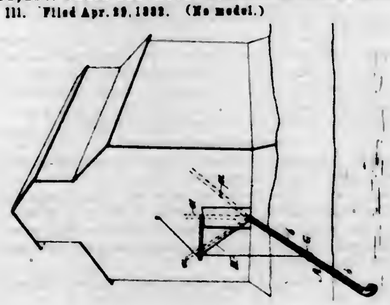
bottom attached to and operated by a bail passing through guide-braces at the bottom of said frame, so as to separate said bisected bottom to allow it to grasp the collar of a lamp, substantially as herein described.

2. The combination, with the frame A, provided with the corner-braces a, of the bail B, bent as shown at *b b*, and the bisected bottom C, attached to and operated by said bail, substantially as and for the purposes herein described.

3. The combination, with the bisected bottom C, constructed as described, of the revolving plates *c*, provided with notches c^1 c^1 and rims c^2 c^2, substantially as herein described.

4. The combination, with the bottom C and revolving plate *c*, of the spring J, attached to said plate and bottom by the rivet or pivot *i*, substantially as and for the purpose shown and described.

5. The combination of the frame or body A, having the beveled bottom D, and the bisected bottom C, having the turned-up edges *e*, substantially as and for the purpose shown and described.

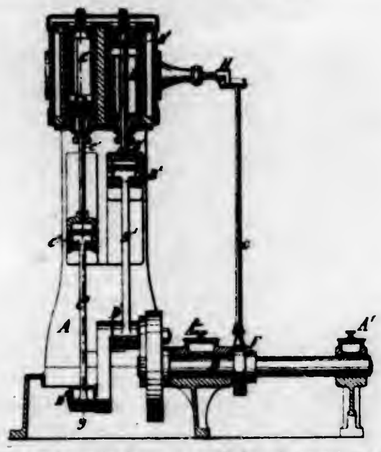


6. The combination, with the frame or body A, of the netting E, spring G, and lugs a^3, for holding the glass sides in place, substantially as shown and described.

259,456. APPARATUS FOR SELF-MASSAGE OR FLESH-KNEADING. CARL ARNDT ANDERSEN, Stockholm, Sweden. Filed Apr. 10, 1882. (No model.) Patented in Germany Aug. 13, 1881, No. 18,954; in England, Sept. 5, 1881, No. 3,858, and in Sweden Oct. 26, 1881, No. 330.

Claim.—An apparatus for massage treatment or flesh-kneading composed of a suitably-constructed handle, upon which is mounted one or more rollers having circumferential ribs or ridges *a*, as shown and set forth.

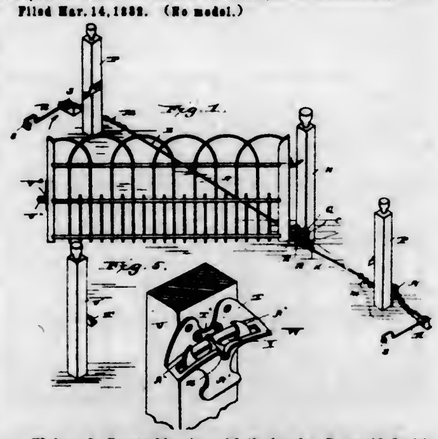
259,457. GRAIN-ELEVATOR. HENDRIAN ARMISTOTOR, Atlanta, Ill. Filed Apr. 29, 1882. (No model.)



Claim.—1. The combination of sections having right-angular slots *e* and bolts *f*, substantially as shown, and for the purpose described.

2. The combination of the sections, bolts *f*, and swivel-jointed elbow C, substantially as shown, and for the purpose described.

3. The combination of the swivel-jointed elbow C, hand G, and sections, substantially as shown, and for the purpose described.

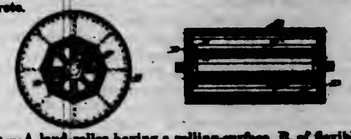


4. The combination of the sections *b b*, hand G, and ring M, substantially as shown, and for the purpose described.

259,458. BALANCED STEAM-ENGINE. JAMES O. BAIRD, Brooklyn, N. Y. Filed Jan. 26, 1882. (No model.)

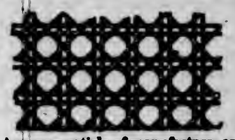
Claim.—An engine having two cylinders of unequal areas, with alternately-working pistons that have independent connections with the crank-shaft, said cylinders being constructed of such relative proportions that the pressures on their crank-pins are in inverse ratios to the distances of said crank-pins from the outboard-bearing, substantially as and for the purpose described, whereby the crank-shaft may be reversed without uneven motion, as set forth.

259,459. GATE. HARVEY C. BAKER, West Alexandria, Ohio. Filed Mar. 14, 1882. (No model.)



Claim.—1. In combination with the bracket C, provided with an angular slot, E, having rounded pintle-bearings F, and a pintle-bearing at the apex of the slot, the pintle secured to the gate, and the link pivoted to said pintle, and the connecting-bars, chains, and levers, all constructed and arranged to operate substantially as specified.

2. In combination with the gate and gate-post, the bracket secured to the post, provided with a shelf inclined in opposite directions, a slot and central bearing, and the double-weighted pawl pivoted in said bearing and adapted to automatically engage and release the bolt of the gate to lock and unlock the same, substantially as specified.

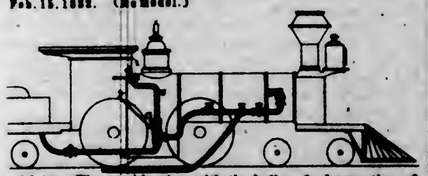


259,460. LAND AND LAWN ROLLER. ARAD BARROWS, Sr., Philadelphia, Pa. Filed July 19, 1881. (No model.)

Brief.—A land and lawn roller having an inner cylinder or tube, the space between said cylinder and outer roller being filled with concrete.

Claim.—A land-roller having a rolling-surface, B, of flexible metal, combined with heads D and an inner casing or box, F, said having the space between such rolling-surface B and box F and heads D filled with a concrete arranged to operate as a weight or load, substantially as and for the purpose set forth.

259,461. RETICULATED WORK FOR CARRIAGE-BODIES, &c. PETER BARRY, New York, N. Y. Filed Jan. 28, 1882. (Specimens.)



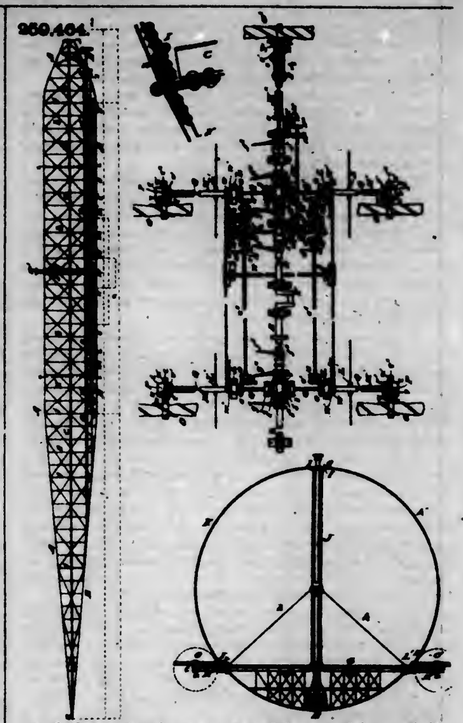
Claim.—1. As a new article of manufacture, an imitation of cane, wicker, or other woven or net work for carriage-bodies or for other purposes, consisting of a reticulated fabric or tissue of oil-paint or other analogous composition, substantially as and for the purpose herein described.

2. The method of making imitation cane-work fabric or tissue, consisting in first casting a mold with an adhesive substance soluble in water, then covering and filling the mold with a composition of which the fabric or tissue is to be made and allowing such composition to dry, then sandpapering off or otherwise removing all the composition except that contained in the grooved or intaglioed portions of the mold, and finally dissolving the adhesive substance by immersing the mold in water, and thereby releasing the reticulated fabric or tissue therefrom, substantially as and for the purpose herein described.

259,462. MATERIAL FOR THE DECORATION OF THE INTERIOR WALLS AND CEILINGS OF HOUSES. FREDERICK BECK, New York, N. Y. Filed Jan. 13, 1882. (No specimens.)

Claim.—A new article of manufacture, consisting of paper or an equivalent material coated with a compound of ground asbestus and adhesive substances, and either with or without a facing of paper and embossed, substantially as and for the purposes described.

259,463. MEANS FOR EXTINGUISHING FIRES ON RAILWAY-TRAINS. ROBERT C. BLACKALL, Albany, N. Y., assignor of three-fourths to Charles D. Hammond and J. White Sprong, Slingerlands, and Samuel Huntington, Albany, N. Y. Filed Feb. 15, 1882. (No model.)



Claim.—The combination, with the boiler of a locomotive, of a feed-water injector, C, having a delivery-pipe, E, for connecting said injector with a check-valve, F, attached to said boiler, provided with a branch pipe, E', and stop-valves *d* and d^2, arranged as described, for the purpose of optionally discharging the entire volume of water passing through the injector either into or outside of said boiler, or for dividing the volume of water in the manner and for the purposes herein specified.

259,464. VESSEL FOR AERIAL NAVIGATION. ALBERT L. BLACKMAN, Nashville, Tenn. Filed July 19, 1881. (No model.)

Claim.—1. In a vessel for aerial navigation, constructed with a sharp long entering prow and a short abrupt after run, as shown,

259,464.

a gas-field involving the greater part of the area of the vessel, divided into compartments by lateral gas-tight metallic bulk-heads, substantially as shown and described.

2. Vessels for aerial navigation, constructed with a sharp long conical entering prow and a short abrupt run, all on one general frame of metal and under one cover or envelope, made air and gas tight and fire and water proof, provided with a rubber-packed gas and air tight hinge along the sides at each gunwale and on each side of the dome-ridge, said hinges forming a part of the envelope of the vessel, substantially as shown and described.

3. In combination, rubber-packed gas and air tight hinges and metal envelope or casing for vessels for aerial navigation, substantially as shown and described.

4. In combination, rubber-packed gas and air tight rubber hinges in and forming a part of vessels for aerial navigation, and revolving, raising, lowering, and propelling screws on the sides and a raising, lowering, propelling, and steering after screw, substantially as shown and described.

5. A vessel for aerial navigation, comprising a hull and a gas-field constructed on one general frame, preferably of steel tubing, inclosed with sheets of thin steel riveted and brazed together, the whole in the form of a cylinder with a long entering-cone forward and a short abrupt cone aft, having the gas-field divided into compartments by lateral metallic bulk-heads and the hull divided into floors near the center, and the floors divided into cabin, living-rooms, freight, store, engine, and other rooms for living and business, substantially as shown, and arranged as described.

6. A vessel for aerial navigation, constructed as shown and described, inclosed within one metal cover or envelope, having rubber-packed hinges therein arranged along the sides of the vessel at the gunwales and on each side of the dome-ridge, and doors, windows, ventilators, lookout-galleries, and dead-eyes arranged in the hull portion thereof, the interior of the vessel divided into gas-field and hull, the hull divided into cabin, store, freight, engine, living, and other rooms, the whole in combination with internally-arranged propulsive machinery and externally-adjusted raising, lowering, and propelling side screws and raising, lowering, steering, and propelling after screws, substantially as shown and described.

7. In combination with gas-compartments of vessels for aerial navigation, induct gas-pipes provided with automatic as well as manual valves leading from the gas-generator and gas-reservoir,

as well as educt-pipes provided with hand and automatic valves leading to the gas-receiver and to a general exhaust-pipe for inflating or collapsing any one or more of such compartments at one and the same time, substantially as shown and described.

8. Propelling-screws for vessels for aerial navigation, secured to a revolving shaft coming through from the inside and adjusted and sustained in bearings in brackets under the stern below what may be called the "stern-frame" of the vessel, substantially as shown and described.

9. In vessels for aerial navigation, constructed upon one general frame of metal, as shown, a gas-field involving the greater part of the area of the vessel, divided into compartments by lateral gas-tight metallic bulk-heads, in combination with induct-pipes provided with automatic and manual valves, and connecting with a gas-generator and gas-reservoirs, and with educt-pipes provided with automatic and manual valves and connecting with gas-condensers, and a general exhaust-pipe passing without the vessel aft, substantially as and for the purpose shown.

10. In vessels for aerial navigation, constructed on one general frame of metal and within one cover, a gas-field involving the greater part of the area of the vessel, divided into compartments by lateral or transverse gas-tight metallic bulk-heads, in combination with rubber-packed hinges in the envelope to admit of the inflation and collapsing thereof without danger of breaking the metal, substantially as and for the purpose shown and described.

11. In vessels for aerial navigation, constructed on one general metallic frame in the form of a cylinder, with a long-drawn-out cone forward and a short cone aft and all under one general cover, a gas-field involving the greater part of the area of the vessel, divided into compartments by gas-tight metallic lateral or transverse bulk-heads, in combination with a cabin, offices, state and other living rooms, store, engine, and other freight and business compartments internally arranged as shown, and also with passage-ways *e* and *e'*, substantially as shown and described.

12. In vessels for aerial navigation, constructed within one envelope or cover on one general metal frame in a cylindrical form with a long conic prow and an abrupt conical end aft, a gas-field involving the greater part of the area of the vessel, in combination with engine-boilers and other internally-arranged machinery for propelling, raising, lowering, and steering the vessel, substantially as shown and described.

13. In vessels for aerial navigation, constructed on one general metal frame within one cover or casing cylindrical in form, having a long conic entrance or prow and a short conic stern, a gas-field involving the greater part of the area of the vessel, in combination with propelling machinery internally arranged for actuating side screws for raising, lowering, and propelling the vessel and a screw aft for raising, lowering, steering, and propelling the vessel, substantially as shown and described.

14. In vessels for aerial navigation, constructed as shown, in combination with gas-generators, gas-condensers, and gas-reservoirs for supplying gas to the gas-field, or receiving, securing, or condensing any surplus occasioned by going into high altitudes, substantially as shown and described.

15. In vessels for aerial navigation, constructed in a cylindrical form on one metal frame, with a sharp conical prow and an abrupt conic stern within one general cover, dead-eyes in the lower part of the hull for the passage of the anchor-cables, in combination with anchor cables and winches internally arranged for hauling them in and paying them out, substantially in the manner and for the purpose described.

16. In vessels for aerial navigation, a pendulum-lever governed by a ball-weight, in combination with levers attached to collars on revolving cylinders, which carry the side screws for automatically revolving the cylinders in their bearings for keeping the vessel on a level keel, substantially as shown and described.

17. A vessel for aerial navigation, built in cylindrical form within one general envelope and on one general frame, having a long conic entrance or prow and a short conic stern, with a gas-field involving the greater part of the area of the vessel, divided into compartments by lateral or transverse gas-tight metal bulk-heads and into cabin, passage-ways, store, freight, and engine rooms within the vessel, the envelope of the vessel provided with rubber-packed hinges on the side and at dome-ridge, and actuated from within by propulsive machinery through side and after screws, substantially as shown and described.

18. A vessel for aerial navigation, constructed in cylindrical form, with a long conic entrance or prow and an abrupt conic stern on one general metal frame and within one general envelope, having a smoke-stack and steam-pipe chimney made water and fire proof and air and gas tight passing up through the gas-field, substantially as shown and described.

19. A vessel for aerial navigation, constructed in a cylindrical form, with a long conic prow and a short conic stern on one general frame of metal within one general envelope, having rubber-packed hinges on the sides and at the dome-ridge, as well as doors, windows, and dead-eyes in the lower part of the hull, and a smoke-stack and steam-pipe chimney passing up through the gas-field, provided with cabin, passage-ways, store and freight rooms, engine and machinery compartments within the vessel, substantially as shown and described.

20. A vessel for aerial navigation, built on one general frame and under one cover or envelope in a cylindrical form, carried to sharp conical prow forward and a short conic stern, having one or more side screws working in revolving cylinder-shafts coming through from the inside for raising, lowering, and propelling, also provided with an adjustable shifting, lowering, raising, propelling, and steering screw aft, working in looped stays forming part of a revolving cylinder passing through from the inside sternward, substantially as shown, and for the purpose described.

21. Revolving cylinder-shaft M^3, terminating at the outer end in a looped yoke, having ways in the periphery and carrying a ring, disk, or revolving carriage embedded therein, in combination with a sliding looped band secured to a collar and under control of a piston handled by a lever for changing the direction of flight of the after screw, substantially as shown and described.

22. Revolving cylinder-shaft M^3, terminating at the outer end in a looped yoke, having ways in its periphery, and having a circular carriage or disk embedded in a suitable recess therein, said disk having racked teeth on a segment of its periphery to mesh with teeth on the inner edge of a sliding looped band secured to a sliding collar operated by a piston handled by a lever for changing the direction of the flight of the after screw for vessels for aerial navigation, substantially as shown and described.

23. Revolving cylinder-shaft M^3, terminating at the outer end in a looped yoke, having ways in its periphery, as well as a recess therein for a circular carriage provided with a sleeve journal-bearing for securing and carrying the axle of the after screw, as well as racked teeth to mesh with similar teeth on the inner side of the sliding looped band secured to a sliding collar adjusted on the revolving cylinder and operated by a piston handled by a lever for changing the position of the after screw from right angles to a position perpendicular to the line of the cylinder, substantially as shown and described.

24. In combination, the after screw O^3, journal-sleeve y', circular carriage or disk $8'$, embedded and carried in recess 8 in the looped yoke 7, terminating the revolving cylinder M^3, the sliding strap-yoke or bow 6, provided with rack-teeth 10 on the inner edge of one side, and secured to a sliding collar, 5, adjusted on revolving cylinder M^3 and operated by a piston, 5^3, handled by a lever, 5^4, for handling and changing the direction of the screw O^3, substantially as shown and described.

25. In combination, the after screw O^3, journal-axle y', universal joint 2, actuating-shaft R, revolving cylinder M^3, terminating in a loop-yoke, 7, having ways in its periphery and a recess, 8, in the interior, the circular disk or carriage $8'$, having rack-teeth $7'$ on a segment of its periphery and a sleeve journal-bearing, y, the sliding strap-yoke 6, carrying rack-teeth 10 on the inner edge of one of the arms secured to a sliding collar, 5, adjusted on revolving cylinder M^3, piston 5^3, and lever 5^4, for carrying, rotating, and changing the after screw of vessels for aerial navigation, substantially as shown and described.

26. A pendulum attachment consisting of a ball, $8'$, lever 8, secured on a rocker-shaft, w^3, carrying two lateral levers w^4 w^4, secured thereto, one above and one below the rocker-shaft w^3, the latter levers by the other ends to lever-arms w' w', forming a part of collars or muffs w w, secured on revolving shafts M M, for carrying the side screws in vessels for aerial navigation, the whole adjusted near the center on the sides within the vessel, substantially as shown, and for the purpose described.

27. A pendulum attachment consisting of a lever, 8, suspended on a rocker-shaft, w^3, carrying a heavy ball, $8'$, dependent therefrom, and connected to two projecting levers, w^4 w^4, secured thereto, one above and one below the rocker-shaft w^3, in combination with lever-arms w' w', forming part of collars w w, secured on revolving cylinder M M, for automatically regulating the plane of flight of vessels for aerial navigation, substantially as shown and described.

28. A pendulum attachment consisting of a lever, 8, suspended within and near the side of the vessel on a rocker-shaft, w^3, and carrying a heavy ball, $8'$, dependent therefrom, and two branching levers, w^5 w^5, secured thereon, one above and one below the rocker-shaft w^3, in combination with lever-arms w' w', collars w w, secured on cylinder-shafts M M, which carry and change the positions of the raising, lowering, and propelling side screws, O O, in vessels for aerial navigation.

29. In combination, the main actuating-shaft R, provided with a double crank, R', secured in journal-bearings 21 and extending longitudinally through the vessel from forward of the cabin to the stern, segregated at intervals, but suitable by grip-clutches $f f' f^3$, and carrying grip-clutches $f f' f^3$, grip-clutches $g g' g^3 g^3$, bevel or miter gear wheels 3^3 3^3 3^3 3^3, and universal joint 2, axle y, and screw O^3, in vessels for aerial navigation, substantially as shown and described.

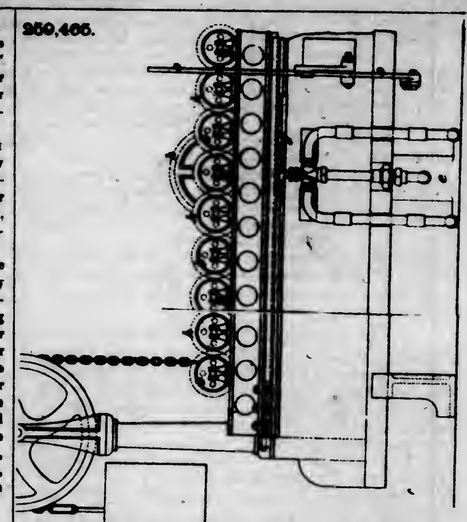
30. In combination, main driving-shaft R, having a double crank, R', therein, and secured in bearings 21 longitudinally through the vessel, beveled or miter gear wheels 3^3 3^3 thereon, beveled or miter gear wheels 3 on shaft Q, shaft Q, beveled or miter gear wheels V' V, shaft P, journaled in revolving cylinders M, and carrying side screws for raising, lowering, and propelling vessels for aerial navigation, substantially as shown and described.

31. In combination, main driving-shaft R, having a double crank, R', therein, and secured in bearings 21 longitudinally through the vessel within the hull under the gas-field, and segregated at intervals, but suitable by grip-clutches $f f' f^3$, carrying grip-clutches $g g' g^3 g^3$, arranged for throwing beveled or miter gear wheels 3^3 3^3 3^3 3^3 into and out of gear, beveled gear or miter wheel 3' on the inner end of shaft Q, journaled in boxing 3 at one end, and passing through revolving shaft M, carries a miter or beveled wheel, V', at the other, the shaft Q, journal-bearings within revolving cylinder M, beveled or mitered gear wheel V', beveled gear or miter gear wheel V, right-angle shaft P, carrying the side screw, O, and journaled in a cross-tube head, t, on the outer end, and forming part of revolving cylinder M, for raising, lowering, and propelling vessels for aerial navigation, substantially as shown and described.

32. In combination, main driving-shaft R, double crank R', bevel-gear wheels 3^3 3^3, clutches $f f' f^3$, clutches $g g' g^3 g^3$, levers f^3 and g^4, cylinder M^3, universal joint 2, revolving carriage 8, journal-sleeve y, after screw O^3, sliding loop-strap 6, collar 5, piston 5^3, lever 5^4, and beveled-gear wheel 3^3, shaft Q, beveled-gear wheel V', beveled-gear wheel V, right-angle shaft P, side screws, O, cross-tube head t, revolving cylinder-shaft M, collar w, lever-arm w', levers w^5, pendulum 8, ball $8'$, and rocker-shaft w^3, in machinery for propelling and handling vessels for aerial navigation, substantially as shown and described.

33. In combination, hand-wheel 14, shaft c^3, bevel gear or miter wheels c'' c''', bevel gear or miter wheels c'' c'', shafts c^4 c^5, miter or bevel gear wheels d d d d on the opposite ends of shafts c^4 c^5, beveled or miter gear bands on the inner end of revolving shafts M M' M M', revolving cylinder-shafts M M', and raising, lowering, and propelling side screws, O' O, for simultaneously changing the position of side screws, O O', in vessels for aerial navigation, substantially as shown and described.

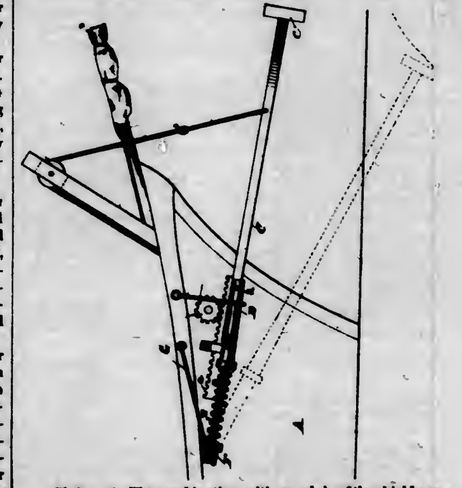
34. In combination, hand-wheel 14, shaft c^3, beveled gear or miter wheel c c, beveled gear or miter wheel c c', shaft c c'', beveled gear or miter wheels 11^4 11^4, shaft $11''$, beveled gear or miter wheel $11'$, beveled gear or miter band 11, revolving cylinder-shaft M^3, terminating in a loop-yoke, 7, recessed for and carrying a revolving carriage, $8'$, journal-bearing y, after screw O^3, axle y', universal joint 2, main shaft R, and journal-bearings 12^3 12^3 a, in machinery for handling, steering, and propelling vessels for aerial navigation, substantially as shown and described.



35. In combination, hand-wheel 14, shaft c^3, beveled gear or miter wheels c''' c''' thereon, beveled gear or miter wheels c'' c'' on shafts c^4 c^5, meshing therewith, longitudinal shafts c^4 c^5, secured in suitable bearings, beveled gear or miter wheels d d d d at the opposite ends thereof, beveled gear or miter bands on the ends of revolving cylinder-shafts M M M' M', revolving shafts M M', raising, lowering, and propelling side screws, O O' O O', also grip-clutch 15 and bevel gear or miter wheel c c on shaft c^3, beveled gear or miter wheel c d on shaft c c'' in suitable bearings, beveled gear or miter wheels 11^4 11^4, shaft $11''$, beveled gear or miter wheel $11'$, beveled gear or miter band 11, revolving cylinder-shaft M^3, sliding muff or collar 5, loop-straps 6, revolving carriage $8'$, adjustable after screw O^3, piston 5^3, hand-lever 5^4, in machinery internally and externally arranged for simultaneously changing the position of the screws, both on the sides and astern, for raising, lowering, propelling, and steering vessels for aerial navigation, substantially as shown and described.

259,465. APPARATUS FOR DYEING AND WASHING HANKS OF YARN, &c. ERWIN BODEN, Manchester, County of Lancaster, England. Filed Mar. 20, 1882. (No model.)

Claim.—1. The combination of a vat, roller-frame *c*, vertical guides, and balance-weights with a hydraulic ram, *a*, carrying said frame, as and for the purpose set forth.



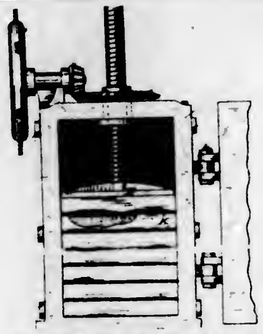
2. The combination of the rollers and a movable frame having

259,466.

bearings for the rollers at one side with a vat having pivoted bearings for the rollers at the other side, all substantially as and for the purpose set forth.

259,466. PEDDLE FOR VESSELS. JOHN BOSS, Brookeridge, Mo. Filed Aug. 6, 1881. (No model.)

Claim.—1. The combination, with vessel A, of the shield composed of bars C, held in shafts D, elastic cushions E, secured to shafts D, and shafts F, connected to cushions E and journaled as described, for the purpose specified.



2. The combination of vessel A, a protecting-shield therefor projecting in front thereof, and sliding rack-bars L, secured to the vessel and provided with ways for the shield, the several parts being adapted to operate as set forth.

259,467. PROCESS OF AND APPARATUS FOR OBTAINING OIL. T. BRAY BOWERS, Chester, Pa. Filed Mar. 14, 1882. (No model.)

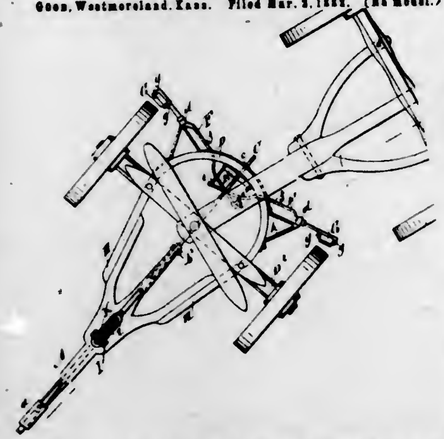
Claim.—1. The herein-described method of separating the oily or fatty matters from waste wash-liquor, it consisting in, first, treating said material with acid to cause a separation of the fatty materials, and, secondly, in subjecting the fatty matters to pressure in a steam-tight compartment and simultaneously applying steam directly thereto, substantially as set forth.

2. The herein-described method for obtaining oil from waste

259,467.

wash-liquor, it consisting in, first, treating said material with acid to cause a separation of the fatty materials, then filtering said materials, then dividing them into portable masses, then arranging two or more of said masses in a series, they resting upon each other, with metal sheets between them, and then subjecting them to pressure and heat, substantially as set forth.

3. The combination of the vertically-arranged door, the detachable cross-bars, the screws for clamping the door, and the pressing-chamber having the tight top and the tight back and sides, substantially as set forth.



4. The combination of the platen, the pressing-chamber having an uninterrupted apartment below the platen and formed with the tight top, back, and sides, and the vertically-arranged door, adapted to be forced tightly against the chamber, substantially as set forth.

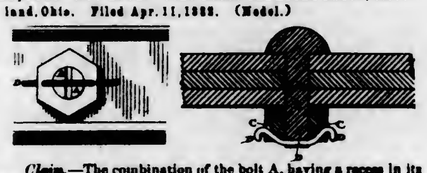
5. In a machine for compressing fatty matters, a compressing-chamber constructed and arranged, substantially as set forth, to provide below the platen an uninterrupted apartment for the material being subjected to pressure and above the platen a steam-tight apartment provided with a passage-way for the introduction of steam, substantially as set forth.

6. The combination of the compressing-chamber having an uninterrupted apartment above the platen and provided with a tight top permanently bolted to the tight back and sides, the screw-shaft passing vertically through said tight top, and a vertically-situated door through which the material is introduced on horizontal lines beneath the platen, and the screw-clamps arranged, substantially as set forth, for forcing the door tightly against the open side of the compressing-chamber.

7. The combination of the platen, the compressing-chamber having an uninterrupted apartment below the platen, and having also a side adapted to be entirely opened and a door which extends entirely across said open side and is adapted to be clamped against it, substantially as set forth.

259,468. WAGON-BRAKE. JAMES D. HEATTON and HENRY H. GOOD, Westmoreland, Kans. Filed Mar. 3, 1882. (No model.)

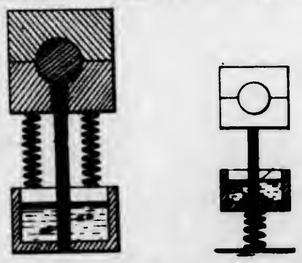
Claim.—1. The combination, with the draft-rod B C and the brake-levers F, of the lever E and the rods *e*, connecting the ends of the said lever with the inner end of the brake-lever controlling the opposite wheel, substantially as and for the purpose set forth.



2. The combination, with the draft-rod B C and the curved bar D, of the brake-levers F, provided with the cranks *f*, the lever E, and the connecting-rods *e*, substantially as and for the purpose set forth.

3. The combination, with the curved bar D and the crank brake-levers F, of the lever E, the connecting-rods *e*, and the draft-rod B C, provided with the arm or bolt I, substantially as and for the purpose set forth.

4. The curved bar D, secured to the hounds and provided with keepers *c* and *d d*, substantially as herein described.

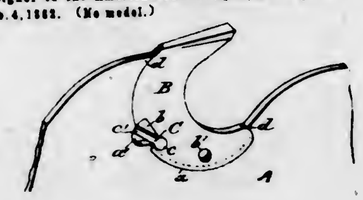


5. The combination, with the wagon-pole A, provided with the slot *i*, the hounds H, and the crank brake-levers F, of the draft-rod B C, provided with arm or bolt I, the curved bar D, the lever E, and the connecting-rods *e*, substantially as and for the purpose set forth.

259,469. NUT-LOCK. JOHN BAKER and EDGAR BAKER, Cleveland, Ohio. Filed Apr. 11, 1882. (Model.)

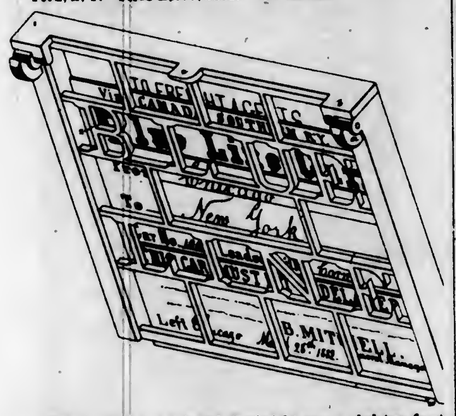
Claim.—The combination of the bolt A, having a recess in its end, a nut having diagonal openings C through opposite sides, and the locking-wire D, which has its ends passed through the holes and its central portion held by the recess in the end of the bolt, substantially as shown and described.

259,470. LUBRICATING MECHANISM. WARREN H. BAUMGARDNER, Auburn, N. Y. Filed Apr. 14, 1882. (No model.)



Claim.—1. In a lubricator for journals and shafting, in which the lubricant is conducted from the oil-cup to the shaft or journal by means of a wick, an oil-cup that is advanced toward the shaft or journal by spring-power or gravity as the wick becomes reduced by friction, substantially as described.

2. The combination, with a box or bearing for journals and shafting, of a movable oil-cup, a wick which is rigidly connected to the oil-cup, and a spring or springs connecting the oil-cup with the box or bearing, substantially as described, whereby the oil-cup will be simultaneously advanced toward the shaft or journal as the wick becomes reduced by friction, substantially as set forth.

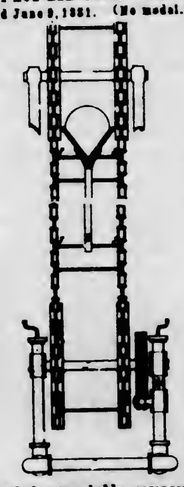


3. The combination, with a box or bearing for shafting, of the oil-cup, the wick secured to the oil-cup and extending to the shaft or journal, and a contractile or expansible spring or springs for advancing the oil-cup, and thereby feeding forward the wick as the latter becomes reduced by friction, substantially as described.

259,471. SAW-TEETH. WILLIAM E. BROOKS, Trenton, N. J., assignor to the American Saw Company, same place. Filed Feb. 4, 1882. (No model.)

Claim.—The combination of the saw-plate A, having recess *a* and sub-recess *a'*, the movable tooth B, having recess *b*, and the locking-latch C, consisting of the disk *c*, having an arm, *c'*, said latch being pivoted in a circular opening formed at the end of the recess *b* and capable of a partial rotation for the purpose of causing its arm *c'* to bear against the edge of the saw-plate in the recess *a'*, whereby the tooth is removably secured, substantially as shown and described.

259,472. LABEL-RACK FOR FREIGHT-CARS. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Apr. 3, 1882. (No model.)



Claim.—1. In a label-rack for freight-cars, a skeleton front having the name of the freight-line or railroad to which a given car belongs formed in and constituting a part of said front, substantially as herein specified.

2. A label-rack for freight-cars, having a skeleton front, a close or substantially close bottom, close or substantially close lateral edges, and a self-closing lift or lid at the top, substantially as herein specified.

3. A label-rack for freight-cars, adapted by means of a skeleton back to be attached to a car side by concealed screws, and by means of a skeleton front indicating the freight-line or railroad to which a given car belongs to expose to view a loosely-inclosed destination-card, substantially as herein specified.

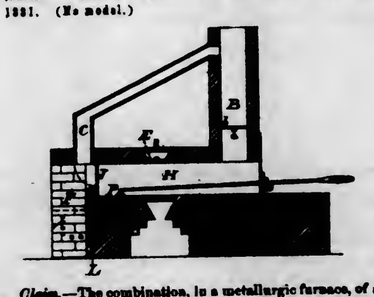
259,473. SAFETY HOD-ELEVATOR. GEORGE W. BROWN, New York, N. Y. Filed June 9, 1881. (No model.)

Claim.—1. A hod-elevating ladder composed of parallel endless chains connected with rounds, constructed and affixed substantially as specified.

2. A hod-elevating ladder composed of parallel endless chains connected with rounds, as described, and so located that one shall support the hod by its bowl and the next lower one afford a resting-place for its shank at the lower part thereof.

3. An endless hod-elevating ladder combined with a detachable hod having a notch in the bottom of the hod-bowl, near the middle of its length and the line of the center of gravity of the load, and suited to afford a seat for the hod-bowl on a round of the ladder.

4. A hod-elevating apparatus combined with and operated by worm-gearing and connecting mechanism.



5. An endless hod-elevating ladder combined with motive mechanism suspended therein and thereby, substantially as described.

259,474. CHURN. MICHAEL BROWN, FRANCIS J. MCFARLAND, and JOSEPH BROWN, Wapakoneta, Ohio. Filed Feb. 7, 1882. (No model.)

Claim.—In a churn, the U-shaped metallic bottom having the outwardly-flanged ends *b*, in combination with the grooved end boards, A, bent packing-strips *c*, and fastening-bolts *d*, and nuts *e*, substantially as specified.

259,475. DESULPHURIZING AND OXIDIZING ORE-FURNACE. WILLIAM T. BROWNE, Stockton, Cal. Filed Oct. 18, 1881. (No model.)

Claim.—The combination, in a metallurgic furnace, of an ore-roasting chamber, H, a fire-place, F, and an intervening bridge-wall, K, inclosing a pipe, L, for injecting hot air into the roasting-chamber, a chimney, C, leading directly from the fire-box, a chimney, B, communicating with the roasting-chamber, and a valve, J, which on being moved in one direction closes chimney C, and on being moved in the other direction shuts off the fire-place from the roasting-chamber without closing the hot-air supply through pipe L, all constructed, arranged, and operated as set forth.

259,476. WINDMILL. WILLIAM M. BRYAN, Ada, Ohio. Filed Apr. 17, 1882. (Model.)

Claim.—1. The tower A, consisting of the tube *a*, through which the pump-rod operates, the tube being supported by the angle brace-irons *e* and the braces *f'*, the said braces *f'* being secured to the spider *c*, having radial arms *c'*, for supporting the platform, and resting upon the collar *d*, rigidly secured to the tube, substantially as shown.

2. The wind-wheel consisting of the wheel G, rigidly secured to the shaft C, and the second wheel, G', loosely mounted and adapted to slide on said shaft, and being provided with the pivoted radial arms *g*, having the fans *g'* secured thereto, the arms *g*, having the rods *g'* rigidly secured to them at the inner ends of the fans, the outer ends of the rods *g'* being pivoted to the rods *g''*, which are pivoted to the wheel G, whereby the rods *g*, carrying the fans, may be turned so as to present the fans at any desired angle to the wind by sliding the wheel G' in or out upon the shaft C, substantially as described.

3. The wind-wheel consisting of the wheel G, rigidly secured to the shaft C, journaled upon the pivoted bracket B, and the second wheel, G', loosely mounted and adapted to slide upon the shaft C, the said wheel G' being provided with the hub *g^4*, having the annular groove *g^5*, in combination with the strap *d^1*, the ends of which are pivoted in the bifurcated ends of the weighted bent lever D, pivoted to the bracket B, and controlled by the rope F, the wheel G' being provided with the pivoted radial arms *g*, having

259,476.

the rods g' rigidly secured to them at the inner ends of the fans, the outer ends of the rods g' being pivoted to the rods g', which are pivoted to the wheel G, whereby the fans may be turned at any desired angle to the wind by raising or lowering the inner end of the weighted lever D, substantially as shown and described.

4. The pump-rod H, extending through the tube *a*, secured at its upper end to the sleeve *h*, which encircles the upper end of the tube *a*, the said sleeve being provided with a bearing-lug, *h'*, adapted to slide up and down against the inner edge of the bracket B, motion being imparted to the sleeve *h*, and through it to the pump-rod, by means of the connecting-rod e^2 and crank-disk *e*, secured to the inner end of the shaft C, all combined to operate substantially as specified.

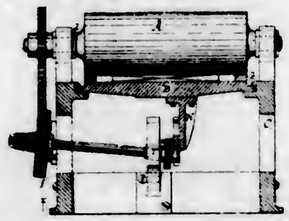
259,477. ELECTRIC ARC LAMP. FRANK H. DUNCAN, Plainfield, N. J. Filed Dec. 14, 1881. (No model.)

Claim.—1. In an electric lamp, the combination, with an adjustable carbon, of a rotary screw carrying the same, a non-rotary nut with which said screw engages, and which is composed of separable or expansible sections from which the screw may be readily disengaged when desirable, and an electric motor comprising a gear-wheel which is locked to said screw so that it will impart rotary motion thereto, and yet will not interfere with its longitudinal movement, substantially as specified.

2. In an electric lamp, the combination, with an adjustable carbon, of a rotary screw carrying the same, a non-rotary nut composed of separable or expansible portions which may be moved apart to release the screw, and a spring for holding said portions normally in engagement with the screw and for returning said portions when moved apart, substantially as specified.

3. The combination, with the screw B', of the non-rotary nut composed of portions C, each pivoted near one end and so arranged that when one portion is swung away from the screw its pivoted end will act upon the other portion forward of its pivot to swing it away also, substantially as specified.

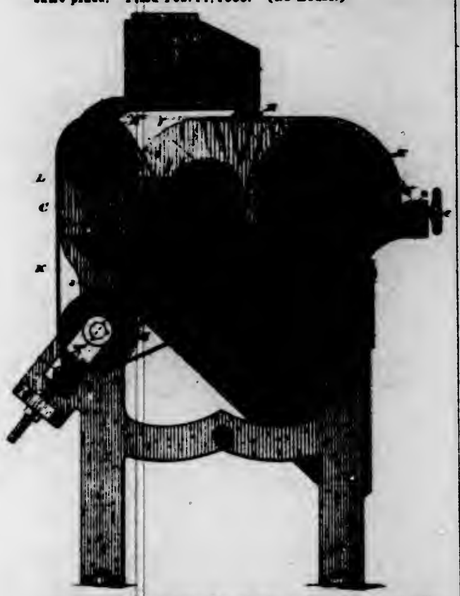
4. The combination, with the screw B', of the non-rotary nut composed of portions C, each pivoted near one end and so arranged that when one portion is swung out away from the screw its pivoted end will act upon the other portion forward of its pivot to swing it away also, and a spring for bearing upon one portion forward of its pivot to keep both portions in engagement with the screw, substantially as specified.



5. In an electric lamp, the combination, with means for adjusting or feeding a carbon, of the derived circuit N P, electro-magnet N' and its armature, electro-magnet P' and its armature and commutator, the circuit-breaker O O' O², the circuit-breaker Q Q', the catch *h*, and the stop *k'*, substantially as specified.

6. The combination, with the frame D D' D² and its attached suspending-rod F, and guides D², of the plate G, guided upon said rod, the rods G², fitting in said guides and supporting the lower carbon, the adjustable collars J on said rods G², the springs I, arranged between said guides and collars, and the electro-magnet H, all substantially as and for the purpose specified.

7. In an electric lamp, the combination, with a holder for one of the carbons, of a horizontal bar on which said holder fits, and on which the holder may be adjusted in the direction of the length of the bar to move its carbon laterally in one direction relatively to the other carbon, or turned to move its carbon laterally in another direction, and means for securing said carbon-holder upon said bar after adjustment, substantially as specified.



8. The combination of the bar D, containing a socket, the suspending-rod F, screwed into the upper side of said socket, and the screw F^2, forming a stop for said rod and adapted to be adjusted in said socket, so that the rod, when screwed down against it, will have its ring or eye standing at any desired angle, substantially as specified.

259,478. CYLINDER PRINTING-PRESS. ANDREW CAMPBELL, ANDREW C. CAMPBELL, and CHARLES H. CAMPBELL, Brooklyn, N. Y., assignors to Campbell Printing Press and Manufacturing Company. Filed Apr. 8, 1881. (No model.)

Claim.—In a cylinder printing-press, in combination with a gear-wheel attached to the impression-cylinder, constructed and adapted to be raised and lowered at alternate revolutions, a double-faced pinion mounted on an oscillating and rotary shaft whose point of oscillation lies without a plane equally dividing the face of the gear-wheel, whereby the teeth on each face of said pinion are caused to follow and alternately engage at a constant depth of engagement with the teeth of said gear-wheel in the raised and lowered positions of the cylinder in the operation of printing a sheet, substantially as set forth.

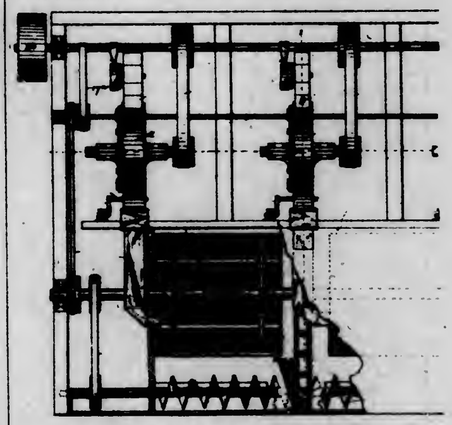
259,479. GRAIN-REDUCTION MACHINE. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Feb. 11, 1882. (No model.)

Claim.—1. The combination of rolls, pulleys thereon of different diameters, a feeding device and a pulley operating said feeding device, and an endless belt common to all.

2. The combination, with the cracking or crushing rolls A B, of the driving-pulleys I J on their respective shafts, the feed driving-pulley L, the tightening-pulley S, and a belt, K, common to all.

259,480. GRAIN-REDUCTION MACHINE. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Feb. 11, 1882. (No model.)

Claim.—1. The grinding-plate C, constructed with a yoke-shaped top, C', downwardly-projecting part c^4, and a chilled working-face, *c*, in combination with the casing and roll, the said grinding-plate being adapted to be hung on and lifted off the casing while the machine is in operation, substantially as herein described.



2. The saddle-piece I and support K, in combination with a grinding-roll and a grinding-plate, C, having yoke C', as set forth.

3. The saddle-piece I, formed with a rib or projection, *i*, in combination with means for supporting the same, grinding-plate C C', and set-screws J J, for transmitting the said grinding-plate relatively to the cracking-roll B, as set forth.

4. In a gradual-reduction machine, the combination of cracking-roll B and a series of two or more grinding-plates, C, having yokes C', means for independently adjusting said plates relatively to the cracking-roll, and a support common to all said grinding-plates, substantially as described.

5. The combination, with the grinding-plate C, having yoke C', saddle-piece I, and means for supporting said saddle-piece, of the rod M, spring N, and set-screw L, forming a stop to the grinding-plate, as set forth.

259,481. GRAIN-REDUCTION MACHINE. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Mar. 29, 1881. (No model.)

Claim.—1. A series of independent reduction-machines arranged in horizontal line, a single frame therefor, a single driving-shaft, and separate driving mechanism for each machine connected with said single shaft, in combination with suitable screens arranged beneath said reduction-machines, and conveyers from said screens, as set forth.

2. A single portable frame, a series of reduction-machines mounted in horizontal line therein, a single driving-shaft, and gearing for operating said machines independently of each other from said single shaft, in combination with a series of screens arranged beneath said reduction-machines, a series of elevators connected with the single driving-shaft, and a conveyer, substantially as set forth.

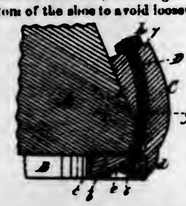
3. A single portable frame, a single driving-shaft, and a bran-cleaning machine, in combination with a series of reduction-machines mounted in horizontal line, a series of screens, a series of elevators, and a conveyer, the whole being independently operated from said single driving-shaft, as set forth.

4. A single portable frame, a single driving-shaft, and a crushing-machine, in combination with a series of reduction-machines mounted in horizontal line, a series of screens, a series of elevators, and a conveyer, the whole being independently operated from said single driving-shaft, as set forth.

5. A single portable frame, a single driving-shaft, and a flouring-machine, in combination with a series of reduction-machines mounted in a horizontal line, a series of screens, a series of elevators, and a conveyer, the whole being independently operated from said single driving-shaft, as set forth.

259,482. GAG-RUNNER. WILLIAM H. CHAPMAN, Middletown, Conn. Filed Apr. 12, 1882. (No model.)

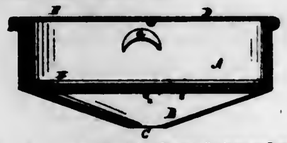
Claim.—The combination, with the curved frame C, having the central perforated bridge, B, of the loop A, provided with the spur D at its upper end, passing through the perforation of the



239,482.

frame and a bole in the bridle, whereby a single spur serves the double purpose of securing the loop to the frame and the frame to the bridle, substantially as herein shown and described.

259,483. TOE-WEIGHT. LUCIUS C. CRAIN, Boston, Mass. Filed Mar. 30, 1882. (No model.)



Brief.—The bolt which secures the weight has its head countersunk in the bottom of the shoe to avoid loosening the weight by concussion.

Claim.—1. The toe-weight C, provided at its lower end with a tang, *b*, adapted to be introduced between the shoe and the hoof, in combination with and held in place by a bolt passing through the shoe from its under side, and having its head countersunk, so that it will be above the lower surface of the shoe, and extending up through the tang and the body of the weight, and secured by a nut, A, applied to a thread at its upper end, and adapted to be screwed down upon or against the weight substantially in the manner and for the purpose described.

2. The combination, with the shoe B, of the toe-weight C, with its tang or projection *b*, fitting between the shoe and the hoof, and the curved bolt D, having its head countersunk in the shoe B, and adapted to extend upward through the shoe, tang *b*, and a curved aperture, *g*, in the weight C, and secured at its upper end by a nut, A, screwed down upon the end 7 or bottom of a recess in the weight C, substantially as and for the purpose set forth.

259,484. FLOUR-SIFTER. MARY E. CHAVERS, Covington, Mo. Filed Jan. 7, 1882. (No model.)

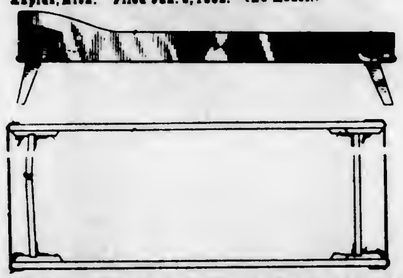
Claim.—1. As a new article of manufacture, a flour-sifter having a hinged cover and a contracted exit, as set forth.

2. In a flour-sifter, the casing A, cover D E, and conical bottom B, having the central orifice, C, as set forth.

259,485. CHAIR SLEEPING-CAR. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Mar. 3, 1882. (No model.)

Claim.—1. In combination, in a sleeping-car, and in combination, a collapsible berth having side pieces, one of which is directly attached to the side of the car, movable end pieces for holding the outer side pieces in extended position, and devices, substantially as described, for supporting the outer side of the berth, all arranged as shown, whereby the berth may be collapsed by horizontal movement upon or into the side of the car, as described.

2. In a sleeping-car, and in combination, a collapsible lower berth having side pieces, and movable end pieces adapted to hold the outer side extended or to permit it to collapse upon the inner, devices for securing the inner side to the car, supporting devices for the outer side, and removable seats or backs, all as shown.



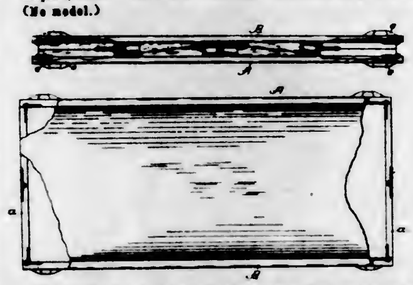
3. In a sleeping-car, a collapsible berth consisting of a side piece, *b*, attached to the car within the cavity of the wall thereof, hinged end pieces, and an outer movable side, *a*, in combination with a suitable cover and suitable supporting devices for the outer side, as set forth.

4. The combination, in a sleeping-car, of the upper berth adapted to collapse or fold sidewise against or into the wall of the car, supporting-cables, and end curtains attached thereto, forming the division between the sections for the upper berths, as set forth.

5. In a sleeping-car, the combination of a lower berth collapsible or folding into or upon the wall and supported upon adjustable legs, and an upper berth collapsible or folding against or into the wall and supported at its outer edge by cords attached to the ceiling, substantially as described.

6. In a sleeping-car, the combination of an upper and lower berth collapsible sidewise into or upon the wall of the car, and a flexible removable partition, E, held detachably to the berths by suitable fastenings, as set forth.

259,486. FOLDING SPRING-COT. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Jan. 6, 1882. (No model.)



Claim.—1. In combination with the side piece of a cot-bed, bench, or light structure, the folding leg formed with a partly-rounded end, and the block *c*, fitted thereto, adapted to bear against the leg and limit its movement, substantially as described.

2. The combination of the side piece, the partly-rounded leg, and block fitted thereto, and the cross-pieces adapted to brace against the legs, substantially as described.

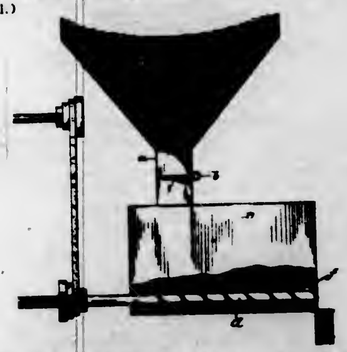
3. The combination of the spring-sides, folding transverse cross-pieces uniting said side pieces near the ends thereof, and the transverse cords adjustably attached to the lower corners, substantially as described.

259,487. FOLDING SPRING-COT. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Oct. 10, 1881. Renewed May 8, 1882. (No model.)

Claim.—1. A frame for cot-beds and the like, consisting of spring side pieces formed of elastic board set on edge, end pieces adapted to hold said side pieces in vertical position, and a cloth or flexible covering attached to the upper edge of said side pieces, as set forth.

2. The side frames, A A, formed of elastic boards set on edge, hinged end pieces, *a a*, and covering of cloth or other flexible material attached to the edge of the side frames, substantially as set forth.

3. The combination of the side pieces, A A, formed of boards set on edge, end pieces adapted to extend said side pieces, flexible covering attached to the upper edge of said side pieces, and the removable legs adapted to the cleats on the outside, as set forth.

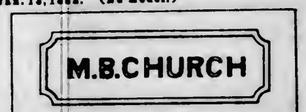


259,488. COATING AND PAINTING EXTERIOR SURFACES. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Jan. 18, 1882. (No specimens.)

Claim.—The improved process of covering exposed surfaces or walls, consisting in first coating said surfaces or walls with the described mixture of pulverized gypsum and glue, and then painting them, substantially as described.

259,489. MANUFACTURE OF PAPER BLANKETS. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Feb. 8, 1882. (No specimens.)

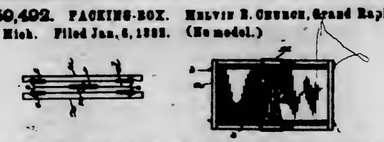
Claim.—A blanket formed of paper covered with a fibrous coating cemented thereon, as set forth.



259,490. FEED-REGULATOR FOR GRINDING-MILLS. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Oct. 7, 1881. (No model.)

Claim.—1. In a grinding-mill, a garner, a chamber, B, below the garner, a throat leading from the garner to said chamber, a feed-screw located in said chamber, properly driven, and having a close case covering it at the discharge end, said case leaving about one-half of the screw uncovered and exposed to contact with the material fed to the chamber, all the parts being combined substantially as described.

2. The combination of the screw *d*, the box or chamber containing the material to be fed, the casing *f*, open at both ends, and covering only part of the screw, as described, and suitable driving mechanism connected to that driving the stone, as set forth.



259,491. SIGN. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Jan. 18, 1882. (No model.)

Claim.—1. The process of forming a sign of plastic material upon a board, consisting, first, in forming a roughened panel or surface on such board; further, in covering that portion of the board outside the panel with oil or other material to prevent adhesion; further, in making a mold having sunken letters or other objects to be transferred; further, in filling such sunken letters and covering the face of the mold with plastic material; and, lastly, in pressing the mold against the previously-prepared board, whereby the roughened panel receives the impression formed in the mold and also a background of smooth plastic material.

2. An improved sign, consisting of a board or panel and a coating of plastic material attached thereto by pressure, and having raised letters or other objects formed on it.

259,492. PACKING-BOX. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Jan. 6, 1882. (No model.)

Claim.—1. The combination of the side pieces, *a a*, the end pieces divided into two equal parts and hinged at 6 and 7, and the cords or cables *b*, attached to the ends of the sides in the manner shown.

2. In a collapsible box, the combination of the top and bottom having the projections 10, the end pieces, the cord 11, connecting the top and bottom to such end pieces, and an intermediate device for straining the cord.

259,493. COVERING FOR WALLS. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Jan. 13, 1882. (No specimens.)

Claim.—1. A coating for walls, consisting of a mixture of finely-pulverized calcined gypsum mixed with glue in substantially the proportions specified, the whole laid thickly upon the wall, and having a rubbed and polished surface, substantially as described.

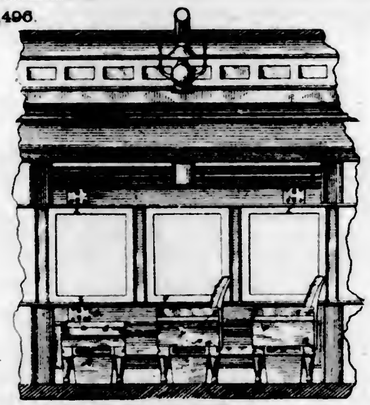
2. A coating for walls, consisting of a mixture of finely-pulverized calcined gypsum mixed with glue in substantially the proportions specified, laid thickly on the wall and polished, in combination with a surfacing of beeswax, substantially as described.

259,494. AUTOMATIC DRAFT-REGULATOR AND VENTILATOR. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Dec. 31, 1881. (No model.)

Claim.—A ventilator-pipe connected to the draft-pipe of the stove at the outside thereof, extending downward toward the floor and opening into the apartment only, in combination with the horizontal valves adapted to be opened upward by the draft and to close by gravity, substantially as described.

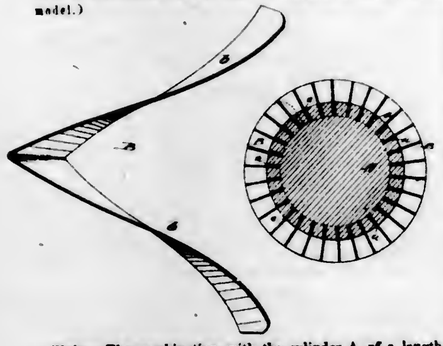
259,495. GRINDING-MILL. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Dec. 15, 1881. (No model.)

Claim.—1. In a grinding-mill, a lower stone adapted to be driven and formed with its face perfectly plain from center to skirt, in combination with an upper stone, said stones having a substantially smooth dress, and the upper stone dished substantially from eye to skirt in the manner described, whereby the spaces between the stones in zones of a given width on any part from center to skirt are made of equal capacity, all as set forth.



2. The improvement in the art of grinding, which consists in feeding the material to be ground between the stones, the lower one revolving and having a plain face and the upper one having a dished face, the dishing giving equal capacity to zones of equal width at different distances from the center in adjusting and regulating the feed to the speed of the stone, keeping them crowded full, in adjusting the speed of the stone to accord with the pressure necessary to the degree of fineness required, and in discharging the finely and uniformly ground material by centrifugal force, substantially as described.

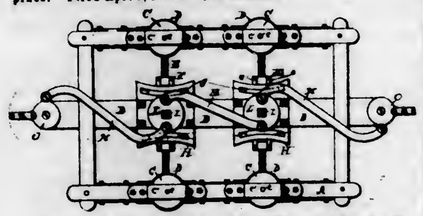
259,496. SLEEPING-CAR. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Mar. 3, 1882. (No model.)



Claim.—1. In a railway-car, fixed seats having removable backs and hinged ends, in combination with the described collapsible bed or cot, having flexible covering, and adapted to rest on said seats and to extend over or beyond them, substantially as described.

2. In a railway-car, and in combination, fixed seats having removable backs, a lower berth consisting of the collapsible frame, having flexible covering, adapted to rest on said seats, and an upper berth composed of the collapsible frame and flexible covering, with legs and holes for connection with the car and cords to support the outer edge, substantially as described.

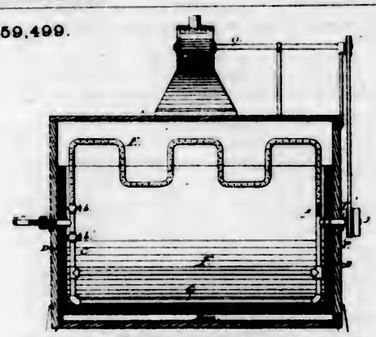
259,496.



259,497. CUTTER FOR LEATHER-WHITENING MACHINES. JOHN E. CLEMENT, Peabody, Mass. Filed Feb. 27, 1882. (No model.)

Claim.—The combination, with the cylinder A, of a length slightly more than its diameter, and provided with V-shaped grooves, of the V-shaped cutters B, provided with spiral wings *b*, and secured in the grooves of the cylinder by the strips of soft metal *a*, substantially as herein shown and described, and for the purpose set forth.

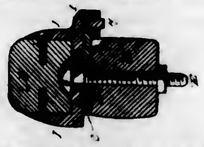
259,498. CAR-TRUCK. ERASTUS L. CLEVELAND, Pittsburg, Pa., assignor of one-half to Allen Cunningham Milliken, same place. Filed Apr. 6, 1882. (No model.)



Claim.—1. In a car-truck, the wheels E', axles E, and cylindrical bearings C, in combination with the segmental guides G, lever K, shafts I, and connecting-rod M, substantially as set forth.

2. In a car-truck, the wheels and axles E' E, mounted in the cylindrical bearings C, in combination with the segmental guides G, levers K, shafts I, connecting-rods M N, and the coupler O, as and for the purpose set forth.

259,499. FEATHER-RENOVATOR. ELLIS D. COLE, Northampton, Mass. Filed Apr. 26, 1882. (No model.)



Claim.—1. In a feather-renovator, the stirrer composed of the portions E F G, formed of tubing provided with cocks *b b'*, the first-named portion being perforated and the other portions being without perforations, as and for the purpose specified.

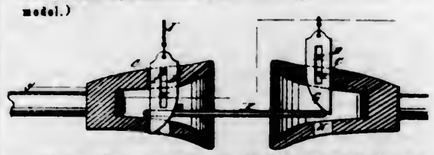
259,499.

2. The stirrer E F G, arranged in part for steaming and in part for drying, substantially as described, in combination with the metallic lining provided with steam-space D, as and for the purpose set forth.

259,500. WHIFFLETREE-PLATE. JOHN H. COMBS, Stamford, Conn. Filed Feb. 8, 1882. (No model.)

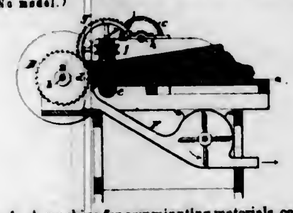
Claim.—The plate C, provided with an extension or flange F, having a square hole for the reception of the bolt E, and the slot G, in combination with the plate I, provided with the screw-pin H, and having the round opening for the reception of the flange F, and the bolt E, provided with a shank, all constructed and arranged substantially as and for the purpose set forth.

259,501. COUPLING FOR TUBING. EDMUND C. CRAVENER, Pittsburg, Pa. Filed Mar. 31, 1882. (No model.)



Claim.—1. In couplings for tubing, the combination of a coupling-collar having an annular recess at each end for the reception of calking material, and a series of wings extending across the mouth of each annular recess, with tubing having one or more lugs or projections at the end adapted to catch under the wings on the collar, substantially as and for the purposes set forth.

2. In couplings for tubing, the combination of the collar B, having central ring, *c*, annular calking-recesses *d*, and wings *e*, with the tubing A, provided with lugs *a*, having inclined edges *g*, substantially as and for the purposes set forth.

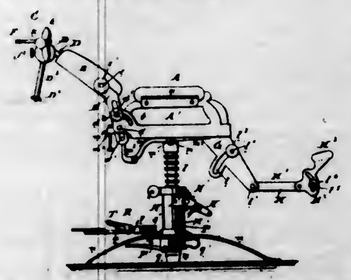


3. In a sleeve or collar for coupling tubing, having an inner central ring, *c*, and annular calking-recesses *d* at each end, the tapering inner faces, *b*, substantially as and for the purposes set forth.

259,502. CAR-COUPLING. ELMER A. CONVERSE and NATHANIEL T. GALVIN, Monticello, Ohio. Filed Apr. 18, 1882. (No model.)

Claim.—In a car-coupling, the flexibly-suspended plate-pin D, made flat, curved at the front lower edge, and slotted at H, in combination with a draw-bar having a cross-pin, I, in its top slot, and a lower slot of less length than the width of the plate, as shown and described.

259,503. STRAW-CUTTER. DANIEL M. CUMMINGS, Enfield, N. H., and NATHANIEL K. FRARY, Bradford, Vt. Filed Mar. 14, 1882. (No model.)



Claim.—1. A machine for comminuting materials, consisting of a gang of independent circular cutters arranged obliquely upon a shaft and parallel to each other, in combination with a bar or rest arranged opposite the cutting-edges, and with a platform supporting the material to be fed to the cutters, substantially as set forth.

2. The combination of the shaft *h*, gang B of independent circular cutters set obliquely, bar *d*, and feed-rolls *f e*, substantially as set forth.

3. The combination, with the cutters and means for driving the same and feeding the material thereto, of a blowing apparatus and conduits, whereby the material as fast as cut is carried away from the cutters, and is then conducted to the receptacle outside the machine by an air-blast, as specified.

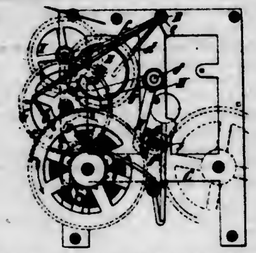
259,504. ADJUSTABLE CHAIR. EMERY B. CUSHING, Lancaster, N. H. Filed Mar. 23, 1881. (Model.)

Claim.—1. The combination of the base, the seat-supporting spindle provided with the circular ribs or teeth, movable endwise and capable of turning or swiveling in said base, the pinion-wheel acting upon the spindle to elevate it, and the crank-shaft N', journaled in lugs *p'* on the upright M', as shown and described.

2. The combination, with chair-seat frame A, having slotted rearward projections, and the back B, pivoted on rod *c*, of the slotted arms B', pins *d*, rod *d'*, and nut *d'*, as and for the purpose specified.

3. The combination, with the chair-back and head-rest, substantially as described, of the slotted ring D, rod D', grooved blocks D', the sliding tube D', provided with jaw *g*, the adjustable rod D', provided with jaw *g'*, and the nuts *f' g'*, as and for the purpose specified.

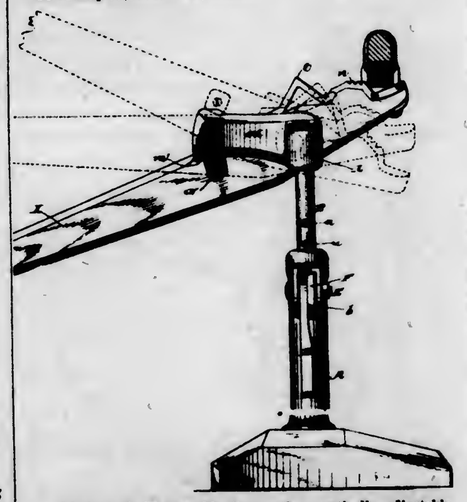
4. In an adjustable chair, the combination, with the slotted side bars, G, of the foot-board-supporting angle-arms H, rods *f' F*, and nut *F'*, substantially as herein shown and described, whereby the foot-board may be adjusted and held in position, as set forth.



5. In an adjustable chair, the combination, with the foot-board-supporting arms H, of the slotted pivoted lugs H', rod *f'*, and nut *F'*, and foot-rest H', substantially as and for the purpose described.

259,505. STRIKING MECHANISM FOR CLOCKS. WALTER D. DAVIES, Brooklyn, N. Y., assignor of one-half to Henry J. Davies, same place. Filed Jan. 31, 1882. (No model.)

Claim.—1. The lever H, having the two arms *g g'*, in combination with the hook-lifter *a*, for acting upon the arm *g*, and the spindle B, provided with arms *b c d*, on the latter of which the arm *g'* of the said lever H acts, substantially as herein described.



2. The combination, with the wheel J, provided with the pin *e*, and the spindle B, provided with the arms *b c d*, of the lever H, pivoted to one of the plates of the frame and having the arms *g g'*, the former of which is flexible laterally and the latter of which is

259,505.

adapted to act upon the arm *d* and to engage with the pin *e*, to serve as a lift-warning, and the hook-lifter *a*, for acting upon the arm *g*, substantially as herein described.

259,506. LIFTING-JACK. LEWIS H. DAVIS, West Chester, Pa. Filed May 19, 1882. (No model.)

Claim.—1. The combination, with a vertically-adjustable stock, of a locking device, a lifting-lever pivoted to said stock, and an arm extending from the latter and having one, or more than one, lip formed upon its edge or edges and adapted to engage with a catch upon the lever, substantially as described.

2. The combination, with a vertically-adjustable stock, of a locking device consisting of a slide-plate carrying a tooth or equivalent device and a cam-lever for operating said plate, a lifting-lever pivoted to said stock, and an arm extending from the latter and having one, or more than one, lip formed on its edge or edges to engage with a catch on the lever, substantially as described.

3. In a lifting-jack, the combination, with the standard and a stock moving vertically therein, of an eccentric locking device mounted upon an adjustable cam-bearing, whereby the throw of said locking device may be varied, substantially as set forth.

4. The combination, with the eccentric locking-lever, of the pivoted pin having a cam-shaped portion and provided with an arm adapted to engage with a series of detents upon the standard, substantially as described.

5. The combination, with the standard, the stock moving vertically therein, and the locking-lever having an eccentric, of the plate actuated by said lever and the pivot-pin upon which the latter turns, said pin having a cam portion and a locking-arm, substantially as set forth.

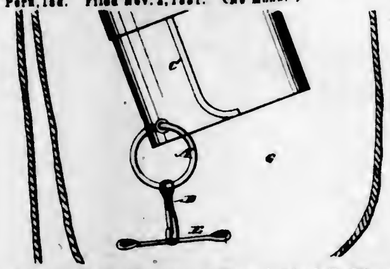
6. The combination, with the stock, of a head to which the lifting-lever is pivoted and an arm or extension formed on said head and provided with lips upon its upper and lower horizontal edges to engage with a catch upon the lever, substantially as set forth.

7. The combination, with the standard of the jack having lips formed upon its rear side, of the pivoted lever provided with a catch or projection at its end adapted to engage with said lips and hold the lever in a vertical position when not in use.

8. A standard for lifting-jacks, having on its interior cylindrical opening two plane-surfaced converging faces placed opposite the locking device, in combination with a stock moving vertically in said opening, substantially as described.

9. The combination, with the standard having the plane-surfaced converging faces *f' f'*, of the stock having perforations *a*, the locking-plate provided with a tost, *a'*, and the cam-lever for actuating said plate, substantially as described.

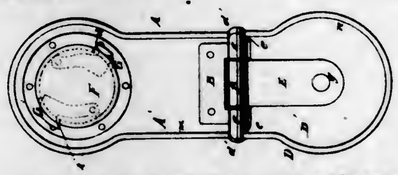
10. The combination, with the stock, of the head L, having an arm, M, provided with lips *m m'*, and lifting-lever I, having catch N, adapted to engage with said arm, substantially as described.



11. The combination of the standard A, having lips *l l'*, with the lifting-lever I, having catch *e*, substantially as described.

12. The combination of the standard A, having lips *l l'*, the stock B, the locking-plate C, and the lifting-lever I, provided with projection or catch *e*, substantially as described.

13. The combination, with the standard having ears *b b*, of the pivot-pin E, having a cam portion, *c*, the lever D, having an eccentric, *d*, the plate C, and the arm G, formed upon said pivot-pin and adapted to engage with notches or detents formed upon one of the ears on the standard, substantially as described.

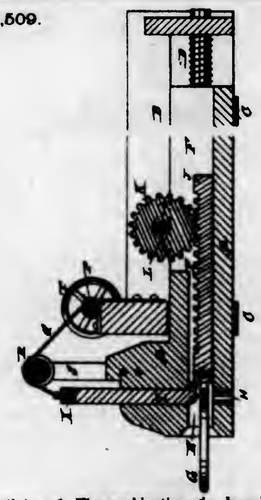


14. The combination of the standard, the stock moving therein, the locking-lever with its eccentric, the pivot-pin having a cam thereon, the extension-arm on the head of the stock having lips upon its edges, and the lifting-lever having a catch engaging with said lips, substantially as described.

259,507. **POCKET-BOOK SECURER.** THOMAS B. DENISTON, Penn, Ind. Filed Nov. 2, 1881. (No model.)

Claim.—The combination, with the pocket-book C, of the ring A, the snap-hook D, and the wire E, attached to the pocket G, substantially as herein shown and described.

259,508. **HASP-LOCK.** THOMAS DONAHUE and WILLIAM W. CONN, Terryville, Conn., assignors to the Eagle Lock Company, same place. Filed Feb. 13, 1882. (Model.)



Claim.—1. The blank A' for the hasp of a hasp-lock made of sheet metal, and provided with the tongue B, having offsets *c*, the opening C, and the side lugs, *d*, substantially as herein shown and described.

2. The blank D', for making the hinge-plate D of a hasp-lock made of sheet metal, and provided with the projecting tongue E, having perforation *f*, the end projections, *e*, and the perforation *g*, substantially as herein shown and described.

3. In a hasp-lock, the combination, with the hinge-plate D, provided with the hinge-loop *p* and the curved pointed projections *r*, and the pintle I, of the hasp A, provided with the hinge-loops *o* and the jaws *d'*, for securing the pintle in the hinge-loops, substantially as herein shown and described.

4. In a hasp-lock, the combination, with the hinge-plate D, provided with the raised edges *n* on its inner surface, and the projections *r*, of the hasp A, provided with raised edges *m* and the lugs *d*, substantially as and for the purpose set forth.

259,509. **CAR-COUPLING.** WILLIAM C. DONALDSON, Atchison County, Kans. Filed Apr. 7, 1882. (No model.)

Claim.—1. The combination of a draw-bar having a groove, F, for the link and a sliding bar, J, in said groove, connected to the link and adapted to slide the link forward and backward in said groove, substantially as specified.

2. The combination of the draw-bar having a groove, F, for the link, a sliding bar, J, in said groove connected to the link, and a toothed wheel and shaft for sliding said bar, the shaft being extended to the sides of the car and provided with crank or other devices for turning it, substantially as specified.

3. The combination, with a draw-bar having a groove, F, as described, of a sliding bar, J, in said groove having the link attached, and arranged to slide the link out and into the draw-head of another car, also to draw said link into said groove, substantially as specified.

4. The combination, with a draw-bar having a groove, F, as described, of a sliding bar, J, in said groove, having the link attached and arranged to draw said link into said groove behind the hole H, for the coupling-pin to allow the link of another car to enter and be coupled, substantially as specified.

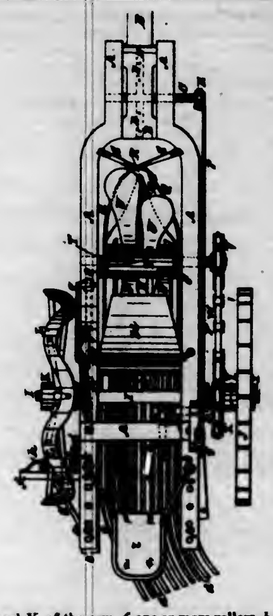
5. The combination, with the draw-head A, the shaft P, provided with the hand-wheels T, of the pin I, provided with the cross-head X, the chain Q, and the springs V, secured to the cross-head of the pin and to the draw-head, substantially as and for the purpose set forth.

6. The combination, with the draw-head A and the shaft P, of the coupling-pin I, provided with the head X, the chain Q, the guide-pulley B, the standards S, and the springs V, substantially as and for the purpose set forth.

259,510. **POTATO-DIGGER.** CHARLES W. DUTCHER, Milltown, St. Stephen, New Brunswick, Canada. Filed Sept. 8, 1881. (No model.)

Claim.—1. In a potato-digger, the combination, with the frame A and the tongue B, of the rod C, the armed lever E, the connecting-rods F, and the lever G, substantially as and for the purpose set forth.

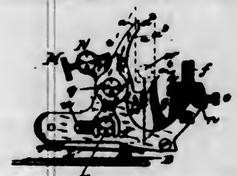
2. In a potato-digger, the combination, with the frame A and the scoop N, of the scraper Q, hinged to the forward part of the scoop, the arched bar B, and the adjustable suspension-rods S, substantially as and for the purpose set forth.



3. In a potato-digger, the combination, with the frame A, the share M, the scoop N, and the drive-wheel J, of the paddles U, the shaft T, carrying the paddles, and the chain and chain-wheels W V X, substantially as herein shown and described, whereby the potatoes are forced up the said scoop, as set forth.

4. In a potato-digger, the combination, with the frame A, the suspension-rods *i*, and the scoop N, of the shaker *c d*, curved to one side and provided with an offset in its bottom and a guard-strip at one side, substantially as and for the purpose set forth.

5. In a potato-digger, the combination, with the frame A, the hanger *c*, the scoop N, and the shaker *c d*, provided with the arm *f*, of the rod *b*, the bar *o*, and the lever *p*, substantially as and for the purpose set forth.



6. In a potato-digger, the combination, with the shaker *c d*,

259,510.

and the wheel K, of the arm *f*, one or more rollers, *h*, and the zig-zag rim L, substantially as herein shown and described, whereby the said shaker will be agitated by the revolution of the said wheel, as set forth.

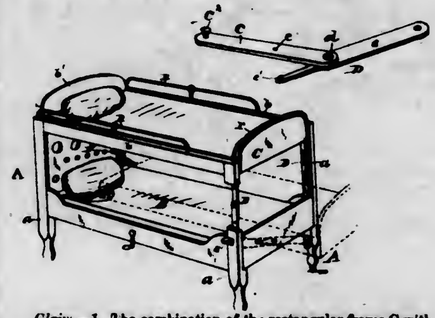
259,511. **RUFFLER FOR SEWING-MACHINES.** EDWARD F. EDMCOMB, Mechanic Falls, Me. Filed Feb. 23, 1882. (No model.)

Claim.—1. A vibratory presser-foot constructed and arranged to rest upon the gathering-blade, and adapted to be raised from the blade by the needle-bar nut while said blade is drawn back.

2. A vibrating presser-foot having hinged front portion held against the goods by spring-pressure, and having a lever or arm whereby said hinged front portion is adapted to be raised from the goods by the action of the needle-bar, substantially as set forth.

3. A presser-foot having the band-guiding slot *l*, with braid-guide *l'*, the piping-guiding slot *m*, with corded-piping guide *m'* formed in advance of the needle-slot *k*, substantially as and for the purpose set forth.

4. In a ruffling attachment, a ruffler-operating lever hinged in front of the needle-bar, and having its face toward the bar, and against which the needle-nut operates, formed with straight faces at its upper and lower ends, and a central cam portion to permit of the motions of said lever being made in different lengths of time relatively to the motions of the needle-bar.



5. The combination, with the feed-cover B, secured to the cloth-slide A, of the cloth-guide *b c*, adapted to be secured to said feed-cover with capability of reversal, substantially as and for the purpose set forth.

6. The combination of ruffling-blade I, slotted slide K, having stud *r*, frame C, having stud *t*, forked lever H, having projection *c*, the operating-lever G, having lug or projection *z*, and stop *d'*, the adjusting-screw M, working within the projection *z*, and the set-screw N, passing through the end of said projection *z* and engaging with the screw M, substantially as and for the purpose set forth.

7. The combination, with the frame C, having slot *u*, and stud *t*, of the slotted slide K *p*, ruffler-blade I, secured thereto, stud *r*, and devices, substantially as shown and described, for operating said slide.

8. A ruffling attachment consisting of a presser-foot having hinged and slotted front portion, a spring-arm for actuating the same, operating cam-lever, a slotted slide carrying the ruffling-blade, slotted frame in which said slide works, a lever adapted to operate said slotted slide, an adjusting-screw for limiting the oscillatory movement of said slide-operating lever, and a feed-cover secured to the cloth-plate, and a cloth-guide secured to said feed-cover, substantially as and for the purpose shown and described.

259,512. **DOUBLE BED.** JOHN A. ELDRIDGE, Chicago, Ill. Filed Apr. 10, 1882. (No model.)

Claim.—1. The combination of the rectangular frame C with the hinged elevating-bars D, substantially as shown and described.

2. The bars D, composed of two parts, *c* and *e*, hinged at *d*, and provided respectively with an opening, *c'*, and projection *e'*, whereby the pieces may be held rigid, forming one continuous bar, or left free to turn at *d*, substantially as described and shown, and for the purpose set forth.

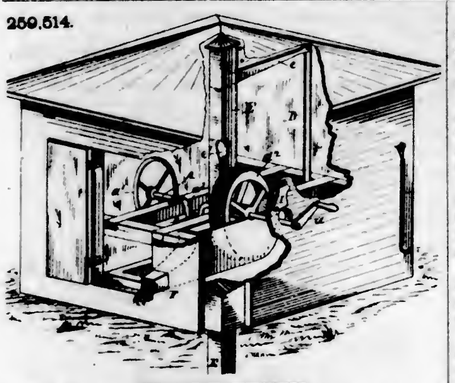
3. The bedstead A A, having extended posts *a*, connected at the top by pieces *b*, in combination with rectangular frame C and the hinged elevating-bars D, substantially as described and shown.

259,513. **ADJUSTABLE MOUTH-PIECE FOR CORNETS.** FERDINAND F. ELLIS and JOHN R. ROWLANDS, Oneida, N. Y.; said Rowlands assignor to said Ellis. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a mouth-piece for musical instruments, the combination of an inner cup, B, and an outer lip-cup, A, adapted to slide inward and outward thereon, the two cups together forming an adjustable bell-shaped air-chamber of ordinary form, and having an open mouth, and a spring for pressing said lip-cup outward relatively to said inner cup and holding it with a yielding pressure, substantially as and for the purpose specified.

2. The combination, with the inner cup and its tube, having an external shoulder, of the lip-cup and its shouldered sleeve, fitting outside said inner cup and tube, and a spring arranged between said sleeve and tube, with its ends bearing against the shoulders thereon, substantially as and for the purpose specified.

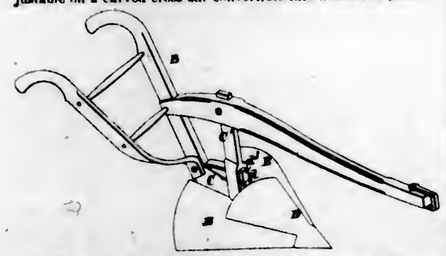
3. The combination of the lip-cup A, its sleeve A', with the shoulder *a*, the inner cup, B, its tube B', the spring *d*, and the nut *e*, substantially as specified.



4. The combination of the lip-cup A, its sleeve A', with the shoulder *a*, the inner cup, B, its tube B', the spring *d*, and adjusting-nut *e*, and a stop for limiting the inward movement of said lip-cup upon said inner cup, all substantially as specified.

259,514. **PUMP.** ARNE HENON and JOHN A. ANDERSON, Augusta, Kans. Filed Mar. 17, 1882. (No model.)

Claim.—1. In combination with the main shaft having the wheel a^4 with buckets, and the crank a^3, intermediate mechanism, substantially as described, and a pump of proper construction, as and for the purpose set forth.

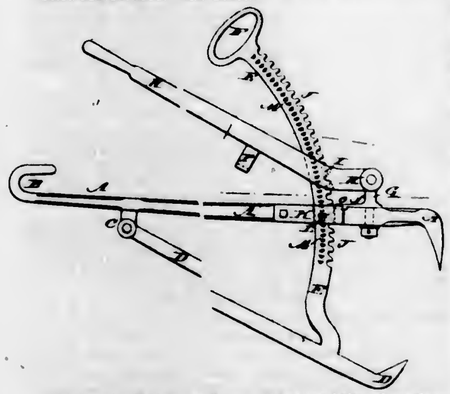


2. In combination with the main shaft A, having the cranks a a^3, and wheel a^4, the connecting-rods B D, the bar C, and pump E, as described.

259,514.

259,515. SHOVEL-PLOW. JOHN H. FELDMANN, St. Louis, Mo. Filed Dec. 7, 1881. (No model.)

Brief.—Convex mold-boards hooked under the share and adjustable on a curved cross-bar convertible into a side-hill plow.



Claim.—1. The combination of the mold-boards E E, each formed with a sleeve, e^3, having set-screw f', the share D, and shoe C, having rigid cross-bar F, whose ends enter the sleeves e^3, the said mold-boards being hinged to the said share, as and for the purpose set forth.

2. The combination of shoe C, having projections d' d', the bow-shaped share D, having arm d, bifurcated standard C', and the wedge d^3, as set forth.

3. The combination of the adjustable mold-boards E E, each formed with a hook, e, the share D, having eyes c' c', the shoe C, and cross-bar F, as set forth.

259,516. SAW-MILL DOG. JAMES B. FISCH, Bozeman, Mont. Filed Jan. 14, 1882. (No model.)

Claim.—1. An improved saw-mill dog consisting of two dogs hinged together, a curved rack-bar attached to one dog and passing through the other, and pivoted lever provided with teeth engaging with the teeth of the said rack-bar, substantially as herein shown and described.

2. In a saw-mill dog, the combination, with the upper dog, A, and the rack-bar E, attached to the lower dog and passing through a slot in the said upper dog, of the lever H, provided with the teeth I, and pivoted to the swiveled stud G on the said upper dog, substantially as and for the purpose set forth.

3. In a saw-mill dog, the combination, with the upper dog, A, and the curved rack-bar E, provided with teeth M on its side, of the spring-pawl K L, secured to the side of the said upper dog and engaging the side teeth of the said rack-bar, substantially as and for the purpose set forth.

4. In a saw-mill dog, the combination, with the swiveled stud G, carrying the lever H, and the spring-pawl K L, of the arm N, having lip O, substantially as herein shown and described, whereby the spring-pawl can be thrown out of gear by the lateral movement of the operating-lever, as set forth.

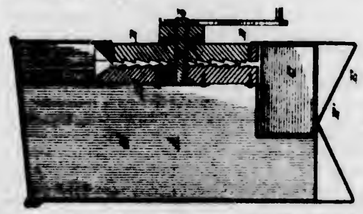
5. In a saw-mill dog, the combination, with the upper dog, A, and the arm N of the swiveled stud G, of the lip Q, substantially as herein shown and described, whereby the lateral movement of the operating-lever is limited, as set forth.

6. In a saw-mill dog, the combination, with the upper dog, A, and the rack E, provided with the teeth J, of the lever H, swiveled to the said dog, and provided with the teeth I and the downwardly-projecting bent arm P, substantially as herein shown and described, whereby the lever can be locked out of gear with rack-bar, as set forth.

259,517. WATCH-PENDANT. EZRA C. FITCH, New York, N. Y. Filed Feb. 15, 1882. (No model.)

Claim.—1. A watch pendant bow or ring formed with flat stiffening webs or flanges extending around its inner circumference on either side of the crown, substantially as and for the purpose set forth.

2. A watch pendant ring formed with webs or wings extending from its inner circumference above the crown, and across, or nearly across, the interior of the ring, forming stops to prevent the movement of the chain-swivel against the crown, substantially as herein set forth.



3. A watch pendant bow or ring formed with a flange or projection at or near its socketed end or ends adapted to underlie the edge of the crown when the ring is placed in its parallel position, and thereby form a stock or lock to hold the crown in its retracted position, substantially as and for the purpose set forth.

4. A watch pendant ring formed with the flanges f f extending around each half of the ring, circumscribing the crown and separated above the crown at or near the middle of the ring, substantially as and for the purposes set forth.

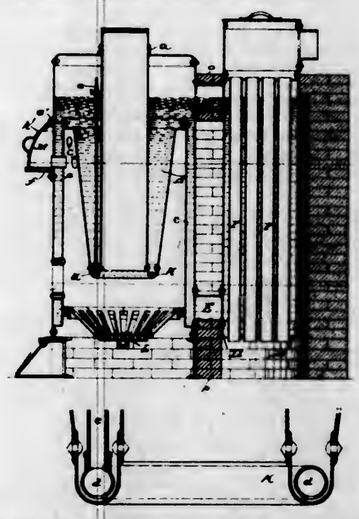
5. A watch pendant ring formed with a plain part at or near its middle opposite its cleft portion, with flanges extending around the interior of the ring from said plain portion to or near the cleft, substantially as herein shown and described.

6. A watch pendant ring formed with flanges projecting interiorly therefrom in a parallel plane therewith and solid or integral with the substance of the ring, substantially as herein shown and described.

259,518. COFFEE-MILL. WM. H. FLEMING, Thorp's Spring, Tex. Filed Oct. 31, 1881. (No model.)

Claim.—In a coffee-mill, the combination of the case A, having the chambers a' a^4 and the hopper a, the burr or grinding-disk B', fastened to the lower end of the inner side of the hopper a and to the upper side or top of the chamber a^4, the burr or grinding-disk B, shaft b, having a disk, b', revolving in a covered recess or chamber in the burr B', bridge c, screws d, and handle D, substantially as and for the purpose set forth.

259,519. BRICK-KILN. ANDREW H. FORBES, Camden, N. J., assignor to Hugh Hatch, Stockton Township, Camden County, and Joseph Hatch, Camden, N. J. Filed Jan. 3, 1882. (No model.)



Claim.—1. The combination of the kiln having the central chamber, D, with the external fire-places, B, communicating with said chamber D through flues a, each consisting of a simple recess or depression in the inside of the wall of the kiln, as set forth.

2. The combination of the kiln having the central chamber, D, fire-places communicating therewith, and exit-flues G G, located at the opposite sides of the kiln, and communicating with the chamber D near the bottom, through independently-valved openings c, as set forth.

3. The combination of the kiln having the chamber D, the fire-places B, the flues a, the central discharge-flue, F, with openings b, and the side exit-flues, G, with their independently-valved openings c, as set forth.

4. The combination of the kiln having fire-places B and chamber D, the central outlet-flue, F, side outlet-flues, G G, end connecting-flues, H, and valves or dampers d and g, as specified.

259,520. BASE-BURNING BOILER. ARTHUR H. FOWLER, Newark, Ohio. Filed Nov. 22, 1881. (No model.)

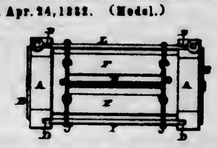
Claim.—1. The combination of a boiler having a water-space, a central magazine surrounded by a water-space, an interior smoke-chamber surrounding the said water-space, and a connected exterior smoke-chamber between the boiler and its brick setting.

2. In combination with the water-jacket, the ring K, containing the pipe d, having the continuous opening in its lower side and connected to the blow-off pipe, as described.

3. In a boiler having double walls, a central magazine, a water-space surrounding the said magazine, an interior smoke-space, and a series of short tubes connecting the said smoke-space with an exterior chamber, M, arranged as shown.

4. In a boiler, the external chamber, M, formed of flanges e f, and having doors or covers b, in combination with brick-work extending partially around the boiler and forming a smoke-space, the said chamber being closed in front, but open at the sides for communication with said smoke-space.

5. The combination of the boiler having fire-place, fuel-magazine, inner and outer water-spaces, and exterior and interior connected smoke-spaces, of a secondary or auxiliary boiler having a water-space communicating with the main water-spaces of the principal boiler, vertical tubes, and a smoke-space communicating with the exterior smoke-space of the main boiler.

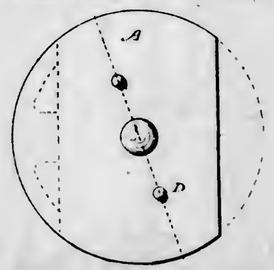


259,521. BOY'S CAP. AARON FRANKENBERG, New York, N. Y. Filed Apr. 20, 1882. (No model.)

Claim.—1. A boy's cap composed of a stiff band and of a crown that is attached to the upper edge of the band by the binding of the same, substantially as set forth.

2. A boy's cap composed of a stiff exterior band, of a crown secured directly to the upper edge of the band by the edge-binding, and of a lining that is attached to the lower edge of the band-covering and to the band, substantially as specified.

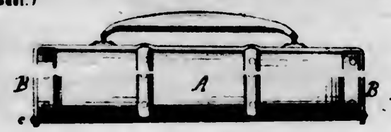
259,522. COOP OR CRATE. LEONHART P. FROESCHER, Bruce, Ky. Filed Apr. 24, 1882. (Model.)



Claim.—1. A coop or crate composed of the grooved side pieces, the end pieces which are held between the side pieces by means of clamping-bolts, and the flexible top and bottom parts, which are slipped into the grooves made in the inner edges of the side pieces, substantially as shown and described.

2. In a crate or coop, the combination of the side pieces, A, provided with the grooves D E, end pieces, F, and bolts P, with the series of strips I L, secured to the cords or bands J, substantially as described.

3. In a coop or crate, the combination of the two series of strips I L, secured to the flexible connections J, the series of strips I secured adjacent to each other on the flexible connections, and the strips L secured apart from each other on the connections J, substantially as set forth.

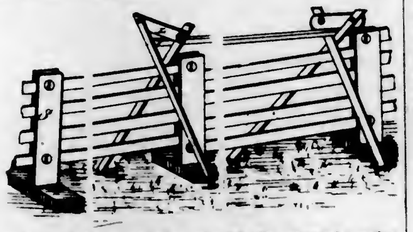


259,523. ROTARY BOLT. WILLIAM H. GAGE, Chicago, Ill., assignor of one-half to William R. Clark, same place. Filed Mar. 1, 1882. (No model.)

Brief.—A circular flat plate cut away at one side is pivoted at its center to a base, which carries spring-actuated pins for locking said cut-away plate in a fixed position.

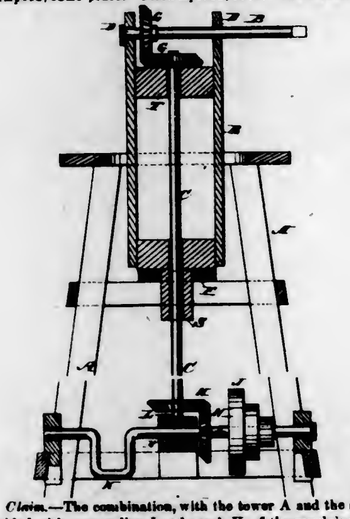
Claim.—The combination, with the plate B, having the recesses a^3 a^3, of the springs b b', the locking-catches C' C', the push-pins D D, and the rotating plate A, substantially as described.

259,524. METALLIC VALISE. ALBINUS H. GARDNER, Darien, and JOHN NORTH, Middletown, Conn. Filed Apr. 27, 1882. (No model.)



Claim.—1. A sheet-metal valise consisting of the body portion or portions, formed of a single sheet of metal, and provided with the heads or ends B, substantially as described.

2. The body portion A, formed of sheet metal, having transverse strengthening ribs or corrugations re-enforced by metal strips lying upon said ribs and secured thereto, substantially as described.

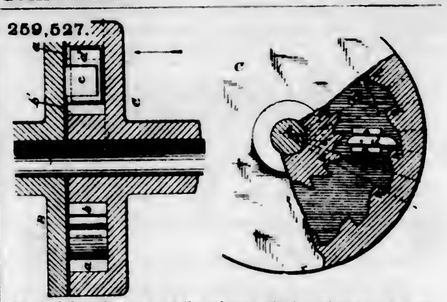


3. The improved article of manufacture, a sheet-metal valise having each part of its body formed of a single sheet of metal, with a flanged metal head or end slipped over its edge and secured thereto, the body portions being braced by flat elastic strengthening plates interiorly applied at suitable intervals and extending transversely throughout the entire inner face of each part, substantially as described.

259,525. FENCE. JOHN M. GARRISON, Stillwaterville, Ind. Filed Feb. 7, 1882. (No model.)

Claim.—A fence consisting of solid sills, of panels resting upon said sills, of automatically-adjusting non-pivoted cross-stakes resting upon the top of the panel at the point where they cross, and having their lower ends resting against pegs, of a rider resting in the crotch of the cross-stakes, and of a brace attached to the upper ends of the cross-stakes, and which, when the parts have been set in place, locks them together, substantially in the manner described, and for the purpose set forth.

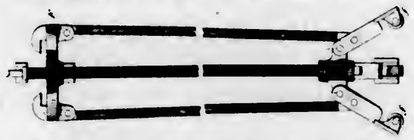
259,526. WINDMILL ATTACHMENT. A. JUDSON GARY, Denison, Iowa, assignor to himself, Henry S. Gullick, and Edward S. Plimpton, same place. Filed Apr. 12, 1882. (No model.)



Claim.—The combination, with the tower A and the shaft I, provided with cone-pulley J and crank K, of the revolving frame E, provided with the sleeve-extension S and bearings D T, the wheel-shaft B, the vertical shaft C, and the gear-wheels G H, substantially as and for the purpose set forth.

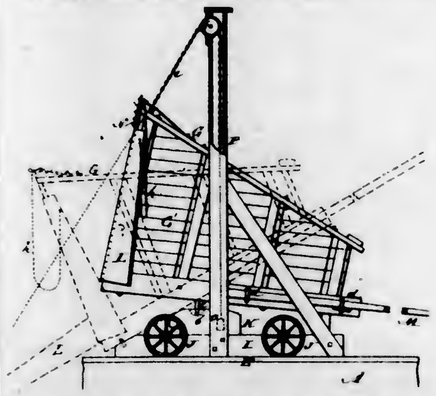
259,527. CLUTCH. CHARLES J. GIBSON, Bergen Point, N. J. Filed May 13, 1882. (No model.)

Claim.—1. A clutch consisting of the combination of two rotary sections, one of which has two sets of ratchet-teeth, *a* and *b*, with the right-line faces of one set in different radial lines from



259,527.

those of the other set, and the other of which sections carries a radially-vibrating dog, *d*, arranged in the plane of the ratchet-teeth of the other section, as and for the purpose described.



2. The clutch-section B, having guide-lugs *c c* and dog *d*, with beveled end faces, in combination with the clutch-section C, having two sets of ratchet-teeth, *a* and *b*, with the teeth of one set alternating radially with those of the other section, substantially as and for the purpose set forth.

259,528. WIRE-DASHER. JOSEPH F. GILPIN and ERNEST V. CLEMENS, Ansonia, Conn. Filed Mar. 6, 1882. (No model.)

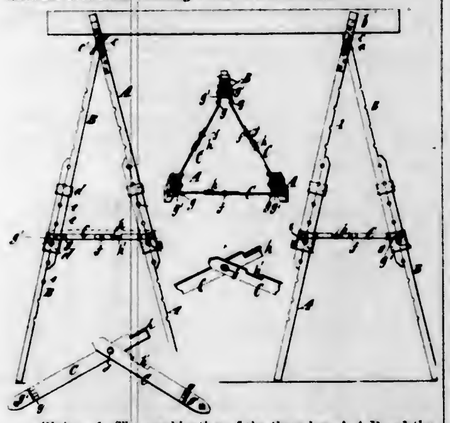
Claim.—The combination of the central lifting-rod provided with arms hinged to its foot, and means, substantially as described, to secure the arms in substantially a horizontal plane and to release them, the arms being provided at their outer end with rolls *f*, substantially as described.

259,529. COALING LOCOMOTIVES AND CHUTE THEREFOR. CORNELIUS GORMAN, De Soto, and WINTHROP BARTLETT, St. Louis, Mo. Filed Apr. 27, 1882. (No model.)

Claim.—1. The method herein described of coaling locomotives by means of a portable chute hung to rock or tilt upon a truck by which it is carried, coaling-platforms having a track or tracks for the truck portion of the chute to run upon, and intersecting inclined tracks for conveying the coal to the platforms, said inclined tracks and platform-tracks being arranged at a higher elevation than the main track, essentially as herein set forth.

2. The combination, with the main track B, of the coaling-platforms A A, the tracks E E, arranged upon or crossing said platforms, the bridge-rails F, and one or more intersecting inclined tracks, C, substantially as and for the purpose herein set forth.

3. The coaling-chute G, constructed of a box or body part having a hinged apron, L, arranged to form when raised a closed end to said body and when lowered a delivery-spout or extension of



said chute, and a truck upon which the body of the chute is mounted with freedom to rock endwise, substantially as shown and described.

4. The body G of the chute, supported by rocker-arms *c* in bearings *b* on or in a truck by which said body is carried, in combination with the apron L, hinged below to said body, and made self-closing when relieved from the weight of coal on its interior surface, essentially as herein set forth.

5. The combination of the self-closing latch N with its attached operating-lever Q, and the hinged apron L at the end of the chute for operation in relation with each other, substantially as herein described.

259,530. SCAFFOLD-SUPPORT. JOSEPH GORMAN, Elizabeth, N. J. Filed Dec. 14, 1881. (No model.)

Brief.—The folding legs of a tripod scaffold-support are connected by braces, which consist of two sections pivoted together and hinged to end plates pivoted to said legs. The pivoted sections are held from buckling downward by a strap.

Claim.—1. The combination of the three legs A A B and the braces C, composed of sections pivoted together at *f*, and having stops *k*, substantially as specified.

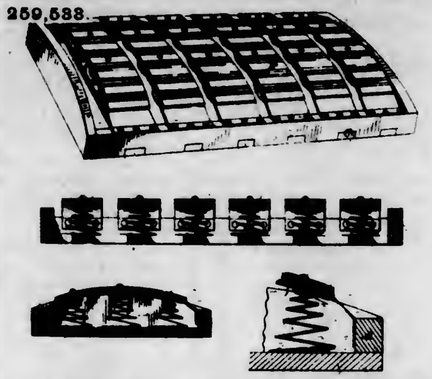
2. The combination, with the legs of a tripod scaffold-support, of the braces C, each composed of two sections pivoted together, and the end pieces or plates, *g'*, to which the braces are hinged, and which are themselves pivoted to said legs, substantially as specified.

259,531. CURTAIN-POLE. GUSTAVE H. GRIMM, Hudson, Ohio. Filed Jan. 30, 1882. (No model.)

Brief.—Overhanging lips are formed on the curtain-pole, which screen the place of attachment of the curtain to the pole.

Claim.—1. A tubular curtain-pole having depending lips, rooted in or part of its body, overhanging and screening the edge of the curtain hung to such pole, substantially as and for the purpose set forth.

2. A tubular curtain-pole wherein the wooden body M, having embedded in it the metal tube D, forms overhanging lips to screen the edge of the curtain hung to such pole, substantially as and for the purpose set forth.



259,532. FIRE-PROOF COMPOSITION FOR SAFES, &c. THOS. GURNEY, Chelsea, Mass. Filed Mar. 13, 1882. (No specimens.)

Claim.—The fire-resisting composition substantially as described, consisting of infusorial earth, silica, asbestus, diluted sulphuric acid, and fire-clay, mixed or combined essentially as set forth.

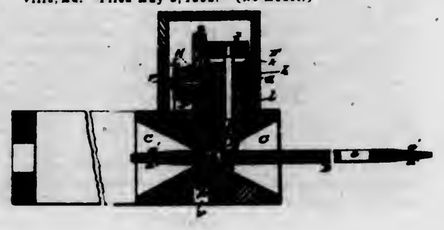
259,533. SEAT. HENRY S. HALE, Philadelphia, Pa. Filed Jan. 3, 1882. (Model.)

Claim.—1. In a seat having a main frame, the combination of

259,533.

the following elements, viz: several independent spring-sections arranged transversely across the seat, several flexible bands of fibrous fabric respectively extended entirely across the top of the spring-sections and supported independently of each other, and wooden slats arranged in several independent transverse rows, which are respectively attached to the flexible band, substantially as set forth.

2. In a seat having a main frame, the combination of the following elements, viz: several independent spring-sections arranged transversely across the seat, several flexible metallic bands respectively secured to the tops of the spring-sections, several flexible bands of fibrous fabric respectively extended independently of each other across and beyond the tops of the spring-sections and fastened to the sides of the main frame, and wooden slats arranged in several independent rows which are transverse to the seat, the slats being transverse to the metallic bands, substantially as set forth.



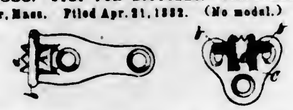
3. In a seat having a main frame, a series of removable spring-sections, each section having two or more springs, a separate band of flexible fibrous fabric extending over and secured to the tops of the springs of the series and adapted to have its ends secured independently of the other bands to the inside of the main frame, a series of wooden slats above the flexible fibrous fabric, and a removable bar below the series of springs attached to the lower side of the main frame, whereby the sections are removable downwardly independently of each other, substantially as set forth.

4. In a seat, two or more spring-sections, each formed of a single row of springs, a series of wooden slats supported by said single row of springs independently of the springs of the other sections and situated transversely to the row of springs below it, and intermediate connecting devices which secure said series of wooden slats to the springs below it, substantially as set forth.

5. A spring-section composed of a row of springs, a metallic spring-band supported wholly by said row of springs, a series of slats arranged contiguously to each other transversely to the metallic spring-band, fastening devices which pass through some of the slats and the metallic band, and means for holding the unperforated slats to prevent them from lateral or vertical displacement relatively to the spring-band, substantially as set forth.

6. A spring-section composed of a row of springs, a supporting-bar below them, a metallic spring-band across the tops of the springs, wooden slats supported entirely upon said row of springs and metallic band, and arranged contiguously to each other, and flexible connecting devices situated outside of the series of slats adapted to be fastened to the frame for steadying the upper portion of the spring-section, substantially as set forth.

259,534. CAR-COUPLING. GEORGE M. HARBAUGH, Sabillasville, Md. Filed May 3, 1882. (No model.)

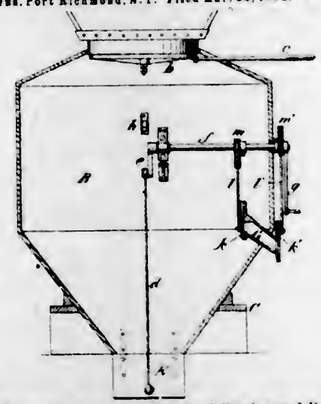


Claim.—1. In a car-coupling, a link-operated vertically-reciprocating trip, K, in combination with a pin-raising lever having a jointed arm, R, terminating in a prop-catch, *z*, substantially as specified.

2. In an automatic car-coupling, the abutment G, above the draw-head, having the guides *g*, passage *k*, and stop *s* at the upper end of said passage, the bevel-headed vertically-reciprocating trip K, the pin-slide H, the pin-lever L, having a raised arm, R, and the pivoted prop-catch *z*, substantially as specified.

3. In an automatic car-coupling, the combination, with a flat solid link-bar, D, having pin-slots near each end, and a draw-head having a narrow throat, *a*, of a pin-lever, L, a prop-catch, *z*, jointed thereto, a pin pivoted thereto, a vertically-reciprocating trip, K, and a stop, *s*, substantially as specified.

4. In a car-coupling, the removable abutment-guide G, having the arms *b'*, seated in apertures *c'*, extending downward into the draw-head, and in connection therewith the transverse horizontal passage *d'*, intersecting the apertures *c'*, the transverse horizontal pins *e'*, seated therein and passing through perforations in the arms of the abutment, and the end fastenings, substantially as specified.



259,535. STEP FOR BICYCLES. GEO. F. HARWOOD, Worcester, Mass. Filed Apr. 21, 1882. (No model.)

Claim.—1. The step A, having the row of upward-projecting saw-like teeth *a* and the surrounding laterally-projecting guard-flange *b*, substantially as and for the purposes set forth.

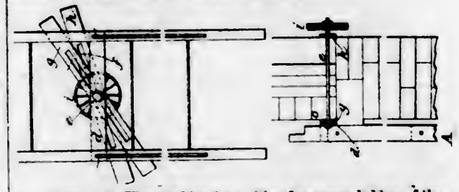
2. The combination, with the back-frame in a bicycle, of a step consisting of the metal loop A, provided with attaching-plate C, and having upwardly-projecting teeth *a* and laterally-projecting guard-flange *b*, as shown and described.

259,536. AUTOMATIC GRAIN-SAMPLER. WASHINGTON HAWES, Port Richmond, N.Y. Filed Mar. 23, 1882. (No model.)

Claim.—1. In an apparatus for delivering or delivering and measuring grain and other substances in bulk, the combination, with the receptacle or chamber down through which the material being measured or delivered passes, of an automatic measuring sampler or toller arranged to tap said receptacle or chamber, and provided with reversely-operating valves at its opposite ends, and means for actuating the same at intervals, substantially as specified.

2. The combination, with a measuring-receiver having a discharge-valve at or near its lower end, of an automatic measuring sampler or toller arranged to tap said receiver, and provided with reversely-operating valves at its opposite ends, and mechanism for actuating the discharge-valve of the measuring-receiver and valves of the measuring-sampler in timely relation with each other and by the same application of power to a prime mover or shaft, essentially as and for the purposes herein set forth.

3. In apparatus for measuring grain and other substances, the combination, with a measuring-receiver having a discharge-valve at or near its bottom, and a platform-scale on which said receiver is carried, of an automatic measuring sampler or toller arranged to tap said receiver, and provided with reversely-operating valves at its opposite ends, and mechanism for actuating, by the same application of power, the discharge-valve of said receiver and valves of the measuring-sampler in timely relation with each other, substantially as specified.



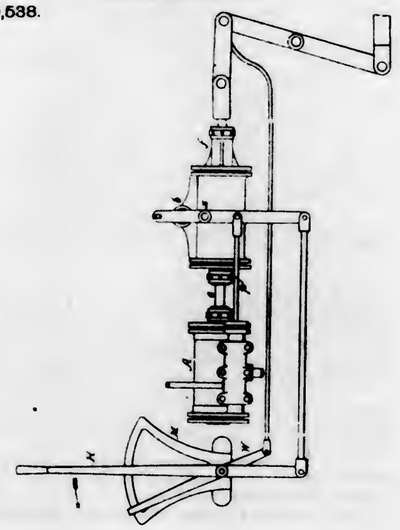
4. The combination, with the measuring-receiver B, provided with a discharge-valve, E, of the rock-shaft *f*, capable of operation from the exterior of said receiver, the rod or connection *d*, and the crank *e*, arranged in relation with said valve as herein described, and whereby the valve is held closed by the crank when reaching its upper dead-center, and is quickly released and opened in the back action of the crank, essentially as specified.

5. The measuring sampler or toller G, fitted with the slide-valves *k k'* at its opposite ends, in combination with the reversely-set eccentrics *m m'*, the rock-shaft *f*, and the rods or connections *l l'*, substantially as specified.

6. The combination, with the measuring-receiver B, provided with a discharge-valve, E, of the rock-shaft *f*, the rod *d*, and crank *e*, the reversely-set eccentrics *m m'* upon said shaft, the rods *l l'*, and the measuring sampler or toller G, with its opposite end valves, *k k'*, essentially as and for the purposes herein set forth.

259,537. FIRE-ESCAPE LADDER. WILLIAM H. HAWKINS, Albany, N. Y., assignor of one-half to Joseph Walter, same place. Filed Mar. 9, 1882. (No model.)

Brief.—Reversible ladder-sections are secured to the building by adjustable clamping-bars placed inside the window, and secured by a bolt passing through slots in them, and secured to a plate vertically adjustable on or in the ladder-rails.

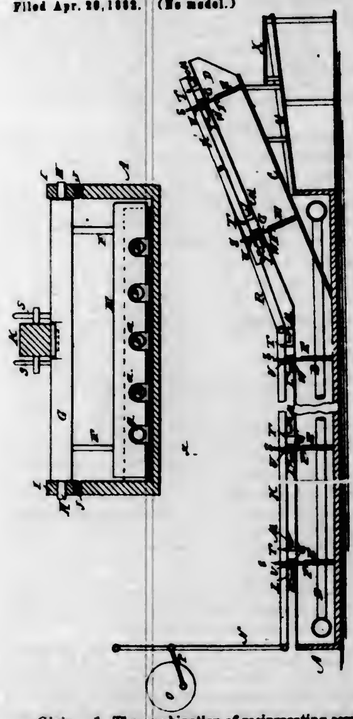


Claim.—1. The combination, with a fire-escape ladder, of the vertically-adjustable plate *d*, carrying the bolt *e*, adjustable clamping-bars *g h*, and adjustable hand-wheel *i*, all substantially as set forth.

2. The combination, in a fire-escape ladder, of one or more adjustable clamping-bars, *g h*, substantially as shown, for the purpose specified.

3. As a new article of manufacture, the reversible fire-escape ladder A, constructed and combined with means for securing it to the side of the building, substantially as shown, for the purpose specified.

259,538.



259,538. REVERSING-GEAR FOR LOCOMOTIVES. WILLIAM P. HUSSEY, Philadelphia, Pa. Filed Nov. 7, 1881. (No model.)

Claim.—1. The combination of the steam-cylinder A and its piston, a valve for admitting steam to and exhausting it from the said cylinder, the hydraulic cylinder having a piston connected to that of the steam-cylinder, a valve for opening and closing a communication between the opposite ends of the said hydraulic cylinder, and mechanism for operating both valves simultaneously, the two valves and the ports relating thereto being constructed substantially as herein set forth, so that on moving the valves in either direction that of the steam-cylinder will always act in advance of that of the hydraulic cylinder, as described.

2. The two cylinders and their connected pistons, the valves, and the hand-lever H, for operating the same, in combination with the stand M, its graduated segment, the pointing-lever W, and mechanism by which the piston-rod of the two cylinders is caused to actuate the said lever, all substantially as specified.

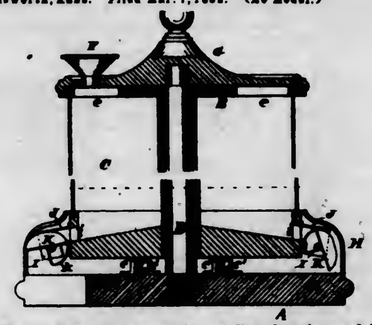
259,539. SALT-GRAINER. HENRY N. HOWLETT, Oscoda, Mich. Filed Apr. 20, 1882. (No model.)

Claim.—1. The combination of reciprocating scrapers E and an inclined discharging-way, C, with the evaporating and graining vat A, substantially as described.

2. The combination of reciprocating and oscillating scrapers E and an inclined discharging-way, C, with the evaporating and graining vat A, substantially as described.

3. The combination, with a graining or evaporating vat, A, having a steam heating-coil, B, of reciprocating scrapers E, having notches *a*, and straddling the pipes of the heating-coil, substantially as described.

4. The combination, with the graining-vat A, of scrapers E, rock-shafts G, and reciprocating bearings I, for said rock-shafts, arranged on ways J upon the sides of the vat, substantially as described.



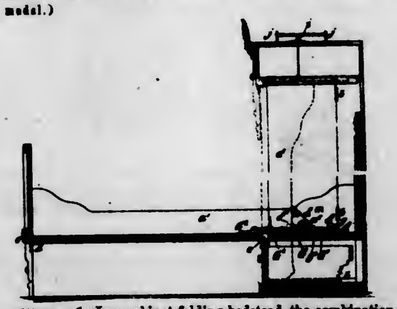
5. The combination of reciprocating bar K, having shoulders L and M, and pins T and V with the scrapers E, rock-shafts G, and stop-pins W, substantially as described.

6. The combination, with the vat A and inclined way C, of a series of scrapers in the vat and a series of scrapers on the said inclined way, substantially as described.

7. The series of scrapers on the inclined way, and the operating-bar K', connected to the operating-bar K of the series of scrapers in the vat, substantially as described.

8. The combination of table X and conductor Y with the vat A, having discharging-scrapers, and the discharging-way C, substantially as described.

259,540. REVOLVING SHOT-CASE. HERMAN F. HOSSMAN, Ellsworth, Kans. Filed Mar. 7, 1882. (No model.)



Claim.—1. In a receptacle for retailing shot, the revolving case C, divided into compartments provided with cut-offs, which are inclosed by a shield, H, secured to the base A, substantially as set forth.

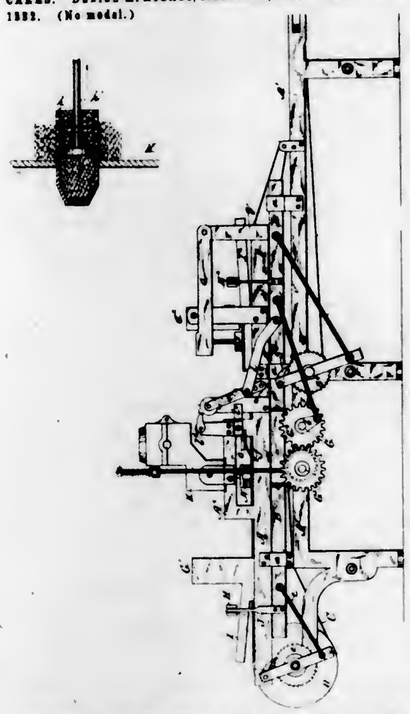
2. The combination of base A, post B, case C, partitions D, friction-rollers *e*, cut-offs J, shield H, cover G, and funnel F, all constructed and arranged substantially as and for the purpose set forth.

3. The cut-off I, consisting of case J and chute K, pivoted within the case, and formed with downwardly-curved portion *k*, adapted to close the rear opening, *i*, of the case when the front end of the chute is depressed, as set forth.

259,541. CABINET FOLDING BEDSTEAD. JAMES H. HOLLY and JOHN C. KNAPP, Warwick, N. Y. Filed Mar. 22, 1882. (No model.)

Claim.—1. In a cabinet folding bedstead, the combination of a resting-surface composed of a stationary section and a section hinged to a stationary portion of the bedstead, both having sides whose adjacent ends are coincident when the hinged section of the resting-surface is extended for use, and the hinged section having its sides extending beyond the hinges which connect it with the stationary portion of the bedstead, and adapted to swing downward below the hinges when the said hinged section is folded upward, substantially as specified.

2. In a cabinet folding bedstead, the combination of a resting-surface composed of a stationary section and a section connected by hinges *c* to a stationary portion of the bedstead, the sides of said sections having their ends cut at double angles a^2 a^3 and a'^2 a'^3, and the slots *d'*, through which the sides of the hinged section work when the latter is folded, substantially as specified.



3. In a cabinet folding bedstead, the combination, with a resting-surface composed of a stationary section and a hinged section, of the spring G_1, the rod G', attached to the stationary section, a plate, G^1, on the hinged section, with which the rod is connected and bearings for the spring, substantially as specified.

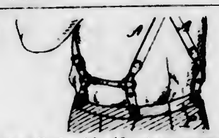
4. In a cabinet folding bedstead, the combination, with a resting-surface composed of a stationary section and a hinged section, of the spring G, the rod G', attached to the stationary section,

plate P on the hinged section, with which the rod is connected, the bearing *f'*, and the nut *g'*, substantially as specified.

5. In a cabinet folding bedstead, the combination, with a resting-surface composed of a stationary section and a hinged section, of a top or hood hinged or having a front section hinged in place, and a spring or springs for aiding in raising the latter, substantially as specified.

259,542. MACHINE FOR JELLYING AND DECORATING CAKES. DANIEL M. HOLMES, Cincinnati, Ohio. Filed Jan. 25, 1882. (No model.)

Claim.—1. The combination of the main belt C, the series of cake-holders C', with subjacent plate *f*, the bar H, having push-plates *g*, and the slide-bars A, connected to the bar H, substantially as and for the purpose described.



2. The paste-feeding devices consisting of a paste-box, a series of pockets opening into the paste-box and terminating in nozzles below, and a set of plungers arranged in said pockets; in combination with a feed-belt and a lift-plate arranged beneath the belt, as described, to lift a row of cakes against the nozzles, as and for the purpose described.

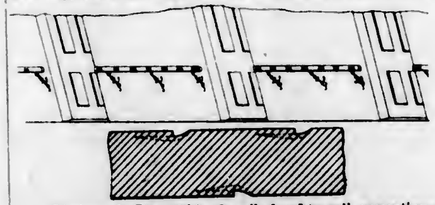
3. The combination, with the paste-box having pockets in the bottom of the same, of a set of plungers working in said pockets and arranged, as described, to alternately discharge paste through the nozzles at the bottom of said pockets and then cut off the supply in the box from the nozzles, as shown and described.

4. The combination, with the paste-box, of a receptacle, substantially as described, having an open upper end, and perforations in the side and a plunger fitting within the same and adapted, as described, to draw the paste in through the said perforations when the plunger rises, and to force it out in definite quantity and cut it off from the supply in the box when the plunger descends, as described.

5. The combination, with a feed-belt and means for supplying jelly to the cakes thereon, of a cake-feeding device, a table or plate located above the belt and having holes with flexible margins, and a set of plungers for forcing the cakes through said holes and on top of the jellied surfaces of cakes on the belt below, as described.

259,543. SUSPENDERS. JOHANN W. HÜLTHING, Barmen, Germany. Filed Apr. 15, 1882. (No model.)

Claim.—1. Suspenders constructed, substantially as herein shown and described, with side straps connecting the front and rear rings, to which the button-hole straps and the bands are attached, as set forth.



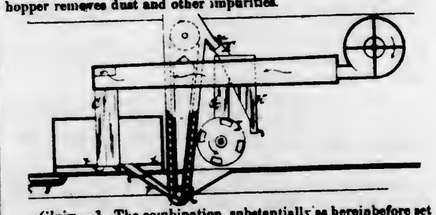
2. The combination, with the suspender-bands A, of the loops B, the rings C, the button-hole straps D, and the straps L, attached to the ring C and to the front ends of the bands or parts attached to the front ends of the bands, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the suspender-straps A, of the loops B, the rings C, the button-hole straps D, the straps L, the button-hole straps K, the rings J, the loops H, the buttons G, the tongues F, and the buckles E, attached to the same, substantially as herein shown and described, and for the purpose set forth.

4. Suspenders composed of crossed straps having their front and rear ends connected by intermediate straps at each side, and provided with four button-hole straps adapted to be secured on four buttons secured on the upper band of the pants equidistant to the front and rear of the side seam of the pants, substantially as herein shown and described, and for the purpose set forth.

259,544. MEANS FOR FACILITATING SPEEDY EXIT FROM BUILDINGS IN CASE OF FIRE OR ALARM. EDWIN H. HOWARD, Baltimore, Md. Filed Mar. 3, 1882. (No model.)

Brief.—Guide-rails are placed along corridors, stairways, &c., having a smooth surface when the hand is passed over it one way and a rough or obstructed surface when the hand is passed over it in the opposite way, as a guide to the exits in case of fire or alarm.

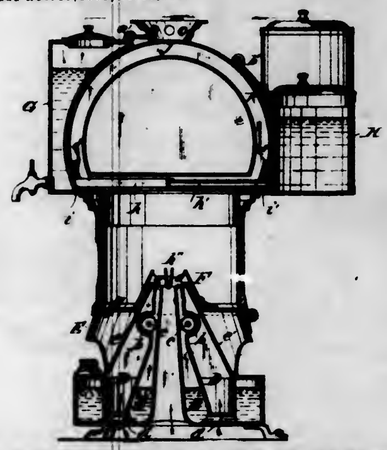


Claim.—1. The within-described safety-rail, presenting a smooth or rough or obstructed surface as the hand is passed over it in one direction or the other.

2. Combined with a building, corridor, avenue, or stairway, a safety-rail presenting a smooth or rough or obstructed surface as the hand is passed over it in one direction or the other, substantially as set forth.

259,545. MACHINE FOR TREATING AND BAGGING COFFEE. GEORGE W. HUSSENFORD and GEORGE S. HUSSENFORD, New York, N. Y. Filed Jan. 18, 1882. (No model.)

Brief.—The coffee-berries, after being treated in the passage A and in the bins, are passed to and through the elevator, whence they are discharged by means of the swival-spout either through the feed-hopper, which conveys them to the polishing-chamber, or through the bagging-hopper. A suction-flue attached to the feed-hopper removes dust and other impurities.



Claim.—1. The combination, substantially as hereinbefore set forth, of the coffee-bins having perforated false bottoms, the air-chamber communicating with the coffee-bins beneath their false bottoms, the fan-blower connected with the air-chamber, the elevator, a passage for conducting the coffee from the bins to the elevator, and devices, such substantially as set forth, for delivering the coffee from the elevator either to a miller or polisher or directly to a receiving-hopper.

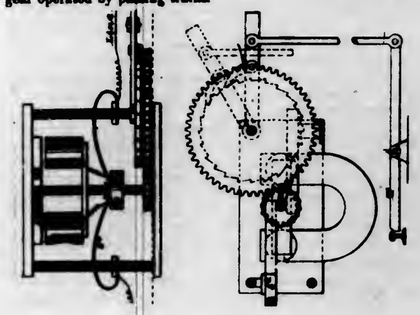
2. The combination, substantially as hereinbefore set forth, of

the scourer or polisher and its feed-hopper, the bagging-hopper located adjacent to the feed-hopper, the elevator having a swivel-spout, whereby it is adapted to discharge into either the feed-hopper or bagging-hopper, the receiving-hopper at the discharge end of the scourer, connected to the elevator, and the coffee-bins connected to the elevator, for the purpose specified.

3. The combination, substantially as hereinbefore set forth, of the receiving-hopper, the suction-flue extending from the receiving-hopper, and the trap in the suction-flue with the scourer and elevator, for the purpose set forth.

259,546. OIL-STOVE. JAMES INDDALE, Toronto, Ontario, Canada. Filed Nov. 4, 1881. (No model.) Patented in Canada Nov. 10, 1881, No. 13,881.

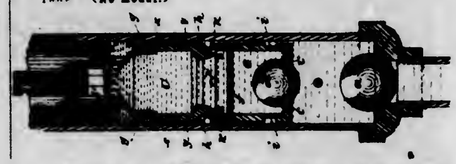
Claim.—1. In an oil-stove, the combination, with the wick-tubes B, the air-passages D, and the housing E, provided with the shelf *g*, of the hinged cap F, substantially as and for the purposes set forth.



2. In an oil-stove, the combination, with the housing E, of the collar I and the oven J, provided with the jacket K and outlet-openings *j*, substantially as and for the purpose set forth.

3. In an oil-stove, the combination, with the jacket K, provided with the openings *i i'*, of the vessel H, provided with the hollow arm *h'*, and projecting into the combustion-chamber under the oven, substantially as and for the purpose set forth.

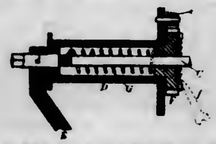
4. In an oil-stove, the combination, with semicircular jacket K, provided with the openings *i*, of the water-vessel G, made to conform in shape on one side to the said jacket, and provided with the hollow arm *h*, and secured thereto by the hooks and eyes *a'*, substantially as and for the purpose set forth.



259,547. MAGNETO-ELECTRIC RAILWAY-SIGNAL. JOHN B. JOHNSON and ORVILLE B. JOHNSON, Boston, Mass. Filed Jan. 21, 1882. (No model.)

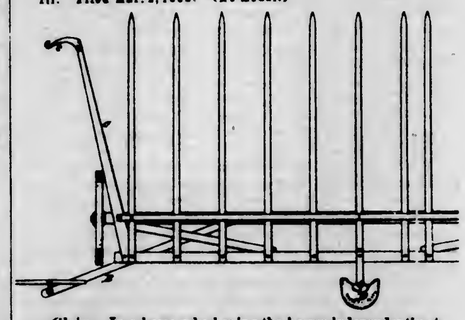
Brief.—A signal which is set mechanically for action by passing trains is unset or displayed by means of a merged or continuous current of electricity generated by a rotary magneto-machine in which the revolving armature is driven through multiplying-gear operated by passing trains.

Claim.—A rotary magneto-machine consisting of a revolving armature, with two induction-coils driven rapidly within the field of a set of permanent magnets by means of multiplying-gear, and devices connecting said gear with a railroad-track, and operated by passing trains of cars, in combination with a signaling mechanism set mechanically by the train, and adapted to be unset by means of a merged or continuous current of electricity generated by said magneto-machine, as hereinbefore described and shown.



259,548. PUMP. HARRY JONES, Sterling, Ill. Filed Apr. 10, 1882. (No model.)

Claim.—1. In a pump, the hollow plunger C, of cylindrical shape, having valve *d*, valve-seat *e*, top and bottom channels, *g* and *i*, and central annular channel, *h*, and provided with oblique ducts *k*, slanting from the intermediate annular chamber or channel, *h*, in a downward direction toward the interior of the hollow plunger, substantially as and for the purpose herein shown and set forth.

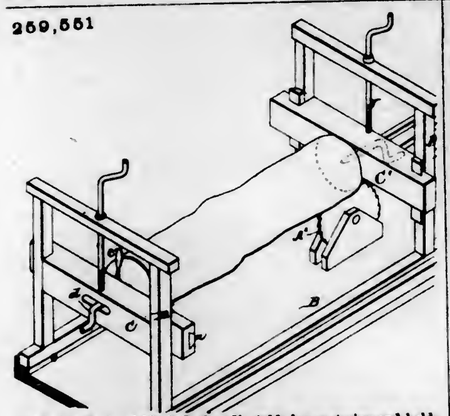


2. In a hollow pump-plunger having a valve and valve-seat of suitable construction, a series of ducts, *k*, opening obliquely from the inside of the hollow valve to an annular chamber or channel, *h*, on its outside, substantially as and for the purpose herein shown and set forth.

259,549. GAS-MACHINE. CLARENCE M. KEMP, Baltimore, Md. Filed Feb. 9, 1881. (No model.)

Claim.—In combination with the tank A, rotary shaft C, and winding-drum D, having the pawl *e*, the ratchet-wheel F, with teeth on its periphery and inner face to engage respectively with the pawls *e* and *f*, as described, and coiled spring G, the same being wound around the said shaft C and forming the connection between the outer end of the said shaft and the outer face of the said ratchet-wheel, substantially as and for the purpose specified.

259,550. HORSE HAY-RAKE. MARTIN H. KENAGA, Monmouth, Ill. Filed Mar. 2, 1882. (No model.)



Claim.—In a horse-rake having the horses independently attached at the ends of the rake, the projecting draft-bars B B, in combination with the projecting poles C C, for hitching the horses forward, whereby they may back the rake from beneath its load, substantially as described

259,551. HEAD-BLOCK. CONRAD KUSTER, Weston, W. Va. Filed Jan. 14, 1882. (No model.)

Claim.—1. The combination of the vertically-adjustable head and foot blocks of the carriage B, the laterally-adjustable bar *a*,

259,551

applied to the head-block C, the adjustable leg centering and holding device *d*, passing freely through the head-block and tapped through the bar *a*, the extension *b* on this bar, provided with a notch, and the lever *c*, for adjusting the bar endwise, substantially as described.

2. The combination of the saw mounted on a stationary bed, the rectilinear reciprocating carriage on this bed, the vertically-adjustable head and foot blocks, the adjustable head-center *d*, the laterally-adjustable bar *a*, and the lever *c*, for adjusting this bar, substantially as described.

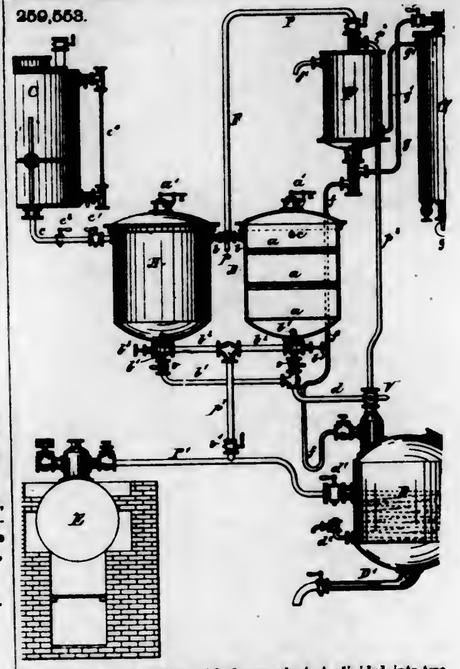
259,552. NUT-LOCK. ALBA T. KINGSLEY, Millport, N. Y. Filed Apr. 26, 1882. (No model.)

Claim.—1. A nut-lock consisting of a nut provided with an interior annular groove, *a*, situated near its bearing-surface, and having said bearing-surface beveled from the edge of the hole to the sides of the nut, substantially as shown and described.

2. In a nut-lock, the combination of the nut A, provided with an interior annular groove, *a*, and having its bearing-surface beveled, with the bolt B and plates to be secured together, substantially as described.

259,553. METHOD OF AND APPARATUS FOR CURING TOBACCO. RICHARD KISSLING, Bremen, Germany, assignor to Fabrik Nicotin Freier Tabacke Patent, Dr. R. Kissling & Co., same place. Filed Nov. 19, 1881. (No model.)

Claim.—1. The method of denicotinizing tobacco which consists in decomposing the nicotine into a nicotine chloride and malic-acid calcium by means of chloride of calcium, as described.



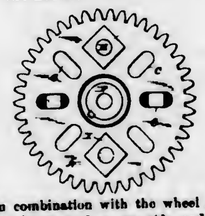
2. The method of denicotinizing tobacco which consists in first steeping the same in a solution of chloride of calcium and then subjecting it to the action of steam under pressure, as and for the purpose specified.

3. In an apparatus for denicotinizing tobacco by means of a calcium solution and steam, the combination of a solution-reservoir, one or more digesting-vessels divided into two or more chambers by perforated diaphragms, a steam-generator, and suitable valve-connecting pipes between the digesting vessel or vessels, the solution-reservoir, and the steam-generator, substantially as and for the purpose specified.

4. In an apparatus for denicotinizing tobacco by means of an alcoholic solution of chloride of calcium and steam, and for recovering the alcohol, the combination of a solution-reservoir, one or more digesting-vessels, a steam-generator, a still, a receiver for the water of distillation, a condenser, and suitable valved pipes connecting the digesting vessel or vessels with the reservoir, the generator, the still, the receiver for the water of distillation, and the condenser, substantially as and for the purpose specified.

5. The combination, with the vessels A A, of the pipes *b'*, having valves *c*, the pipe *d*, the pipe *p*', having three-way valve V, the still D, the receiver F, and condenser G, substantially as and for the purpose specified.

259,558.

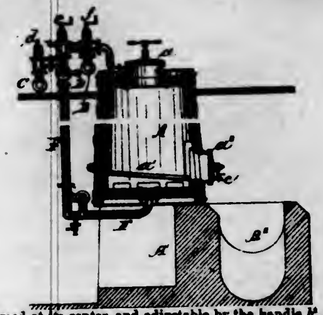


6. The combination, with the vessels A A, divided into two or more chambers by means of perforated diaphragms, the reservoir C, and suitable valved connecting-pipes, of the pipes *b'*, having valves *b'*, the pipe *p'*, having valve *v'*, the pipe P', and the generator E, substantially as and for the purpose specified.

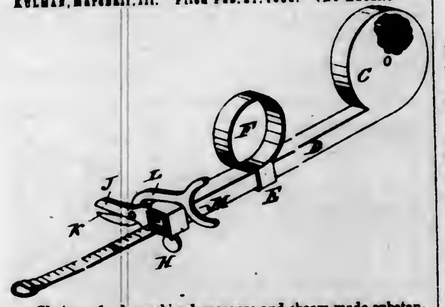
7. The combination, with the vessels A A, of the pipes *b b*, having three-way valve *p*, the pipe P, receiver F, pipe *p'*, and condenser G, substantially as and for the purpose specified.

8. The combination, with the vessels A A, the pipe P, receiver F, condenser G, still D, and pipes *f p*', the latter having three-way valve V, of the valved pipes *b' d b' p'* P', and the generator E, all arranged for operation substantially as and for the purpose specified.

259,554. LOOM-GEAR. CHAS. S. KNIGHT, Selma, Ala. Filed May 1, 1882. (No model.)



Claim.—In combination with the wheel A, provided with cogs on its periphery, recessed on one side, and having a central and a series of radial openings, the disk D, adapted to fit in the recess of the wheel A, having a hub, E, and apertures G, and adapted to be secured to the wheel by means of screw-bolts, substantially as specified.



259,555. APPARATUS FOR EXTRACTING TANNIC ACID. OTTO KOHLRAUSCH, Vienna, Austria-Hungary. Filed Feb. 20, 1882. (No model.) Patented in Austria Aug. 8, 1878, No. 16,879; in Hungary Aug. 8, 1878, No. 2,089; in England Feb. 13, 1880, No. 627; in France Apr. 9, 1880, No. 134,979; in Belgium June 30, 1880, No. 51,756; in Luxemburg Jan. 6, 1881, No. 104; in Germany Jan. 28, 1881, No. 12,896, and in Italy Mar. 8, 1881, 15, 13,668, XXV, 249.

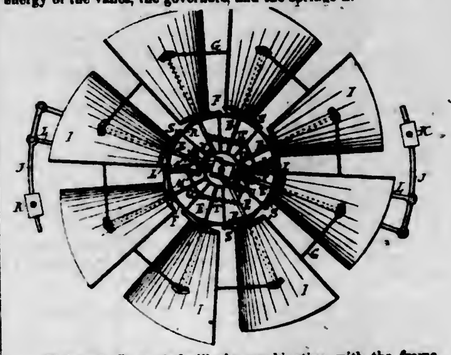
Claim.—The tank A, having the inclined screen *a'*, arranged a short distance above its bottom, and the door *a*', having the lever *b* fulcramed at its center, and adjustable by the handle *b'*, nut and screw *b'*, in combination with the arrangement of pipes E, D, C, B, and F, and their cocks, substantially as and for the purpose set forth.

259,555.

259,556. COMBINED TAPE-LINE AND SHEARS. JOHN C. KULMAN, Marshall, Ill. Filed Feb. 21, 1882. (No model.)

Claim.—1. A combined measure and shears made substantially as herein shown and described, and consisting of a tape-line case having a tubular projection, to the end of which projection shears are attached, whereby the tape-line can be withdrawn and a cut made in the edge of the material at the end of the desired measured length, as set forth.

2. The combination, with the tape-line case C and the tape-line A, of the tubular projection D of this case C, and the shears J K, attached to the end of this tubular projection, substantially as herein shown and described, and for the purpose set forth.



3. The combination, with the tape-line case C and the tape-line A, of the tubular projection D, the shears J K on the end of this tubular projection D, and the ring or finger-loop F on this projection D, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the tape-line case C and the tape-line A, of the tubular projection D, the ring or finger-loop F, and the sleeve G, detachably mounted on the end of the tubular projection D, and of the shears J K, attached to the sleeve G, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the tape-line case C and the tape-line A, of the projection D and the shears J K on the end of the projection D, and of the crutch M on the handle end of the pivoted blade K of the shears, substantially as herein shown and described, and for the purpose set forth.

259,557. WINDMILL. CORNELIUS KUSKEL, Oregon, Mo. Filed July 20, 1881. (Model.)

Brief.—The shaft C, which is suitably journaled on the turntable B in bearings B' B', has over the outer end of B' two concentric hubs, the inner being in rigid connection with the shaft only at its forward end, thus forming a counterrunk rear end, whereby the overhanging of the wheel is prevented. A sliding head, *y*, is mounted on the shaft between the forward end of bearing B' and the inner vertical wall of the hub D, which can be operated either from the ground through the cords *c* and levers *a* Z or by the wheel by means of the motion imparted by the governors K to the levers U V W X. The hub D carries the spokes E, which form a pivot-connection with the vanes I. The hub E carries spokes whose outer ends are attached to the inner ends of the vanes, thereby causing the loose wheel E to rotate independently on the hub D when the vanes are thrown out of the wind by the action of the centrifugal force on the governors. The movement of the loose wheel is accomplished against the force exerted by springs T, which connect the two spokes E R. Hence the loose wheel will only operate when the wind is strong enough to overcome the opposing energy of the vanes, the governors, and the springs T.

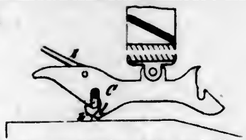
Claim.—1. In a windmill, the combination, with the frame D E F G, the wings I of the wind-wheel, and the shaft C, of the weighted levers J K, the connecting-rods L, the angle-levers M N P, the loose wheel R, the connecting-rods S, and the springs T, substantially as herein shown and described, whereby the wind-wheel will be made to revolve at a uniform velocity, as set forth.

2. In a windmill, the combination, with the frame D E F G and the wings I of the wind-wheel, and the shaft C, of the bent lever *a* and its connecting-rod Z, the sliding head Y and its connecting-rods X, the bent levers W, the connecting-rods V, and the bent levers U N P, the loose wheel R, the connecting-rods S, and the springs T, substantially as herein shown and described, whereby the wind-wheel can be readily stopped and started, as set forth.

3. In a windmill, the wind-wheel hub D, countersunk from its rear end, substantially as herein shown and described, whereby the weight of the wind-wheel can be brought over the main bearing and the overhanging of the wheel prevented, as set forth.

259,558. ELECTRIC SWITCH-BOARD. THOMAS W. LAWS, Boston, Mass., assignor to Charles Williams, Jr., same place. Filed Apr. 7, 1882. (No model.)

Claim.—1. An electric switch-board of the class described, having line-circuit strips perforated to receive plugs, and connecting-strips provided with springs, which are arranged in pairs, as described, said pairs coinciding with the holes in the line-circuit strips, the springs of each pair projecting from two independent connecting-strips, so that by semi-rotating a plug inserted in a perforation of a line-circuit strip the connection of said strip will be changed from one connecting-strip to the other, as set forth.



2. An electric switch-board of the class described, composed of the frame *a*, parallel supports *b*, perforated line-circuit strips *c*, connecting-strips *d*, and springs *e*, projecting from the connecting-strips and arranged to coincide in pairs with the perforations of the line-circuit strips, as set forth.

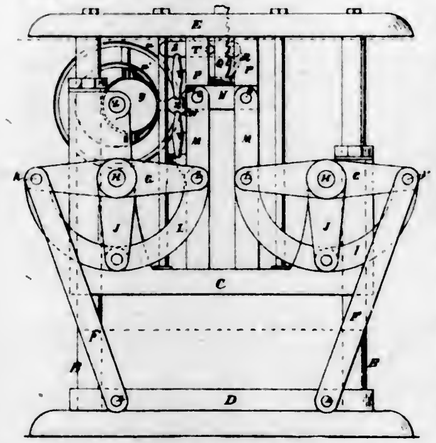
3. The combination of the perforated line-circuit strips, the springs projecting from the connecting-strips and arranged to coincide in pairs with the perforations of the line-circuit strips, and plugs, each having an insulating-surface on one side, whereby the plug is adapted to make mechanical but not electrical contact with one of the springs of each pair, as set forth.

4. An electric switch-board having perforated line-circuit strips and connecting-strips provided with springs projecting toward and coinciding with the perforations of the line-circuit strips, said connecting-strips being placed edgewise to the line-circuit strips, and thereby adapted to be arranged comparatively close together without liability of interference with each other by induction, as set forth.

259,559. SHUTTER-FASTENER. THOMAS F. LANGLEY, East Kingston, N. H. Filed Dec. 9, 1881. (No model.)

259,559.

Claim.—The combination of the vertically-vibrating latch C, having the vertical slot *f*, and the gravitating locking-piece or hook E in the said slot, substantially as and for the purpose herein specified.



259,560. SASH-WEIGHT. CHRISTOPHER W. LEVALLEY, St. Paul, Minn. Filed Jan. 13, 1882. (No model.)

Claim.—1. A sash-weight composed of two tubular sections, one of which is longitudinally adjustable relatively to the other.

2. In a sash-weight, an outer tubular section provided with an internal screw-thread, in combination with an inner tubular section provided with an external screw-thread, substantially as set forth.

259,561. BALING-PRESS. AUSTIN LEYDEN, Atlanta, Ga. Filed Apr. 12, 1882. (No model.)

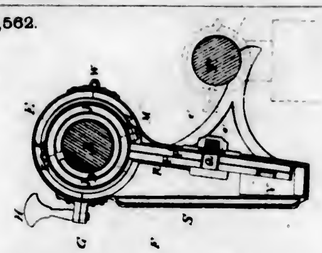
Claim.—1. The combination of the toggle-bars V and eccentric driver Y therefor with the toothed racks Q, pawl-lever S, and pawls R, the said rack-bars being connected with the follower of a press, substantially as described.

2. The follower D of a press, connected by rods F, levers G, rods M, and cross-head N, with toothed racks Q, for working said follower thereby, the said racks being provided with pawl and ratchet lever driving mechanism, substantially as specified.

3. The combination, with the press-follower D, of rack-bars Q and connecting apparatus, substantially as herein described, for transmitting the power from said rack-bars to said follower, substantially as specified.

4. In a press having rack-bars Q and apparatus connecting the follower thereto, the said rack-bars having pawls and a pawl-lever connected to and operated by a single eccentric driver, Y, substantially as specified.

5. The combination of rack-bars Q, cross-head N, guides I', and connecting-rods M with the rock-levers G, connecting-rods F, and press-follower D, substantially as specified.



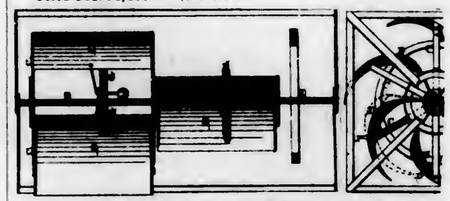
6. The combination, in a press, of the eccentric and toggle mechanism, and the pawl-lever, pawls, and rack-bars, to transmit the driving-power to the follower of the press, substantially as specified.

7. The combination, in a press, of the eccentric and toggle mechanism, pawl-levers, pawls, and rack-bars, and the cross-head, connecting-rods, and rack-levers, to transmit the driving-power to the follower, substantially as specified.

259,562. CYCLOMETER. HENRY S. LIVINGSTON, Cincinnati, Ohio. Filed Nov. 15, 1881. (No model.)

Claim.—1. The worm-sleeve J O, adapted for application to

259,562.



the axle B and provided with bearings J', in combination with the cyclometer case or housing E F, suspended on said bearings, substantially as herein set forth.

2. The combination of the divided worm-sleeve J J O, hinges K, clamps L M, and elastic bushing N, substantially as and for the purpose set forth.

3. The combination of the two-part housing E F, having semi-annular flanges E' F', the thumb-screws H H, sockets *e*, gaskets *f*, worm-sleeves J J O, hinges K, clamps L M, and elastic bushing N, substantially as and for the purpose set forth.

4. The rack or bar T at the rear of a cyclometer-housing for bicycles, &c., for suspension of a lamp or lantern, in the manner set forth.

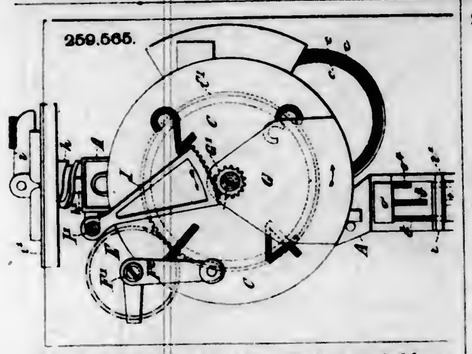
259,563. WINDMILL. LORENZO D. LOWTHER, Seguin, Tex. Filed Feb. 14, 1882. (No model.)

Claim.—In a horizontal windmill, the combination of the vertical shaft, the supporting-arms projecting out from the shaft, the curved buckets pivoted between the arms, the central ring, against which the inner ends of the buckets bear, and a spring or weight for making the bucket self-adjusting, substantially as set forth.

259,564. CANT-DOG. EDWARD MASSFIELD, Orono, Me. Filed Dec. 13, 1881. (No model.)

Claim.—1. In a cant-dog, the improved pick-point having its shank formed of two substantially cylindrical portions adapted to be driven into the wood of the stock without previous boating, and held in place by the contraction of the fibers, in combination with said stock and surrounding ferrule, substantially as set forth.

2. In a cant-dog, the hook *c*, round, or nearly so, in cross-section, and formed with the triangular rib *f* upon its back, as and for the purposes described.



259,565. FARE-REGISTER. JOHN NEVIL MASKELYNE, Egyptian Hall, Piccadilly, County of Middlesex, England. Filed Mar. 15, 1882. (No model.) Patented in England Aug. 23, 1881, No. 3,077.

Claim.—1. The combination of the dial C, wheels C' and H, pinions E F, handle F', spring-pawls *n* and O, registering mechanisms J J', and gong mechanism, all arranged and operating substantially as herein shown and described.

2. The combination of the wheel H, stop-plate *d*, adjustable stop *e*, snail-cam *h*, pointer *i*, and dial *i'*, all arranged and operating substantially as shown and described.

3. The combination of the wheel H, stop-plate *d*, adjustable stop *e*, slide *l*, arm *j*, spring *k*, toothed sector I, and shutter G, all arranged and operating substantially as herein shown and described.

259,565.

4. The combination of the wheel H, pin *g*, cranked bar *p*, compound punch *o*, and counterparts *r r*, provided with a slit, *r'*, all arranged and operating substantially as herein shown and described.

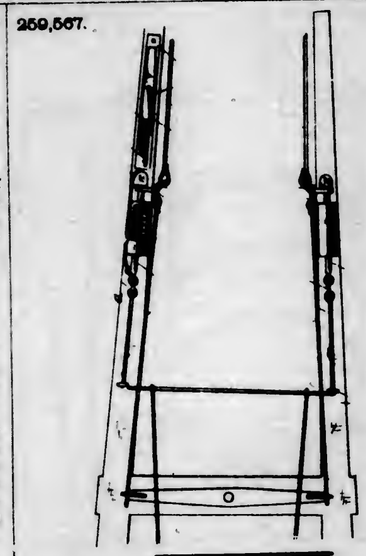
5. The combination, in an apparatus for registering fares, of a punch block or carrier having attached to it two or more points or punches of different lengths, mechanism for operating such block or carrier, and a variable stop mechanism, whereby the movement of the said block or carrier may be regulated to produce the operation of one or more of said points or punches, substantially as and for the purpose herein set forth.

259,566. BOILER FOR HEATING PURPOSES. JOSHUA MASON, Paterson, N. J. Filed Feb. 20, 1882. (No model.)

Claim.—1. The combination, in a boiler, of an upper and a lower hollow annular water chamber or head, a series of water-tubes connecting and forming separate communications between said chambers or heads, a series of fire-tubes extending one through each of said water-tubes and through both of said chambers or heads, and forming the inner surfaces of annular water-spaces in the said water-tubes, and a fire-pot arranged below said lower chamber or head, and from which the products of combustion may pass upward around the chambers or heads and said water-tubes, and also through the said fire-tubes, substantially as and for the purpose specified.

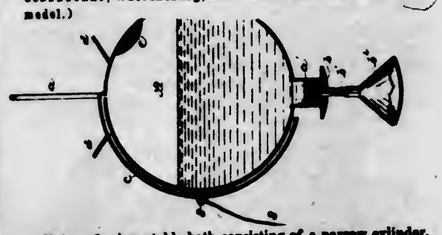
2. The combination, in a boiler, of an upper and a lower hollow annular chamber or head, a series of water-tubes connecting said chambers or heads, a series of fire-tubes extending through said water-tubes and through both chambers or heads, and a fire-pot having double vertical walls, and an intervening water-space arranged below the lower chamber or head and in communication therewith, substantially as specified.

3. The combination of the water chambers or heads A B, the outer and inner tubes, C D, the fire-pot F, having water-spaces *f*, the tubes *g*, the casing H, and the magazine or cylinder I, all substantially as specified.



259,567. HORSE-DETACHER. JOHN P. MAY, Troy, Ala. Filed Apr. 4, 1882. (No model.)

Claim.—1. In combination with the shafts, the cylindrical inclosed casings, and the straight sliding bolts and spiral springs, the straps connected to the eyes at the rear of the springs, and the hame-straps and traces, adapted to be held by the bolts and abutments on the shafts and to be released therefrom, substantially as specified.



2. In combination with the shafts, the plate and lever fulcrumed thereto, and the tongue adapted to hold the tug in connection with the lever, substantially as specified.

3. In combination with the shafts, the casings, and the sliding bolts and springs and their harness-connections, the plates and levers and the tongues to which the tugs are adapted to be attached, substantially as specified.

259,567.

259,568. PORTABLE BATHING-MACHINE. THOMAS J. MCCONAUGHAY, Warrensburg, Mo. Filed Mar. 10, 1882. (No model.)

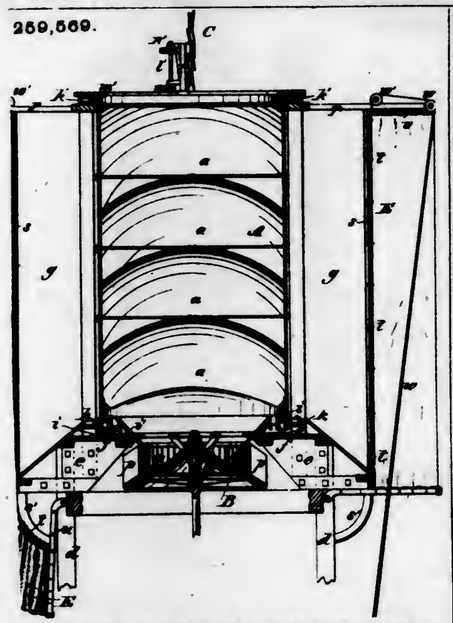
Claim.—1. A portable bath consisting of a narrow cylinder, A, journaled centrally between the arms of the bail *a*, provided with a vent-pipe, *c*, arranged around its circumference, with feet *d d*, hook *g*, and tilt-cord *g'*, nozzle *a'*, in which fits the plug *b*, provided with a flexible tube, *b'*, and sprinkler *b²*, said pipe and sprinkler being adapted to convey the contents of the cylinder to the person who is to receive the bath, substantially as described.

2. In a portable bath, the combination of the cylinder A, provided with a vent-pipe, *c*, nozzle *a'*, plug *b*, pipe *b'*, and sprinkler, feet *d*, weight *e*, and pins *f f'*, with the bail *a*, all arranged substantially as shown and described.

259,569. WIND-MOTOR. JOHN MCLACHLAN, New Orleans, La. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a wind-motor, the combination, with the motor-wheel B, of the revolving turret A, provided with an opening at one side, and with the downwardly-curved deflectors *a*, and arranged above the said motor-wheel, substantially as and for the purpose set forth.

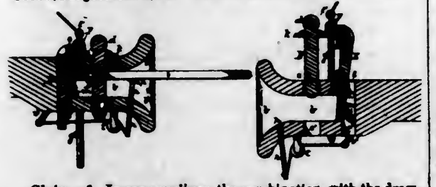
2. In a wind-motor, the combination, with the curb *f*, provided with the rollers *h*, and the wing-boards *g*, provided with rollers *h'*, of the turret A, provided with the rollers *i*, substantially as and for the purpose set forth.



3. In a wind-motor, the combination, with the frame *l*, the shaft *l'*, the pinion *m*, the worm-wheel *n'*, and the vane-wheel C, of the turret A, provided with the cogged rim *m'*, substantially as and for the purpose set forth.

4. In a wind-motor, the combination, with the wing-boards *g*, provided with the T-shaped brackets *e*, of the sails E, provided with the loops *i*, substantially as and for the purpose set forth.

5. In a wind-motor, the combination, with the wing-boards *g* and the supports *d'*, provided with T-plates, of the sails E, provided with the loops *i*, the arms *n*, the bars *o*, and the ropes *w*, substantially as and for the purpose set forth.



6. In a wind-motor, the combination, with the revolving-tur-

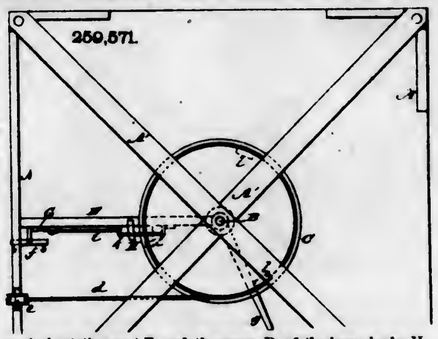
259,569.

ret A, provided with the deflectors *a*, of the motor-wheel B, provided with the fans *p* and the fixed curved guides *q*, arranged below the said turret, substantially as and for the purpose set forth.

259,570. CAR-COUPLING. HENRY B. MCMURRAY and LEVI SCOTT, Burgettstown, Pa. Filed Feb. 7, 1882. (No model.)

Claim.—1. In car-couplings, the combination, with the draw-head, of the lifting-frame F above the draw-head, vertically-moving guide *g*, rigidly secured thereto, coupling-pin D, removably supported in the lifting-frame, and tripping-rod E, pivoted at its head to the lifting-frame and extending through the draw-head back of the coupling-pin, substantially as and for the purposes set forth.

2. In car-couplings, the draw-head B, having the recess *m* back of its link-cavity for the reception of the tripping-rod, and the slot *F*, below the recess, adapted to hold the tripping-rod entirely back of the link-cavity, substantially as and for the purposes set forth.

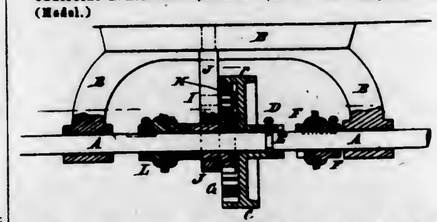


3. In car-couplings, the combination, with the draw-head having the recess *m* back of its link-cavity *b*, of the pivoted tripping-rod E, fitting within the recess, and adapted, when raised, to swing forward into the link-cavity and catch upon its base, substantially as and for the purposes set forth.

4. In car-couplings, the combination, with the draw-head, of the lifting-bar *r*, sliding freely through the lower part of the draw-head, and mechanism for raising and lowering the lifting-bar from the side of the car, substantially as and for the purposes set forth.

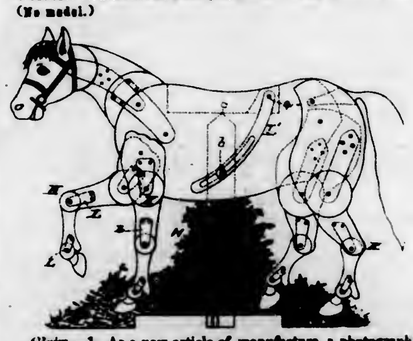
5. In car-couplings, the combination, with the draw-head, of the lifting-bar *r*, sliding through the lower part of the draw-head, pulley *t*, chain *u*, and crank-bar *v*, substantially as and for the purposes set forth.

259,571. VERTICAL WINDLASS. SYLVESTER J. MILLER and THEODORE B. BALLARD, Millersville, Ill. Filed May 1, 1882. (No model.)



Claim.—1. The combination, with the loose drum C, having one or more driving-stops, *l*, on its bottom, near its periphery, the

vertical rotating post B, and the sweep D, of the lever-brake H, arranged to act upon the outer periphery of the drum, the locking-lever I, arranged to act upon the stops *l*, and the hand-lever G, with its connecting-rod *i*, all of said levers being pivoted to the sweep or brace therefrom, for operation in relation with each other and the drum, substantially as specified.



2. The combination, with the loose drum C and frame cross-braces A', of the vertical shaft or post B, constructed with three upper journals having shoulders *a b c*, whereby the weight of the drum is supported both above and below, and the cross-braces A' are restrained from resting on the drum, essentially as shown and described.

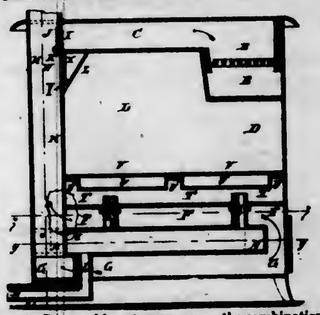
259,572. REVERSIBLE MECHANISM FOR COUNTER-SHAFTS. CHRISTIAN B. L. MORRIUS, New York, N. Y. Filed May 2, 1881. (Model.)

Claim.—The combination, with a counter-shaft journaled in a hanger, B, carrying a loose pulley, C, having clutch-teeth and provided with a sliding clutch, F, of the gear-wheels G H K, the gudgeon I, and the hanger-stud J, having a bearing at its lower end for the wheel K, as and for the purpose specified.

259,573. PHOTOGRAPHIC BACKGROUND OR ACCESSORY. WILLIAM H. MORRISON, Dubuque, Iowa. Filed Mar. 18, 1882. (No model.)

Claim.—1. As a new article of manufacture, a photographic background or accessory consisting of a life-size image of an animal cut from flat material, the members being jointed to the body and painted or covered in imitation of the natural parts, the joints having friction devices to hold them to various adjustments, the image having a suitable support for posing it and the person to be photographed, as set forth.

2. A life-size image of an animal for photographers' use, having the support B, cross-bar C, brace E, pivoted foot-bar F, and concealing scenery-piece H, substantially as specified.

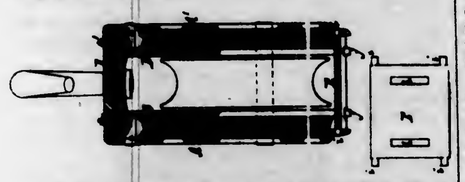


3. A life-size image of an animal for photographers' use, having jointed members, support B, pivoted cross-piece C, hinged brace E, and foot-bar F, slotted arm L, clamp-screw *b*, and concealing scenery-piece H, substantially as specified.

259,574. COMB. GEO. J. MORROCK, Binghamton, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—In a magnetic hair-comb, the vertical orifices C C, back of comb D, and magnets B, substantially as shown and specified.

259,575. COOKING-STOVE. HOSMER A. MICHELSON, Richwood, Ohio, assignor of one-fourth to Francis M. Dicks, same place. Filed Mar. 11, 1882. (Model.)



Claim.—1. In a cooking stove or range, the combination, with the smoke and distributing chambers, of the partitioned hot-air chamber arranged directly beneath the oven, as and for the purpose described.

2. In a cooking stove or range, the combination, with the oven D and the smoke-chambers F G, of the air-heating chamber M and the air-distributing chamber T, the inlet-pipe L, the connecting-pipes S, and the plate U, having perforated offsets U', substantially as herein shown and described, whereby cold air is heated and introduced into the oven, as set forth.

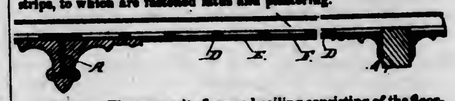
3. In a cooking stove or range, the plate U, interposed between the oven D and the air-distributing chamber T, and provided with upward offsets U', having perforated sides, substantially as herein shown and described, whereby the heated air is introduced into the oven, as set forth.

4. In a cooking stove or range, the combination, with the plate U, provided with upward offsets U', having perforated sides, of the perforated plate V, substantially as herein shown and described, whereby the heated air is distributed through the oven, as set forth.

259,576. SHACKLE-BLOCK. JOSEPH W. MORRISON, Lockport, N. Y. Filed Dec. 3, 1881. (No model.)

Claim.—1. The combination, in a snatch or pulley block, of the fixed metallic frame, provided at its upper end with eyes, the fixed pin, the shackle having one end secured to the fixed pin, on which said shackle can swing vertically, and the sliding pin arranged to connect the other end of the shackle with the fixed metallic frame, substantially as described.

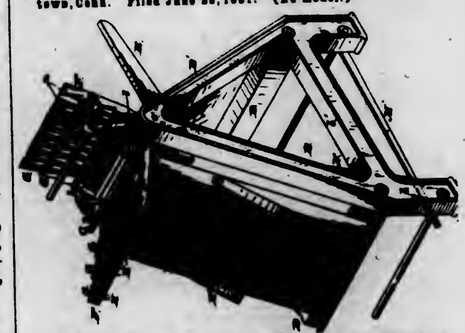
2. The combination, in a snatch or pulley block, of the fixed metallic frame provided with eyes at its upper end, the fixed pin, the shackle having one end secured to the fixed pin, on which said shackle can swing vertically, the sliding pin arranged to connect the other end of the shackle with the fixed metallic frame, and a locking device for confining the sliding pin in position when drawn out to permit the shackle to swing, substantially as described.



3. The combination, substantially as hereinbefore described, of the metallic frame, the eyes formed on said metallic frame, the shackle connected at one end to said eyes by a stationary pin and at the opposite end by a movable pin, the notches formed in the movable pin, and the spring-latch, constructed to engage with said notches, and to retain said pin when it is pushed in, and also when it is drawn out sufficiently far to release the shackle.

4. In a pulley-block, the combination, with the two sets of inner and outer metallic frames provided at their lower ends, respectively, with outwardly-projecting rivets *j* and transverse apertures, and at their upper ends with means for their suspension, of the wooden cheek-pieces interposed between the respective inner and outer metal frames, and the bottom plate, E, provided at its opposite edges with projecting rivets *i*, and within such edges with openings A, for connecting with the rivets and apertures of the metal frames to secure them upon the wooden cheek-pieces, substantially as described.

5. The combination, substantially as hereinbefore described, of the inside straps, B B', the outside frames, A A', the arms extending from the inside straps, the holes formed in said straps, and the two sheaves, the axles of which have their bearings in said holes.



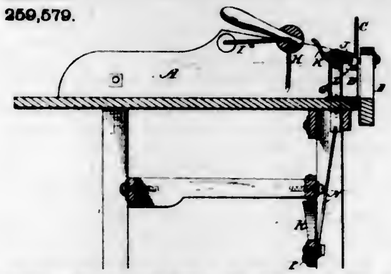
259,577. CONSTRUCTION OF FLOORING AND CEILING. GOTTFRIED L. MORRMAN, Atlanta, Ga. Filed Dec. 20, 1881. (No model.)

Brief.—To planking laid upon girders are secured furring-strips, to which are fastened laths and plastering.

Claim.—The composite floor and ceiling consisting of the flooring-planks, furring-strips D, laths E, plastering F, and supporting-girders A A, all constructed and arranged as set forth.

259,578. HAND TYPE-DISTRIBUTER. JOHN MORTH, Middletown, Conn. Filed June 29, 1881. (No model.)

Claim.—1. The combination, with the support for the type-case, of the elevated hinged tables F, provided with type-conducting-channels, and the books arranged to support said tables when they are raised to admit of the removal of the cases from the support, substantially as described.



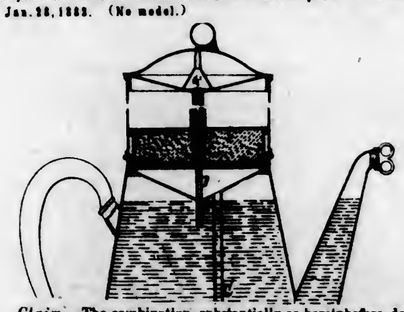
2. The combination, with the type-case-supporting frame adapted to maintain the type-cases in an inclined position, of the inclined swinging table provided with type-conducting channels, and hinged to the case-supporting frame with the discharge ends of its channels in position to deliver the type into the upper ends of the type-cases, substantially as described.

3. The combination of the type-case-supporting frame having inclined sides, and a rod, C, secured to the top ends of said frame, with the swinging tables F and the two-armed vibratory packers L, supported upon the said rod, the cross-bars M, rigid with the packers, the treadles, and the rods N, connected with said cross-bars, substantially as described.

259,579. STRAW-CUTTER. ELIAS C. NEATHERY, Forks Township, Sullivan County, Pa. Filed Mar. 14, 1882. (Model.)

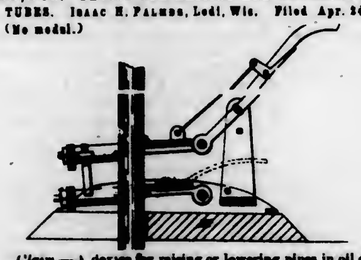
Claim.—1. In a feed-cutter, the trough A, provided with metal head B, slotted extension C, and slotted plate E, with ribs *b*, in com-

259,579.



bination with the knife-beam D, having upon its inner side the spring F to bear against said ribs, substantially as and for the purpose set forth.

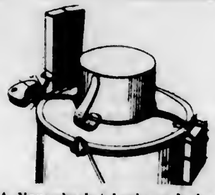
2. In a feed-cutter, the combination, with the frame I, pivoted to the sides of the trough A, of the rake H, loosely connected to said frame, whereby it is capable of movement at any angle from a perpendicular independent of the swinging motion of the pivoted frame, substantially as and for the purpose specified.



3. In a feed-cutter, the knife-beam D and beam J, carrying deflecting-plate K, constructed to operate as described, in combination with the rake H, loosely connected to the swinging frame, whereby said rake may be brought to any angle required with relation to said frame, substantially as and for the purpose described.

259,580. COFFEE-POT. FAITH ORM, Brooklyn, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—The combination, substantially as hereinbefore described, of the upper or decoction chamber and the lower or water chamber, the water-pipe extending from the bottom of the upper chamber into the lower chamber, the steam-pipe extending from the top part of the upper chamber into the lower chamber, the lower terminal of the water-pipe being near the bottom, and that of the steam-pipe near the top, of the lower chamber, the foraminous false bottom to the upper chamber, and the lid to the upper chamber, constructed with a whistle adapted to connect with the steam-pipe.

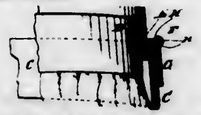


259,581. DEVICE FOR RAISING AND LOWERING WELL-TUBES. ISAAC H. PALMER, Ledi, Wis. Filed Apr. 24, 1882. (No model.)

Claim.—A device for raising or lowering pipes in oil or other wells, consisting of a pair of automatically-biting devices arranged in connection with pivot-bearings, the one above the other, and adapted one to grip and hold the pipe while the other is being adjusted for a new purchase, substantially as specified.

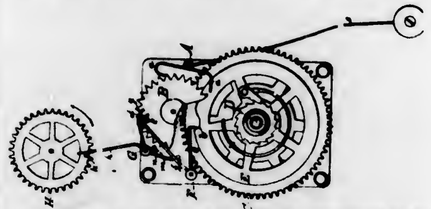
259,582. DINNER-BUCKET. JOHN B. PATTON, Chattanooga, Tenn. Filed Apr. 15, 1882. (No model.)

259,582



Claim.—1. A dinner-bucket having a device for locking the cover and condiment-box thereof, consisting of a hasp provided with an end hook and an end loop, in combination with the bucket-body having staples for receiving the hasp and a padlock, as and for the purpose set forth.

2. The divided or split hasp adapted to fit on the drinking-cup, in combination with the bucket having staples for receiving the hasp, as and for the purpose set forth.

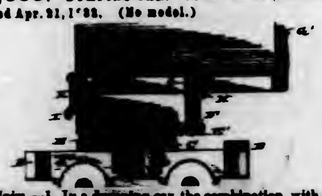


3. The supplementary hasp having openings for the passage of knife and fork, in combination with main hasp and the staple and padlock on the body of the bucket, as and for the purpose set forth.

259,583. NECKTIE AND COLLAR FASTENER. ADOLPH PLATKY and EMANUEL FINSTEHER, New York, N. Y. Filed Apr. 21, 1882. (No model.)

Claim.—In a necktie-fastener, the flat shank E, having a head, D, and an eye, F, with three notches, H, in combination with a U-shaped tapering and elastic link, G, open at one end, as shown and described.

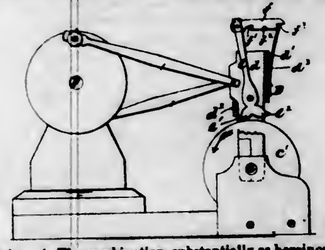
259,584. TIME-ALARM. JOHN POMEROY and JOHN WISELOW, Jr., Bristol, Conn. Filed Aug. 16, 1881. (No model.)



Claim.—1. In an alarm-movement, the combination of the main wheel, smooth-edge disk having a notch in its periphery, the escapement-wheel bearing pin *e*, the lock-work shaft bearing arms *c d*, and mechanism for tripping said arms once in twenty-four hours, substantially as described, and for the purpose specified.

2. The combination *of* the main wheel C, disk E, escapement-wheel B, pin *e*, lock-work shafts F *c d* G *f g*, lever A, and twenty-four-hour pin-wheel, substantially as described, and for the purpose specified.

3. In an alarm for an eight-day clock, the adjustable stop for acting upon the hammer-wire and holding the pallets from escaping when desired, substantially as described.

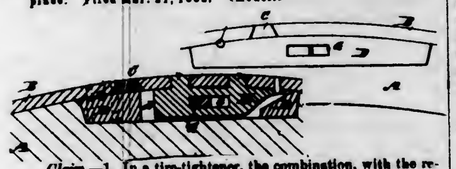


259,585. DUMPING-CAR. JOHN M. RICH, New Castle, Pa. Filed Apr. 21, 1882. (No model.)

Claim.—1. In a dumping-car, the combination, with the truck A, having platform C, provided with the circle E, of the box or hollow base F, adapted to form a receptacle for ballast, and provided with the circle E', center bolt, I, and hinged car-body G, substantially as described, for the purpose set forth.

2. In a dumping-car, the combination of the side sills, A, having the projecting ears O and slotted journal-bearings N, arranged on opposite sides thereof, detachable boxes M, having laterally-projecting wings or flanges *m* and shield or guard-plate *m'*, and detachable pin or bolt *o*, inserted through the part O and bearing against the guard-plate *m'*, all constructed and combined substantially as and for the purpose herein shown and specified.

259,586. DEVICE FOR CONVERTING MOTION. GEORGE W. RICHARDSON, Milton, Vt. Filed Mar. 16, 1882. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the wheel *c'*, the pawl-post D, pivoted and swinging concentrically with the wheel, and the pawl pivoted in the pawl-post and swinging therewith, and constructed with the points *c' c²*, and means whereby the said pawl is held with either of the said points bearing on or clear of the periphery of the said wheel, as and for the purposes described.

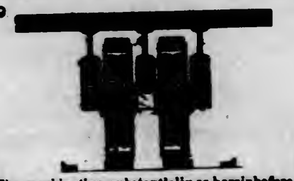
2. The combination, substantially as hereinbefore set forth, of the wheel *c'*, the pawl *e*, pivoted in a frame rocking on the shaft of the said wheel, and constructed with the points *c' c²*, and means whereby the said pawl may be held with one or the other of the said points *c' c²* bearing on the periphery of the wheel *c'*, as and for the purposes described.

3. The combination, with the shaft *c* and wheel *c'*, of the pawl-post D, the double-pointed pawl *e*, pivoted between the bars of said post, bar *f*, pivoted to the upper end of pawl *e* and provided with notches *f' f² f³*, and spring *d²*, having one of its ends fixed to the back board, *d'*, and its opposite end arranged to engage the notches in bar *f*, substantially as and for the purposes set forth.

259,587. WITHDRAWN.

259,588. TIRE-TIGHTENER. SYLVANUS H. ROBISON, Valparaiso, Nebr., assignor of one-half to Arthur H. White, same place. Filed Mar. 21, 1882. (Model.)

Claim.—1. In a tire-tightener, the combination, with the recessed wooden felly A and the tire B, of the iron felly D, secured to one end of the tire and provided with the slots *d d²*, the staple or bar E, secured to the other end of the said tire and provided with the slot *e*, and the wedge or key G, substantially as and for the purpose set forth.



2. The combination, with the tire B, having its ends notched and pointed and beveled inward, of the block C, having its ends notched and pointed and beveled outward, substantially as herein described.

3. In a tire-tightener, the combination, with the recessed wooden felly A and the tire B, having its ends notched and pointed and beveled inward, of the notched and pointed beveled block C, the iron felly D, provided with the slots *d d²*, and the staple or bar E, provided with the slot *e*, and the wedge G, substantially as and for the purpose set forth.

259,589. ELECTRIC RAILWAY. CHARLES H. RUDD, Evanston, Ill., assignor to James W. White, James Clarence White, and H. H. Lewis, Trustees, Philadelphia, Pa. Filed Apr. 6, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a carriage with one or more of its supporting-wheels divided at its periphery into electrically-insulated sections.

259,589

2. The combination, substantially as hereinbefore set forth, of a wheel divided into electrically-insulated sections with electro-magnets carried by said wheel and electrically connected with said sections.

3. The combination, substantially as hereinbefore set forth, of a wheel divided into electrically-insulated sections, a non-rotating shaft around which said wheel turns, electro-magnets carried by said wheel and electrically connected with its insulated sections, an armature fixed upon the said non-rotating shaft, and circuit-connections, including a source of electricity, to convey current to excite said electro-magnets and cause them to act upon said armature.

4. A wheel composed of a body portion, a rim or felly of non-conducting material to insulate said body portion from a rail upon which the wheel runs, and a sectional conducting-tire, one or more of whose sections are in electrical connection with said body portion, and through it with the axle or shaft of said wheel.

5. The combination, substantially as hereinbefore set forth, of a non-rotating shaft, a hollow wheel fitted to turn around said shaft, electro-magnets carried by and inclosed within said wheel, and an armature fixed upon said shaft within said wheel, so as to be acted upon by said electro-magnets when excited.

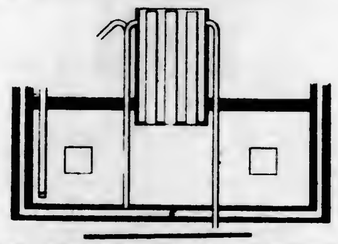
6. The combination, substantially as hereinbefore set forth, of a carriage, a track upon which said carriage runs, two electromotors forming part of said carriage, one to move said carriage in a forward direction and the other to move said carriage in a backward direction, a generator of electricity, circuit-connections, and switch mechanism forming part of said connections to throw either one of said motors into action.

7. The combination, substantially as hereinbefore set forth, of a railway-carriage having two electromotors, separate insulated rails for the driving-wheels of said carriage, an electric generator to throw current upon either of said rails to propel said carriage, and a separate return or third conductor for the current traversing either one of said insulated rails.

8. The combination, substantially as hereinbefore set forth, of a vehicle, a shaft of said vehicle, an electromotor-wheel revolving around said shaft to propel the vehicle, and a rail between the main rails of the track upon which said motor-wheel travels.

9. The combination, substantially as hereinbefore set forth, of a vehicle, electro-magnetic mechanism mounted on said vehicle so as to propel it, a generator at a fixed station supplying electricity to said mechanism, and a switch device by which said propelling mechanism is controlled, so as to enable the operator at a fixed station to produce either forward or backward motion of the vehicle at will.

259,590. REMEDY FOR CATARRH. CHARLES W. SCHNELL, Philadelphia, Pa., assignor to Charles W. Schnell & Co., same place. Filed Apr. 11, 1882. (No specimens.)



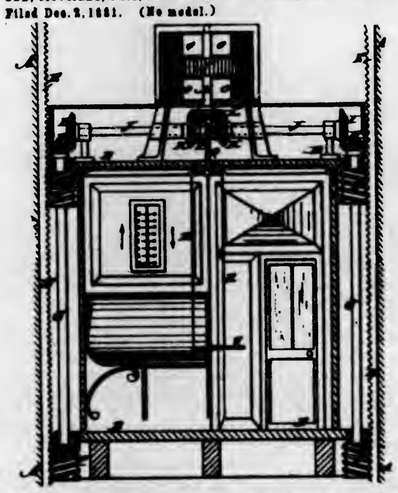
Claim.—The composition of matter consisting of powdered borax, bicarbonate of soda, sugar, burnt alum, salt, saffron, blood-root, sassafras-root, and cubebs in the proportions stated, forming a remedy for catarrh, as herein set forth.

259,591. COUCHING-CHAMBER FOR MALTING. HENRY B. SCHOLES and JAMES HAGERIAN, Brooklyn, N. Y. Filed Sept. 22, 1879.

Brief.—The couching-chamber is cooled externally by a body of water issuing from a water-receptacle located in the ceiling of the chamber and circulating between double side walls and flooring. The air within the couching-chamber is cooled by passing downward through vertical air-pipes open at both ends and located in the water-receptacle.

Claim.—The combination, with a couching-chamber for malting, having a water-space between its walls and under its flooring, and provided with a water-tank projecting above and slightly below its ceiling, with inclosed vertical air-pipes open at each end and extending through said water-tank, of pipes connecting with said tank, whereby it is filled with water and the surplus thereof discharged into the space surrounding such couching-chamber, substantially as and for the purpose set forth.

259,591.



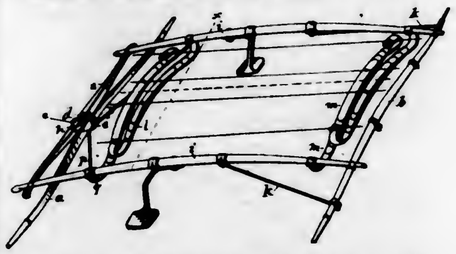
259,592. JACKETED CAN. ISAAC SUTTON, Somerville, Mass. Filed Apr. 24, 1882. (No model.)

Claim.—The combination, with a flanged can, of a sheet-metal jacket having a wooden hoop secured in its upper end, said hoop having a beveled upper edge, forming a seat for the flange of the can, and being provided with metallic bands folded over the hoop, riveted to the jacket, and presenting metallic surfaces on the upper edge of the hoop for the attachment of the flange of the can by solder, as set forth.

259,593. ELECTRIC SAFETY-ELEVATOR. HENRY B. SHERIDAN, Cleveland, Ohio, and HERMANN A. GOSS, New York, N. Y. Filed Dec. 2, 1881. (No model.)

Claim.—1. In an electric elevator, the combination, with the well A, provided with the racks E in diagonally-opposite corners, and the electric motor M N O, of the car B, the vertical shafts G, provided with worms E, pinions H, and journaled in bearings in diagonally-opposite corners, the horizontal shaft J, and the gear-wheels I K L, substantially as and for the purpose set forth.

2. In an electric elevator, the combination, with the car B, the electric motor M N O, and the driving-gearing K L K, of the clutch P, levers Q S, and connecting-rods R R, substantially as herein shown and described, whereby the movement of the car can be stopped and reversed, as set forth.

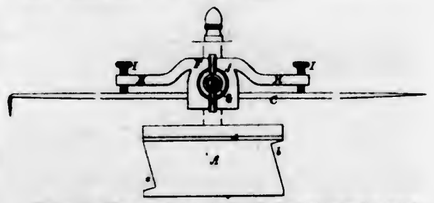


259,594. SPRING BED-BOTTOM. GEO. W. SHOTWELL, Brodhead, Wis., assignor of one-half to G. W. CRONK, same place. Filed Apr. 11, 1882. (No model.)

Claim.—In a spring bed-bottom, the combination of the bed-

stead, the slats B, the springs C, cover made of any textile material, and the coiled springs to which the edges of the cover are attached, substantially as shown and described.

259,595. SIDE-BAR VEHICLE. ANDREW F. SEBLER, Arcanum, Ohio. Filed Mar. 22, 1882. (No model.)



Claim.—1. The combination, with the side bars, *i i*, of the front springs, *l l*, and rear springs, *m m*, having a spring of each pair secured at one end to one of the side bars, and thence curved downwardly and upwardly and secured to the bottom of the baggy-body, and having the other two springs of each pair secured to the opposite side bar *i* at their outer ends, and thence curved downwardly and upwardly and secured to the baggy-bottom, substantially as described, and for the purpose set forth.

2. The combination, with the front axle, *a*, front cross-bar, *c*, having slot *h*, king-bolt *d*, clevis *e*, side bars, *i*, and front springs, *l*, secured to the opposite side bars at one end and to the baggy-body, of the brace-rod *p*, secured at its ends to the side bars, and passing through the clevis and around the king-bolt, substantially as described, and for the purpose set forth.

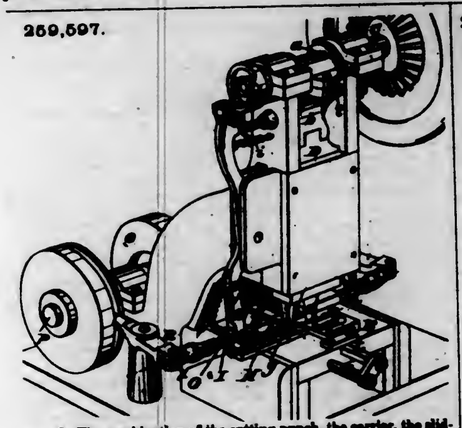
3. The combination of the front and rear axles, *a b*, slotted front cross-bar, *c*, king-bolt *d*, clevis *e*, side bars, *i*, brace-rod *p*, front and rear springs, *l l* and *m m*, constructed and arranged as shown, and brace-rods *k k*, substantially as described, and for the purpose set forth.

259,596. SURFACE-GAGE. CHARLES W. SMITH, Hyde Park, Mass. Filed Jan. 3, 1882. (No model.)

Claim.—1. The base A, provided with the right-angular notch *a*, arranged in it as represented.

2. The base A, provided with the right-angular notches *a b c*, arranged in it in manner as represented.

3. The base A, provided with the external right-angular notches, *a d e*, arranged as represented.



4. The base A, provided with the right-angle notches *a*, *b*, *c*, *d*, and *e*, arranged in it in manner as represented.

5. The revoluble needle-carrier F, having jaws and one or more arms, H, and screws I thereto, to operate with the needle as explained.

259,597. MACHINE FOR MAKING LACING-HOOKS FOR SHOES. STEPHEN H. SMITH, Providence, R. I. Filed July 28, 1879.

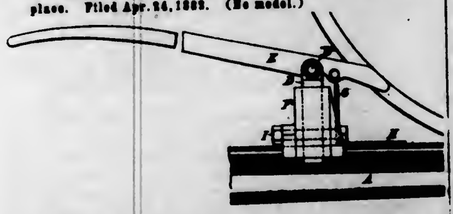
Claim.—1. In a machine for making lacing-hooks, the series of punches for scoring, indenting, and cutting, constructed as described, jointly with the feed mechanism, arranged to move the prepared stock from the first two punches to the last.

259,597.

2. The combination of the cutting-punch, the carrier, the sliding anvil, and the vertically and horizontally moving slides arranged to act successively and bend the blank over the anvil.

3. The combination of the anvil O and the two slides, arranged to act successively and double the blank thereon, as described.

4. In combination with the cutting-punch, the carrier-slide, the anvil, and a bending mechanism, substantially as described, the yielding presser-foot arranged to act upon and hold the blank.



5. In combination with the blank-forming devices, as described, the presser-foot, the bar having a spring-connection with the foot, and means, substantially such as described, for imparting a reciprocating movement to the bar.

6. The blank-carrier having the notched end to receive the tubular necks of the blanks, in combination with the tongue adapted to close said notch and contain the blank.

7. In combination with the scoring and cutting punches and the feeding-finger, the grooved guide H, provided with the hole *g* and spring A.

8. In a lacing-hook machine for operating upon stock having tubular necks, the combination of the indenting devices, the cutting devices operating subsequently to the indentation, the carrier, and the bending devices, whereby the blank is folded across its middle into a U form, substantially as described and shown.

259,598. APPARATUS FOR MOVING CARS. PETER J. STOUT, Athens, Pa., assignor of one-half to Charles Kellogg, same place. Filed Apr. 24, 1882. (No model.)

Claim.—1. In a device for moving cars by hand-power, the combination, with an adjustable lever, E, of a slide, D, links C C, and claws B B, arranged and operating substantially as described.

2. In combination with the casing F, the claws B B, pivoted therein, the links C C, pivoted to said claws at their upper ends, the slide D, and adjustable lever E, beveled on its short end, all arranged for joint operation, substantially as described.

3. The combination, with the rail A, of claws B B, projecting under the head of said rail, said claws having a common pivotal point, I, and operated by an adjustable lever, E, substantially as set forth.

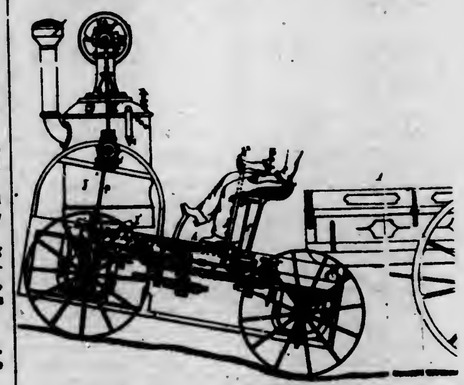
4. The combination, with the adjustable lever E, slide D, links C C, and claws B B, of a fulcrum-standard, G, and shoe H, all arranged substantially as described and shown.

259,599. REIN-HOLDER. JOSEPH C. W. STOUT, Farmingdale, N. J. Filed Apr. 1, 1882. (No model.)

Claim.—1. A rein-holder constructed substantially as herein shown and described, consisting of open frame A, spring-actuated

259,599.

toothed and bevel-tipped jaws D, and beveled horns or guides B' B', all arranged and operated as set forth.



2. In a rein-holder, the jaws D, having beveled edges *p* and teeth of different lengths, combined with the frame A and springs, substantially as and for the purpose set forth.

3. The frame A, arms B B, and whip-socket F, formed of a single piece of metal, having a recess adapted to receive the pivoted beveled jaws D *p*, having teeth *l m n o* of different lengths, combined with said jaws D and springs *h*, as set forth.

4. The pivoted jaws D, having teeth *n*, combined with the springs *h*, and adapted to lock the reins between their inner surfaces against movement in one direction, as specified.

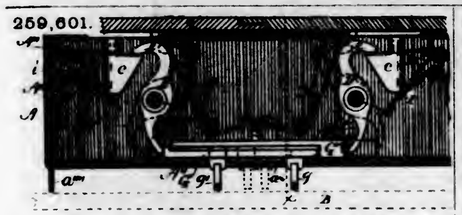
5. The jaws D, having teeth *l m n o* of varying lengths, combined with the removable beveled horns B' and the springs *h*, as set forth, for the purposes specified.

259,600. TRACTION-ENGINE. JOHN V. SPRIBLING, Westminster, S. C. Filed Mar. 29, 1882. (No model.)

Claim.—1. In machines for operating traction-engines, the combination of the vertical wheel E' and pinion E with the horizontal wheel F, supported in the gimbal, whose center of motion is in a line with the center of wheel E', whereby at any transverse tilting of the wheels the wheels E' and D' remain in gear, substantially as and for the purpose described.

2. The combination of the driving-wheels F' F, wheel and pinion E' E, wheel D', box D, with its loose wheels *b' b'*, and beveled wheels *b b* with the shafts or axles B B, substantially as and for the purpose described.

3. In machines for operating traction-engines, the combination of the sprocket-wheels P F' F', chain S, beveled wheels F' F, wheels E', E, and D', and the box D with interior loose wheels, *b' b'*, and beveled gears *b b* on the shaft or axles of the four traction-wheels, substantially as and for the purpose described.



4. The combination of the sprocket-chain S, sprocket-wheel O, spur-gears *m* and *n*, friction-cones W, *c*, and *c'*, worm-gear *f f'*, and segment-rack I', whereby the wheels are turned in steering, substantially as and for the purpose described.

5. The combination of the sprocket-chain S, the sprocket-wheel O, spur-gears *m* and *n*, friction-cones W, *c*, and *c'*, cones *w* W' *w'*, and worm-gear whereby the rear wheels are steered, substantially as and for the purpose described.

6. The combination of the exterior wheel, Q, having in its tire a series of orifices, the interior wheel, Q', provided with a series of projecting turtle-heads, *g'*, to protrude through the orifices in exterior wheel, Q, and the adjustable eccentric Q' on the axle of a traction-engine, all substantially as and for the purpose described.

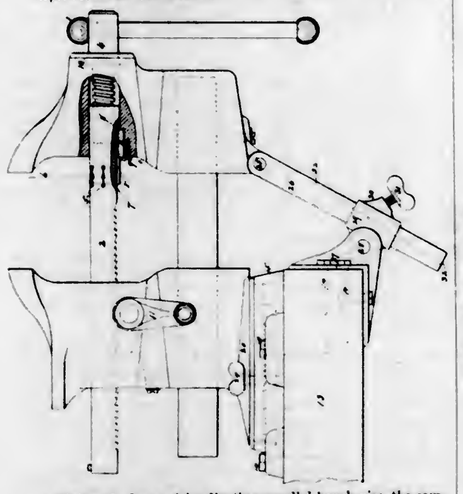
259,601. SHUTTER-FASTENER. SWAN E. SWANSON, Galesburg, Ill. Filed Mar. 9, 1882. (Model.)

259,601.

Claim.—1. In a window-shutter fastening, in combination with catches c, fixed to the shutters, and pivoted catches D, constructed substantially as described, and held by springs F, the slides G G', having thumb-pieces g g' projecting through the case A and adapted to operate the catches D, substantially as and for the purpose specified.

2. In a window-shutter fastening, in combination with the shutters having catches c, the swinging catches D D', having ends e e', as shown, springs F, stops e'', and slides G G', substantially as and for the purpose specified.

3. In combination with the shutters having catches c and the spring-actuated catches D D', the spring-actuated plates H, adapted to close the holes a' in the case A when the catches c are not therein substantially as and for the purpose specified.



259,602. CUTTER-BAR FOR REAPING AND MOWING MACHINES. THEODORE TAYLOR, La Grande, Oreg. Filed Jan. 10, 1882. (No model.)

Claim.—1. The combination, with a cutter-bar provided with studs on its bottom plate, and knives having recessed edges, of hinged clamping-pieces adapted to be secured in the space between knives and cap-plate, substantially as herein shown and described, and for the purpose set forth.

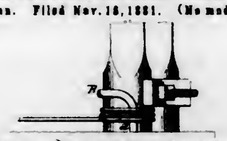
2. The combination, with the cutter-bar A, having studs d on its bottom plate, a, and the knives c, having recessed edges, of the clamps f, hinged to the ends of the said cutter-bar, and having overlapping ends, and the fastening-bolt h, substantially as and for the purpose set forth.

259,603. BENCH-VISE. JOHN THOMSON, Brooklyn, N.Y. Filed Apr. 14, 1882. (No model.)

Claim.—1. In a quick-adjusting parallel bench-vise, the combination, with the front and back jaws, clamping-screw 4, spline 3, and locking-screw 9, of the ratchet-rod 2, in which is formed a slot, 1, having a solid terminus or stop, 8, for the purpose herein set forth.

2. In a quick-adjusting parallel bench-vise, the combination of the ratchet-rod 2, having a slot, 1, and solid terminus or stop 8, with the spline 3 and stop-screw 9, for the purpose herein set forth.

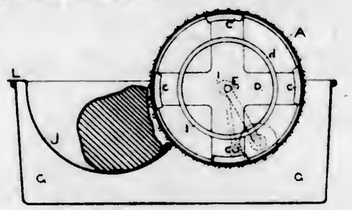
3. In a quick-adjusting parallel bench-vise, the combination of the front jaw, ratchet-rod 2, and screw 4 with the indicating-marks, as 5, for the purpose specified.



4. In a quick-adjusting parallel bench-vise, the combination, with the back jaw, on the bottom and outer circumference of which is formed an upright journal-bearing, 18 19, of the cone-shaped box 15, constructed as described and shown, and the annular clamping ring 22, when said ring is situated within the box and secured at its outer side to the bottom of the base by screws, as 23, and manually operated from above the base by means of hand-screws, as 24, for the purpose specified.

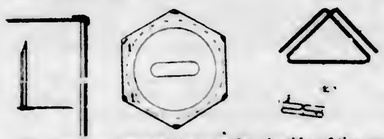
5. In a parallel bench-vise, the combination, with the front jaw and bench, 13, of a bearing, 29, secured to the bench, and a supplementary brace, 26, attached to the jaw, and means for locking said bearing and brace together when desirable, for the purpose set forth.

6. In a parallel bench-vise, the combination, with the front jaw and bench, 13, of the bracket 27, bearing 29, supplementary brace 26, and hand-screw, as 31, for the purpose specified.



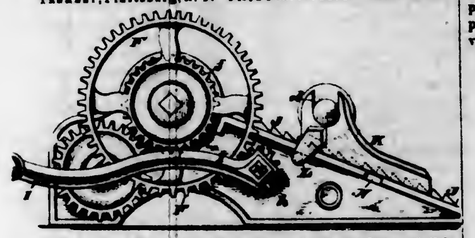
7. In a parallel bench-vise, the combination, with the front jaw and bench, 13, of the bracket 27, bearing 29, supplementary brace 26, in which is formed a tapering or wedge-shaped slot, 32, and hand-screw, as 31, for the purpose specified.

259,604. PIANO-TUNING-PIN LOCK. JAMES S. THORPE, Waterbury, Conn. Filed Nov. 18, 1881. (No model.)



Claim.—The herein-described lock for piano-pins, consisting of the clamp B, taking a bearing upon the surface of the pin, with one end extending through a stationary bar, and with a clamping device, substantially such as described, on the opposite side of the said bar to draw the clamp into frictional contact with the pin, the other end of the clamp extending down on the surface of the pin, and between the pin and the wire thereon, substantially as described.

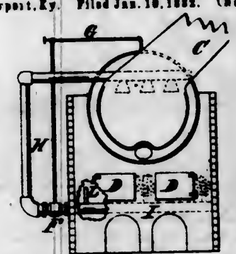
259,605. GRATER. JEFFERSON D. TODD, Williams, Cal. Filed Feb. 18, 1882. (No model.)



Claim.—The grater herein described, consisting of the cylinder A, supported and revolved by the detachable spiders D, secured on the spindle E, which is turned by the crank F, the whole being arranged and operated within the pan G, in connection with the swinging basket J, (swinging within the pan at the side in front of cylinder A,) in which the substance to be grated is held and gradually fed against the roughened surface of the cylinder, substantially as described.

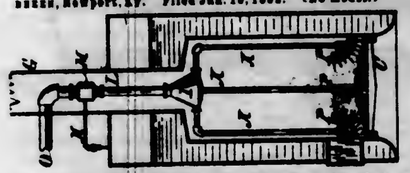
259,606. METALLIC JOINING FOR BOXES, MICA LAMP-CHIMNEYS, &c. GILBERT TOWNSEND, 2d, Lodi, N. Y. Filed Mar. 1, 1881. (Model.)

Claim.—The ribs a, holding together the sides of the panels of boxes and other like articles, in combination with binding-plates b, which hold the ends of the ribs, said ends being inserted through and folded on said plates, as set forth.



259,607. MACHINE FOR BENDING WAGON-TIRES. EDWD. C. TRUMBLY, Plattsburg, N. Y. Filed Feb. 16, 1881. (No model.)

Claim.—1. The inclined frame formed with ratchet-teeth J J and side flanges, the latter being slotted at N N, in combination with the adjustable roll-carrier K, provided with hooks L L and teeth M M, and the geared rolls, substantially as and for the purposes herein set forth.

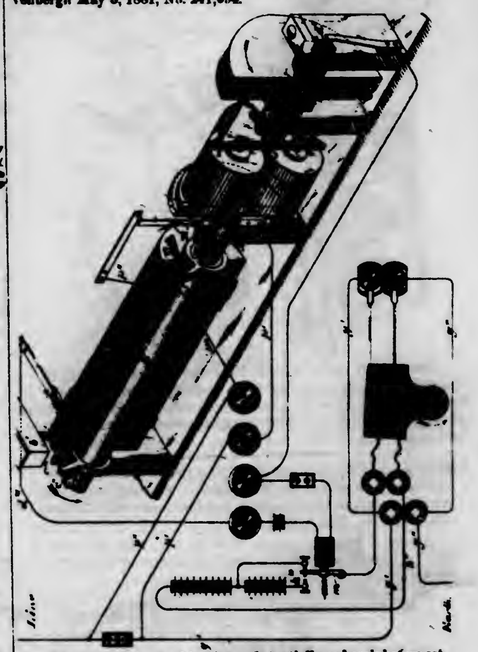


2. The inclined frame provided with ratchet-teeth J J and side flanges, in combination with the adjustable roll-carrier K, having hooks L L and teeth M M, and the geared rolls B C, substantially as described.

259,608. SMOKE-CONSUMING FURNACE. EZRA W. VANDUZEN, Newport, Ky. Filed Jan. 10, 1882. (No model.)

Claim.—In a boiler-furnace, the combination of the steam-injector pipe G, the gas-supply pipe H, tapping and terminating in the uptake C, the injector F, and the transverse distributing-pipe I, connected with the injector and arranged along the front of the grate in close proximity to the cluster of independent air-orifices pierced in the front wall of the furnace, substantially as and for the purposes described.

259,609. SMOKE-CONSUMING FURNACE. EZRA W. VANDUZEN, Newport, Ky. Filed Jan. 10, 1882. (No model.)



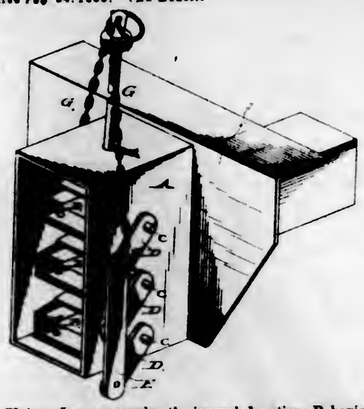
Claim.—1. In combination with the hollow air and steam-distributer I, suspended near the bottom of the flue of a vertical boiler by a depending supply-pipe inserted in the flue from a point above the boiler, one or more diffuser-pipes, K, tapping in and suspended by the diffuser and suspending pipe, and having nozzles P, for distributing the air in a furnace-chamber, substantially as herein set forth.

2. The combination of the air-distributing pipe O, steam-pipe N, suspending-pipe L, injector M, and series of distributing-pipes K, and nozzle P, suspended in the flue and furnace-chamber of a vertical boiler, substantially as described.

259,610. TRANSMITTER FOR PRINTING-TELEGRAPHS. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Nov. 27, 1880. (No model.) Patented in England Dec. 10, 1880, No. 5,163.

Brief.—An electro-magnetic clutch connects the motor to the key-cylinder. Depression of any key breaks the local-battery circuit of this clutch, releases an armature, which falls against its back stop, and puts additional battery to line for actuating the press mechanism. The type-wheel of the receiver is operated by currents of opposite polarity. At each revolution of the key-cylinder a resistance is automatically cut out of main line for the purpose of actuating the unison mechanism. This transmitter is peculiarly adapted to the printing-receiver patented to Van Hoevenbergh May 3, 1881, No. 241,094.

Claim.—1. The combination, substantially as hereinbefore set forth, of a series of pins or stops mounted upon a revolving cylinder, a series of keys corresponding with said pins, each one of which, when depressed, engages with its corresponding pin, and thereby arrests the motion of said cylinder at a determinate point in its revolution, a commutator or pole-changer actuated by the shaft of said cylinder, a continuously-revolving shaft which is normally coupled to the commutator-shaft by the attraction between an electro-magnet mounted upon one of said shafts and its armature mounted upon the other, and a circuit-breaker which is brought into action by the engagement of any one of the keys with its corresponding pin upon the cylinder to demagnetize said electro-magnet and disconnect the commutator-shaft from its motor.



2. The combination, substantially as hereinbefore set forth, of a series of keys, an intermittently-revolving shaft the movements of which are controlled by said keys, a rock-shaft which performs a determinate number of oscillations during each revolution of said shaft, and two or more independent commutators for actuating separate circuits mounted upon said rock-shaft.

3. The combination, substantially as hereinbefore set forth, of a series of keys, an intermittently-revolving cylinder the movements of which are controlled by said keys, and a circuit-changer which is automatically actuated by said cylinder to momentarily augment the normal strength of current in the main line at one and the same determinate point in each and every revolution of the cylinder.

4. The combination, substantially as hereinbefore set forth, of a series of pins or stops mounted upon a revolving cylinder, a series of keys corresponding with said pins, each one of which, when depressed, engages with its corresponding pin, and thereby arrests the motion of said cylinder, a yielding mechanical connection between said cylinder and its driving-axis, and a ratchet-wheel and click for preventing a retrograde motion of the driving-axis.

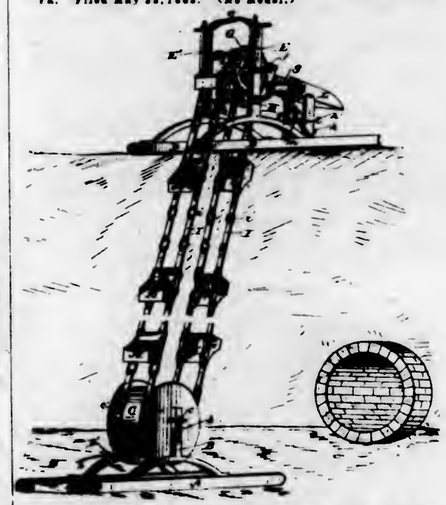
5. The combination, substantially as hereinbefore set forth, of an intermittently-revolving cylinder, a key which, when depressed, arrests said cylinder at a determinate point in its revolution, a cam which acts to maintain said key in a position to arrest the cylinder, and a spring which automatically throws said cam out of position and releases said key when the latter is depressed by the operator.

259,611. CAR-COUPLING. WILLIAM WARD, Zanesville, Ohio. Filed Feb 24, 1882. (No model.)

Claim.—In a car-coupler, the journaled sections B, having V-shaped bottoms, and provided with the springs B and C, in combination with the lever-arms D, vertical bar E, chain G, and pin I, all constructed to operate substantially as and for the purpose set forth.

259,612. DEVICE FOR SUSPENDING ELECTRIC-ARC LAMPS. ADDISON G. WATENBOUGH, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Apr. 15, 1882. (No model.)

Claim.—1. A combined supporting and circuit-controlling apparatus for electric lamps, consisting of an insulating-plate to which are fixed a swivel-hook, contact-springs, and binding-posts in electrical connection with the said springs, these parts being so constructed and arranged that a lamp suspended from the swivel-hook and turned will be brought into circuit by contact of suitable terminal points thereon with the springs, as set forth.



2. The combination, with an electric lamp, of two springs fixed to an insulating-support and connected with an electric circuit, electrically-connected contact-points upon which the springs bear, and a swivel-support between the springs, these parts being so arranged that a lamp suspended from the swivel-support and turned will be brought into circuit by the contact of terminal points thereon with the springs, as set forth.

3. The combination, with an electric lamp, of a tube inclosing the carbon-holder, and conductors leading to the regulating mechanism and carbons, and a block or support, L, provided with terminal points with which the said conductors are connected, these parts being constructed and arranged substantially as described, and for the purpose of facilitating the introduction of a current to the lamp from suitably-arranged circuit-terminals.

4. The combination, with an electric lamp having terminal contact-points N, of a plate, A, springs D E, electrically-connected stops F G, and swivel-hook B, substantially as described.

5. In a supporting and circuit-controlling apparatus for electric lamps, the combination, with the hook B, of the contact-springs D E, bent as described, for holding the terminal stops of an electric lamp.

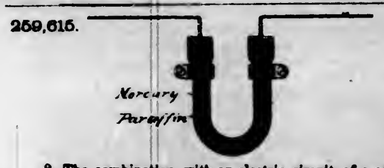
259,613. HOD-ELEVATOR. EPHRAIM W. WATSON, Norfolk, Va. Filed May 23, 1882. (No model.)

Claim.—The base-frame A, provided with the drum C, having flanges c' c^2, and the top frame, D, drum F, gear G, pinion H, and adjustable trough L, in combination with the endless belt I i, having buckets K, as set forth.

259,614. SAFETY DEVICE FOR ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 5, 1882. (No model.)

Claim.—1. The combination, with a circuit or branch thereof, of a safety device which fuses at a temperature below the ignition-point of wood, paper, fabrics, or other like combustibles.

2. The combination, with an electrical conductor, of a strip or wire of higher resistance than the said conductor, and which fuses at a temperature lower than the ignition-point of wood, paper, fabrics, or other like combustibles, substantially as set forth.

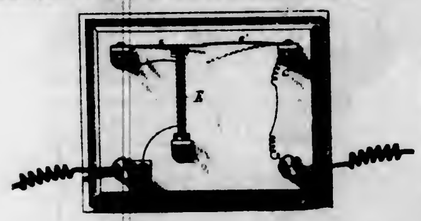


3. In a safety device for electric circuits, the combination, with a slab of wood, of a strip of fusible metal attached thereto by varnish or similar cement, and binding-posts in contact with the ends of the strip, as and for the purpose set forth.

259,615. SAFETY DEVICE FOR ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 10, 1882. (No model.)

Brief.—When an abnormal current melts the paraffine case by heat from the mercury the latter falls out, and thus breaks the circuit.

Claim.—1. The combination, with an electric circuit, of a fluid-conducting medium having a higher relative resistance than the conductors of the circuit, and a retaining-case composed partly or wholly of highly-fusible material, substantially as described.



259,615.

2. The combination, with an electric circuit, of a column of conducting-liquid of higher relative resistance than the conductors of the circuit, and an inclosing tube or casing of highly-fusible material, substantially as described.

259,616. SAFETY DEVICE FOR ELECTRIC CIRCUITS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Jan. 6, 1882. (No model.)

Brief.—When the paraffine E melts from the heat of the resistance F it allows the springs c and c' to separate and break the circuit before damage is done to the instruments in line.

Claim.—1. The combination, with an electric circuit, of a wire or similar conducting medium of higher relative resistance than the conductors with which it is connected, a circuit-interrupter, and a mass of fusible material surrounded by or in proximity to the wire of high resistance, and arranged to maintain the continuity of the circuit through the interrupter until softened by heat.

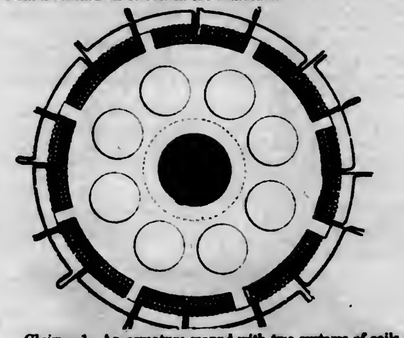
2. In a safety device for electric circuits, the combination, with a circuit-interrupter, of a mass of highly-fusible material for preventing the same from acting, and a resistance-wire included in the circuit with the interrupter and in proximity to the fusible material, substantially as set forth.

3. In a safety device for electric circuits, the combination of springs c c', a mass of fusible material for maintaining the same in contact, and a resistance-wire surrounding the fusible material, for the purpose set forth.

4. The rod E, or its equivalent, composed of a non-conducting substance, which softens at a low temperature, and powdered metal for rendering the same a better conductor of heat.

259,617. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—Divides the armature-coils by taking loops from the middle of the coils to the plates of a second commutator.



Claim.—1. A cylindrical armature for dynamo-electric machines, wound with a double system of continuous coils in separate divisions, in combination with two independent commutators, connected respectively with loops taken from diagonally-opposite portions of the said divisions, substantially as described.

2. An armature wound with a double system of continuous coils in separate divisions, in combination with two independent commutators, connected respectively with loops taken from the junctions of the several divisions of coils, and from the middle of each of said divisions, substantially as set forth.

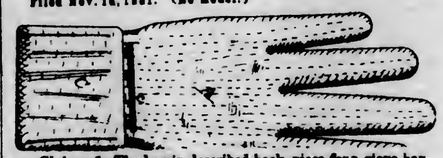
259,618. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—The armature is wound with two systems of coils, each section containing four coils, those of each system being alternately above and below. The terminals of the two systems are connected to form a continuous circuit in the armature.

Claim.—1. An armature wound with two systems of coils in diametrically-separate divisions, the divisions of one system being alternately under and over those of the other, and the said divisions being looped together and connected to the commutator, substantially in the manner described.

2. An armature for dynamo-electric machines, containing recesses or grooves wound with two systems of coils in diametrically-separate divisions, each recess containing four of such divisions, the divisions of one system being alternately under and over the divisions in the other, and all being looped together and connected to commutator-segments, substantially as shown and described.

259,619. WHEEL-FENDER FOR VEHICLES. H. WHEELER, Philadelphia, Pa., assignor to Benjamin F. Enoch, same place. Filed Mar. 6, 1882. (Model.)



Claim.—1. The combination of the axle, with the arms which extend horizontally outward therefrom, with the fender and the braces, which serve both to brace the fender in place and act as guards to prevent the fender from striking against the body of the vehicle, substantially as described.

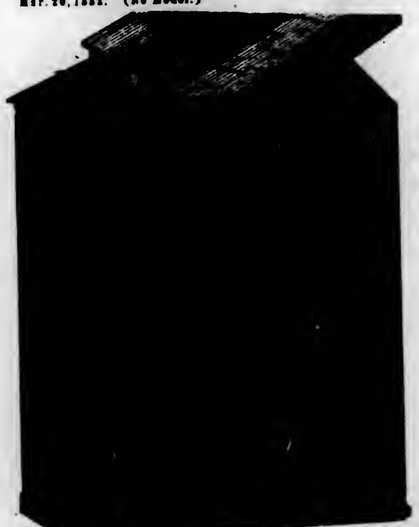
2. The combination of the fender with a U-shaped guard secured to its rear end, and the inwardly-flaring guard I, which serves to catch the dirt thrown up by the spokes of the wheels, substantially as set forth.

3. In a guard for wheels, the combination of the horizontal supporting-arms X, the guard G, secured thereto, the braces J K, and an apron or curtain which is buttoned to the guard, substantially as specified.

259,620. GLOVE. WILLIAM W. WHITAKER, Cloversville, N. Y. Filed Nov. 14, 1881. (No model.)

Claim.—1. The herein-described back-piece for a glove having a back for the hand and two or more two-ply back-pieces for fingers formed in one continuous piece, the two folds of each finger-back being closed and joined along the edges of the fingers, substantially as set forth.

2. The herein-described wrist and back-piece for a glove having a two-ply finger-back attached thereto and knit in one continuous piece, with the edges of the two folds closed and joined along the edges of the fingers, substantially as set forth.



3. A glove having two or more back-pieces for fingers attached to the hand part when each finger-back is formed of a two-ply fabric the two folds of which are formed in one continuous piece and are joined and closed along the edges of the fingers, substantially as set forth.

4. A glove having two or more back-pieces for fingers attached to the hand part, each of said finger-backs having a knitted selvage edge along the edges of the finger adapted to have a front finger-piece secured to said edges, substantially as set forth.

5. A glove having a fibrous two-ply back for the hand and fingers, a leather palm and finger-fronts, and a forgette which unites the edges of the finger-backs with the leather finger-fronts, substantially as set forth.

6. A glove having a fibrous two-ply back for the hand and fingers, a leather palm and finger-fronts, a fibrous lining for the finger-fronts, and a forgette which unites the edges of the finger-backs with the leather finger-fronts and the fibrous linings of the finger-fronts, substantially as set forth.

259,621. FRUIT-DRIER. WILLIAM H. WILEY, Henderson, assignor of one-half to J. Allen Moore, Greensborough, Md. Filed Mar. 20, 1882. (No model.)

Claim.—1. As an improvement in fruit-driers, the combination, with a vertical casing, of an endless double chain or carrier supported wholly by and pendent from two combined carrying-wheels which are secured to and revolve with the same shaft within the upper portion of said casing; crates for trays of fruit, pivoted to and swinging upon said carrier; a groove at or within each side of said casing, adapted to receive the ends of the pivotal shafts of said crates and to guide and control the position of said carrier below said carrying-wheels; and means whereby the latter may be caused to rotate and to move said carrier longitudinally, substantially as and for the purpose specified.

2. The means employed for insuring the relative positions of and for moving the fruit-crates through the vertical drying-chamber, consisting of the shafts F, having pivoted thereon said crates, the links G, connecting together said shafts, the wheels E, secured upon the same shaft D, and provided with peripheral recesses *e*, and the grooves A, adapted to receive the ends of said pivotal shafts F and to guide and control the position of the endless carrier in its passage from said wheels downward through the lower end of said drying-chamber and upward again to said wheels, substantially as and for the purpose shown.

3. In combination with the shafts F, wheels E, and groove A, the rollers I, journaled upon the ends of said shaft and having their outer ends enlarged to form shoulders *i*, substantially as and for the purpose set forth.

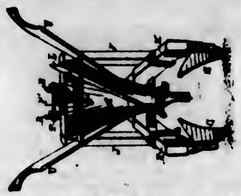
4. In a fruit-drier having means for moving the fruit through a vertical casing, a central chamber provided with valves for regulating the temperature and currents of air, and adapted to receive and contain trays of fruit, substantially as and for the purpose shown and described.

5. The crates for containing trays of fruit, consisting of the plates K, provided with the grooves *k'*, slots *k²*, and pins *k³*, and combined by means of the connecting-rods *k*, substantially as and for the purpose shown.

6. The hereinbefore-described fruit-drier, in which is combined a vertical casing, an endless carrier, provided with swinging crates, that passes over and is wholly supported by a pair of combined carrier-wheels journaled by the same shaft within the upper portion of said casing, grooves that receive the edges of and guide said carrier while passing through the lower portion of said casing, and mechanism, substantially as described, whereby said parts are caused to operate in the manner and for the purpose substantially as set forth.

259,622. FIRE-ESCAPE. ALFRED WILLIAMS, Philadelphia, Pa., assignor of one-half to Isaac W. Heysinger, same place. Filed Nov. 1, 1881. (No model.)

Brief.—A ladder with safety platforms or balconies secured thereto is provided with pulleys outside of the vertical line of the ladder, whereby it is moved across the face of the building.



Claim.—1. In combination with the ladder B, provided with one or more platforms, C C, the supporting-rail K, permanently attached to the walls of a building, upon which the said ladder is supported and moved from side to side, substantially as and for the purpose described.

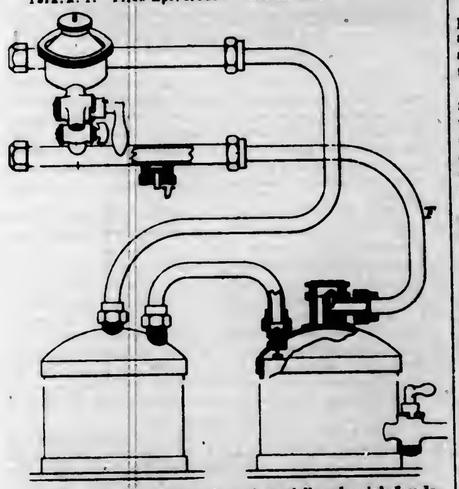
2. In combination with the safety-platforms C C, ladder B, and supporting-rail K, the friction-rollers I I, placed beyond the outside lines of the said ladder B, so as to overhang the said platforms C C and support the same, substantially as shown and described.

3. A fire-escape for buildings, consisting of a ladder provided with safety-platforms at different heights, the said ladder being hung from a supporting-rail permanently attached to the building and laterally movable upon the said rail by means of traction-chains, or their equivalent, worked from the surface of the ground, substantially as herein set forth.

4. A movable ladder for fire-escapes, provided with safety-platforms at various heights, said platforms being permanently attached to the said ladder and having openings therein to allow the descent of persons from the said platforms upon the said ladder, substantially as described.

259,623. SEED-PLANTER AND FERTILIZER-DISTRIBUTER. NOAH R. WILSON, Piedmont, S. C. Filed Dec. 19, 1881. (No model.)

Claim.—In a seed and fertilizer dropper, the combination of hopper A, having the perforated disk P, cone B, and movable disk or slide Q, lever L, connected to said disk Q, beams K, having the handles U, the graduated slotted cross-bar U', secured to and between the handles U and receiving the lever L, and nut W, substantially as and for the purpose set forth.



259,624. ANIMAL-POKE. LEWIS T. WIRE, Cambridge, Iowa. Filed Sept. 13, 1881. (No model.)

Claim.—1. The collar-coupling device *g*, having a barbed extension, *h*, and perforations *i i*, in combination with a jointed animal-collar, as and for the purposes set forth.

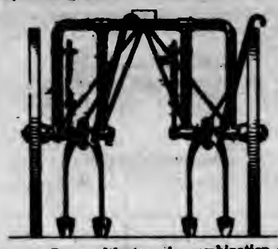
2. The improved animal-poke composed of the bar A, having a central bow, *b*, and hooks or elbows *c* at its ends, the half-collar D, and the barbed connecting devices *g h*, substantially as shown and described, to operate in the manner set forth.

259,625. BEER APPARATUS. LOUIS WINTERBARER, New York, N. Y. Filed Apr. 4, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the gas-reservoir, the service-pipe emanating from the reservoir, the receiver having a suction-valve and discharge-valve, the return-pipe terminating in the suction-valve of the receiver, and the coupling-pipe extending from the discharge-valve of the receiver to the reservoir.

2. The combination, substantially as hereinbefore set forth, of the receiver having a suction-valve and discharge-valve and the pumping attachment of the receiver with the reservoir, the coupling-pipe, the service-pipe, and the return-pipe.

3. The combination, substantially as hereinbefore described, of the receiver having a suction-valve, discharge-valve, and water-cock with the reservoir, the coupling-pipe, and the return-pipe.



4. The combination, substantially as hereinbefore set forth, of the service-pipe, the return-pipe, and the two-way cock having both pipes connected therein with the reservoir, the receiver having a suction-valve and discharge-valve, the coupling-pipe extending from the discharge-valve of the receiver to the reservoir, the service-pipe emanating from the reservoir, and the return-pipe terminating in the suction-valve of the receiver.

5. The combination, substantially as hereinbefore set forth, of the service-pipe having arranged therein the check-valve E, the gas-pressure-regulating valve O, and the chamber common to both such valves with the reservoir and receiver.

6. The combination, substantially as hereinbefore set forth, of the return-pipe and the suction-valve arranged therein with the receiver having a suction-valve and discharge-valve, the return-pipe connected to the suction-valve, and the pumping attachment of the receiver.

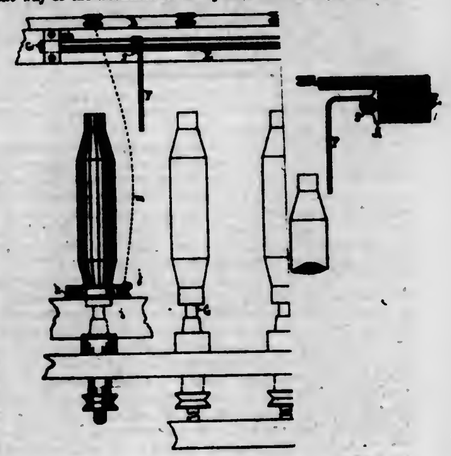
259,626. CULTIVATOR. EDGAR A. WRIGHT, Hollis, Ill. Filed Apr. 6, 1882. (No model.)

Brief.—The wheels are loose upon the axles and the axles rotate in bearings in the frame. The spring-arms are attached to the axles direct, avoiding thus the use of a sleeve.

Claim.—1. In a cultivator, the combination of the frame, the wheels, the two axles rotating independently of the frame and wheels, the plow-beams coupled to the axles, substantially as described, and the arms applied to the axle and adapted to co-operate with springs, weights, or draft devices, substantially as described.

2. The combination of the arched frame, the wheels, the independently-rotating axles, each provided with an arm, the spring attachments co-operating with the arms, substantially as described, and the beams connected with the axles, substantially as shown, to swing vertically therewith.

3. In a cultivator, the combination of a draft-frame, an axle revolving freely in said frame, a ground-wheel revolving freely on the axle, a plow-beam vertically pivoted to the axle, and an arm or projection, substantially as described, secured to the axle, and a spring-connection interposed between the frame and arm, substantially as described, for the purpose of acting through the arm and axle upon the beam.



4. The combination of the arched frame *a* and standards *c*, provided with the axle-bearings, the two independent loose axles, the two loose wheels, the two beams connected with the axles by vertical axes, the arms rigidly secured to the beams, the rods pivoted at one end to the arms and sliding at the opposite ends in guides, and the springs mounted on the rods, as shown.

5. In combination with the rotating axle and the beam having a forked head, the coupling consisting of the tube, the bearing-block between the tube and axle, the clamping devices, and the vertical pivot.

6. The combination of the draft-frame, the ground-wheels, the rotating axle, the beam connected with the axle by a vertical axis, and the arm secured rigidly to the axle and extending downward therefrom.

259,627. THREAD-GUARD FOR SPINNING-MACHINES. WM. A. WRIGHT, Lowell, Mass. Filed Mar. 31, 1881. (No model.)

Brief.—The thread-guard is adapted to prevent snarls and kinks formed in the thread being spun upon one spindle from breaking the threads being spun upon adjacent spindles, and by the means detailed in the claim the guard may be readily swung out of the way to permit of the removal of the ring-rail for repairs. The construction is also such that the guard will be out of the way of the workman in the operation of doffing the bobbin.

Claim.—In a ring-spinning machine, the combination of the thread-board rail E, spindles C, and guards F with the rock-shaft G, which bears the guards, and is held by frictional contact in its bearings in whatever position of oscillation it is placed, substantially as described.

259,628. BRACE FOR PUMP-SPOUTS. S. JARVIS ADAMS, Pittsburg, Pa. Filed Apr. 5, 1882. (No model.)

Claim.—1. In braces for supporting pump-spouts, the combination of a ring adapted to fit around the spout and a supporting-strap adapted to fit within the ring and be held between the ring and the spout, substantially as and for the purposes set forth.

2. In braces for supporting pump-spouts, the combination of a ring adapted to fit around the spout, a supporting-strap adapted to fit between the ring and the spout, and means for preventing the movement of the ring on the strap, substantially as and for the purposes set forth.

3. In braces for supporting pump-spouts, the combination of the ring *c*, having the recess *e* and lug *k*, and the supporting-strap *d*, adapted to fit within the recess *e*, and provided with the slot *l*, for the reception of the lug *k*, substantially as and for the purpose set forth.

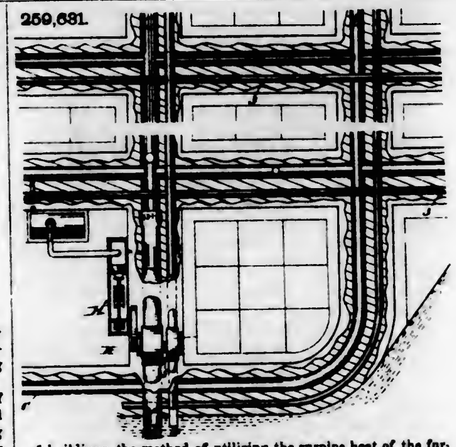
259,629. MANUFACTURE OF ARTIFICIAL INDIGO. ADOLPH BAEYER, Munich, Bavaria, assignor to Badische Anilin und Soda Fabrik, Mannheim, Germany. Filed May 11, 1882. (Specimens.)

Claim.—1. As a new product, an artificial indigo having the characteristics above set forth.

2. The within-described process of producing an artificial indigo by starting from toluene successively through benzyl chloride, benzyl cyanide, phenylacetic acid, oxindol, nitroso-oxindol, amido-oxindol, artificial isatine, and isatine chloride to the artificial indigo, substantially as set forth.

259,630. HORSESHOE. GEORGE B. BROWN, Boston, Mass. Filed Jan. 24, 1880.

Claim.—The new article of manufacture, consisting of a horse-shoe having a flat bearing-surface from the toe to the quarters, the sides gradually increasing in thickness vertically, but diminishing in thickness laterally, and having their upper parts inclined outwardly from the quarters to the heel and the inner upper surface concaved, as shown and described.



259,631. METHOD OF VENTILATION. JOHN COMSTOCK, Hudson, Wis., and THOMAS B. JEFFERSON, Boston, Mass. Filed Mar. 29, 1882. (No model.)

Claim.—1. In the art of ventilation, the method of utilizing the sewers of a city as main ventilating-conduits, whereby the discharge of the sewage is accelerated and the sewers rendered more efficient in their action, which consists in connecting the sewers by suitable branches to the buildings to be ventilated, inducing a powerful mechanically-produced draft toward the exits of the sewers, and automatically preventing the back flow of air-currents into the sewers and drains, substantially as set forth.

2. In ventilating the sewers of a city or district and the drains of a building or buildings, the method of utilizing the products of combustion of furnaces, stoves, &c., as an aid to the purification of the gases within the sewer and drains previous to their elimination from the same, which consists in connecting the flues of the heating apparatus to said drains and sewers and inducing a powerful mechanically-produced draft of air within said sewer, &c., whereby the said products of combustion are commingled with the noxious gases and vapors, and are finally discharged at a point beyond the inhabited portions of the city or district, as set forth.

3. In ventilating the sewers of a city or district and the drains

259,631.

of buildings, the method of utilizing the surplus heat of the furnaces or other heating apparatus of the buildings located within a defined district to prevent the sewer contents from freezing, and thus interfering with effective ventilation, which consists in connecting the heating apparatus with the sewers, mechanically inducing a powerful draft of air toward the exits of the sewers, and regulating the discharge from the heating apparatus to the sewers, as set forth.

4. In the art of ventilation, the combination, with a conduit rendered approximately air-tight, and means for inciting therein a powerful and continuous draft in the direction of its exit, of branches connecting said conduit with the apartments of buildings, and means whereby the back flow of sewer-gas from said conduit is automatically provided against, substantially as set forth.

5. The combination, with a conduit having suitable connections with apartments of buildings, and means for inducing a draft of air therein in the direction of its outlet, of check-valves or gates arranged at proper points in the conduit and connections, and adapted to automatically prevent the back flow of impure air into said apartments when the draft-inciting means are not in operation, or from other cause, as set forth.

6. The combination, with a suitable condnit and the draft-inducing means, of connections between apartments and said conduit, and devices within said connections, whereby the back flow of impure gas is automatically prevented, as set forth.

7. The combination, with an approximately air-tight sewer having inlets from the places to be ventilated, of the means for inducing a powerful draft of air toward the exit of the sewer, and means applied to the sewer whereby air-currents in the opposite direction are automatically prevented, as set forth.

8. The combination of the house-drains G, having check-valves S, with the main conduit, the fan H, and hood Y, as and for the purposes set forth.

9. The combination of the house-drains G, having check-valves S, and the main conduit C, having check-valves W, with the fan H, and the hood Y, as set forth, for the purposes specified.

10. The combination, with the main conduit, having check-valves W, and hood or gate Y, of the fan H, the connections between the main conduit and the heating apparatus, and the means X, for regulating the escape of the products of combustion from the latter to the main conduit, as set forth.

11. The combination, with the main conduit, having check-valves W, and hood or gate Y, of the fan H, the connections between the main conduit and the apartments, and heating apparatus, of the dampers X and ventilators R, for regulating the draft and ventilation, as set forth.

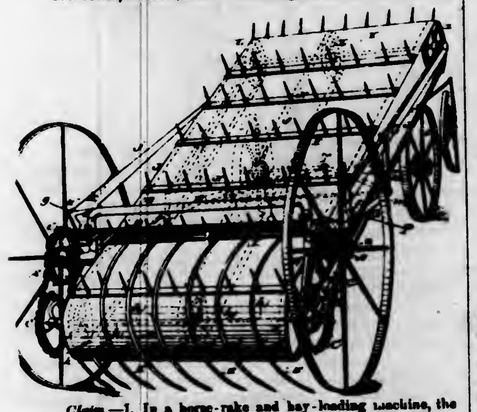
12. The combination, with the main conduit, the fan H, and hood Y, of the connections between the main conduit and the apartments to be ventilated, and means for controlling the draft and air currents within the main conduit, and within the connections between the apartments and the conduit, as set forth.

13. In the art of ventilation, the combination of the heating apparatus of buildings, the main ventilating-condnit, the fan H, and hood Y with connections between the said heating apparatus and the main conduit, valves within the connections, and regulators attached to the heating apparatus, whereby the impure air is conducted into the heating apparatus, from thence into the sewer, and finally discharged into the open air at a point away from the

inhabitants of a city, substantially in the manner and for the purposes set forth.

14. The combination, with the main conduit, the means for inducing a powerful draft therein toward its exit, and a hood, Y, of a supplemental valve located near the exit of the main conduit, between the hood or gate Y and fan, as set forth.

15. The combination of the main conduit and means for producing a powerful draft therein with the valve at or near the outlet of said conduit, adapted to slide up and down in guides, and provided with means for adjusting it, as set forth.



16. The combination, with two main ventilating-conduits, each provided with air-exhausting means at or near its exit, of a single motor arranged to impart motion to both exhausters, as set forth.

17. In the art of ventilation, a sewer-main having ventilating-connections through furnaces, stoves, &c., and an auxiliary main having ventilating-connections with apartments and buildings, combined with means for creating a powerful draft in each main in the direction of its outlet, and a motor common to both of said draft-inciting means, as set forth.

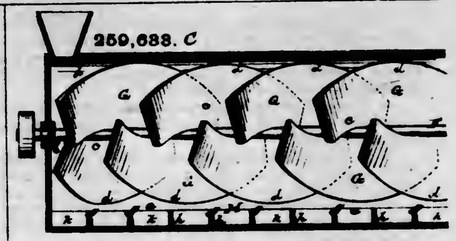
18. In the art of ventilation, a sewer and an adjacent main, the former having connections with stoves, furnaces, &c., the latter with ventilating-connections with apartments, buildings, &c., and both having means for preventing back flow and means for regulating amount of ventilation, combined with draft-inducing means for each main, operated simultaneously by a single motor, as specified.

19. The combination of the sewer C, having check-valves W and connections with heating apparatus, the auxiliary condnit 3, having check-valves and connections with apartments, and regulating means, with the suction-fans H 4, hung upon the same shaft, 5, and operated by a single motor, H', as and for the purposes set forth.

259,632. COMBINED HAY RAKE AND LOADER. SHERAN F. COON, Independence, Mich. Filed Aug. 11, 1881. (No model.)

Claim.—1. In a horse-rake and hay-loading machine, the combination, with the driving-wheels A, having extended hubs E, sprocket-wheels C, formed with clutch-teeth on their inner edges, clutch-rings *b*, pins *c*, springs *c*, and feather-keys *a a*, of the levers *d*, arms *n*, pins *d'*, rake-head D, lever H, and bent axle B, as shown and described.

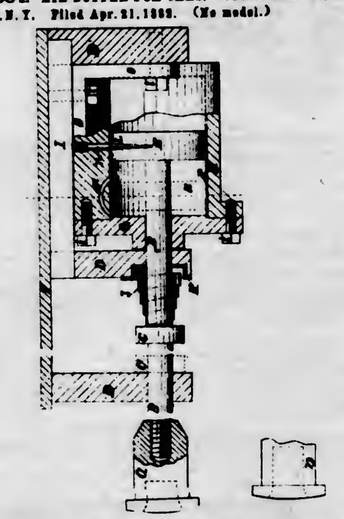
2. In a combined horse-rake and loading-machine, in which the rake has a bent axle, the combination of lever H, striking plate or hook *i*, cord *j*, having a knot or button, *g*, and pulley *k*, substantially as described, and for the purposes set forth.



3. In a combined horse-rake and loading-machine, the combination of the shaft or pole G, supporting-fulcrum M, and lever O, having a ratchet-bar, P, secured at its short end, substantially as described, and for the purpose set forth.

259,633. AMALGAMATING ORE-SEPARATOR. DAY O. CRANE, Washington, D. C. Filed Feb. 31, 1882. (No model.)

Claim.—1. In an amalgamating ore-separator, the opposite series of inclined flume-blades G, having their faces coated with quicksilver, and arranged in parallel directions on opposite sides of a rotating shaft, in combination with said shaft, journaled at the ends of a cylinder-case, substantially as specified.



2. In an amalgating ore-separator, the combination, with the cylinder-case A, provided with the base-trough H, having the

259,633. C

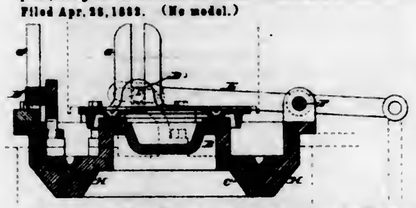
grooves *g* and the removable transverse riffles *h*, of the inclined flume-blades G, coated with mercury, and arranged on opposite sides of a rotating shaft and in parallel inclined directions, and having the elliptically-curved margins *d*, working near the case-wall and near the upper edges of the riffles, substantially as specified.

259,634. AIR-BUFFER FOR CARS. WESLEY GROVER, Rochester, N. Y. Filed Apr. 21, 1882. (No model.)

Claim.—1. In a pneumatic car-buffer and draw-bar, the combination of an air-cylinder and a piston fitting within the cylinder and connected with the buffer or draw-bar, said cylinder being provided with a passage opening at one end into the cylinder close to the cylinder-head and at the other end at a distance from the head slightly greater than the thickness of the piston, whereby the air between the piston and the cylinder-head is subjected to compression until the piston reaches a point between the two openings of the passage, and is then permitted suddenly to pass to the other side of the piston, substantially as and for the purpose set forth.

2. In combination with a car-buffer, a piston connected therewith and arranged to move within an air-tight cylinder, substantially as shown and described, whereby the elasticity of the compressed air on one side of the piston and the force or effect of the partial vacuum on the opposite side are both utilized to take up the concussion of the buffer.

3. In a pneumatic car-buffer and draw-bar, the combination of a cylinder filled with air and a piston fitting closely within the cylinder and attached to the buffer or draw-bar, the cylinder or the piston being provided with a small passage through which the air can slowly pass from one to the other side of the piston, but so small as to have no appreciable effect upon the compression of the air, whereby a sudden movement of the piston is caused to compress the air, but a very slow and gradual movement is permitted without compressing the air.



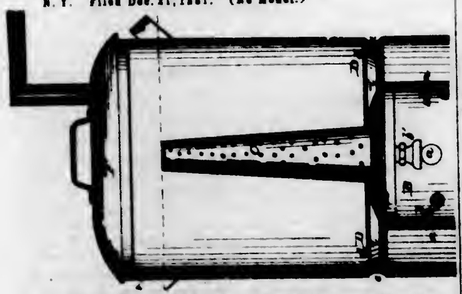
4. In combination with a draw-bar or buffer provided with a piston, a cylinder containing said piston, a passage through which air may slowly pass from one side of the piston to the other, and a spring applied to the draw-bar and arranged, substantially as described and shown, to return the piston to the middle of the cylinder after being forced from said position.

5. The herein-described combined draw-bar and buffer, consisting of draw-head A, draw-bar or piston-rod B, provided with collar C and piston E, cylinder H, provided with ports m m and channel I', beam or support D, and spring J, all combined and operating substantially as shown and described.

6. In combination with the cylinder having the oil-hole n and plug I, the piston E, provided with groove L, as and for the purpose explained.

7. In a car-buffer substantially such as shown and described, the combination of an air-cylinder, a piston arranged to move within said cylinder, and a collar applied to the piston-rod and arranged to come into contact with a stop outside of the cylinder, whereby the piston is prevented from coming into contact with the cylinder-heads.

259,635. SOLDERING-POT. JAMES W. FARRELL, Philadelphia, assignor of one-half to Frank W. Edwards, Thurlow, Pa. Filed Apr. 28, 1882. (No model.)



Claim.—1. The bed B, in combination with vertically-movable trough C, depressed below said bed and surrounding it, and provided with gudgeons D, the shaft F, the longitudinally-slotted arms E, and the vertically-slotted guides G, the said gudgeons sitting in the slots of said arms and said guides, substantially as set forth.

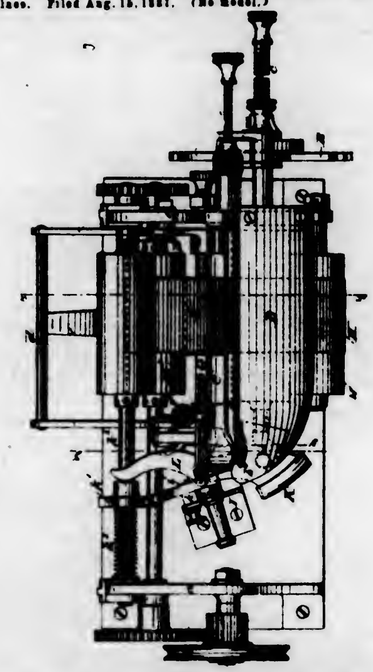
2. Slotted guides G and G', in combination with a vertically-movable trough having lugs which fit in the former guides and gudgeons which fit in the latter guides, the bed B, which supports the cans, the shaft F, and slotted arms E, substantially as set forth.

3. The trough, in combination with the pot formed with a groove in its bottom of a shape corresponding to the contour of said trough, in order that it may receive said trough when the latter is lowered, substantially as set forth.

4. The trough, in combination with the pot having a groove in its bottom, said groove being adapted to receive said trough, substantially as set forth.

259,636. WASHING-MACHINE. WILLIAM G. FLAGLER, Troy, N. Y. Filed Dec. 21, 1881. (No model.)

Claim.—In a wash-boiler as described, the combination of chamber B, having side openings, a, automatic valves b, and perforated pipe C, with a perforated screen or diaphragm, D, which fits close upon the top of B, all substantially as set forth.



259,637. TRUSS FOR VEHICLE-AXLES. WILLIAM A. GALBRAITH, Flint, Mich., assignor of one-half to James Gillett Mallory, same place. Filed Mar. 31, 1882. (No model.)

Claim.—1. The combination, with the axle A, of the skeins B, having eyes G G, the transverse clips C, secured under the axle by the bound-bolts D, and having eyes E E, and the truss-rods F F, located in the eyes E G and secured by nuts, which also serve to hold the skeins upon the axle, as set forth.

2. The combination of the axle A, the skeins B, having eyes G, grooves I, and diagonal perforations J, the bound-bolts D, clips C, having eyes E E, the truss-rods F F, rods K, having eyes L, and nuts M, all arranged substantially as set forth.

259,638. CIGAR-MACHINE. FREDERIC HARENDL, New Orleans, La., assignor to the New Orleans Cigar Factory, same place. Filed Aug. 15, 1881. (No model.)

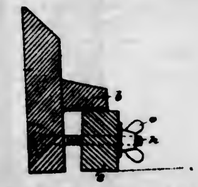
Claim.—1. In a cigar-machine, a bunch-holder provided with a removable adjustable conforming tip-former, c', in combination with a suitable spring, substantially as specified.

2. In a cigar-machine, the vibrating cutter i, having the angular slots i' and i'', and pivoted to a standard, I, and means for operating it intermittently, substantially as described.

3. In a cigar-machine, the vibrating cutter i, having the angular slots i' i'', and pivoted to a standard, I, provided with an adjustable stop, k, in combination with means for operating said knife intermittently, substantially as set forth.

4. In a cigar-machine, the curved plate K, attached to a curved lever, L, arranged on the shaft n, in combination with the sprocket-wheel K' and spring k' on the shaft k', for throwing the sprocket-wheel out of contact with the lever i', substantially as and for the purpose described.

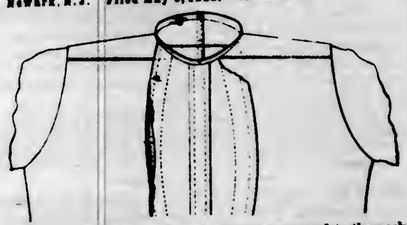
5. In a cigar-machine, the table B, provided with a receptacle, b, and opening b', constructed and arranged as shown, in combination with a flexible tube and a paste-reservoir, D, all as shown, and for the purpose set forth.



6. In a cigar-machine, the adjustable knife N, provided with a curved cutting-heel, constructed as shown, in combination with the bunch-holder O C' and vibrating knife i, all arranged substantially as specified.

7. In a cigar-machine, the vibrating cutter i on the lever i', operated by the sprocket-wheel K on shaft k', in combination with the stationary knife N, secured adjustably to the lower part, C, of the bunch-holder, and the part C', all arranged substantially as specified.

8. The vibrating cutter i, having rectangular slots i' i'', for adjusting said cutter to the lever i', which is pivoted to the standard I, in combination with the lever L on the vertical shaft n, the sprocket-wheel K on shaft k', the thumb-plate K, and the bunch-holder, all substantially as shown and specified.



9. In a cigar-machine, the table B, provided with a receptacle, b, on its lower side and an elongated opening, b', in combination with a flexible tube and a paste-reservoir, D, for delivering the paste to the under side of the cigar-wrapper, substantially as shown and set forth.

259,639. DEVICE FOR TIGHTENING BOLTING-CLOTH. HILPORN HARMON, Jackson, Mich., assignor to the George T. Smith Middlings Purifier Company, same place. Filed Oct. 8, 1881. (No model.)

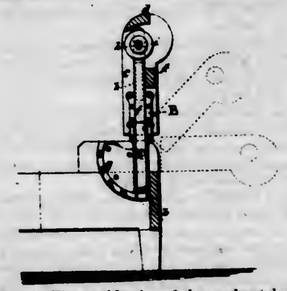
Claim.—The combination, with the shaker-frame, of the inwardly-projecting ribs b, the cloth-bars c, the bolts A, and thumb-nuts e, the bolts being arranged in the described relation to the ribs b and the cloth-bars, whereby said bolts and nuts are adapted to draw the cloth-bars toward the shaker-frame, and also to press the upper edges of the cloth-bars into close contact with the lower faces of the ribs b, substantially as set forth.

259,640. SHIRT. JOSEPH H. HARRISON and JAMES H. HARLEY, Newark, N. J. Filed May 8, 1882. (No model.)

Claim.—1. A shirt having the bosom connected to the neck-band and extended over and above the yoke, substantially in the manner and for the purpose described.

2. The loose-edge bosom, the neck-band having the bosom attached to it, and the yoke extended beneath the upper extended flaps or loose edges of the bosom, all in combination, substantially as described.

259,641. FIRE-PROTECTOR. ENOS HIBBS, Germano, Ohio, assignor of one-half to R. J. Patten, same place. Filed Mar. 16, 1882. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the plate a, the plate b, the wire web c, the edge of which is secured between the said plates, hooks e, bolts d, and thumb-nuts d', whereby the web is secured between the said plates, so that it can be easily replaced, as and for the purpose set forth.

2. The combination, with the blower b', of the plate or frame b, web c, bolts d, winged thumb-nuts d', cross-bar b', and pins b', extended from top of bar b', the said blower being adapted to be placed and fit snugly over the web c, and be secured thereto by the pins b' and wings of thumb-nut d', substantially as set forth.

3. The combination, with a screen for an open grate, of a shelf pivoted to the lower part of the said screen, and means whereby the said shelf is held at any desired angle to or away from the surface of the said screen, substantially as set forth, and for the purpose described.

4. The combination, with the bar b', provided with eyes f and notched bar f', of the shelf g, provided with hooks g', and pawl g', hinged to under side of shelf g, and arranged to engage the notches on bar f' and hold the shelf at any angle desired, substantially as and for the purposes set forth.

259,642. SOFA OR LOUNGE. THEODORE HOFSTATTER, Jr., New York, N. Y. Filed Nov 25, 1881. (No model.)

Claim.—1. The combination of the quadrantal ratchet-plate B, having the central pivot-socket and neck, with the latch-plate B, having pivot e and fulcrumed latch f, and the cam-shaft and cams i, substantially as and for the purpose specified.

2. In combination with the adjustable head of a lounge or sofa, duplicate quadrantal ratchet-plates B B, latch-plates and latches B f B f, and cams i i, substantially as set forth.

3. As a new manufacture, the quadrantal plate B and latch-plate and attached latch B f, formed to co-operate as and for the purpose set forth.

259,643. RUFFLING ATTACHMENT FOR SEWING-MACHINES. ALLEN JOHNSTON, Ottumwa, Iowa. Filed Mar. 29, 1882. (Model.)

Claim.—1. The combination, in a ruffling attachment, with the ruffler-blade adapted to move past the needle and blade-carrier, of operating mechanism adapted to reciprocate the blade and carrier at each reciprocation of the needle, and comprising means for regulating the stroke of said blade and carrier, so that the length of stroke is increased or diminished simultaneously at both ends, and the ruffler-blade moves farther past the needle for full than for scant gathers, but not to the extent of the increased fullness of the gathers, substantially as described.

2. The combination of a ruffler-frame, an operating device—such as a lever attached to or carried by said frame, and adapted to be vibrated at each stroke of the needle—a blade-carrier separate from the aforesaid device, but connected with the same so as to be operated thereby, a ruffler-blade adapted to move past the needle, and adjusting means for increasing or diminishing the blade-carrier's movement simultaneously and progressively at both ends, so that the carrier moves farther past the needle for full gathers than for scant ones, substantially as described.

3. The combination, with a blade-carrier, a reciprocating device, and steps through which motion is imparted from said device to said carrier, of an adjusting device connected with both said steps for moving them in opposite directions to increase or diminish the space between them, substantially as described.

4. The combination, with the operating-lever and a link connected therewith, of a sliding blade-carrier having two steps between which a pin or cross-head on said link works, so as to move said blade-carrier in both directions, said steps being adjustable toward and away from each other, substantially as described.

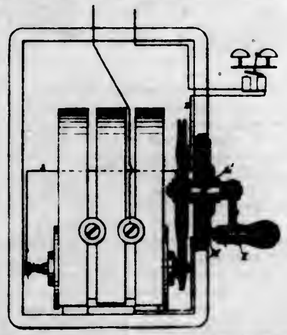
5. The combination of the operating-lever, link, and cross-head, blade-carrier, and steps on said blade-carrier for limiting the lost motion of said link, said steps being connected together so as to be simultaneously adjustable toward and away from each other, substantially as described.

6. The combination of the blade-carrier, movable top plate, and combined cam and eccentric, constructed and operating substantially as described.

7. The combination of the blade-carrier, reciprocating device for communicating motion thereto, movable top plate on said carrier, eccentric engaging with said plate, and cam attached to or in one piece with said eccentric, said eccentric and cam being adjustable, substantially as described.

8. The combination, with the cam for regulating the stroke of the ruffler-blade, of a lever or plate detachably connected with said cam, and provided with a handle for operating the same, substantially as described.

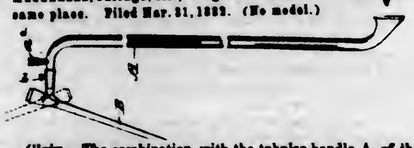
9. The combination, with the blade-carrier and the operating-lever, of a link jointed to said lever at one end, and having its opposite end guided by a groove in the body of the blade-carrier, substantially as described.



10. The operating-lever having its arms separable, in combination with a blade-carrier, devices connecting the blade-carrier and operating-lever, and adjusting means between the carrier and lever for regulating the stroke of the carrier independently of that of said lever, substantially as described.

11. In a ruffling attachment, an operating-lever with two branches or arms adapted to receive between them the needle screw, or like projection, one arm or branch being pivoted independently of the other, and combined with a catch for holding it parallel, or nearly parallel, with the other arm or branch, so as to leave a slot substantially the width of said screw or projection, as set forth.

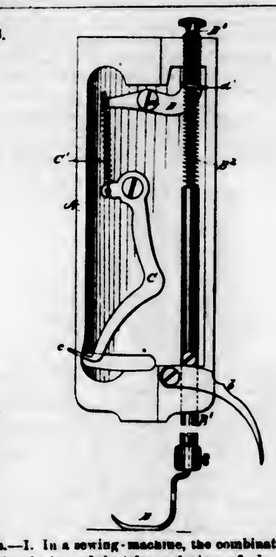
12. In a ruffling attachment comprising a sliding blade-carrier supported on an extension or projection of the ruffler-frame, and a lever pivoted to said frame and connected with said blade-carrier, a detachable device such as the top plate, held in place by a set-nut, and forming part of the connection between the blade-carrier and lever, so that on removal of said device the blade-carrier may be removed from the ruffler-frame without disturbing the other parts of the attachment, substantially as described.



259,644. MAGNETO-GENERATOR. THOS. W. LAHR, Boston, assignor to Charles Williams, Jr., Somerville, Mass. Filed Feb. 28, 1882. (No model.)

Brief.—A pin capable of moving lengthwise in the crank-handle normally rests in contact with an annular plate surrounding the crank-shaft. An outward movement on the handle during rotation breaks the short circuit around the machine; but the crank may be rotated without breaking the short circuit.

Claim.—In a magneto-generator, the combination, with the annular plate H, metallic collar G, and electrical connections, as described, of the armature-rotating crank rigidly attached to its shaft and provided with the pin or handle I, adapted to move longitudinally, but incapable of lateral or rocking motion, whereby the generator is enabled to be operated either while the pin I is separated from the plate H or in contact therewith, as and for the purposes set forth.



259,645. LAMP LIGHTER AND EXTINGUISHER. THOMAS S. MACARRELL, Chicago, Ill., assignor to Andrew P. W. Skinner same place. Filed Mar. 31, 1882. (No model.)

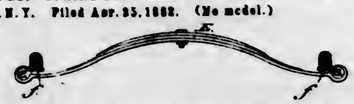
Claim.—The combination, with the tubular handle A, of the wick-tube B and the tubular extension *a'*, substantially as and for the purpose set forth.

259,646. TAKE-UP REGULATOR FOR SEWING-MACHINES. GEORGIUS A. MAYO, Erie, Pa., assignor to George H. Noble, same place. Filed Mar. 15, 1882. (No model.)

259,646.

Claim.—1. In a sewing-machine, the combination, with the cloth-pressing device and the take-up devices, of a lever or bar connecting the said devices in the manner substantially as described, and an adjusting device engaging said bar or lever, whereby said adjusting device is adapted to regulate the tension of said take-up and cloth-pressing device, as set forth.

2. In a sewing-machine, the combination, substantially as shown, of the following elements: the foot B, bar B', spring B², screw B³, lever D, spring C', lever C, and hook *e*, for the purposes mentioned.



259,647. CAR-COUPLING. JAMES C. MITCHELL, Lancaster, N. H., assignor to himself, James A. Smith, and Alden R. Fishham, same place. Filed May 15, 1882. (No model.)

Claim.—1. The combination of the draw-bar B, provided with the inclined plane E, with the link-pin C and the elevating-pawl D, hinged thereto, all being arranged and to operate substantially as set forth.

2. The combination of the draw-bar provided with the two inclined planes E and F with the link-pin and its elevating-pawl D, all being arranged, adapted, and to operate substantially as set forth.

259,648. SPRING FOR VEHICLES. J. SIDNEY MUNN, Rochester, N. Y. Filed Apr. 25, 1882. (No model.)

Claim.—1. As an improved article of manufacture, the transverse semi-elliptic spring with its ends curved to nearly complete circles and bent inwardly parallel with the body of the spring, affording horizontal rests or supports for the side bars of a vehicle, as shown.

2. The combination, with the side bars of a vehicle, of the transverse semi-elliptic springs E, whose ends, projected unbroken in length, each is in a circular portion, *e*, curved slightly downward, then upward and inward, terminating in the supports *f*, for the attachment of the side bars by the clips, substantially as shown.

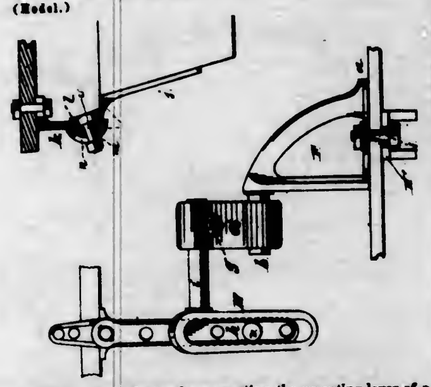
259,649. INJECTOR. HORACE B. HURDOCK, Detroit, Mich., assignor to James Jenks, same place. Filed Oct. 13, 1881. (No model.)

Claim.—1. In an injector, the screw-plug B, provided with a central nozzle, and cast with a recess, N, having dividing-partitions, *a*, substantially as shown and for the purpose specified.

2. In an injector, the plug C, provided with a central nozzle, and cast with a resting-flange, *b*, and projections *c* thereon, substantially as shown and for the purpose specified.

259,649.

259,650. BUCKLE. JAMES A. PARK, Lansing, Mich., assignor to Edward W. Sparrow, same place. Filed Mar. 30, 1882. (Model.)

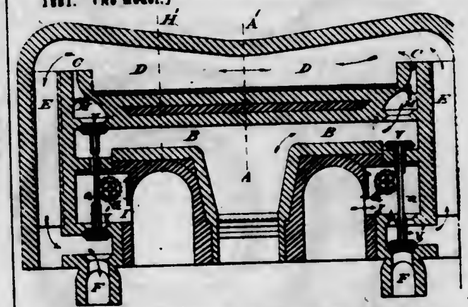


Claim.—A buckle consisting of the combination, with the loop K, provided with a semicircular portion, F, of the loop H, provided with a leg, E, and adapted to embrace the loop K, to which it is pivoted at one end, substantially as set forth.

259,651. DASH-BOARD. JOSEPH B. PLATT, Cleveland, Ohio. Filed Apr. 3, 1882. (Model.)

Claim.—The combination, with the dash A, having the curved channel-rail B, of the bevel-headed bolt C, slotted T-headed foot-piece D, curved washer E, and nut *a*, constructed and arranged for adjustment substantially as and for the purpose specified.

259,652. DEVICE FOR CONNECTING CHECK-ROWERS TO PLANTERS. WILLIAM B. RUSH, Decatur, Ill., assignor to Chambers, Boring & Quinlan, same place. Filed Nov. 7, 1881. (Model.)



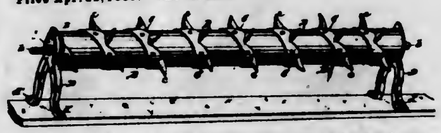
Claim.—1. A device for connecting the operating-lever of a check-rower with the shake-bar of a corn-planter, composed essentially of the three adjustable parts F, G, and H, the part F being secured to the shake-bar and the part H being capable of vertical adjustment on the operating-lever for changing the position of the part G and adapting the device to various machines, substantially as described.

2. A device for connecting the operating-lever of a check-rower with the shake-bar of a corn-planter, composed essentially of the part F, adapted to be secured to the shake-bar and having a projecting round arm, *b*, the part H, adapted to be attached to the lever and having a projecting round arm, *i*, and the intermediate part, G, having a hole in its upper and lower ends, in which are respectively arranged the arms *i* and *b*, substantially as described.

3. In a device for connecting the operating-lever of a check rower attachment with the shake-bar of a corn-planter, a clamping-piece, G, composed of two parts held by a bolt, and adapted to be used in connection with the parts F and H, substantially as and for the purposes specified.

4. The device herein described for connecting the check-rower attachments with the seed-box of a corn-planter, composed of the part *j*, having a half-round portion at its upper end, provided with the longitudinal slot *m*, the part *k*, having a concaved lower end provided with the vertical slot *n*, and the bolt *o*, passing through the slots in the half-round portion and the concaved end of the parts *j* and *k*, substantially as described.

259,653. METALLURGICAL GAS-FURNACE. WILLIAM W. WAPLINGTON, Halifax, Nova Scotia, Canada, assignor of one-half to Arthur C. McKee, Steubenville, Ohio. Filed June 23, 1881. (No model.)



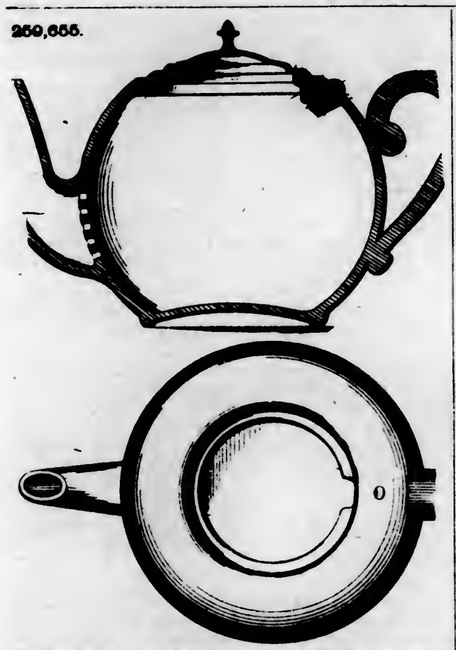
Claim.—1. In a metallurgical gas-furnace, the working-chamber D, provided on each side with the flues E C, and valves V V', also on each side, constructed and connected as described, whereby a movement of the same in one direction opens the induction-ports of the flues and a movement in the opposite direction closes the induction-ports and opens the port of eduction-flue F, in combination with the gas-producing chamber A, arranged under said working-chamber, flues B B, and air-chambers I, substantially as described.

2. In a metallurgical gas-furnace, the working-chamber D, provided on each side with the flues E C, valves V V', arranged on each side, as set forth, rack-bars *a*, and cog-gears G, in combination with gas-producing chamber A, arranged under the working-chamber, gas-flues B, air-chamber I, and spent-gas flues F substantially as described.

3. The working-chamber D, provided with the flues E C, alternately closing and opening valves V V', rack-bars *a*, and cog-gears G, in combination with the gas-producing chamber A, arranged under the working-chamber, gas-pipes B, air-chambers I, and spent-gas tubes F, adapted to receive said valves, substantially as described, and for the purpose set forth.

259,654. FENCE. THOMAS M. WORTHINGTON, New York, N. Y. Filed Apr. 22, 1882. (No model.)

Claim.—1. In combination with brackets D, adapted to be secured to the top of a fence, a barbed roll journaled therein, for the purpose set forth.



2. In combination with a fence and brackets thereon, a roller, B, having gudgeons or journals *b b*, which turn in said brackets, and a strip, C, which is wound on said roller and provided with barbs *c*, substantially as set forth.

259,655. DEVICE FOR ATTACHING COVERS TO VESSELS. HENRY WRIGHT, Pittsburg, Pa., and ISAAC W. KNOWLES, East Liverpool, Ohio. Filed Apr. 18, 1882. (No model.)

Claim.—1. The combination, with a stoneware, porcelain, earthenware, or glass vessel, of a metallic cover and a hinge pivotally secured to said cover and provided with a depending and rearwardly-extending arm resting against and secured to the inner face of the vessel, substantially as set forth.

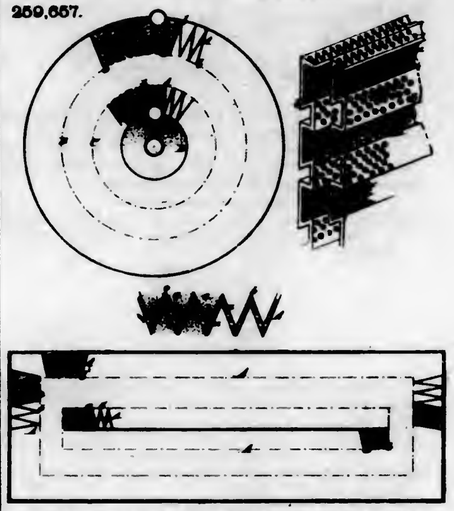
2. The combination, with a stoneware, porcelain, earthenware,

259,655.

or glass vessel, of a metallic cover and a hinge pivotally secured to said cover and provided with a depending and rearwardly-extending arm adapted to conform to and resting against the inner face of the vessel, and screws (one or more) which pass through perforations in the vessel and into the arm of the hinge.

3. The combination, with a stoneware, porcelain, earthenware, or glass vessel, of a metallic cover, a hinge pivotally secured to said cover and provided with a vertical arm and a cross-bar, and screws which pass through perforations in the vessel and secure the said cross-bar to the inner face thereof.

4. The combination, with a vessel the open top of which is provided with a flange, of a metallic cover, a hinge pivotally secured to said cover and provided with a vertical arm and a cross-bar, the vertical arm of the hinge being received in a slot formed in the said flange, and screws which pass through perforations in the vessel and secure the cross-bar of the hinge to the inner face thereof.

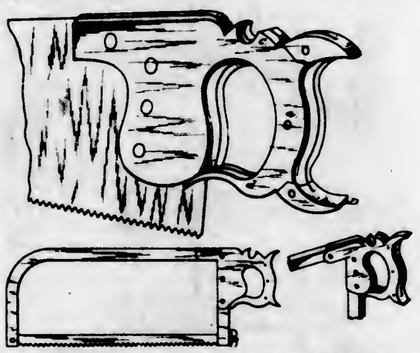


259,656. COMBINED BUTTON AND FASTENING. WILLIAM H. HAHL, New York, N.Y. Filed Mar. 21, 1882. (Model.)

Claim.—The button-fastener B, made of a single strip of metal bent to form a closed loop, c, about the shank of the button, and having depending prongs *b*, bent as described, whereby they are adapted for being clinched in the leather or fabric, with both prongs pointing in the same direction, as and for the purpose set forth.

259,657. SECONDARY BATTERY. JOHN S. SELLON, Hatton Garden, County of Middlesex, England. Filed Apr. 3, 1882. (No model.) Patented in England Sept. 19, 1881, No. 3,926.

259,657.



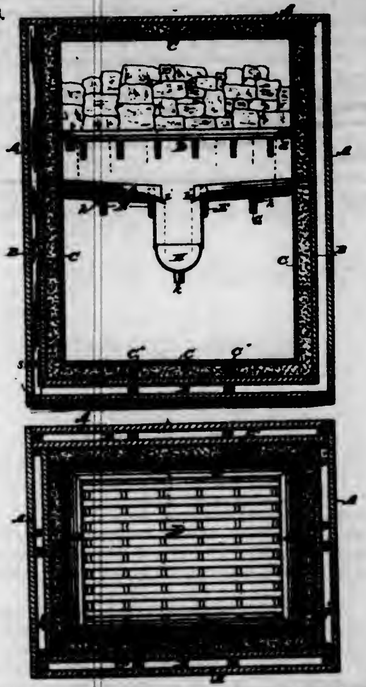
Claim.—1. An electrode for secondary batteries or accumulators having one or more receptacles wherein the active material, or material to become active, is packed, and provided with holes or perforations in the walls of said receptacles, substantially as described.

2. In a secondary battery or accumulator, a perforated battery-plate having formed therein recesses or receptacles, and having the active material, or material to become active, packed in said recesses or receptacles, substantially as described.

REISSUES.

10,185. SAW-HANDLE. EMANUEL ANDREWS, Williamsport, Pa. Filed Mar. 11, 1882. Original No. 159,140, dated Jan. 26, 1875.

Claim.—1. In combination with a grip-saw handle, the saw-blade extended centrally into the same to or beyond the grip-opening, for strengthening the handle, as set forth.



2. In a grip-saw wherein the blade extends centrally into the grip-handle for strengthening the same, the construction of the blade-butt, as described, whereby it is made to coincide in contour with that of the handle, as set forth.

3. In combination with a hand-saw handle, the saw-blade extending centrally through the same and conforming to the outlines thereof, substantially as described and shown.

4. In a saw-handle, the tips or horns D, substantially as described and shown.

10,186. ICE-HOUSE, ICE-BOX, AND REFRIGERATOR. JUSTUS BRAUER, Philadelphia, Pa. Filed May 22, 1882. Original No. 244,376, dated July 19, 1881.

10,186.

Claim.—1. In an ice-house or refrigerator having an air-space between its inner and outer walls, A B, a lining, C, forming a space to be filled with closely-packed granulated cork of nearly uniform size, substantially as specified.

2. An ice-house or refrigerator consisting of inner and outer walls, A B, forming an air-space, and a lining, C, forming a space to be filled with closely-packed granulated cork, a grated floor, and a drip-floor, constructed substantially as shown and specified.

3. In an ice-house or refrigerator having inner and outer walls, forming an air-space, and a supplementary space packed with closely-rammed granulated cork, the inclined ledge *d*, arranged as shown, and for the purpose herein specified.

4. In an ice-house or refrigerator provided with an air-space between its inner and outer walls, and having a supplementary space packed with closely-rammed granulated cork, a drip-floor consisting of girders supporting removable ledges, provided with gutters *f*, overhanging edges *e*, and recesses *g*, constructed substantially as shown and specified.

5. In an ice-house or refrigerator having inner and outer walls, forming an air-space, an inner space packed with closely-rammed granulated cork, a drip-floor constructed as described, and gutters for carrying off the drip-water, all arranged substantially as shown and specified.

6. The ice-house herein described, having inner and outer walls, A B, forming an air-space, lining C, forming a supplementary space packed with closely granulated cork, a grating, D, inclined ledge *d*, drip-floor E, provided with removable ledges F, and gutter H, all constructed and arranged as shown and specified.

7. An ice-house having inner and outer walls, A B, forming an air-space, and a lining, C, forming a space packed with closely-rammed granulated cork, in combination with a grated floor, D, inclined ledge *d*, drip-floor E, constructed substantially as described, and suitable gutters for carrying off the drip-water, all substantially as specified.

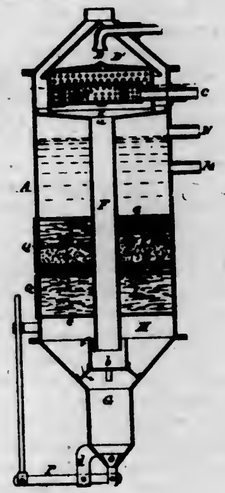
8. An ice-house, refrigerator, &c., having inner and outer walls, A B, forming an air-space, with an inner lining, C, the space between which and wall B is filled with granulated cork of nearly uniform size and packed by ramming to form a compact mass, substantially as herein specified.

9. An ice-house or refrigerator having walls, sides, top, and bottom made double, and the space filled in with closely-packed granulated cork of nearly uniform size, forming a practically solid mass, substantially as specified.

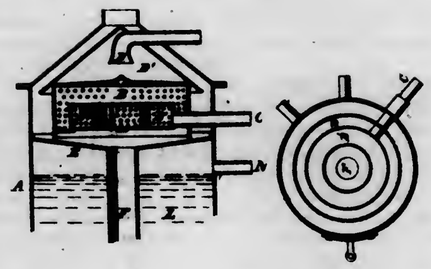
10. An ice-house or refrigerator having double walls, sides, top, and bottom, and filled with granulated cork of nearly uniform size, and so closely packed as to form a practically solid mass, substantially as set forth.

11. In ice-houses or refrigerators, an open drip-floor composed of independent ledges arranged in such manner as to leave an unobstructed air-passage between the edges of said ledges and allow a free circulation of air, substantially as shown and specified.

12. In ice-houses or refrigerators, an open drip-floor composed of removable ledges arranged on supports in such inclined manner that the adjoining edges overlap each other to prevent water dripping into the room below, while the spaces between the edges form unobstructed passages for the circulation of air, substantially as specified.



13. In ice-houses or refrigerators, the ledges F, consisting of boards *b*, having recessed sides *g*, and covered with suitable metal, *c*, bent over the edges, as at *e*, and forming a tongue, *i*, substantially as shown and described.



10,187. TREATING ANIMAL-FATS. COMMERCIAL MANUFACTURING COMPANY, CONSOLIDATED, New York, N.Y., assignee, by mesne assignments, of Hippolyte Mège, deceased. Filed May 26, 1882. Original No. 145,612, dated Dec. 30, 1873; Reissue No. 5,886, dated May 13, 1874; Reissue No. 6,436, dated Sept. 24, 1878.

Claim.—1. The improved material herein described, produced by treating animal-fats so as to remove the tissues and other portions named, with or without the addition of substances to change the flavor, consistency, or color, as set forth.

2. The process herein described of treating animal-fats in the production of oleomargarine.

10,188. FEED-WATER HEATER. ARCHIBALD KENNEDY and JOHN H. BRENNEMAN, Muscatine, Iowa, assignors of one-third to Charles Page, same place. Filed Apr. 15, 1882. Original No. 134,085, dated Feb. 27, 1873.

Claim.—1. In an apparatus for condensing steam and heating and purifying feed-water, the steam receiver and distributer B B', arranged in a tank under the cold-water-supply pipe, substantially as and for the purposes described.

2. The combination, in the tank A, with the receiver and distributer B B', of the diaphragm E and conducting-pipe F, constructed and arranged to conduct the heated water and condensed steam to the lower part of the tank for upward filtration, substantially as and for the purposes described.

3. The combination, with the pipe F, arranged below the diaphragm E, to conduct the water to the lower part of the tank A, of the vessel *b*, arranged below the filter-chambers K L and immediately above the mud-well G, to receive the descending water and allow it to ascend for filtration without coming in contact with the sediment below, substantially as described.

4. The combination, in the tank A, provided with the water-chambers and filter-chambers H I K L, located as set forth, of the receiver and distributer B B', the diaphragm E, the pipe F, the vessel *b*, and the mud-well G, substantially as and for the purposes described.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

HARMET *v.* REESE *et al.*

Decided May 24, 1882.

1. PRIORITY OF INVENTION—ABANDONMENT AFTER REDUCTION TO PRACTICE—EX PARTE QUESTION.

When it appears that one of the parties to an interference has put the invention into actual operation before the appearance of the other inventors in the field, the question as to whether he has in any manner by his long delay lost his right to a patent therefor goes to the merits of his application, and is strictly *ex parte*.

2. SAME—LACHES—SUBSEQUENT INVENTOR.

An inventor who has perfected his invention cannot by neglect and laches forfeit his right to obtain a patent therefor in favor of a subsequent inventor.

3. SAME—LACHES AS AFFECTING FIRST AND SECOND INVENTOR.

No proof of laches on the part of the first and original inventor occurring subsequently to the perfection of the invention can avail a subsequent inventor, and no laches short of abandonment of the invention can defeat the right of the first inventor to the patent.

INTERFERENCE.—CASE A.

MANUFACTURE OF STEEL.

APPEAL from the Board of Examiners-in-Chief.

Application of Henri Harmet filed September 19, 1879. Application of Jacob Reese filed July 28, 1879. Application of Sidney G. Thomas filed May 20, 1879; patented July 29, 1879, No. 217,962.

Mr. Ellis Spear for Harmet.

Messrs. Bakewell & Kerr for Reese.

Mr. W. H. Finckel for Thomas.

MARBLE, *Commissioner:*

The invention in this case is defined in the following language, viz:

Desiliconizing the molten iron in a converter with a silicious lining and then removing the metal to and further refining it in a converter with a basic (calcareous) lining.

Thomas and Harmet appeal from the decision of the Board of Examiners-in-Chief awarding priority of invention to Reese. It appears from the testimony exhibited in behalf of Thomas and Harmet that their inventions were made in England and France, respectively. Thomas offers evidence to show that his invention was conceived in 1877; that it was shortly afterward communicated to others, and particularly to his agent, George H. Maynard, who arrived in this country March 29, 1879, and filed Thomas's application for a patent in this Office May 20, 1879. In behalf of Harmet it is shown that he is the inventor of the subject-matter of French Patent No. 129,111, taken out February 1, 1879, in the name of his father.

According to the rule made in this case by Mr. Commissioner Paine (*Thomas* v. *Reese*, 17 O. G., 195) Thomas's invention, for the purposes of this interference, must be held to date March 29, 1879, the date of its introduction into this country, and Harmet's invention must be held to date February 1, 1879, the date of his foreign patent.

The Examiner of Interferences and the Board of Examiners-in-Chief concur in finding that Reese practiced this invention as early as 1867. An examination of the testimony leaves no doubt that as early as 1866 Reese had a plant, illustrated in sketches offered in testimony, which consisted of the various appliances necessary to the practice of this invention. There was a cupola, beneath which was placed the first converter lined with a brick or silicious lining, and in convenient proximity a second converter lined with lime or basic lining, (Case A,) and also an open-hearth furnace lined with a basic lining, (Case B.) The workmen who were employed in operating this plant do not seem to have been informed of the rationale of the experiments, but they recall distinctly the actual operations performed, and their testimony fully substantiates the claim of Reese that he successfully practiced the invention in controversy at that time. At a later date, but before the dates given to the inventions of Thomas and Harmet, Reese recalled these circumstances to the recollection of some of the persons concerned, explained the nature of the invention, and announced his intention of obtaining a patent therefor. Various causes contributed to delay the filing of the application, but upon learning of the existence of rival claims Reese at once took steps to assert his rights. His application was filed July 28, 1879. Ordinarily evidence offered to show an invention at so remote a period as claimed by Reese in this case is accepted with great doubt. Owing, however, to the elaborate and costly appliances required for experiment in this line of invention and the number and character of assistants necessarily concerned in carrying them on, the testimony in this case is unusually satisfactory, and leaves no doubt as to the fact and nature of the invention.

It is urged that certain later patents taken out by Reese contain expressions which are inconsistent with the claim that he had then made the invention in controversy. A list of these supposed discrepancies is presented, but I am unable to conclude that the direct and circumstantial testimony as to facts should yield to these remote and insubstantial inferences. The patents referred to dealt, of course, with matters of public knowledge, and it was not incumbent upon Reese to disclose in those patents matters of private information, which were the fruit of his other inventions and discoveries.

Reese, then, having put the invention into actual operation before the appearance of the other inventors

in the field, the question arises whether he has in any manner by his long delay lost his right to obtain a patent therefor. This question goes to the merits of his application, and is, strictly speaking, *ex parte*. Counsel, however, have advanced the proposition that an inventor who has perfected his invention may by his neglect and laches forfeit his right to obtain a patent therefor in favor of a subsequent and independent inventor. This doctrine is, as I believe, foreign to the patent law. When a person has reduced an invention or discovery to a fixed, positive, and practical form, and made a full disclosure of its character to others his right to a patent is complete, (*Reed* v. *Cutter*, 1 Story, 590;) and if he foregoes that right no subsequent inventor can comply with the conditions upon which alone a patent can be granted. (*Pickering et al.* v. *McCullough et al.*, 13 O. G., 818.) If the first and original inventor abandons his invention to the public expressly or tacitly by neglecting seasonably to assert his exclusive right, he cannot recall that right, (*Mellus* v. *Silsbee*, 4 Mason, 108,) and still less can a later inventor appropriate it to himself. (*American Hide Company* v. *American Tool Company*, 4 Fish., 284.) Under these circumstances the first invention is not a waif or stray which can be reclaimed at will by its original owner or converted by a subsequent discoverer to his own use. It has passed into the public domain, and the public is already, therefore, in possession of the knowledge of the invention which would form the consideration of the grant of a patent to the second inventor. (*Consolidated Fruit Jar Company* v. *Wright*, 4 Otto, 92.) I decline, therefore, to rule, as requested, that there is a difference between the questions of laches and abandonment after the reduction of the invention to its final form. No proof of laches on the part of the first and original inventor occurring subsequently to the perfection of the invention can avail a subsequent inventor, and no laches short of abandonment of the invention can defeat the right of the first inventor to the patent.

In the case of *Rowley* v. *Mason* (2 Am. L. T., U. S. R., 106,) Mr. Justice Fisher, extending the application of the doctrine of diligence, said:

> The same sound policy seems to me to require that, as between two independent inventors, the one who has perfected his invention but chooses to sleep upon it for nine years, or even a less period, and is only aroused from his slumbers by the application of a subsequent inventor for his patent, has no right to complain if that application should meet with success.

This judgment was founded on those undoubted authorities that hold the first inventor to the exercise of a reasonable diligence in the development and perfection of his invention. The race of diligence, however, which is referred to in these decisions ends with a reduction of an invention to its final form, and no subsequent inventor can then engage in rivalry with an inventor who has already reached the goal. The same results follow from the express provisions of the statute. Section 4886 declares that the first and original inventor alone is entitled to the grant of a patent. This rule is subject to the implied exception that an invention made abroad unpatented and unpublished will not bar a second inventor. With this exception and the case of lost arts, where the prior invention has passed into oblivion, (*Gaylord* v. *Wilder*, 10 How., 477,) the rule is, so far as I am aware, universal. Section 4920 leads to the same conclusion. Under this section a patent granted to a second inventor may be invalidated by proof that the invention was known and used by others prior to the invention by the patentee, or, in the language of the fourth special matter, which may be given in evidence under the general issue, (section 4920, fourth clause,) "that he was not the original and first inventor or discoverer of any material or substantial part of the thing patented," and it is not necessary to show under this defense that such first inventor is still diligently following up his invention or that he intends or is in a position to obtain a patent therefor. In no decided case of which I am aware has such a question been raised under this defense. If, then, the perfected invention of the first inventor will defeat the grant of a patent to the second inventor, although such first invention has not been diligently prosecuted to a patent, it follows that no such patent should be granted to the second inventor as the result of an interference. (5 Opinions of the Attorneys-General, 18; *Chambers et al.* v. *Duncan et al.*, 10 O. G., 787.)

The case of *Kendall* v. *Windsor* (21 How., 322) has often been referred to in this connection as showing that a slothful inventor might forfeit his rights to his perfected invention in favor of a more diligent and meritorious inventor. (*Erbe* v. *Hill*, C. D., 1869, 29; *Hosea Ball*, C. D., 1870, 97; *Gray* v. *Hale et al.*, C. D., 1871, 129; *Farmer* v. *Brush*, 17 O. G., 150.) I do not consider the case as an authority for such a doctrine. A careful examination of the case shows that the only question was whether an inventor had forfeited to the public his right to a patent by secretly practicing his invention for a number of years, and there was no intimation in the case that a subsequent inventor had secured or might secure a monopoly of the same invention. The language of the court is:

> That which is once given to or is invested in the public cannot be recalled nor taken from them. * * * It is the unquestionable right of every inventor to confer gratuitously the benefits of his ingenuity upon the public, and this he may do either by express declaration or by conduct equally significant with language—such, for instance, as an acquiescence with full knowledge in the use of his invention by others—or he may forfeit his rights as an inventor by a willful or negligent postponement of his claims or by an attempt to withhold the benefit of his improvement from the public until a similar or the same improvement should have been made and introduced by others.

Upon the whole case I find that Reese is the prior inventor. In the further treatment of the case the Examiner will determine whether the facts disclosed in the accompanying record show that Reese has lost his right to obtain a patent by reason of abandonment or public use.

The decision of the Board of Examiners-in-Chief is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of New York.

SCHMIDT *v.* FREESE.

Decided May 10, 1882.

LETTERS PATENT NO. 197,328—DROPPING AN ELEMENT—INFRINGEMENT.

When the defendant dispensed with one element of the combination claimed in the patent and substituted another whereby the same result is accomplished in a manner different from that described in the patent, *Held* that there was no infringement.

Mr. F. v. Briesen for the complainant.
Mr. W. C. Hauff for the defendant.

BENEDICT, *J.*:

This action is for an injunction and account. It is based upon two letters patent for improvements in feed mechanism for button-hole sewing-machines. A form of machine conceded to be made and sold by the defendant is alleged to infringe both the patents set forth in the bill. The defendant denies the infringement and also disputes the validity of the patents.

The first patent set forth in the bill is No. 197,598, dated November 27, 1877. This patent has seven claims. Infringement of the second and fifth claims is charged; but the charge as to the fifth claim has been abandoned, leaving the second claim only to be considered here.

The object of the invention set forth in this claim is to simplify the mechanism for imparting motion to the feed-wheel of a button-hole sewing-machine. The specification refers to a former patent, No. 183,333, and states that, instead of the jointed lever described in such former patent as a means of transmitting to the feed-wheel the motion of a rotary shaft, the patentee has invented a system of independent levers. A particular description of these levers is given in connection with drawings attached. One of these levers, E, which is pivoted to the frame of the machine and subjected to the action of two toes that project from a rotary shaft, is termed the "operating-lever." When this lever is oscillated by means of the rotating shaft its motion is transmitted to another lever, D, termed the "intermediate lever." This intermediate lever, when oscillated by the action of the operating-lever, in turn transmits its motion to a sliding feed-dog, by which an intermittent rotary motion is imparted to the feed-wheel.

The words of the claim are as follows:

> The sliding feed-dog C, combined with the intermediate lever D, operating-lever E, and with the shaft F, having the toes *l* and *m*, substantially as specified.

This claim is for a combination of old devices. Friction-feeds as distinguished from ratchet-feeds moved by a rotating shaft have long been employed in sewing-machines. Similar devices to those employed by the plaintiff have often been used to produce similar results. All that is claimed to be new in the plaintiff's invention is the particular combination described in the patent.

In the machines made by the defendant the feed-wheel is made to rotate by the action of a sliding feed-dog, as in the plaintiff's machine. The motion of the feed-dog is effected by the action of a rotating shaft in connection with an operating-lever, as in the plaintiff's machine; but the defendant dispenses with the intermediate lever, which the plaintiff employs. By changing the relative position of the operating-lever and the feed-dog a sliding link is employed to transmit the motion of the operating-lever to the feed-dog instead of an intermediate lever. Here lies the point of the controversy. The plaintiff contends that the sliding link employed by the defendant is in fact a lever, and the intermediate lever of the plaintiff's combination, while the defendant insists that his sliding link is in no sense a lever, but a different thing, the employment of which changes the combination. Upon this question my opinion is in favor of the defendant's contention. I consider it plain that in the defendant's machine there is no lever intermediate the feed-dog and the operating-lever. There is a piece intermediate the feed-dog and the operating-lever employed to transmit the motion of the operating-lever to the feed-dog, but that piece is not a lever in any sense of the term. It has no fulcrum, and its slight vibratory motion is opposite to the direction in which the end of the lever by which it is operated moves. The plaintiff's expert disposes of this question adversely to the plaintiff when he says, (Plaintiff's Record, page 177:)

> The necessities of the motion of the feed-dog alone cause the vibration of the piece on its pivot.

This conclusion that the sliding link of the defendant's machine is not a lever is decisive of the case so far as the patent under consideration is concerned, for there is no evidence on which to found a conclusion that the defendant's sliding link, not being a lever, is nevertheless an equivalent for the plaintiff's intermediate lever. Indeed, reliance upon the doctrine of equivalents was expressly disclaimed at the argument, and the case, so far as the patent under consideration is involved, was made to depend upon the question whether the defendant's sliding link is a lever. My determination, therefore, is that the plaintiff has failed to prove infringement of the second claim of the plaintiff's patent of 1877.

The complainant's second patent, No. 219,656, dated September 16, 1879, relates to improvements on the mechanism described in the letters patent which have just been considered and in Patent No. 183,333, dated October 17, 1876.

The invention described in this 1879 patent is stated to consist in "a new mechanism for regulating the length of stitch." All the mechanism covered by the second claim of the patent of 1879 is retained, and the necessary change in motion of the feed-wheel from fast to slow is effected by the interposition between and its withdrawal from between the two contact-surfaces of the operating-lever E and the intermediate lever D of one arm of an elbow-lever, J, which is pivoted upon the face of the operating-lever next the face of the intermediate lever. The end of the operating-lever E in contact with the intermediate lever D is step-shaped, and the arm of the elbow-lever is interposed in such a manner that it partly closes or equalizes and fills out the step, whereby the outline of the contact-surface of the operating-lever is changed, and in consequence the vibration of the intermediate lever changed. This interposition and withdrawal of the arm of the elbow-lever is effected by vibrating the elbow-lever upon its pivot. To this end its second arm is by an elastic rod, I, connected to a lever, H, which is caused to swing by means of a pin, *t*, entering a groove, *a*, in the feed-wheel.

There are three claims. The first claim is as follows:

> 1. The combination of the lever E and lever D with the intermediate pivoted elbow-lever J, and with mechanism for vibrating the said parts on their respective pivots, substantially as herein shown and described.

The second claim is as follows:

> 2. The combination of the lever H, elastic rod I, with the pivoted elbow-lever J, and with the levers E and D, and with mechanism F *s m*, for oscillating the lever E, substantially as herein shown and described.

The third claim is as follows:

> 3. The lever E, having fixed contact portion *t* and elbow-lever J, in combination with the lever D, and with the spring-rod I, passing through the elbow-lever J, and with the lever H, grooved wheel B, and actuating-shaft F, substantially as herein shown and described.

It will be observed that each of these claims is for a combination one essential element whereof is the intermediate lever D, already noticed in considering the

plaintiff's patent of 1877. The conclusion already announced that the defendant's machine has no intermediate lever affords one ground, therefore, for holding that such machine does not infringe the patent of 1879 because it omits one element of the combination claimed in that patent by which motion is imparted to the feed-dog and substitutes another whereby the same result is accomplished in a manner different from that described in the patent. There are, besides, other grounds to be found in the difference between the mechanism employed by the plaintiff to secure a fast and slow motion of the feed-wheel and the mechanism employed by the defendant to secure the same result. As has been already noticed, the elbow-lever employed by the plaintiff to change the motion of the contact end of the operating-lever is pivoted upon the face of the operating-lever next the face of the intermediate lever and moves in the direction of the contact plane. From this method of construction two difficulties arise. One difficulty, not wholly insignificant, is that the elbow-lever, when so pivoted, is liable to work loose upon its pivot. Another, more important, is that the free arm of the elbow-lever may be moved by the lever H to interpose between the operating and the intermediate lever before those levers have separated sufficiently to permit such interposition, in which case breakage must result, unless provision be made for a yielding of the parts. To obviate this difficulty the plaintiff employs an elastic rod to transmit motion from the lever H to the elbow-lever. This rod, by springing where the contingency suggested arises, avoids breakage.

Both the difficulties alluded to are avoided in the defendant's machine. Instead of interposing one arm of an elbow-lever pivoted upon the operating-lever for the purpose of changing the outline of the contact surface of the operating-lever, the defendant employs an elbow-lever to move a sliding cam upon the operating-lever, which cam, by sliding in the direction in which the part to which it transmits motion moves, changes the outline of the contact end of the operating-lever, and thereby changes the speed of the feed-wheel. By this arrangement the interposing pieces or cam can be and is kept steady in its slide without danger of working loose, and all danger of any obstacle being presented to its action whenever moved by the lever H is removed. There is therefore no need in the defendant's machine of an elastic rod, I, such as is employed in the plaintiff's machine, and this feature, which is an essential element of the plaintiff's combination, is dispensed with.

The court has been pressed to say from an inspection of the defendant's machine that the connecting-rod employed to transmit motion from the lever H to the elbow-lever is so made as to be elastic; but this cannot be said, especially in view of the fact that there is no necessity requiring the rod to be elastic, and the positive testimony that the rod is not a spring-rod, and does not yield in the direction in which it transmits motion. These differences in the action of the two machines which I have thus endeavored to point out are, in my opinion, substantial and sufficient to compel the conclusion that the defendant's arrangement is not a colorable modification in form of the plaintiff's arrangement for regulating the length of stitch, but entitles the defendant's machine to be considered as substantially different from the plaintiff's, and not an infringement upon any of the claims of the patent under consideration.

The bill must therefore be dismissed, and with costs.

U. S. Circuit Court—Eastern District of Pennsylvania.

WALLICK *v.* CANTRELL *et al.*

Decided May 3, 1882.

LETTERS PATENT NO. 163,825 SUSTAINED.

Letters Patent No. 163,825, for an improvement in apparatus for enameling moldings, sustained.

Mr. Charles Howson for the complainant.
Mr. J. W. Shortledge for the defendants.

BUTLER, *J.*:

A very few lines will explain our views of this case. Letters Patent No. 163,825, for an improvement in apparatus for enameling moldings, were issued to the plaintiff, May 25, 1875, containing a single claim, as follows:

An enameling-box divided into two compartments by a slotted partition, and having openings at the end in a line with the slot in the partition, all substantially as and for the purpose set forth.

The bill charges infringement of this patent. The defenses set up and urged at the hearing were, first, that the patent is invalid, and, second, that the defendants have not infringed. The first was based principally on an allegation of prior use. As respects this it is sufficient to say that in our judgment the allegation is not sustained. A written review of the testimony would be of no value. A careful examination has satisfied us that its weight is against the defendants, while the burden of proof is on them.

The suggested objection to the claim is unfounded. The claim embraces nothing that should not have been included. It covers simply the peculiar enameling-box invented and constructed by the plaintiff and shown by the model.

That the defendants' device infringes the plaintiff's we cannot doubt. It was designed for the same purpose and accomplished it in the same way and substantially by the same means. The mechanical appliances are virtually undistinguishable, and the mode of operation and the result are identical. Without the expert testimony, which is very positive, this conclusion is fully sustained by inspection of the two boxes and their work.

A decree must be entered accordingly.

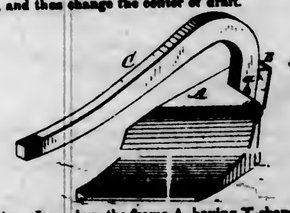
259,658. PAPER-PULP-DIGESTER SLIDING VALVE. THEOPHILUS ATCHESON, Philadelphia, Pa., assignor to himself and JOHN SAUNDERS, Wilmington, Del. Filed Mar. 23, 1882. (No model.)

Claim.—1. In a valve for paper-pulp digesters, the combination of chest A H, seat H', sliding valve F, with its inclined pieces F' F', full back K to the sliding valve, wedges E E, for throwing the upper surface of the valve F truly against the seat H', and a stem or rod, M, for opening and closing the valve, substantially as described.



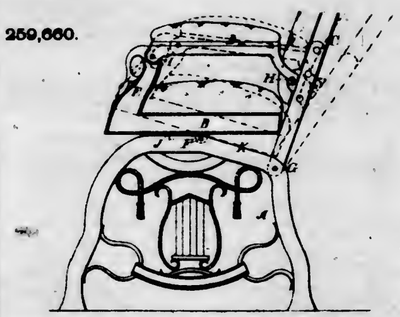
2. In a valve for paper-pulp digesters, the combination of chest A H, seat H', sliding valve F, with its inclined pieces F' F', full back K to the sliding valve, detachable adjustable guides D D, wedges E E, for the purpose described, and a stem or rod, M, to open and close the valve, substantially as described.

3. In a sliding valve for discharging the contents of vessels after the treatment of said contents, the combination of chest A H, seat H', sliding valve F, with its inclined pieces F' F', wedges E E, for throwing the valve and its seat into contact, and stem M, to open and close the valve, substantially as described.

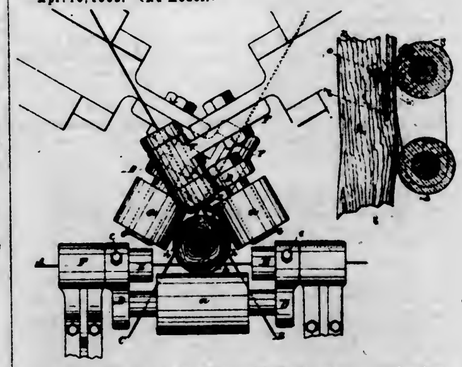
4. In a sliding valve for discharging the contents of vessels after the treatment of said contents, the combination of chest A H, seat H', sliding valve F, with its inclined pieces F' F', wedges E E, for throwing the valve and its seat into contact, adjustable removable guides D D, and stem M, to open and close the valve, substantially as described.

259,659. PLOW. ALBERT BALL, Canton, Ohio. Filed Dec. 17, 1881. (No model.)

Brief.—The plow-beam can be attached to either side of the bracket, and thus change the center of draft.



Claim.—In a plow, the frame A, having T-shaped bracket B at its rear, in combination with the adjustable plow-beam C, connected thereto, substantially as and for the purpose set forth.

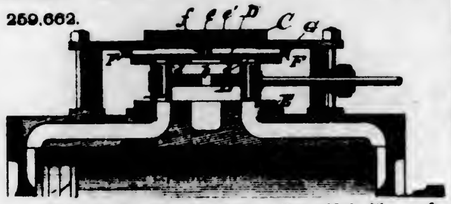


259,660. BARBER'S CHAIR. EUGENE BRENNEMANN, Cincinnati, Ohio. Filed Nov. 17, 1881. (No model.)

Claim.—In barber-chairs, the combination of the base, having on the upper side the horizontal surface J and rearwardly-sloping surface K, with the seat B, centrally hinged, as shown, having the upturned arms E at the front, and with the back C, having the lower side hinged to the base A, and the arm-rest D, connecting the standard E and back C, substantially as and for the purpose herein set forth.

259,660.

259,661. BAND-SAW GUIDE. WILLIAM BOWERS, Somerville, assignor to himself and ROBERT WILLIAMS, Boston, Mass. Filed Apr. 10, 1882. (No model.)



Claim.—1. In combination with the hand-saw, mechanism, substantially as described, for guiding it and bending it laterally, in order to cause it to cut in a pole a kerf in parallelism with the median longitudinal line of the surface of the hoop or portion separated by it from the pole, such mechanism consisting of the two rollers *a b*, their sustaining lever or levers D, and the grooved journal E to each of such levers, all being arranged with the saw and applied substantially as set forth.

2. The combination of the kerf spreader or opener H with the saw and the mechanism for guiding it and bending it laterally, such mechanism consisting of the grooved journal E, its carrying-lever D, and its pressure-rollers *a b*, all being arranged, applied, and operated essentially as set forth.

259,662. BALANCED SLIDE-VALVE. WESLEY S. BROWN, Richmond, Ind. Filed Dec. 24, 1881. (No model.)

259,662.

Claim.—1. The plate D and piston C, provided with a perforation, *e*, extending through both, in combination with the valve-chest cover G, provided with the cavity *e'*, substantially as and for the purpose specified.

2. The auxiliary balanced valve-seat D, in combination with the guide-lugs F of the valve-chest cover and the slide-valve, substantially as and for the purpose specified.

3. In combination with the valve and ordinary seat, the auxiliary seat D, piston C, and hollow neck *f*, connecting the seat and piston and establishing communication between the exhaust-cavity of the valve and the cylinder-cavity of the steam-chest cover, substantially as set forth.

259,663. VEHICLE-SPRING. JAMES H. BRADLEY, Plattsburg, N. Y., assignor to William E. Smith, same place. Filed Mar. 31, 1882. (No model.)

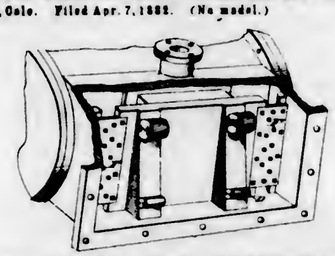
Claim.—1. The side springs arranged in pairs, as described, one spring of a pair being attached to one side of the transverse middle of the body and the other spring to the other side, as set forth.

2. The pair of springs *a a'*, each having a long and a short arm, the long arm of one coming by the short arm of the other, as and for the purpose set forth.

3. The shackle D, having the lip *d'* and the two rigid aligned eyes *e* extending from the stock *d* horizontally, in combination with the loose supporters or stirrups A, one secured to each eye, as set forth.

259,664. VEHICLE-SPRING. JAMES H. BRADLEY, Plattsburg, N. Y., assignor to William E. Smith, same place. Filed Mar. 31, 1882. (No model.)

Claim.—1. The shackle E, having perforated lugs *g g* and the slot *l*, as set forth.



2. A pair of springs, in combination with the slide-shackles E, one end of each spring being secured and the other resting loosely in its shackle, as shown.

259,665. SPRING-WASHER. THOMAS W. BROOMALL, West Chester, and EVAN A. HENCHE, Christiana, Pa. Filed Apr. 27, 1882. (No model.)

Claim.—The serpentine spring-washer A, of the form substantially as shown, having outwardly-projecting bearing-points *a a*, *b b*, and *c* and inwardly-projecting points *d d*, *e e*, said washer being concave laterally and horizontally throughout its entire length, substantially as and for the purpose set forth.

259,666. BALANCED SLIDE-VALVE. ELA A. BURNAP, Denver, Colo. Filed Apr. 7, 1882. (No model.)

Claim.—1. In a balanced slide-valve, a balance-plate provided with elastic plates at its ends connected with the valve-chest, so as to prevent end or side thrust or displacement thereof, substantially as shown and described.

2. In a balanced slide-valve, a balance-plate held against end or side thrust or displacement by elastic plates arranged at its ends, and perforated to permit the escape of exhaust-steam, substantially as shown and described.

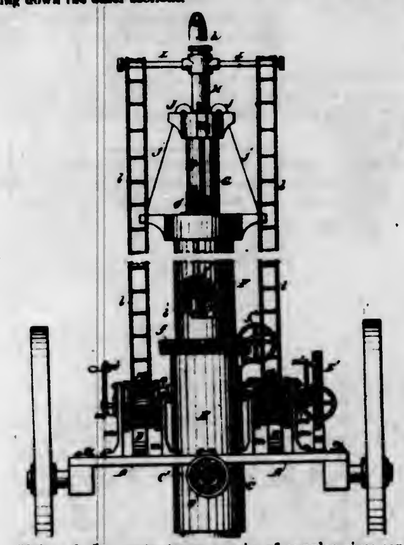
3. In a balanced slide-valve, a balance-plate and rolls acting thereupon by gravity to hold such plates steam-tight, substantially as shown and described.

4. In a balanced slide-valve, a balance-plate held against endwise or sidewise displacement, combined with gravitating rolls to keep it steam-tight, substantially as shown and described.

5. In a balanced slide-valve, the valve-chest provided with inclines and a balance-plate, combined with gravitating rolls interposed between them, substantially as and for the purpose set forth.

259,667. NOZZLE. THOMAS C. CHURCHMAN, Sacramento, Cal. Filed Jan. 30, 1882. (No model.)

Claim.—A nozzle for hose, having within a tapering core provided with flanges or leaves which terminate a short distance back of the muzzle, said core extending to and projecting slightly beyond the discharge end of the nozzle, terminating in an abrupt taper, substantially as and for the purpose herein shown.



259,668. SNAP-HOOK. LUTHER A. CLARK, Strafford, Vt. Filed May 1, 1882. (Model.)

Claim.—The snap-hook for driving-reins, consisting of the metallic hook and its attached spring, as described, covered with leather throughout and over the whole extent, substantially as and for the purpose set forth.

259,669. PORTABLE WATER-TOWER. WILLIAM H. COGSWELL and THOMAS H. HULVIN, Chicago, Ill. Filed June 27, 1881. (No model.)

Brief.—The lower section of a series of pipes is set in a sleeve which is secured on a turn-table. The pipes are capable of rotation by cogs on the periphery of the lower section and a worm-wheel working therein. The second section is elevated by a rack and pinions, and carries up the third section with it by means of an arrangement of cords and sheaves. Flexible ladders wound upon drums on the base are secured to arms on the upper section and are carried up with it. Retracting cables are arranged so that when the top section is drawn in it causes the cables to contract, drawing down the other sections.

Claim.—1. In a water-tower, a series of annular pipes capable of longitudinal projection and retraction, forming at any point of extension one continuous pipe through which water received at the base of the lower section may be forced from the extremity of the upper section, in combination with means independent of the column of water for projecting and retracting the several pipes, substantially as described.

2. The combination, in a water-tower, of a series of annular pipes capable of longitudinal projection and retraction, and provided with mechanism for projecting and retracting the same, with a turn-table by means of which the tower may be rotated, substantially as and for the purposes described.

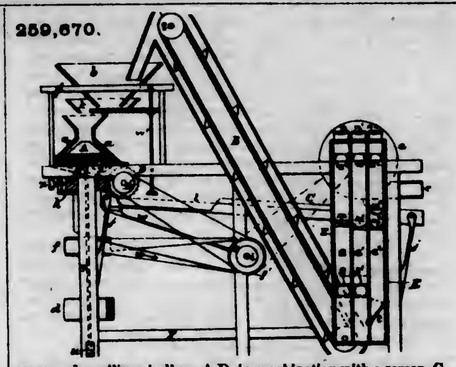
3. In a water-tower, an erectable stand-pipe so supported as to be capable of rotation, provided with a flange having cogs upon its periphery, in combination with mechanism for rotating the same, substantially as described.

4. In combination with a water-tower consisting of a series of longitudinally-adjustable sections, the cords *j* and K, with the sheaves J and *k*, so connected with the sections that the projection or retraction of a section shall project or retract the section contained within it, substantially as described.

5. The independent sleeve E, provided with trunnions, in combination with the tower and mechanism for rotating the tower within the sleeve, substantially as described.

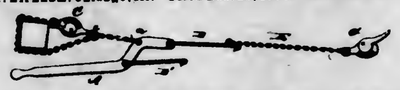
6. The combination of the oscillating longitudinally-adjustable tower F G H with the sleeve E, provided with trunnions, the worm-wheel E', worm *c'*, rack *g*, pinion *g'*, worm O', cords *j* and K, flange *f*, screw *f'*, and turn-table B, constructed and arranged substantially as described.

259,670. BUCKWHEAT HULLING AND SEPARATING MACHINE. WILLIAM A. COWLEY, Stamford, N. Y. Filed Aug. 25, 1881. (No model.)



Claim.—1. The combination, in a buckwheat hulling and separating machine, of two separate and distinct hullers, being the primary huller, A, with case *a*, and the secondary or auxiliary huller, D, with stripping-block *h*, for the uses and purposes as herein set forth.

2. The vibratory screen C, in a buckwheat hulling and separating machine, with its sieves *l p*^{1} *p*^{2}, its spouts *m m'* *m*^{1} *m*^{2}, its diagonal bar *r*, and gate *s*, in combination with the compartmented draft-chest E, as specified and described.



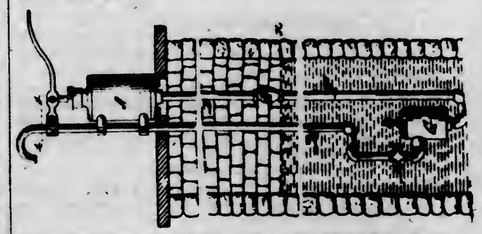
3. The compartmented draft-chest E, provided with air-passages *c' c*^{2} *c*^{3}, slides *n n'* *n*^{1} *o o'* *o*^{1}, spouts *s s'* *s*^{2}, and switch-valve *t*, in combination with the vibratory screen C, exhaust fan-blower *e*, and elevator B of a buckwheat hulling and separating machine, all substantially as and for the uses and purposes set forth and described.

4. In a buckwheat hulling and separating machine, the primary and auxiliary hullers, A D, in combination with a screen, C, draft-chest E, fan-blower *e*, and elevator B, arranged substantially as described, and for the purposes mentioned.

259,670.

259,671. WIRE-STRETCHER. GEORGE S. DEAN, Independence, Iowa, assignor, by mesne assignments, to H. H. Crandal and C. H. Kirkham, Chicago, Ill. Filed Dec. 30, 1881. (No model.)

Claim.—The combination of the angular lever A, the post-chain, its hook and clamp, the two hooks D D', pivoted directly to the lever A, on opposite sides of the angle *a*, the chain E, fastened permanently to the hook D, and the clamp G, fastened permanently to this chain, substantially as described.

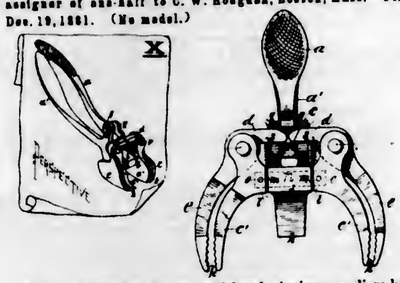


259,672. WAGON HANDLE AND SEAT SUPPORT. JOHN D. DENNIS, Lynn, Mass. Filed Apr. 3, 1882. (No model.)

Claim.—As a new article of manufacture for application to the side of a wagon, the handle and seat supporter constructed and combined substantially as set forth.

259,673. PUMP. JOHN DICKENS, Kingston, N. J. Filed Oct. 15, 1881. (No model.)

Brief.—The air which is compressed in the cylinder escapes through the valve C into reservoir D, and when the pressure within this reservoir is sufficient to overcome the pressure of the atmosphere upon the under side of the valve E and the force of a spring encircling the piston-rod the air passes into pipe F, where it exerts its force downwardly upon the column of water admitted through the inwardly-opening valve in the chamber G and elevates it through the pipe H, the check-valve *h* preventing back flow. The air is permitted to escape through the passages *c' c*^{2}, thereby relieving the pressure on the valve *g* and allowing the chamber G to fill.



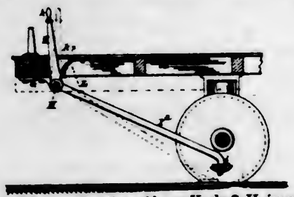
Claim.—1. The combination of an air-compressing cylinder or chamber, A, with a connecting-pipe, D, forming a reservoir for

a column of compressed air, a spring-valve, E, opening outwardly or downwardly, pipes F and H, and intermediate water-supply chamber, G, with valve *g*, substantially as shown and described.

2. The combination of an air-compressing cylinder or chamber, A, located above a fluid to be lifted, a downwardly-extending pipe, D, located below and communicating with said cylinder, a spring-valve, E, opening downwardly or outwardly and having ventages for admitting atmospheric pressure to its under side when closed, a water-pipe, F, connected to said valve, a supply-chamber submerged in the fluid to be lifted, and an ascending discharge-pipe having an upwardly-opening check-valve, said parts being constructed and combined for operation substantially as shown and described.

3. The valve E, having hollow stem *e'*, with lateral passages *e²*, and valve-body E', having corresponding passages, *e²*, whereby when said valve is closed on its seat external atmospheric pressure is admitted to its under side and when said valve is opened or unseated such external pressure is cut off, substantially as shown and described.

259,674. HAND-PINCHERS. MARTIN V. B. ETHERIDGE, Lynn, assignor of one-half to C. W. Hodgdon, Boston, Mass. Filed Dec. 19, 1881. (No model.)



Claim.—1. The construction of hand pinchers or pliers having double clinching-jaws *c c'*, working simultaneously by one operation of the grip-handles *a a'*, in combination with the jaw-lever arms *d d*, the projecting arm *i*, and cam-lever *b*, constructed and arranged to operate substantially in the manner and for the purpose set forth.

2. The construction of the jaws *c c'*, provided with a rotating shaft, *a*, in combination with the elongated nose or bearing *l*, forming a part of the handle *a'*, essentially as specified.

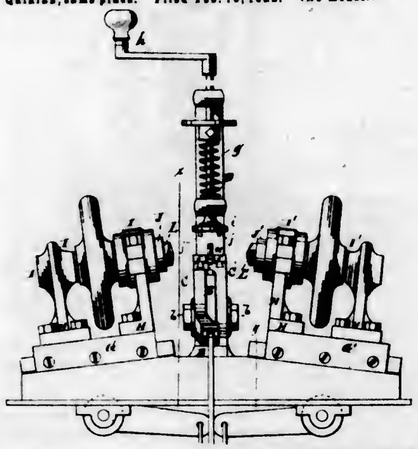
259,675. STREET-CAR-SWITCHING SYSTEM. THOMAS B. ESTEP, Cincinnati, Ohio, assignor of one-half to Hiram M. Stephenson, Covington, Ky. Filed Oct. 13, 1881. (No model.)

Brief.—The cars are directed onto a siding through a flanged roller and curved and flanged guide-rail, the former, carried on the lower end of a frame, consisting of two converging bars secured at their upper ported ends to a cross-shaft, which turns in bearings on the under side of the car, a vertical handle extending therefrom up through the floor, the whole being held up out of operative position by a spring.

Claim.—1. The combination of lever K, shaft H, journaled in bearings secured to the car, spring L, converging bars I I, the stud *i*, attached to said bars at their junction, washer *j²*, and roller J, which is held to said stud by said washer, substantially as set forth.

2. The combination of lever K, shaft H, journaled in bearings secured to the car, spring L, converging bars I I, stud *i*, and roller J, with a fixed guide-rail adapted to engage said roller, substantially as and for the purpose set forth.

259,676. UMBRELLA OR PARASOL RUNNER. SAMUEL W. EVANS, Jr., Philadelphia, Pa. Filed Mar. 30, 1882. (No model.)



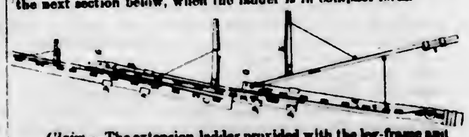
Brief.—A struck-up head surrounds the slot of the runner.

Claim.—The runner having a struck-up head surrounding the

slot, the edge of which is set out, whereby the runner is strengthened, and said edge does not project beyond either the inner or outer surface of the runner, substantially as and for the purpose set forth.

259,677. MACHINE FOR FORMING INTERLOCKING EYES. ROBERT FARIES, Decatur, Ill., assignor to Chambers, Boring & Quinlan, same place. Filed Feb. 10, 1882. (No model.)

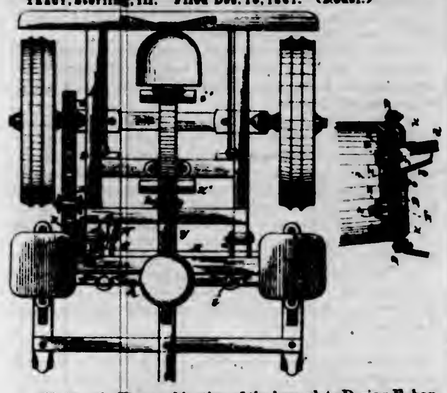
Claim.—1. In a machine for forming interlocking eyes and knots on check-row chains for corn-planters, the inclined ways *f f'* and blocks G G', carrying the bearings I I', in combination with the shaft J J' and spindles L L', substantially as and for the purposes specified.



2. In a machine for forming interlocking eyes and knots on check-row chains for corn-planters, the combination of the hollow shafts J J', arranged opposite each other, the springs *s*, arranged therein, and the hollow spindles L L', arranged within the shafts and acted on by the said springs, and having their projecting ends constructed to turn the ends of the wires, said spindles having independent longitudinal movement within but revolving with the shafts, substantially as described.

3. In a machine for forming interlocking eyes and knots on check-row chains for corn-planters, the levers C C, provided with jaws *c c*, each jaw being provided with inclined grooves *d d*, in combination with the standard B, all constructed and operating substantially as and for the purpose specified.

4. In a machine for forming interlocking eyes and knots on check-row chains for corn-planters, the inclined hollow shafts J J' and the yielding spindles L L', located in such shafts and rotating therewith, in combination with the standard B and bell-crank levers C C', each provided with a jaw, *c*, all constructed, arranged, and operating substantially as and for the purposes specified.

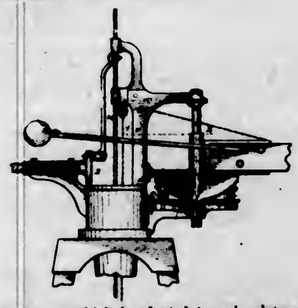


259,678. EXTENSION-LADDER. JAMES F. FLINT, West Danvers, Mass. Filed Mar. 13, 1882. (No model.)

Brief.—The extension-ladder has struts to support each section, the struts for the bottom section being hinged to the leg-frame, those for the other sections being hinged to the side bars of the ladder, and each strut being closed or shut up by a rod at the top of the next section below, when the ladder is in compact form.

Claim.—The extension-ladder provided with the leg-frame and its struts, and with the auxiliary struts, their supporting-lines, and tripping-rods *t*, all arranged and combined substantially in manner and to operate as shown and described.

259,679. CORN-PLANTER. THOMAS A. GALT and GEORGE S. TRACY, Sterling, Ill. Filed Dec. 16, 1881. (Model.)



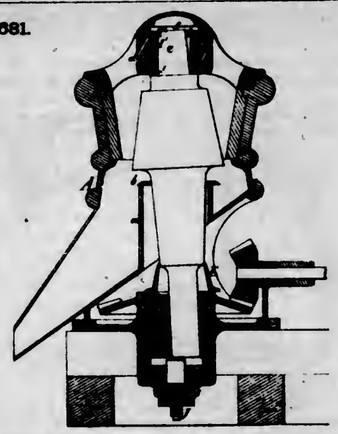
Claim.—1. The combination of the base-plate D, ring E, having the gear *h*, seed-plate F, cap-plate G, and the cut-off plate H, provided with the adjuster I, cut-off K, and discharger L, the latter being adapted to be operated by said seed-plate, substantially as and for the purpose described.

2. The combination of the seed-plate F, the cut-off plate H, the adjuster I, the cut-off K, and the discharger L, the seed-plate being both acted upon and actuating said discharger, substantially as and for the purpose specified.

3. The combination of the hand-lever *i*, reciprocating bar *h*, provided with the clutch *g*, the valve *d*, provided with the horizontal lever *f*, and the tube *b*, having the shelf *c*, in the manner substantially as shown, and for the purpose described.

4. The combination of the sleeve P, provided with the recess *g'*, axle M, head *d'*, provided with the wrist-pin *c'*, axle *c'*, and lever N, constructed and operating together, substantially as shown, and for the purpose mentioned.

259,680. WIND-ENGINE. GEORGE GARDNER, Kalamazoo, Mich. Filed Mar. 20, 1882. (No model.)



Claim.—1. A vane which is adapted to swing laterally and play vertically, provided with a screw-hinge consisting of the eye and the two spiral leaves or wings secured thereto, and having the downwardly-increasing pitch, in combination with the wheels adapted to traverse the under surface of said leaves, all substantially as set forth.

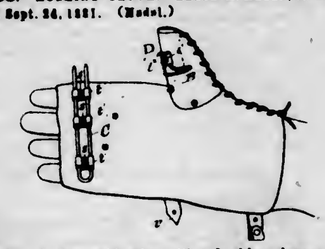
2. The engine-head provided with the rear arm, having the wheel-mortises and the wheels detachably located in said mortises, in combination with the vane provided with the screw-hinge consisting of the center eye and the integrally-connected spiral wings or leaves, all substantially as specified and shown.

259,681. JOURNAL-BEARING FOR STONE AND ORE CRUSHERS. PHILETUS W. GATES, Chicago, Ill. Filed Apr. 6, 1882. (No model.)

Claim.—1. A gyrating crusher-shaft having the tapering journal *c*, in combination with a journal-bearing, whereby only a portion of said tapering journal stands parallel and in contact with the vertical surface of said bearings during the gyration of the shaft, substantially as described.

2. The combination of the journal-bearing *d*, adjustable lining *d'*, and the gyrating crusher-shaft having a journal, *c*, only a

portion of which stands parallel and in contact with the journal-bearing during the gyration of the shaft, the whole constructed and operating substantially as and for the purpose described.

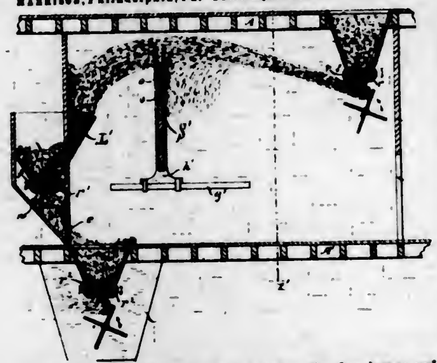


259,682. AIR-VENT FOR BEER-KEGS. JOHN P. GRUBER, Jersey City, N. J. Filed Apr. 11, 1882. (Model.)

Claim.—1. The combination, with the plug provided with an air-passage and a valve-recess in its end and a stopper to close said recess, provided with an air-passage and recesses, *j*, of the rubber valve C, provided with the protuberance *e* and perforated flange *g*, all constructed and arranged substantially as set forth.

2. The rubber valve C, made concave on its under side and provided with a protuberance, *e*, a plate, *i*, and a thin perforated flange *g*, in combination with a vent-plug having a recess to receive it, substantially as set forth.

259,683. HUSKING-GLOVE. REUBEN H. HAGER, Chicago, Ill. Filed Sept. 24, 1881. (Model.)



Claim.—1. In combination with a husking-glove, a pointed stripper extending across the face of the glove and rigidly secured thereto near the pointed end of the stripper, and one or more guides fixed to the face of the glove between the point of rigid attachment and the butt-end of the stripper, holding the said stripper to the face of the glove, and adapted to slide on the stripper, though not freely, substantially as and for the purpose set forth.

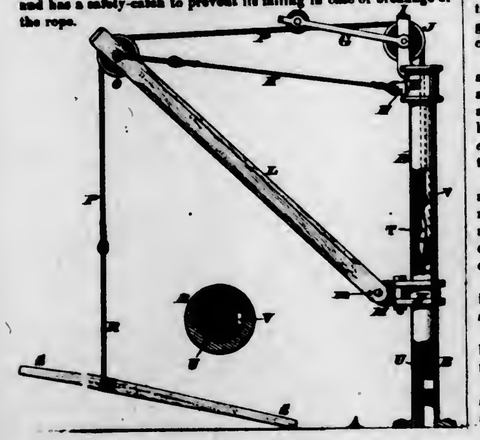
2. In combination with a husking-glove, the U-shaped stripper C, having inwardly-curved points, band *i*, secured to the face of the glove and tightly inclosing the stripper near its sharpened end, and one or more bands, *i'*, secured to the face of the glove toward the butt-end of the stripper and loosely inclosing the stripper, substantially as described.

3. In a husking-glove, the combination, with the thumb thereof, of the claws formed of a piece of wire, D, having its opposite ends bent toward each other, then outward parallel, or nearly so, with each other, and finally upward at a right angle, the device being secured to the face of the thumb at the outside bends of the wire, and also at the parallel parts, substantially as described.

4. A hooking-pin formed of wire bent to the shape of a U, and having its ends pointed and curved to form prongs, substantially as described.

259,684. APPARATUS FOR MIXING SUGAR. ALFRED C. HARRISON, Philadelphia, Pa. Filed Apr. 28, 1882. (No model.)

Claim.—1. An apparatus for separating the fine lumps and soggy particles from a sugar, consisting in the combination of an apparatus for throwing the sugar in a cloud or in a more or less finely divided condition, and a shield or deflecting-plate, fixed or adjustable, interposed in the path of the flying sugar, and operating to separate the same into two portions, substantially as specified.



2. The combination, with a fixed or adjustable shield, or its equivalent, placed in the path of a flying sugar, and operating to separate the sugar into two portions, one lumpy and the other comparatively free from lumps, of an apparatus for receiving the said lumpy portion and washing the same, substantially as specified.

3. The combination, with an apparatus for throwing a sugar in a more or less finely divided condition, and with a shield, S, interposed in the path of the flying sugar, of a hopper, L, for receiving the portion of the sugar that flies over the top of the said shield, and a pair of rolls, r' r', for receiving the said portion of sugar from the hopper L and for washing the lumps in the same, substantially as specified.

4. In an apparatus for mixing sugars, the combination of, first, apparatus for throwing the sugar in a cloud or in a more or less finely divided condition; second, apparatus interposed in the path of the flying sugar and operating to separate it into two portions, a lumpy portion and one comparatively free from lumps; third, apparatus for washing the lumps of the said lumpy portion; and, fourth, apparatus for remixing the two portions of sugar, the combination operating substantially as and for the purpose specified.

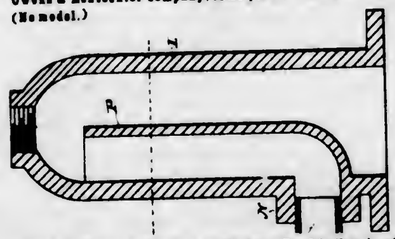
259,685. STAGING FOR STEAMBOATS. JAMES L. HAVEN and JOHN B. MOONEY, Cincinnati, Ohio; said Mooney assignor to said Haven. Filed Apr. 5, 1882. (No model.)

Brief.—The counterbalance-weight slides inside the mast, and has a safety-catch to prevent its falling in case of breakage of the rope.

Claim.—1. In combination with a steamboat-staging, a counter-balance traversing the tubular mast or cage, to which latter is coupled the swinging boom that supports the platform, substantially as herein described and set forth.

2. The combination of tubular mast or cage B, rotatable cap E e I, swinging boom L M, sheaves J O, suspender P, staging S, and counter-balance U, which latter plays within said mast, as and for the purpose described.

3. The grooved mast B C c, surmounted with a rotatable cap, E e F, resting on the balls D, said cap being extended below the mast-head, and being furnished with a secondary set of balls, D', bearing against the exterior of said mast, for the purpose specified.



4. The combination, in a steamboat-staging, of tubular mast B, internal rack, V, counter-balance U, pivoted detent T *t*, spring W, and rope P, which latter passes over a pulley applied to the swinging boom, and has said counter-balance U and platform S secured to its opposite ends, as and for the purpose described.

5. The combination, in a steamboat-staging, of tubular mast B, internal rack, V, and weight U, said weight having a longitudinal groove, *u*, that surrounds the rack to prevent rotation of said weight, as herein described.

6. In a steamboat-staging, the rope P, traversing the tubular mast B, and supporting at one end the platform S and at the other end a counter-balance, U, the latter being provided with a pivoted detent, T *t*, that automatically engages with the internal rack, V, of the mast as soon as said rope breaks, substantially as described.

7. The combination, in a steamboat-staging, of rotatable cap E, sheave J, fair-leader G, and suspension-cable P, for the purpose specified.

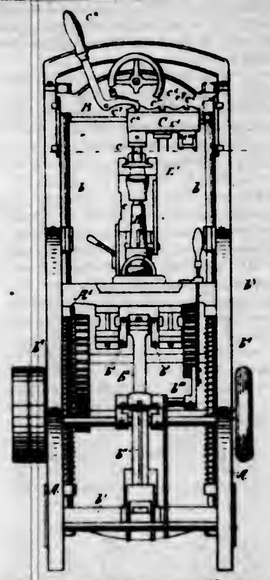
259,686. STEAM-SEPARATOR FOR TRACTION-ENGINES. GEORGE H. HOLWAY, Hamilton, Ohio, assignor to the Reeves, Owens & Rentschler Company, same place. Filed Oct. 18, 1881. (No model.)

Claim.—The combination, with dome B of boiler A, of the body-casting L, attached to the dome B, and having partition P cast integrant with the body, and having steam-outlet N, substantially as and for the purpose set forth.

259,687. HEEL-NAILING MACHINE. HENRY A. HENDERSON, Lynn, Mass., assignor, by mesne assignments, to the National Heeling Machine Company, of Maine. Filed Apr. 17, 1882. (No model.)

Claim.—1. In an organized heel-nailing machine, the combination of a jack for holding the boot or shoe, the reciprocating cross-head B, and sliding carriage C, adapted to have a straight horizontal movement upon said cross-head imparted to it, and a gang or group of awls and a gang or group of drivers supported by said carriage, all substantially as described.

2. In an organized heel-nailing machine, the combination of a jack for holding and presenting the work to the nailing mechanism, a reciprocating cross-head, B, and a sliding carriage, C, adapted to have a straight horizontal movement upon said cross-head imparted to it, an awl-holding block, *c*, driver-holding block *c'*, and top-lift spanker *c²*, supported by said carriage, all substantially as and for the purposes described.



3. In an organized heel-nailing machine, the combination of a jack for presenting the work to the heel-nailing mechanism, the reciprocating cross-head B, the sliding carriage C, adapted to have a horizontal movement upon said cross-head imparted to it, and a driver-holding block, *c'*, and top-lift spanker *c²*, supported by said carriage, all substantially as and for the purposes described.

4. The combination of the reciprocating cross-head, the sliding block or carriage C, and the adjustable stop c^{11}, all substantially as and for the purposes described.

5. The combination of the cross-head B, the carriage C, the hand-wheel c^9, and mechanism, substantially as specified, for connecting it with the carriage C, all as and for the purposes set forth.

6. The combination, in an organized heel-nailing machine, of a jack for presenting and holding the work to the heel-nailing mechanism, the table or support E', the sliding templet E^2, adapted to be moved horizontally in a straight line upon said support into position over the jack, and a gang or group of awls adapted to be reciprocated by means substantially as specified, for the purpose described.

259,687.

7. The combination, in an organized heel-nailing machine, of a jack for presenting and holding the work to the nailing mechanism, the table or support E', the templet E^2, adapted to be moved horizontally in a straight line upon said support or table into position over the jack, and a gang or group of drivers adapted to be reciprocated by means substantially as specified, all as and for the purposes described.

8. The combination, in an organized heel-nailing machine, of a jack for presenting and holding the work to the nailing mechanism, a support or table, E', a templet, E^2, adapted to be moved horizontally on the said table into position over the jack, a gang or group of awls and a gang or group of drivers interchangeably arranged upon a cross-head, and means for reciprocating said cross-head, all substantially as and for the purposes described.

9. In an organized heel-nailing machine, the combination of a jack for presenting and holding the work to the nailing mechanism, a table or support, E', a templet, E^2, adapted to be moved horizontally in a straight line upon said table or support into a position over the jack, and a nail-holder adapted to be moved horizontally in a straight line into position over the templet, all substantially as and for the purposes described.

10. In an organized heel-nailing machine, the combination of a jack for presenting and holding the work to the heel-nailing mechanism, a table or support, E', a templet, E^2, adapted to be moved horizontally in a straight line upon said table or support into position over the jack, a nail-holder supported by the templet-plate e^2 and adapted to have a horizontal movement therewith, and to be moved into position over the templet E^2 after the templet-plate has come to rest, all substantially as and for the purposes described.

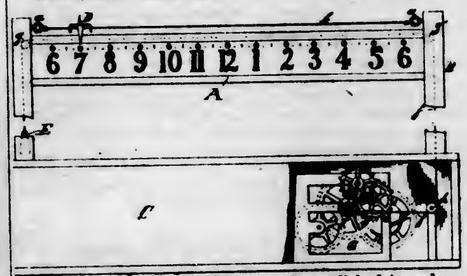
11. In an organized heel-nailing machine, the combination of a jack for presenting and holding the work to the heel-nailing mechanism, the vertically-movable table or support E', the templet E^2, supported by said table and adapted to be moved horizontally thereon in a straight line to a position over the jack, and then to be moved vertically with said support or table, all substantially as and for the purposes described.

12. In an organized heel-nailing machine, the combination of a jack for presenting the work to the heel-nailing mechanism, a heel-receiver, and a templet adapted to have horizontal and vertical movements imparted to it, all substantially as and for the purposes specified.

13. The combination of a jack for holding and presenting the work to the heel-nailing mechanism, a heel-receiver, a templet, and a nail-holder adapted to have a horizontal and vertical movement in relation to the heel-receiver, and a group or gang of awls and a group or gang of drivers adapted to be alternately reciprocated in line with the templet, all substantially as and for the purposes described.

14. The combination of the vertically-movable table E', and the templet-plate e^2, adapted to slide thereon in a straight line, all substantially as and for the purposes described.

15. The combination of the vertically-movable table E', the templet-plate e^2, adapted to slide thereon, and the nail-holder plate e^{21}, adapted to slide upon the templet-plate, and means, substantially as specified, for regulating the extent of the movements of said plates, all substantially as and for the purposes described.



16. The combination of the heel-receiver E^4, its slotted standard e^{26}, the bracket or post E, and the set-screw e^{28}, all substantially as and for the purposes described.

17. The combination, in a heel-receiver, of the curved spring-arms e^{27}, fastened to the outer end thereof, as specified, and the curved spring e^{29}, fastened at the back thereof, as specified, all substantially as and for the purposes described.

18. The combination of the reciprocating connecting-rod b^3, the cross-bar b^7, the movable block b^9 and its pin b^{10}, the slotted arm b^{11}, and means for moving and locking the same, all substantially as and for the purposes described.

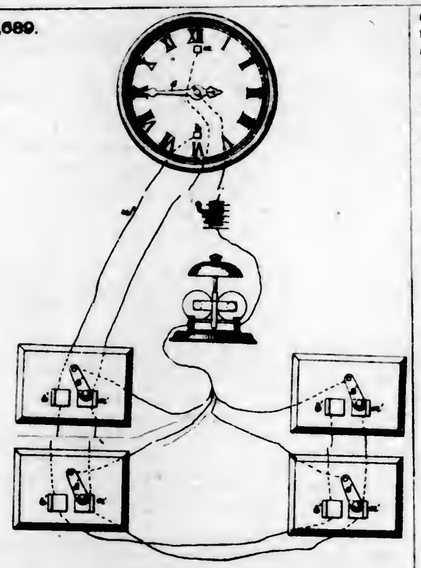
19. The combination of the horizontally-moving jack D, the heel-receiver E^4, a templet adapted to move horizontally and vertically upon the heel-blank, to clamp it in position and upon the work, and to lock it in that position prior to the reciprocation of the awls or drivers, and said reciprocating awls or drivers, all substantially as and for the purposes described.

259,688. CLOCK. THEODORE HELLARDER, Chicago, Ill. Filed Oct. 11, 1881. (No model.)

Claim.—1. The combination, with a linear dial-plate graduated in twelve hours, columns or supports B B, and wire *b*, of a single index-hand, D, having index-point *d*, saddle-plate *e*, and clamp-bar *e*, weighted thread or cord *f*, and suitable clock-work, substantially as and for the purpose set forth.

2. The combination, with the linear dial-plate A, of the index-hand D, composed of index-point *d*, saddle-plate *e*, and clamp-bar *e*, wire *b*, weighted thread *f*, sheaves *g g'*, and spool F, rotated by a clock-work, all substantially as and for the purpose set forth.

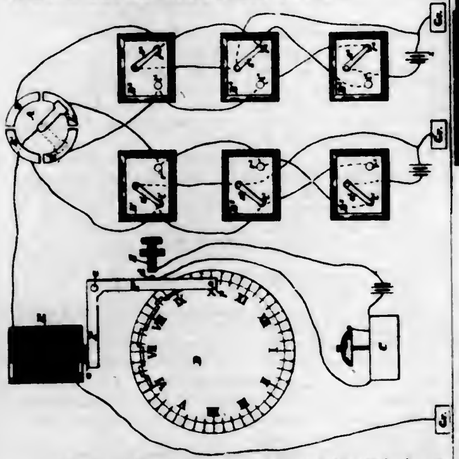
3. The combination of the linear dial A, posts B B, wire *b*, index-hand D, constructed and adapted to ride upon said wire, as described, and reciprocated by thread or cord *f*, winding upon the spool F, clock-work G, and weight E, all substantially in the manner described and shown.



4. The combination, with the minute-spindle H, of a clock-work, G, pinion *i*, disk I, pawl *m*, with tail-projection *o*, and spring *n*, spool F, with ratchet-wheel *j*, and gears J, *k*, and L, with pin *p*, all substantially as and for the purpose shown and specified.

259,689. ELECTRIC DETECTING APPARATUS FOR WATCHMEN. CHAS. W. HUBBARD, Boston, Mass. Filed Dec. 5, 1881. (No model.)

Brief.—All the *a'* connection-points of the switches are in electrical connection with the contact-point *a* of the automatic circuit-closer; all the *b'* points with the contact-point *b*. An alarm is included in the circuit to prevent the pointer in its revolution from closing the circuit and sounding the alarm. The watchman must periodically reverse all the switches.



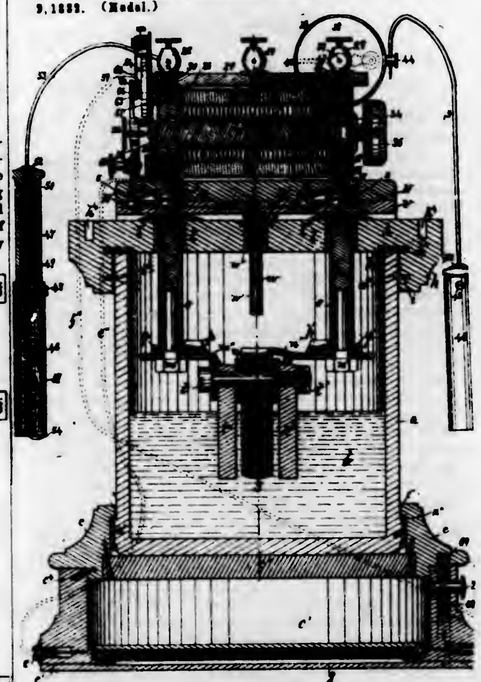
Claim.—The combination, with an alarm or recording instrument, an electric circuit, and an automatic circuit-closer closing the circuit at regular intervals, of suitable contact-points and a series of hand-switches, substantially as described, so that an alarm will be given or a record made periodically unless the periodic action of the circuit-closer is counteracted by a corresponding periodic movement of all the switches.

259,689.

259,690. ELECTRIC DETECTING APPARATUS FOR WATCHMEN. CHAS. W. HUBBARD, Boston, Mass. Filed Mar. 22, 1882. (No model.)

Brief.—Each of two series of switch-boards is electrically connected with two of four concentric contact-plates. A pointer connected through an electro-magnet to ground is caused to slide along the contact-plates successively. By periodically reversing the hand-switches a constant ground-circuit may be maintained through the electro-magnet and pointer and one or the other of the series of switch-boards with its battery. Otherwise the battery is short-circuited and a record is made on the dial.

Claim.—1. The combination, with a common ground-wire, an alarm or recording instrument in said common ground-wire, several electric circuits, and an automatic commutator causing the currents of said circuits to flow through said common ground-wire successively at regular intervals, of suitable contact-points and one or more series of hand-switches, substantially as described, so that an alarm will be given or a record made periodically, unless the periodic action of the automatic commutator is counteracted by a corresponding periodic movement of hand-switches.



2. The combination, with two circuits, each containing a battery, and one or both containing a series of hand-switches and contact-points, of suitable wires, an alarm or recording instrument, and an automatic circuit-shifter adapted to periodically and alternately connect each circuit with a common ground through the alarm or recording instrument, substantially as described, for the purpose specified.

3. The recording-instrument herein described, consisting essentially of the automatically-revolving dial D, provided with a circular and radial lines, as shown, the electro-magnet E, the bell-crank lever P, armature *e*, and pencil *p*, in combination with an automatic commutator, suitable wires, and two branch circuits, substantially as described, to make records of the battery-circuit in which and of the time at which a break occurs.

4. The automatic commutator or circuit-shifter A, electro-magnet E, lever P, armature *e*, pencil *p*, and automatically-revolving dial D, in combination with two circuits, each provided with an independent battery, and one or both provided with hand-switches for short-circuiting the said battery or batteries, and the two normally making ground alternately through said commutator A and electro-magnet E, substantially as described.

5. The automatic commutator or circuit-shifter A, electro-magnet E, lever P, armature *e*, pencil *p*, automatically-revolving dial D, and relay-bell C, in combination with two circuits, each provided with an independent battery, and one or both provided with hand-switches for short-circuiting the said battery or batteries, and the two normally making ground alternately through said commutator A and electro-magnet E, substantially as described.

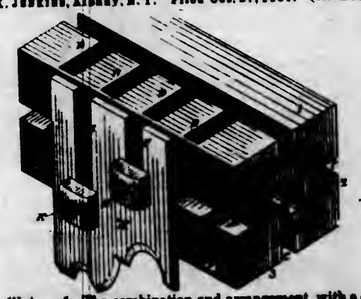
259,691. ELECTRICAL APPARATUS FOR MEDICAL PURPOSES. WILLIAM HUNARD, Cambridgeport, Mass. Filed Jan. 9, 1882. (Model.)

Claim.—1. In an electrical apparatus, the combination of coils 21 27, base-board 1, pole-changer board *v*, spring-rod *w*, posts *m n*, springs *p p'*, and battery-plates *r r' s*, as and for the purpose set forth.

2. In combination, the sliding base-board 1, carrying the coils 21 27, and having screws 2 3 and springs 4 5, adapted to connect respectively with the buttons M N' and M' N, so as to change the direction of current from one handle to the other connected to the terminals of coil 27 by sliding the said base-board 1 and its springs 4 5, as set forth.

3. In an electrical apparatus, the combination of the battery-plates *r r' s*, posts *m n*, coil 21, core 32, armature 57, wheel 24, spring-lever 62, pin 63, vibrating rheotome 25, and circuit-connection 26, as and for the purpose set forth.

4. In an electrical apparatus, the primary coil 21 and secondary coil 27, having one end of their wires connected to the screw-cap 28, in combination with the opposite end of secondary coil 27, connected to screw-cap 28, and opposite end of primary coil 21, connected to spring 4 and battery, as set forth.

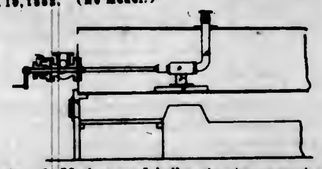


5. The electrode-handles as composed of metal shield 46, wooden shield 47, and internal spring, 51, as set forth.

6. In combination with cap 28, board 29, coils 21 and 27, the hand-interrupter as composed of hard-rubber disk 36, metal toothed ring 39, spring-lever 41, handle 42, spring 43, and shank 37, as described.

7. In combination, the battery-plates *r r' s*, brackets *m'' n''*, posts *m n*, springs *p p'*, cover A, spring *w*, pole-changing board *v*, coils 21 27, and electrical connections, as set forth.

8. In combination with a pair of electrode-handles 46, the insulated yoke 56 and pins 55 55, as described.



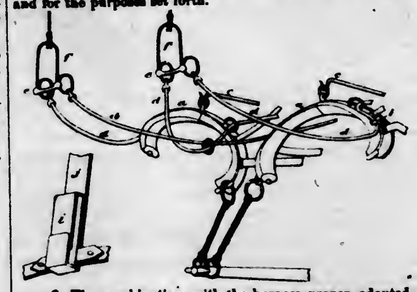
259,692. CUTTER-HEAD FOR MOLDING-MACHINES. EDWD. K. JENKINS, Albany, N. Y. Filed Oct. 27, 1881. (No model.)

Claim.—1. The combination and arrangement, with a cutter-head having longitudinal slots C and transversely-arranged slots D or D', made in opposite sides of said head, and attaching-bolts E E, adapted to fit in each said slots and hold with said head, of cutting-knives or bits K, each provided with slots *e* and *e'*, whereby said knives or bits will be held at two points in their lengths on the faces of said cutter-head, substantially in the manner and for the purpose set forth.

2. The combination, with a cutter-head having longitudinal slots C made in its four sides and in its two opposite sides transverse slots D, connecting with slots C of said opposite sides, and transverse slots D', made in its transverse sides, relatively staggering or dodging the first-mentioned transverse slots and communicating with slots C in said transverse sides, of attaching-bolts E, adapted to work in all of said slots, and also with slots *s s'*, made in the knives or cutting-bits, whereby said knives or bits may each be attached to said head at two points in their lengths, and be adjusted on two sides longitudinally on said head in either direction, and be capable of a similar attachment and adjustment on the transverse sides of said head, with the knives and head balanced, substantially as and for the purposes set forth.

259,693. APPARATUS FOR REMOVING SCALE, SEDIMENT, &c., FROM BOILERS. THOMAS J. JENNS, Sharon, Pa. Filed Apr. 10, 1882. (No model.)

Claim.—1. My improved boiler-cleaning apparatus, consisting of a blow-off pipe and an oscillating scraping-deflector, operated by a rod which passes through an automatic valve-chamber.



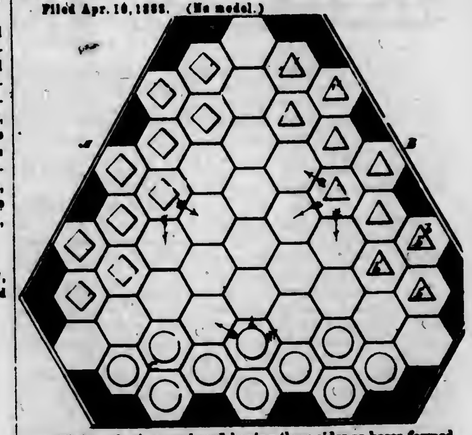
2. In a device for removing scale, &c., from boilers, the combination of a blow-off pipe, an oscillating sleeve mounted thereon and communicating therewith, and a deflector and scraper attached to the sleeve by a hollow arm, whereby the scale, &c., passes to the blow-off pipe from below the deflector and scraper, substantially as specified.

3. The combination of a boiler-scraper with a rod or handle which passes through an automatic valve-chamber.

4. In a device for removing scale, &c., from boilers, the combination of a blow-off pipe, a sleeve adapted to rotate on the blow-off pipe and provided with a scraper, a rod for actuating the sleeve, and an automatic valve, through the case of which the actuating-rod passes, substantially as and for the purpose specified.

259,694. HARNESS. WILLIAM H. JUDSELYN, Bridgeport, Conn. Filed Apr. 17, 1882. (No model.)

Claim.—1. In a harness, the bit provided with a bail adapted to engage in a snap or holdfast on the headstall, substantially as and for the purposes set forth.



2. The combination, with the harness proper, adapted to be suspended as shown, of the reins *d*, the bit *c*, provided with a bail, *f*, and attached to the reins, and the headstall provided with a snap, *i*, all arranged substantially as set forth, and for the purposes specified.

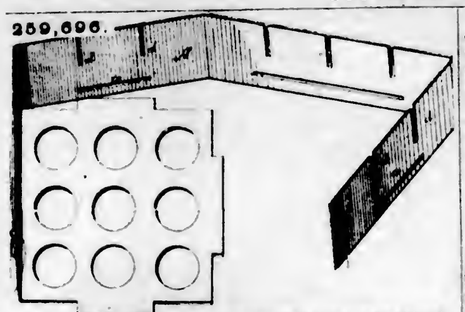
3. The combination, with the bit provided with a rigid bail, of the headstall provided with an elongated snap, *i*, to engage the bail, substantially as and for the purposes set forth.

4. The hinged collar *a*, provided with a spring-clasp, *l*, to hold the rein, substantially as and for the purposes set forth.

5. The improvement in the art of ready hitching, which consists in attaching the bits permanently to the reins and providing the horse with a headstall without a bit, whereby in hitching it is only necessary to put the bit in the mouth and attach it to the headstall, substantially as set forth.

259,695. GAME-BOARD. JOHN F. KISSWELL, Chicago, Ill. Filed Apr. 10, 1882. (No model.)

Claim.—1. A game-board having three sides or bases formed by hexagonal or other spots or checks, from each side or base of which the play can be made, substantially as specified.

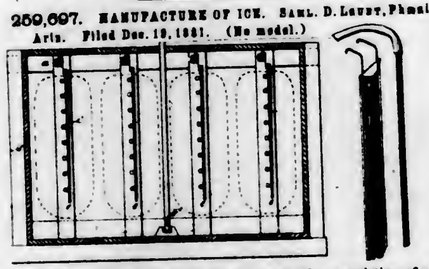


2. A game-board having three sides or bases and corresponding corners and formed with hexagonal or other spots or checks, substantially as and for the purposes specified.

3. As an improved article of manufacture, the herein-described board or card having the long triangular sides A, B, and C and playing spots or checks, arranged substantially as described.

4. A three-sided game in which the men of each set are played each from a separate and distinct base and move in lines away from the playing-base, substantially as specified.

259,696. EGG-CARRIER. JOEL H. LOUDER, Chicago, Ill. Filed July 14, 1881. (No model.)



259,696.

Claim.—1. A knockdown box provided with a series of longitudinal and transverse division-boards, the surrounding rim of the box being connected at each of its sides to the bottom of the box and slotted at its upper edges to receive corresponding slots in the lower edges of the longitudinal and transverse boards, said transverse boards being slotted within the rim on their upper edges to receive the slots in the lower edges of the longitudinal boards, substantially as described.

2. A knockdown box having its bottom and entire upturned rim in one piece, in combination with transverse and longitudinal division-boards, respectively, locked together and to the rim, substantially as described.

259,697. MANUFACTURE OF ICE. SAML. D. LEVEY, Phœnix, Ariz. Filed Dec. 19, 1881. (No model.)

Claim.—1. A congealer for an ice-machine, consisting of one or more flat coils or rows of pipe attached to and supported by posts and placed in an upright position in a tank containing the water to be frozen, when so constructed and arranged that the blocks of ice which are formed upon it will be held in position by the posts which support the congealer, and will not come in contact with the tank or any other support, except at one end of the blocks, substantially as and for the purpose set forth.

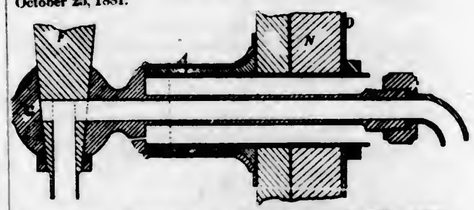
2. The combination, with the congealer of an ice-machine which is placed in a tank containing the water to be frozen, but does not extend to the bottom of said tank, of an agitator placed within the tank and below the congealer and also below the blocks of ice formed upon it, substantially as described.

3. The process herein described for detaching the ice from the congealer, which consists in freezing tubes closed at one end in the blocks of ice along the line of the congealer, removing the tubes after the ice has attained sufficient thickness, and finally splitting the blocks of ice along the line of holes left by said tubes.

4. The method herein described for loosening the parting-tubes previous to drawing them from the ice, which consists in pushing a smaller tube inside the same and introducing a stream of water which is above the freezing temperature through this inside tube into the parting tube near the closed end, substantially as and for the purpose set forth.

5. The process of removing the ice from the congealer of an ice-machine which consists in making a line of holes in the block of ice along the line of the congealer, and then splitting the block of ice through this line of holes.

6. In combination with the congealer of an ice-machine, the parting-tube *e*, made with one flat side between two sharp edges, the flat side being in contact with the congealer.

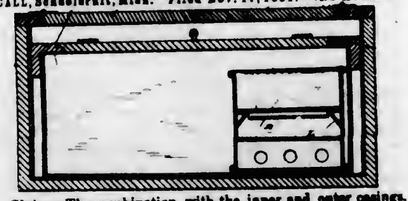


7. The method herein described for securing contact between the parting-tubes and congealer, which consists in suspending the parting-tubes from a point on one side of the center of gravity.

8. In combination with the congealer of an ice-machine and a row of parting-tubes placed along the line of said congealer, removable supports for the parting-tubes, substantially as herein described.

9. The combination, with the tank of an ice-machine which contains the water to be frozen and an agitator for keeping the water in motion, of suitable receptacles for catching the solid impurities which are suspended in the water, substantially as described.

259,698. BEER-FAUCET. MICHAEL HAGIN, Rochester, N. Y. Filed Mar. 29, 1882. (No model.)



Brief.—Improvement on Letters Patent No. 248,646, dated October 25, 1881.

Claim.—1. In combination with an ice-box, a beer-faucet provided with an outer non-conducting jacket and an inner cold-air space, substantially as and for the purposes set forth.

2. In combination with an ice-box, a beer-faucet provided with an outer non-conducting jacket and an inner cold-air space having one or more orifices communicating with the external air, substantially as and for the purposes set forth.

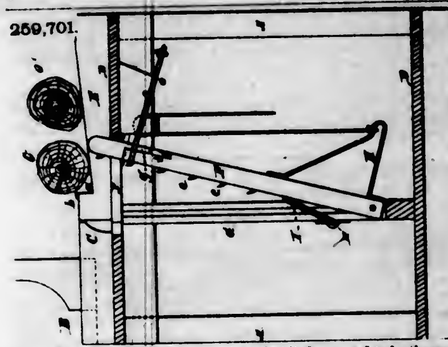
259,699. REFRIGERATING BUTTER-SAFE. JAMES R. MCCALL, Schoolcraft, Mich. Filed Nov. 17, 1881. (No model.)

Claim.—The combination, with the inner and outer casings, constructed as described, of the vessel or vessels for containing milk or cream and the tray or trays located therein for containing butter, substantially as and for the purpose specified.

259,700. PAD FOR HORSE-COLLARS. EDWARD L. MCCLAIN, Greenfield, Ohio. Filed Apr. 24, 1882. (No model.)

Claim.—1. As attachments to a sweat or other horse-collar pad, the elastic springs *s s*, substantially as described, and for the purposes set forth.

2. The combination, in a sweat or other horse-collar pad, of the springs *s s* and of the choke-strap billet-loop *l* with the collar-pad, substantially as described, and for the purposes set forth.



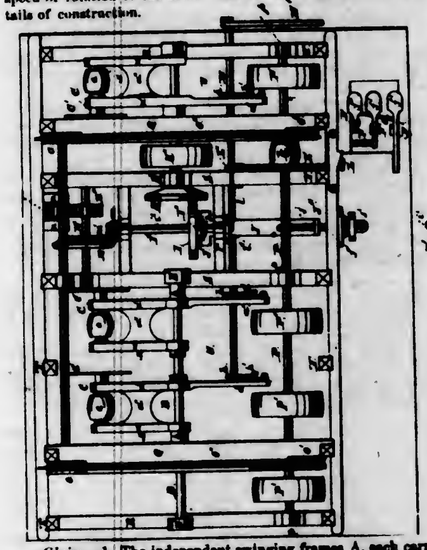
259,701. LOG-TURNER. FRANK MCDONOUGH, Eau Claire, Wis. Filed Oct. 3, 1881. (No model.)

Claim.—1. The log-turner F, arm or crank I, rock-shaft H, and arm or lever J, in combination with the rod or bar L, for operating the arm or crank I and throwing the log-turner out of perpendicular, substantially as and for the purposes specified.

2. The log-turner F, arm or crank I, rock-shaft H, and arm or lever J, in combination with the weighted rod or bar L and weighted rod or lever K, for bringing the arm or crank I into position to bear against the log-turner and return it to its normal position, substantially as and for the purposes specified.

3. The combination, with the carriage, log-ways, and the log turner or canter, pivoted at its lower end to swing out of perpendicular, and having a projection, *g*, at its upper portion, of a pivoted bar, *e*, having a catch, *f*, adapted to engage the projection on the log turner or canter when the latter is swung back, and to hold the same out of perpendicular for a portion of its vertical movement, and to then automatically release the said log turner or canter, substantially as described.

259,701.



4. A log turner or canter pivoted at its lower end to be thrown out of perpendicular, and provided with a catch or projection, *g*, in combination with a lock or catch, *e f*, cord *h*, and weight *w*, in combination with the rope or chain M and arm N, for raising the log turner or canter, releasing it from the lock or catch, and throwing it forward, substantially as and for the purposes specified.

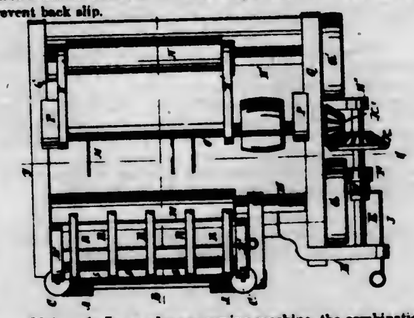
5. A log turner or canter pivoted at its lower end, and arm or crank arranged to have its free end bear against the turner or canter, in combination with an automatic lock or catch, *e f*, rope or chain M, and arm N, substantially as and for the purposes specified.

259,702. MACHINE FOR TRIMMING AND CUTTING LUMBER. FRANK MCDONOUGH, Eau Claire, Wis. Filed Sept. 10, 1881. (No model.)

Brief.—The lumber is fed to a series of edging-saws, which can be raised into position or lowered independently of each other by a feed mechanism operated by a face friction disk operating against a movable edge friction disk. Thus with a single source of power the feed may be varied in speed independently of the speed of rotation of the saws. The invention consists in the details of construction.

Claim.—1. The independent swinging frames A, each carrying a saw and having an arm or extension, in combination with the link or rod *d*, double crank D D′, connecting the link E, and crank-shaft F, for raising any one or more of the saws independently of the others, substantially as specified.

2. The independent swinging frames A, each carrying a saw and having an arm or extension, in combination with the link *d*, double crank D D′, link or rod E, arm *f*, shaft F, and foot-treadle F′, for bringing any one or more of the saws into position for use, substantially as specified.



3. The independent swinging frames A, each carrying a saw and having an arm or extension, in combination with the link *d*, double crank D D′, rod or link E, crank-shaft F *f*, foot-treadle F′, hook *g*, and rod or bar G, for raising any one or more of the saws into position for use and locking it into position, substantially as specified.

4. The independent frames A, each carrying a saw and having an arm or extension, in combination with the rock-shaft H, having arms *h*, links or bars *h′*, and lever or arm H′, for simultaneously raising all of the saws into position for use, substantially as specified.

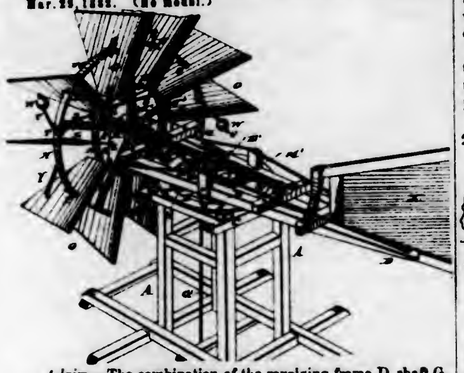
5. The wheel or disk I, mounted upon the shaft I′, journaled eccentrically in disk *l′*, and the connecting-link *l*, in combination with the crank-shaft L″ and L′, and lever or arm L, and wheel or disk K, for producing the necessary frictional contact between the disks for feeding purposes, substantially as specified.

259,703. EDGER SAWING-MACHINE. FRANK MCDONOUGH, Eau Claire, Wis. Filed Aug. 15, 1881. (No model.)

Brief.—The lumber is fed to a gang of saws by feed-rollers having variable speed of revolution as compared with the saws. A screw on one of the rollers causes the boards to bear against guide-rollers at the sides. Pointed hinged dogs above the lumber prevent back slip.

Claim.—1. In an edger or sawing machine, the combination of a rotary shaft provided at its end with a screw-thread or worm, with a gage-roller journaled to rotate in a horizontal plane at the outer portion of the screw-thread or worm, and constituting a rolling bearing for the material, which is drawn up against the same by the said screw-thread or worm, substantially as and for the purpose described.

2. In an edger or sawing machine, the combination of the shaft B, journaled directly at the receiving or front end of the machine, and provided with a screw-thread or worm, A, the gage-roller C, journaled to rotate in horizontal plane adjacent to the outer portion of the said screw-thread or worm, and the feed-rollers H, arranged in rear of the said shaft and driven independently of the same, said screw-threaded or worm shaft rotating at a greater speed than the feed-rollers, whereby the material is drawn up against the rotary gage, which affords a rolling bearing for the same, all substantially as described.



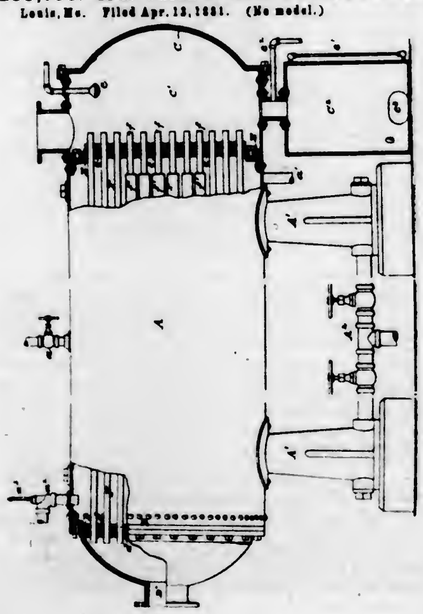
3. In an edger or sawing machine, the shaft B, journaled directly at the receiving or front end of the machine, and provided at each end with a screw-thread or worm, A, in combination with the gage-rollers C, journaled to rotate in horizontal planes at the outer portions of the screw-threads or worms, and the feed-rollers H, arranged in rear of the said screw-threaded or worm shaft and driven independently of the same, said shaft rotating at a greater speed than the feed-rollers, all substantially as and for the purposes described.

4. In an edger or sawing machine, the supports D D, arranged directly at the receiving or front end of the machine, at opposite sides thereof, in combination with the gage-rollers C C, journaled on the said supports to rotate in horizontal planes, and the shaft B, also journaled in said supports and provided at each end with a screw-thread or worm arranged adjacent to and coacting with the gage-rollers, all substantially as and for the purpose described.

5. In an edger or sawing machine, the combination, with the arbor carrying the circular saw or saws, and the feed-rollers located in front of said saw or saws, of the horizontal shaft E, journaled at its ends in bearings at one side of the machine-frame, pinions by which said horizontal shaft is rotated directly from the saw-arbor, a friction-wheel, G, fixed directly to the arbor of one of the feed-rollers, and the horizontally-adjustable friction-wheel F, for imparting motion directly from the said shaft to the said friction-wheel on the feed-roll, all substantially as shown and described.

6. The combination, with the feed-roller H, of the swinging fingers or pawls R, located upon the shaft T, and the sleeves S, arranged between said fingers or pawls, substantially as and for the purposes described.

259,704. WIND-ENGINE. TERON T. MILLER, Rico, Tex. Filed Mar. 29, 1882. (No model.)



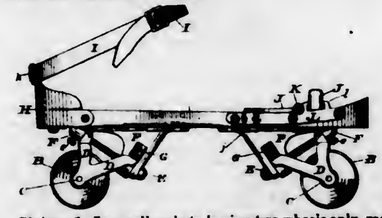
Claim.—The combination of the revolving frame D, shaft G, having wheel H, consisting of the hub J, spokes L, rim M, brace N, wings O, having slots P and pins Q R Z, ring A', forming bearings for the pins Z, rock-shafts T, having arms U V and weights W, connecting-rods X, and springs Y, the shaft E', having bell-crank lever F', chain G', rod H', sleeve B', having spiral slot C' to receive a stud, D', upon shaft G, the pulley K' upon one of the spokes, and the cord J', connecting the sleeve B' with one of the wings, as and for the purpose set forth.

259,705. LAMP-LIGHTING IMPLEMENT. ELIJAH MORRISON, Boston, Mass. Filed Sept. 30, 1881. (No model.)

Claim.—An implement for lighting lamps and the like having in combination the box-like receptacle, tube, and wick, as described, with the cushion, as described, and handle, all as set forth and described.

259,706. FEED-WATER HEATER. EDMUND L. MORSE, St. Louis, Mo. Filed Apr. 13, 1881. (No model.)

Claim.—1. The combination, in a feed-water heater, of a series of pipes, F, having reduced portions *f*, with the head D, provided with a series of stuffing-boxes, *d*, for the passage of said reduced portions, for the purpose set forth.



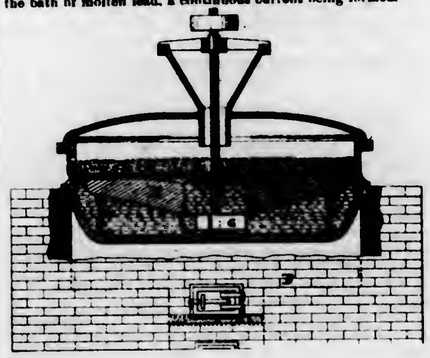
2. The combination, in a feed-water heater, of the heating-tubes F, shell A, and chamber C', provided with a spray pipe or nozzle, *e*, with a receiving-tank, C', substantially as and for the purpose set forth.

259,707. HARNESS. ALBERT MURRAY, Rockport, Mass. Filed Apr. 27, 1882. (No model.)

Claim.—The trace A, provided with the plate *d*, screw G, and loops L K, and having an end slot, in combination with the lift I and loop J, when constructed, combined, and arranged to operate substantially as and for the purpose specified.

259,708. ROLLER-SKATE. THADDEUS A. NEELY, Muncie, Ind. Filed Mar. 14, 1882. (Model.)

Claim.—1. In a roller-skate having two wheels only, rocking or oscillating bearings, the bearing-shafts being located centrally above said wheels and running from a point about vertically above the wheel-shafts on an angle toward the floor, substantially as shown and specified.



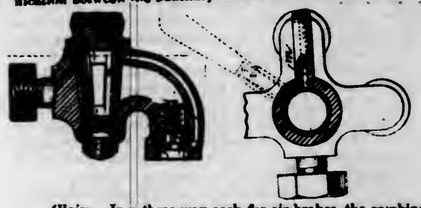
2. The combination, in a roller-skate, of the brackets F, the shafts E, the wheel-frames D, the single wheels B, and the wheel-shafts C, said several parts being arranged and operating substantially as shown and specified.

3. The combination, with a skate, of the heel-piece H, having turned-over lip A, and the strap I, said lip being clinched down upon said strap, which is thus secured, substantially as set forth.

4. The combination, with a skate, of the sole-clamps J, pivoted at *j*, and the screws K, whereby said clamps are operated, substantially as set forth.

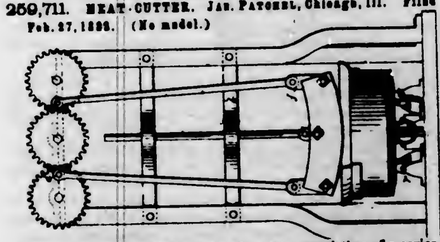
259,709. APPARATUS FOR THE EXTRACTION OF PRECIOUS METALS FROM ORES. BUTLER O. NOBLE, Brooklyn, N. Y. Filed Oct. 19, 1881. (No model.)

Brief.—The wing-wheel below the suspended hollow cylinder being set in motion causes the supernatant silver ore to pass downward through the cylinder and outward and upward through the bath of molten lead, a continuous current being formed.



Claim.—1. In combination with a pan or other vessel for containing a bath of molten lead, a stationary block provided with a central vertical opening, and means for producing a vortex within such opening, substantially as and for the purpose described.

2. In combination with a pan or other vessel for containing a bath of molten lead, a well-block having the under surface inclined from the edge of the well upward toward the periphery of the block, and a displacer secured to a shaft passing through the well, substantially as and for the purpose described.

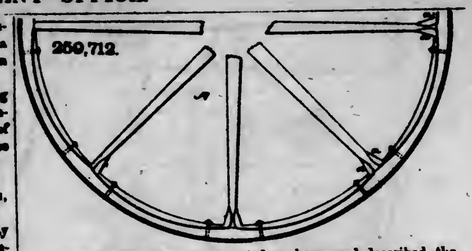


259,710. COCK FOR AIR-BRAKES. NORMAN J. PARADISE, Aurora, Ill. Filed Mar. 17, 1882. (No model.)

Brief.—To insure the quick release of the brakes a three-way cock is provided, one branch of which connects with the train-pipe, a second with the exhaust, and a third with the main reservoir, the latter branch having a spring-valve of resisting power equal to the reserve force which it is desired to retain in the main reservoir, and a supplementary passage leading around the valve from a point below it to the interior of the cock. By an additional turn of the handle the supplementary passage is opened into the train-pipe and the reserve force of compressed air thrown suddenly upon the triple valves under the several cars, cutting off communication between the auxiliary reservoir and brake-cylinders.

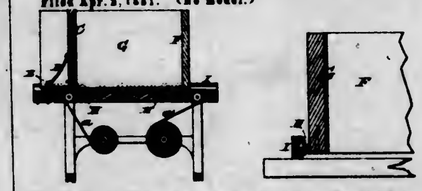
Claim.—In a three-way cock for air-brakes, the combination of a spring-valve in the interior of the reservoir branch thereof, and a supplementary air-passage leading from the interior of the reservoir branch, at a point below the spring-valve, to the interior of the body of the cock, the hollow plug being provided with a separate opening in a position to register with the supplementary air-passage without cutting off communication with the train-pipe, substantially as described.

259,711. MEAT-CUTTER. JAS. PATCHELL, Chicago, Ill. Filed Feb. 27, 1882. (No model.)



Claim.—1. The combination of a cutter consisting of a series of segmental-shaped knives arranged parallel to each other and operated by pitmen connected to lugs on either side of the same with a vertical shaft moving in suitable guides and pivoted to a central lug on said cutter, which point of connection forms the center of oscillation of the same, substantially as hereinbefore specified.

2. A meat cutting or chopping machine consisting of a drive-shaft driven through the medium of a speed-pulley, and having a gear-wheel at its forward end, which meshes with a gear-wheel of same diameter, said side gears having studs projecting from their outer faces, pitmen pivoted to and extending downward from said studs and connected to lugs extending upward from the ends of the oscillating cutter, said cutter having its oscillating center at its point of union with the vertical shaft located above and reciprocating in suitable guides, a horizontal shaft near the base of the machine, having suitable bearings placed under, extending in the same direction with, and operated by the driving-shaft through the medium of belt and pulleys, a segmental gear on the end of said horizontal shaft, a beveled gear meshing with and driven by said segmental gear, a bed-block mounted upon said bevel-gear, and a turn-table attached thereto, said block and turn-table having their pivotal center immediately under said vertical shaft, substantially as and for the purpose hereinbefore set forth.



259,712. VEHICLE-WHEEL. JEFFERSON PEARCE, North Leasing, Mich. Filed Apr. 19, 1882. (No model.)

259,712.

Claim.—The plate constructed as shown and described, the body A, extending from spoke to spoke, snugly fitting the intersection of the same and the felloe, and provided at its ends with upwardly-extended right-angular lugs, concaved on their outer faces to conform to the shape of the spokes, for the purpose specified.

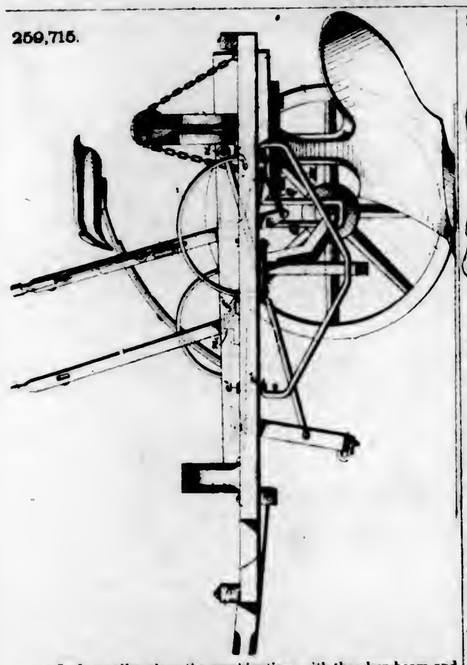
259,713. CARPET-EXHIBITOR. ADOLPHUS PETERSON, New York, N. Y., assignor of one-half to Silas C. Croft, same place. Filed Apr. 3, 1881. (No model.)

Claim.—1. In a device for exhibiting and multiplying patterns, a movable frame lined with mirrors forming three sides of a parallelogram, and arranged to travel on a table or support to and from and in combination with a single stationary mirror which forms the fourth side of the parallelogram, all working substantially as and for the purposes shown and described.

2. In a device for exhibiting patterns, the combination of an upright mirror, C, with three rigidly-connected mirrors, F G G, provided at the base with grooved wheels H H H H, arranged to run within or between rails I I, laid on the support or table A, substantially as shown and described.

259,714. HAND-RAKE. ALVAH T. PHILLIPS, Milford, Mich. Filed Jan. 14, 1882. (No model.)

Claim.—A hand-rake consisting of a rake-head and handle mortised into but not through the head, and, in combination therewith, one or more wire braces passed through the handle, thence in a straight line to and through the head, beyond which they are clinched, said wires being crimped by forcing them in against the sides of the handle adjacent to the points where they pass through the latter, substantially as described.

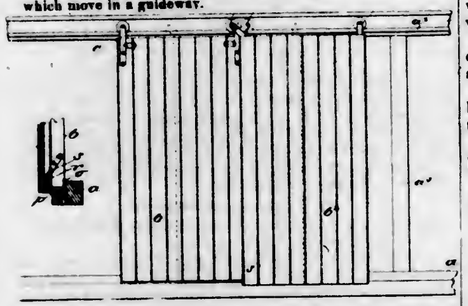


259,715. SULKY-PLOW. JAMES B. POLLOCK, Mansfield, Ohio. Filed Mar. 25, 1882. (Model.)

Brief.—From the land-wheel the axle extends oblique and horizontal across the frame where it rises to form a rocking seat for the side bar of the frame. The land side of the frame is raised and lowered from the axle by a lever that loosely rests upon the axle, and is locked to a segment on the frame. The plow-beam plays between guides above the frame, and has front and rear bell-crank levers, one of which is provided with a third arm and chain and pulley. Draft from the rear end.

Claim.—1. In a sulky-plow, the combination, with the frame, of a plow-beam supported between vertical guides projecting above the frame, the forward end of said beam being connected to one arm of a bell-crank lever, while its rear end is secured to a chain which passes over a pulley mounted in one of said vertical guides, and is connected to a lifting-lever, substantially as set forth.

2. In a sulky-plow, the combination, with the plow-beam working in guides above the frame, of a swinging draft-bail depending from the forward end of the frame, and inclined draft-rods secured at their forward ends to said bail and at their rear ends to the plow-beam, substantially as set forth.

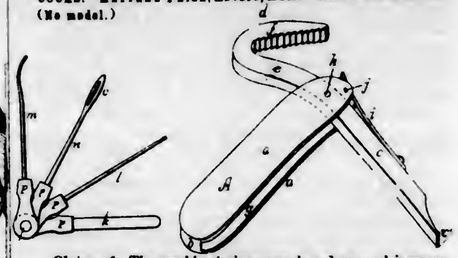


259,715.

3. In a sulky-plow, the combination, with the plow-beam and frame-guides, of a swinging draft-bail depending from the forward end of the frame, and two or more draft-rods having their forward ends secured on each side of said bail and their rear ends secured on either side of the plow-beam, substantially as set forth.

259,716. HANGING DOOR. ERWIN PRESCOTT, Arlington, Mass. Filed Apr. 3, 1882. (No model.)

Brief.—A pair of overlapping sliding doors are suspended by hangers which move on the same track. The extent of the lap and the separation of the doors are governed by stops. A finger on one door engages a cleat on the other, and one door has stays which move in a guideway.



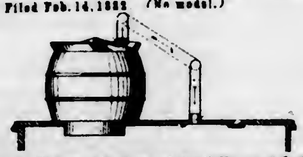
Claim.—1. The combination, with a single track, of two overlapping doors having their hangers arranged to run on the said track, to operate substantially as and for the purposes set forth.

2. The single track, a series or pair of doors, and hangers to support them from the said track and permit one door to overlap its mate, combined with a stop to regulate the extent of the lap of one door over the other, substantially as described.

3. The single track, a series or pair of doors, and hangers to support them from the said track and permit one door to overlap its mate, combined with a stop to prevent the passage of one door of the series or pair of doors from the other and the contact of their rollers or sheaves, substantially as described.

4. The door b^3, the cleat r, door b, and finger s, combined with a stay and a guide therefor, to prevent the movement of the doors outward from the line of posts, substantially as set forth.

259,717. COMBINATION INSTRUMENT FOR CLEANING GAS-COCKS. MATTHEW PRIOR, Revere, Mass. Filed Mar. 20, 1882. (No model.)



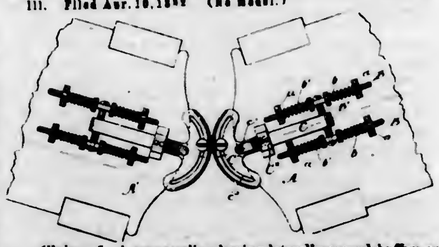
Claim.—1. The combined pipe-wrench and screw-driver consisting of the shank c, terminating at one end in the screw-driver c' and at the other in the U-shaped head, with its smooth and serrated jaws $e\,f$, in combination with the chambered handle A, the wrench being pivoted to the handle and constituting a cover to its chamber, substantially as explained.

2. The pipe-wrench composed of the shank c, with its U-shaped head d, in combination with the chambered handle A, when the said shank is pivoted to and constitutes a cover to the chamber of the handle, as explained.

3. The combined pipe-wrench and screw-driver consisting of the shank c, terminating at one end in the screw-driver c' and at the other in the U-shaped head, with its smooth and serrated jaws $e\,f$, in combination with the chambered handle A, the wrench being pivoted to the handle and constituting a cover to the chamber, and said chamber being adapted to receive supplemental pivoted tools, substantially as set forth.

4. The combination of a pivoted wrench with a chambered handle, the wrench being pivoted to the handle and constituting a cover to its chamber, substantially as set forth.

259,718. ATTACHMENT FOR COOKING-VESSELS. SILAS G. RANDALL, Greene, N. Y., assignor to Amelia A. Randall, same place. Filed Feb. 14, 1882. (No model.)



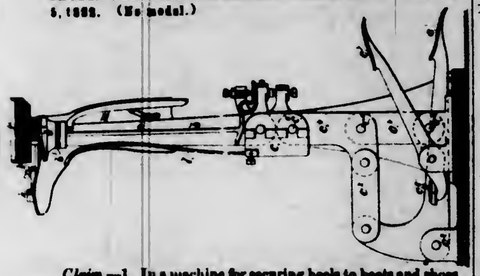
Claim.—1. The combination, substantially as set forth, of the vessel-cover, the stove-lid, and the connecting-pipe hinged to flex vertically, for the purpose set forth.

2. The combination of the vessel-cover, the stove-lid, and a connecting-pipe eccentrically connected with the lid and cover, substantially as described.

3. The combination of the vessel-cover, the stove-lid, and the hinged connecting-pipe, which fits over the nipples placed eccentrically on the cover and lid, substantially as described.

4. The stove-lid formed with a nipple for the reception of the pipe D, substantially as and for the purpose set forth.

259,719. CAR-COUPLING. CHARLES W. RASMUSEN, Chicago, Ill. Filed Apr. 10, 1882. (No model.)



Claim.—1. A car-coupling having laterally-curved buffers or draw-heads, each with a slot or open space behind the face of the same, in combination with a connecting-link, and with mechanism for attaching said link to the draw-heads, adapted to travel in each slot or open space and to permit the free lateral movement of the link from side to side of the draw-heads without displacement, substantially as described.

2. A car-coupling having a connecting-link, rollers for said link, and buffers or draw-heads having laterally-curved rails upon which said rollers travel, substantially as described.

3. A car-coupling the buffers or draw-heads of which are provided with laterally-curved faces, having slots extending across said faces to receive the connecting link or bar and permit the free lateral movement of the same from side to side of the draw-heads without displacement, substantially as described.

4. The combination, with the draw-heads or buffers C' and their shanks C, of the yoke C^2 and spring c', the axle E', rods R, springs $b\,b'$, and yokes a, substantially as described.

259,720. MACHINE FOR SECURING HEELS TO BOOTS AND SHOES. FREDERICK RICHARDSON, Providence, R. I. Filed Feb. 6, 1882. (No model.)

Claim.—1. In a machine for securing heels to boots and shoes, the combination of the fixed die g, the sliding block a, the jack b, secured thereto, and a foot-lever arrangement, substantially as set forth, by which the jack is forced upward against the die to hold the boot or shoe and the heel in place, as described.

2. The combination, with the sliding block a and the jack b, of the bell-crank levers c' and c', and the links c^2 and c^2, constructed to force the jack against the die, and the lever c^3, constructed to release the levers and allow the jack to descend, as described.

3. The combination, with the sliding block a, of the hinged jack b, provided with the arm b', the stop b^4, and adjusting-screw d^3, constructed to adjust the jack with reference to the die, as described.

4. The combination, with the sliding block a, provided with the arm d and the adjusting-screw d', of the hinged jack b, provided with the arm b', and the stop b^4, provided with the adjusting-screw d^3, constructed to adjust the jack, as described.

5. The combination, with the hinged jack b, provided with the arm b', and the stop b^4, provided with the adjusting-screw d^3, of the spring b^5, interposed between the arm of the jack and the stop, as described.

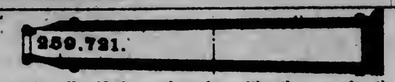
6. In a machine for securing heels to boots and shoes, the swinging trays $a^4\,a^5$, pivotally secured near the die, as and for the purpose described.

7. The combination, with the jack operated by foot-power, substantially as described, and the die g, of the adjustable guides $k\,k'$, in advance of the die, to bear against the side edges of the sole of the boot or shoe, whereby the bottom of the boot or shoe is held in proper position with reference to the die g.

8. In a heeling-machine, the combination, with the jack b, heel-last b^6, and shanks b^8, for adjusting the length of the jack, of the die g, provided with holes through which the nails may be driven and with a projection constructed to receive the heel-shell, as described.

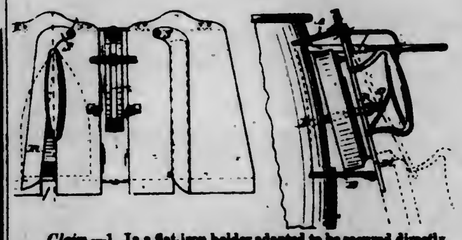
9. In a machine for securing metallic heels to boots or shoes, the combination, with the die g, provided with the holes g', having an enlarged countersunk recess at their upper end, of the driver i, provided with the enlargement g^3, forming a shoulder constructed to drive the nails and secure the heel-shell, as described.

10. The combination, substantially as before set forth, of the sliding block a, the jack pivoted thereto, and the guide l, rigidly secured to said sliding block.



11. The combination of the jack b, pivoted guide m, and the adjusting-link n, adapted to adjust said guide with relation to the jack, substantially as and for the purpose described.

12. The combination, with the die g and the hinged jack b, of the wedges $o\,o$ and screws $o'\,o'$, constructed to adjust the jack with reference to the die, as described.



259,721. PROCESS OF SECURING RUBBER TO METAL. FREDERICK RICHARDSON, Providence, R. I. Filed Dec. 28, 1881. (No model.)

Claim.—The improved process substantially as herein set forth, the same consisting in preparing the metal surface by removing all oxidation, scale, or impurities, then covering the clean surface with liquid rubber, next securing a thin sheet of soft rubber by pressure and heat, then cementing the rubber to this thin sheet and subjecting the whole to vulcanization, as described.

259,721.

259,722. FLAT-IRON HEATER. GEORGE I. ROBERTS, Fort Wayne, Ind. Filed Mar. 18, 1882. (No model.)

Claim.—1. In a flat-iron holder adapted to be secured directly in front of an open doorway in the vertical wall of a stove, a fastening device which passes through said doorway and engages with the inside of the stove, substantially as set forth.

2. A detachable flat-iron holder upon which the iron rests and is supported, and which has attached thereto devices, substantially as described, for clamping it to a vertical or downwardly-projecting wall of a stove.

3. The combination, with the detachable flat-iron holder, of the clamping devices provided with the threaded shank, and a nut adapted to engage with said shank, substantially as set forth.

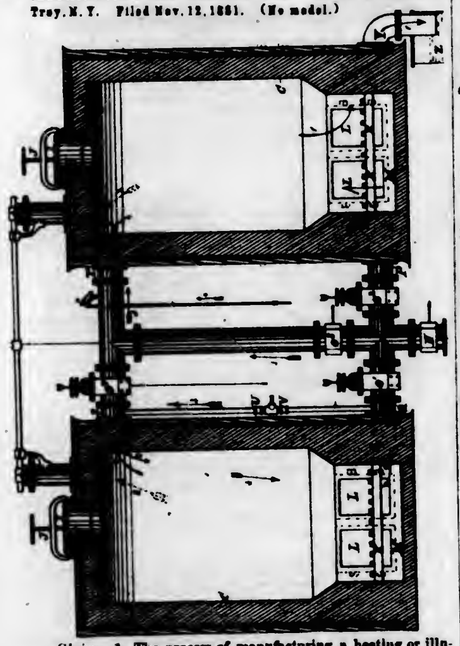
4. The combination, with the detachable flat-iron holder, of the clamping-hook arranged to swing vertically before it is fastened, and means, substantially as set forth, for clamping it against the stove.

5. The combination, with the detachable flat-iron holder, of the clamp which engages with the stove, the shank which carries the clamp, provided with a screw-thread adapted to receive a clamping-nut, and arranged, substantially as described, to prevent its being rotated.

6. The combination, with the detachable flat-iron holder having the upper and the lower plates or walls, A and B, of the supporting-piece G, the clamping device mounted in said supporting-piece, and the outwardly-projecting slotted supporting and guiding piece H, substantially as set forth.

7. A detachable flat-iron holder having at the bottom a horizontal supporting part, B, on which rests the heel of the iron, and the slotted vertically-arranged door extending below said support B, the iron-holder being open on the side opposite to the said door, substantially as set forth.

8. In a detachable flat-iron holder which closes and surrounds an open doorway in the vertical wall of a stove, a vertically-swinging slotted plate or door which closes the outside of the holder and prevents the escape of heat from said open doorway, substantially as set forth.



9. In a detachable flat-iron holder arranged to have the iron heated while resting on its heel, the combination, with a swinging door, of a stop attached thereto and arranged to bear against the bottom of the iron to prevent its moving inwardly, substantially as set forth.

10. In a flat-iron holder, the combination, with the bottom-support, B, upon which the heel of the iron rests, of the slotted door which swings toward and from the said support, and the stop attached to said slotted door to prevent the flat-iron from moving away therefrom, substantially as set forth.

11. In a flat-iron holder, the combination, with the swinging door, of a stop attached thereto which prevents the iron from moving inwardly from the door, and is adjustable relatively thereto, substantially as set forth.

12. In a flat-iron holder, the combination of a vertically-arranged outwardly-swinging door provided with a slot for the handle of the iron, and a laterally-swinging door or valve for said slot, pivoted to the outwardly-swinging door, and constructed, substantially as set forth, to be opened by the handle of the iron while the toe or body of the iron is swinging the main door outwardly, and arranged to automatically operate by gravity to close the slot after the iron has been withdrawn.

259,723. PROCESS OF AND APPARATUS FOR PRODUCING ILLUMINATING AND HEATING GAS. HENRY C. SHIELDS, Troy, N. Y. Filed Nov. 12, 1881. (No model.)

Claim.—1. The process of manufacturing a heating or illuminating gas which consists in heating independently the carbonaceous materials simultaneously in a generator and a superheater by separate blasts, and the direct internal combustion of the coal in each generator and superheater, then decomposing steam by passing it through one of the beds of the carbonaceous material, then carrying the escaping product—water-gas—forward and mingling it with hydrocarbon vapors, then passing the mixed gases through the other bed of carbonaceous material for fixing the gases, and finally conducting the same to the hydraulic main or seal, as hereinbefore set forth.

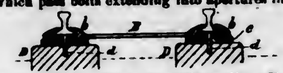
2. In combination with a gas-generator, the by-pass pipe R, pipes S and Q, and connecting steam-pipes U and V, with their connecting-valves, for the purpose of reversing the direction of steam into the generator and the escape of gas therefrom, substantially as set forth.

259,724. DECORATION OF CLAY-WARE. HENRY SIND, Hamilton, Ohio. Filed Feb. 1, 1882. (No model.)

Claim.—The improved process of making clay-ware with medallion decorations in colors, which consists in applying stains of the various colors to the decorative recesses of the mold before the mold is filled with the clay-liquid, substantially as set forth.

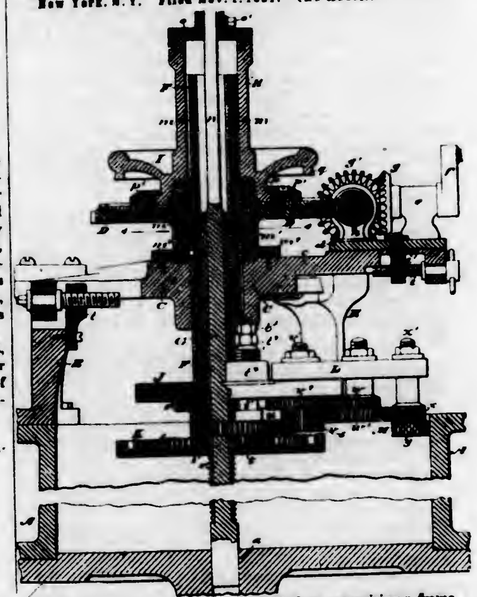
259,725. FILTER. JAMES S. SHARP, Salem, Mass. Filed Feb. 8, 1882. (No model.)

Brief.—The case *a* has projections *b* as bearings for filtering-plug *c*, which has a free way, *g*, for the water, and a filtering-way, *f*.



Claim.—The herein-described water-filter, consisting of the shell or case *a*, with internal divisions and bearing-surfaces *b b b* for the cylindrical or slightly-tapering hollow plug *c*, with its

strainers *f f*, filtering material *e*, and direct channel *g*, as and for the purpose set forth.



259,726. RAILWAY. DANIEL SMITH, Mabel, Pa. Filed Oct. 11, 1881. (No model.)

Brief.—Upon stone beds are placed wooden blocks and couplings having seats for the reception of rails, and through the center of which pass bolts extending into apertures in the stone.

Claim.—In a railway, the rail-couplings B, having seats *b* and bolts *d*, passing centrally down through said seats, in combination with blocks *c* and stones D, the said bolts extending into apertures in stones D, as herein shown and described.

259,727. TOOL FOR BORING CYLINDERS. JOSEPH H. SMITH, New York, N. Y. Filed Nov. 1, 1881. (No model.)

Claim.—1. A tool for dressing cylinders, comprising a frame to support the mechanism, a fixed axial screw, a tubular shaft mounted rotatively in the frame and bearing a nut which screws onto the said axial screw, a milling wheel or cutter mounted on an arm fixed to the tubular shaft, a toothed wheel mounted on the axial screw and arranged to slide longitudinally thereon, a pinion mounted on the cutter-bearing arm and arranged to mesh with the sliding toothed wheel on the axial screw, and a train of gears arranged between said pinion and the milling-wheel, whereby the latter is rotated, all combined and arranged substantially as set forth.

2. A tool for dressing cylinders, comprising a frame to support the mechanism, a tubular shaft, F, mounted rotatively in said frame, an axial screw-spindle, G, capable of being clamped fast to the frame and having a male screw to engage a female screw in the shaft F, a cutter, M, a pinion, *t*, and an intermediate train of gears mounted on an arm or plate on the shaft F, and a toothed wheel, K, mounted to slide on the axial spindle and to mesh with

the pinion *t*, whereby rotation of the shaft F imparts axial rotation to the milling-wheel and causes it to move in a spiral orbit, all combined and arranged substantially as set forth.

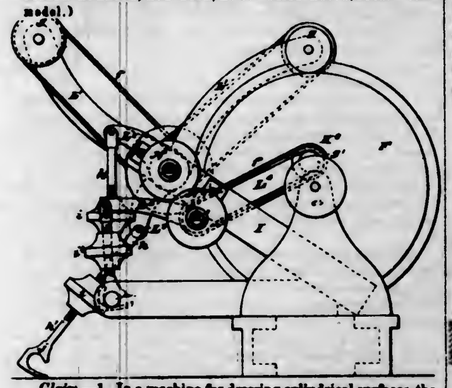
3. The combination of the axial screw-spindle, the tube H, provided with a hand-wheel, a clamp to fix said tube H to the fixed frame of the tool, a tubular shaft, F, mounted rotatively in the frame and provided with a longitudinal groove, *m*, a worm-wheel on said shaft, mounted rotatively in keepers on the frame and provided with a spline to engage the groove *m* in the shaft, a worm, A, to drive said worm-wheel, an axial spindle, G, fixed in the tube H and provided with a male screw to engage a female screw in the shaft F, a toothed wheel, K, mounted in keepers on the shaft F and provided with a spline, *s*, to engage a longitudinal groove in the axial spindle, a cutter, M, adjustable pinion *t*, and an intermediate train of gears mounted on an arm attached to the shaft F, all arranged to operate substantially as set forth.

4. The combination, with the supporting-legs of the frame and the adjusting-screws mounted rotatively therein, of the frame provided with guides arranged to slide in keepers on the supporting-legs, and provided with nuts to engage the adjusting-screws on said legs, whereby the axis of the frame may be properly adjusted to the axis of the cylinder, substantially as set forth.

5. The frame for supporting the operative mechanism of the tool, having three or more arms mounted adjustably in keepers on the supporting-legs, the said legs, the worm-wheel D, tubular shaft F, tube H, provided with a suitable clamping-flange, axial screw-spindle G, the worm A, toothed wheel K, plate J, pinion *t*, milling-wheel M, and the intermediate train of gears to drive said wheel, all combined and arranged to operate substantially as set forth.

6. The milling-wheel mounted rotatively on a plate or arm mounted on and arranged to turn on the same axis with the driving gear-wheel *v'*, the said wheel mounted on an arm or plate fixed to the shaft F, the wheel K, and the intermediate train of gears, all combined and arranged to operate substantially as set forth.

7. The combination, with the plate J, of the plate L, mounted thereon and provided with a curved rack, L', and the pinion *z*, all arranged to operate substantially as set forth.



8. The combination of the pinion *t*, arbor *t'*, screw-threaded sleeve *t''*, mounted rotatively between shoulders formed on or fixed to said arbor, and the socket *t'*, all constructed and arranged to operate substantially as set forth.

9. The combination, to form a clamping device, consisting of the jaw *r'*, the sliding jaw, and the pin provided with an eccentric which has a bearing in the sliding jaw, all arranged to operate substantially as set forth.

10. The combination of sliding bed upon which the driving-worm is mounted, the said worm, the worm-wheel, means for adjusting the sliding bed to and from the worm-wheel, the jaw *r'*, fixed on said sliding bed, and the clamping-flange on the hand-wheel, the said jaw being arranged to stand out of contact with the clamping-flange when the worm is engaged with the worm-wheel, substantially as set forth.

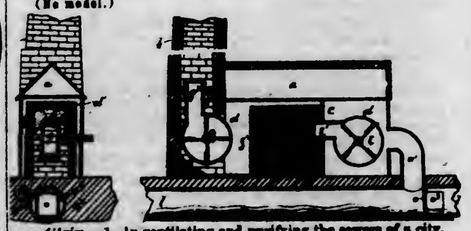
11. The combination, with the clamping-flange *g*, of the sliding bed *d*, the clamping-jaw *r'*, mounted thereon, the sliding jaw *r''*, and mechanism for actuating the sliding jaw and the sliding bed, all arranged to operate substantially as set forth.

259,728. TOOL FOR DRESSING CAR WHEELS AND AXLES. JOSEPH H. SMITH, New York, N. Y. Filed Nov. 1, 1881. (No model.)

Claim.—1. In a machine for dressing cylindrical surfaces, the combination of the following elements, namely: a shaft mounted rotatively and a pulley fixed thereon, a sleeve mounted rotatively on said shaft and provided with a cutter-bearing arm and a cutter-moving arm, a cutter or dressing-wheel mounted rotatively on the cutter-bearing arm, and a pulley fixed on the cutter-arbor, a belt arranged to couple the driving-pulley with that on the cutter-arbor, mechanism for moving the cutter to and from the surface to be dressed, and mechanism for moving the cutter across the face of the work to be dressed, all constructed and arranged substantially as set forth.

2. A machine adapted for simultaneously dressing the two journals of a car-axle and the treads of the two wheels thereon, comprising bearings in which the axle is rotatively mounted, two diamond dressing-wheels for the wheel-treads, mounted on radial arms and driven from a shaft upon which said arms are mounted, two dressing-wheels for the axle-journals, mounted on radial arms and driven from a shaft upon which said arms are mounted, the shaft which bears and drives the axle-dressing mechanism being driven from the shaft which bears and drives the wheel-tread dressing mechanism, and mechanism for feeding the cutters up to and across the face of the work, all constructed, combined, and arranged to operate substantially as set forth.

3. A machine for dressing cylindrical surfaces, comprising two centers in which to rotatively mount the object to be dressed, a shaft, H, rotatively mounted, a sheave, K, fixed on the shaft H, a sleeve, L, mounted loosely on the said shaft and provided with means for adjusting it longitudinally, an arm, L', on the sleeve bearing the cutter-shaft, a cutter and sheave, K', on the shaft, arranged to be driven from the shaft H, an arm, L^3, on the sleeve L, and a rod adjustable as to length, arranged to couple the arm L^3 with a fixed part of the machine, all combined and arranged to operate substantially as set forth.



4. In a machine for dressing car-axle journals and the treads of the wheels fixed thereon, the combination, with the bed-plate and centers for rotatively mounting the axle, of a split pulley adapted to be fixed and adjusted on the axle, the driving-shaft H, driving-pulley J, gear-wheel O, sheaves G and K', belts *e f*, shaft H', gear-wheel O', sleeve L^2, arm L^4, bearing the cutter, the milling-wheel *g'*, sheaves K^2 K^3, belt *f''*, adjusting-nut N', arm L^5, and a rod adjustable as to length, arranged to couple the end of the arm L^5 with some fixed part of the machine, all arranged to operate substantially as set forth.

5. The combination, with a shaft, H, and a sheave, K, fixed thereon, of the sleeve L, nut N, dog *l*, bearing-arm I, arm L', cutter *g*, sheave K', arm L^2, nut *i*, section A, and section A', provided with a hook to engage a fixed part of the machine, all arranged substantially as and for the purposes set forth.

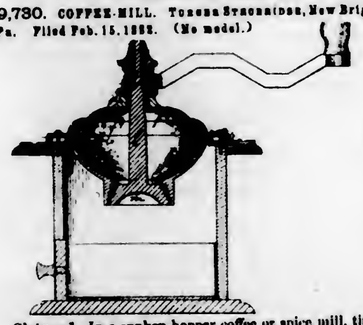
6. The combination, in a machine for dressing cylindrical surfaces, of a rotatively-mounted shaft, H, on which is fixed a sheave, K, the said sheave, a sleeve, L, bearing a radial arm, L', said arm having a bearing in its free end for the cutting-wheel, the said cutting-wheel, the sheave K', the belt *f*, the nut N, and the dog *l*, mounted on the sleeve-bearing and arranged to engage a groove in the nut, all arranged to operate substantially as and for the purposes set forth.

7. The combination, with the bed-plate and a bearing for the live center D, made movable along said bed-plate, the arm I, fixed on said bearing, the sleeve L, screw-threaded at its end and rotatively mounted in said arm, the nut N and dog *l*, the shaft H, extending through the sleeve L, and the cutting mechanism mounted on an arm projecting from said sleeve and arranged to be driven from the shaft H, all arranged substantially as shown, whereby the movement of the bearing of the center D imparts equal movement to the cutting mechanism, for the purposes set forth.

259,729. APPARATUS FOR VENTILATING AND PURIFYING SEWERS. JAMES STRATFORD, Buffalo, N. Y., assignor of one-half to Elias S. Hawley, same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. In ventilating and purifying the sewers of a city, an apparatus consisting substantially of a disinfecting-chamber having double reticulated walls filled in with disinfecting mate-

rial, combined and operating in connection with a suction fan or fans, such disinfecting-chamber being connected both with the sewers and the open air, whereby the sewer-gases may be passed through the walls of such disinfecting-chamber by the action of the fan or fans, and thereby purified before being discharged into the open air, substantially as shown and described.



2. An apparatus for ventilating and purifying sewers, consisting of a disinfecting-chamber having double reticulated walls filled in with disinfecting material, as shown, and a suction fan or fans for drawing the obnoxious gases from the sewer and passing them through the walls of the disinfecting-chamber in order to remove their impurities, the whole being inclosed in a suitable building having connection with the sewer, and provided with a flue through which the purified gases are discharged into the open air, substantially as shown and described.

3. In an apparatus for ventilating and purifying sewers, the combination of the suction-fans *e* and *g* with the disinfecting-chamber *f*, all located and operating within the building *a*, provided with connection *a'* and flue *b* at its ends, substantially as shown and described.

4. In an apparatus for ventilating and purifying sewers, the combination, with the suction-fan *e* and disinfecting-chamber *f*, operating, as shown, within the building *a*, of the automatic valve *o*, located within the sewer, near its connection with the building *a*, to prevent the ingress of air from the mouth of the sewer, substantially as shown and described.

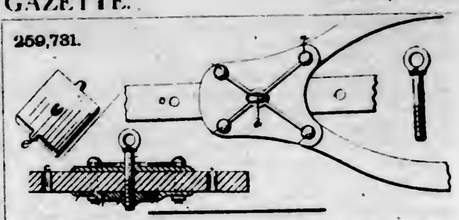
5. In an apparatus for ventilating and purifying sewers, the automatic valve consisting of the swinging gate *o* and wings o^2 o^3, operating as shown and described, and for the purpose stated.

259,730. COFFEE-MILL. THOMAS STACKHOUSE, New Brighton, Pa. Filed Feb. 15, 1882. (No model.)

Claim.—1. In a sunken-hopper coffee or spice mill, the combination, with the hopper and box, of a detachable box-top and detachable flanged hopper-cover having a series of registering holes, whereby the parts may be detachably united by a single set of fastening devices, together with a single set of fastening devices adapted to secure the several parts, substantially as and for the purpose specified.

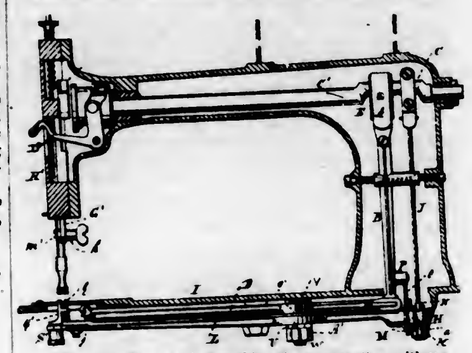
2. In a sunken-hopper coffee or spice mill, the combination, with the box, of a detachable box-top, a detachable flanged hopper-cover, and a detachable hopper, the several parts having registering screw-holes, whereby the several parts may be secured to the box at one time and by the same fastening devices, together with a set of fastening devices for securing the several parts, substantially as and for the purpose specified.

3. In a sunken-hopper coffee or spice mill, the combination, with the box, of a detachable box-cover and a detachable hopper, said devices having registering screw-holes, whereby the parts may be secured by a single set of fastening devices, and a set of fastening devices adapted to secure the several parts, substantially as and for the purpose specified.



4. In a coffee or similar mill, the combination, with the grinding-nut shaft and crank, of a clutch-collar adapted to clutch both the crank and shaft, substantially as and for the purpose specified.

5. In a coffee or similar mill, the combination of the grinding-nut shaft, of irregular cross-section at its end, with a clutch-collar whose aperture corresponds to a cross-section of the shaft, a bridge or cover having an opening adapted to receive the clutch-collar, a crank-arm adapted to engage in a notch of the clutch-collar, and an adjusting-nut, substantially as and for the purpose specified.



259,731. WAGON-REACH COUPLING. THOMAS C. THOMPSON, Baldwin, Wis. Filed Apr. 5, 1880. (No model.)

Claim.—In wagon-couplings, the combination of reach, screw-bolt, flat nut with dogs, and under plate with sockets, substantially as and for the purposes described.

259,731.

259,732. SEWING-MACHINE. JAMES TRIPP and JOHN H. OSBORN, Cleveland, Ohio, assignors of one-third to Samuel E. Henderson, Kansas City, Mo. Filed Apr. 13, 1882. (Model.)

Claim.—1. In a sewing-machine, the combination, with the driving-shaft C' and the crank C, of the bifurcated lever B, the self-adjusting blocks E and F, provided with longitudinal semicircular ribs adapted to fit and move freely in corresponding grooves in the bifurcations of said lever B, substantially as shown and described.

2. In a sewing-machine, the combination, with the cam H, having irregular and cylindrical portions, as described, of the feed-lever L, the block K, and mechanism for reciprocating the said block K, substantially as and for the purpose set forth.

3. In a sewing-machine, the combination, with the feed-cam H, having irregular and cylindrical parts, as described, of the feed-lever L, block K, rod J, crank C, and shaft C', substantially as and for the purpose set forth.

4. In combination with the feed-cam and feed-lever provided with a grooved roller, an adjustable feeding-block having an anti-friction facing, and the back of the said block being adapted to move in the groove of the said roller, substantially as set forth, and for the purpose specified.

5. In a sewing-machine with the feed-cam H and pinion *f'*, the combination of the rack M', pinion *g*, and thumb-piece or button N', substantially as and for the purpose set forth.

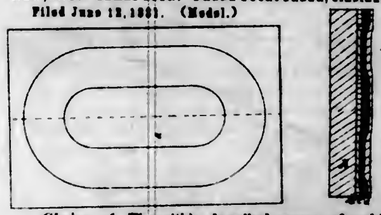
6. In combination with the feed-lever of a sewing-machine and bifurcated lever B and roller, the cam O, substantially as described, and for the purpose specified.

7. The bifurcated shuttle-lever D, secured to its rock-shaft, and adjustable thereon by means of a set-screw for regulating the height of the shuttle, in combination with the lever B and shaft C', substantially as and for the purpose set forth.

8. In a sewing-machine, the combination, with the shuttle-lever D, provided with a slit cylindrical socket, of the cross-head D', having a cylindrical shank and means for securing said shank in said socket, whereby the shank may be adjusted longitudinally and torsionally, substantially as set forth.

9. In combination with the cross-head D', the shuttle-cradle connected thereto by set-screws *f*, inserted in slotted openings *k*, for adjusting said cradle and shuttle therein, for the purpose specified.

10. The combination, with the face-plate H' and the needle-bar G', of the adjustable guide 1, having a gib or plate, L', formed integral therewith, and the stationary guide 2, said guides and needle-bar being arranged within the interior of the face-plate, substantially as and for the purpose set forth.

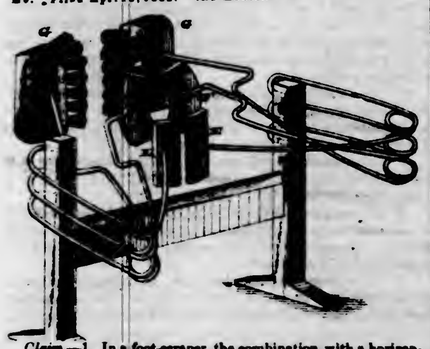


11. In a sewing-machine, the thumb-piece or button N', having on the surface or face thereof a numerical scale, *a'*, index or pointer *p*, and pinion *g*, in combination with the rack M', pinion *f'*, and feed-cam H, in the manner substantially as and for the purpose set forth.

12. In a sewing-machine, a combined needle-clamp and thread-guide, consisting of a bolt having a slit in the side of the head thereof parallel with the plane or top of said head, and a notch in the outer side of the slit, through which projects a pin fixed in the inner side of the slit, and secured to the needle-bar by a thumb-nut, substantially as herein shown and described.

13. In a sewing-machine, the combination of the center-pointed shaft U, carrying the adjustable shuttle-lever D, step V, adjusting-screw, step W, and clamp A', substantially as and for the purpose set forth.

14. The combination, with the feed-lever L, of the feed provided with a cylindrical shank or spindle, the sleeve S', having an arm, T', the collar or cap U', and pin O, substantially as and for the purpose set forth.



259,733. GLASS SIGN. FRANK TUCHFARBER, Cincinnati, Ohio. Filed June 13, 1881. (Model.)

Claim.—1. The within-described process of making glass signs and show-cards, consisting in first placing upon suitable transfer material all of the design, except the portions which are to appear of a polished gold or silver surface; secondly, transferring said design to glass; thirdly, covering the blank spaces intended for the reception of gold or silver leaf with a hard, glossy, transparent varnish; and, finally, applying the gold or silver leaf with water-size, substantially as and for the purposes specified.

2. As a new article of manufacture, a glass sign or show-card consisting of a foundation of glass carrying a transfer design provided with open spaces to allow a final backing of gold or silver leaf to be seen through the glass, and a layer of hard, glossy, transparent varnish interposed between the said leaf and the glass, substantially as described.

259,734. FOOT-SCRAPER. GEORGE P. TURNER, Meadville, Mo. Filed Apr. 19, 1882. (No model.)

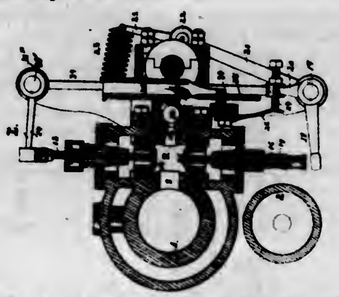
Claim.—1. In a foot-scraper, the combination, with a horizontal scraping-blade, of a series of vertical scraping-blades and brushes mounted upon springs, substantially as set forth.

2. In a foot-scraper, the combination of a pair of uprights, a horizontal scraping-blade connecting said uprights, a series of curved springs secured to the upper ends of said uprights, and the vertical scrapers and brushes secured to the inner adjoining ends of said springs, as set forth.

3. In a foot-scraper, the combination, with the horizontal scraping-blade, of the vertical scrapers E F, having straight and concave edges, respectively, and the brushes G, all arranged, mounted upon springs, in nearly the same horizontal plane above said horizontal scraper, substantially as set forth.

259,735. FEEDING MECHANISM FOR PAPER-CUTTING MACHINES. JOSEPH WELKER, Jr., Pawtucket, R. I., assignor of one-half to Henry B. Cole, same place. Filed Apr. 1, 1882. (No model.)

259,735.



Claim.—1. In a machine for feeding and cutting paper, &c., the friction-wheels B, C, and D, (the latter having a circular slot, *d'*,) arranged to produce an intermittent feed, substantially as shown and described.

2. In a machine for feeding and cutting paper, &c., the combination of the friction-wheels B D C, dog E, brake-lever G, and spring S, all substantially as shown and described.

3. In a machine for feeding and cutting paper, &c., the combination of the friction-wheel C with the slotted friction-wheel D and bolt *d'*, said wheels having suitable friction-surface extending partially around their circumference, substantially as shown and described.

259,736. GAS-ENGINE. HERMANN WIEDLING, Baltimore, Md. Filed Aug. 1, 1881. (No model.)

Claim.—1. In a gas-engine, a cylinder and piston, a reservoir for compressed inflammable gas, and suitable inlet and exhaust valves and actuating mechanism, whereby the exhaust-port is closed previous to the completion of the stroke of the piston, and a portion of the burned gases from the previous stroke is compressed in the end of the cylinder, and a charge of combustible gas is introduced into the cylinder and exploded pending the return-stroke of the piston, substantially as set forth.

2. In a gas-engine, a cylinder and piston and a pair of valve-chambers having valves and actuating mechanism, substantially as described, whereby a charge of gas or vapor led from a suitable supply is intimately mingled with air and follows the piston in its stroke, and on the return-stroke is compressed in a suitable reservoir, a portion of the burned gases from a previous stroke being compressed in the cylinder, and on the return-stroke a charge of combustible gas is introduced into the cylinder with the said exploded gas and fired, substantially as set forth.

3. In combination with the disk-valve 6, seating upon the gas-inlet pipe, the annular valve 52, seating upon the air-inlet around the gas-valve and carried by the latter, as and for the purpose set forth.

4. In combination with the cone-faced disk-valve 6, the annular valve 52, carried thereby and located in the plane of the same, as set forth.

5. In combination with the inlet gas-chamber having gas and air valves and a reservoir into which the mixed gases are forced, a spring-seated valve in the passage connecting the said reservoir with the cylinder and subserving the end of a safety-valve to limit the pressure, as set forth.

6. In combination with the valve 6, having ports 77, the cylinder 70, having openings 51', whereby the flow of gas may be regulated independent of the air-supply, as set forth.

7. In combination with the gas-valve 6 and ring 52, connected therewith, the ports 54 48 51 and the tube 49, having orifices 51', as set forth.

8. In combination with the cylinder and piston and valve-chamber 9, the inlet and exhaust valves 10 11, cams 44 and 45, and intermediate mechanism for operating the valves, as set forth.

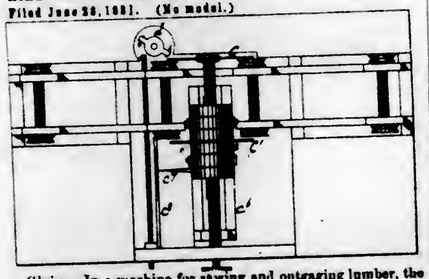
9. In combination with the cylinder and piston, the valve-chamber 9, having valves 10 11 and suitable actuating mechanism, the port 12, tubular valve 28, channel 29, and firing-jet 27, as set forth.

10. In combination with the cylinder and piston, the valves 9 and 10, curves 44 and 45, and shaft 33, combined and operating substantially as described, whereby the exhaust is cut off before the piston reaches the end of its stroke and the incoming compressed inflammable gas is mixed with a portion of the burned gas from the previous stroke.

11. In combination with the valve-chamber 9, having inlet and exhaust valves, the tubular valve 28, piece 26, spring 25, and mechanism for intermittently compressing and releasing the spring, as and for the purpose set forth.

12. In combination with the valve 28 and actuating-cam 46, the spring 71, eccentrically attached to the cam and connected with the valve-lever, as and for the purpose set forth.

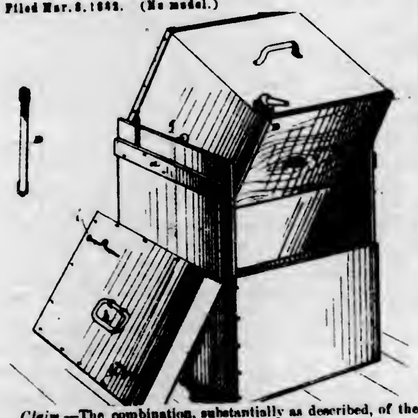
13. In combination with the valve-chamber 9 and valves 11 10 28, the cams 44, 45, and 46, mounted upon the shaft 33 and actuating the valves, substantially as described.



14. In combination with the inlet-valve and its actuating cam and roller 62, the circular plate 64, actuated by the governor, as set forth.

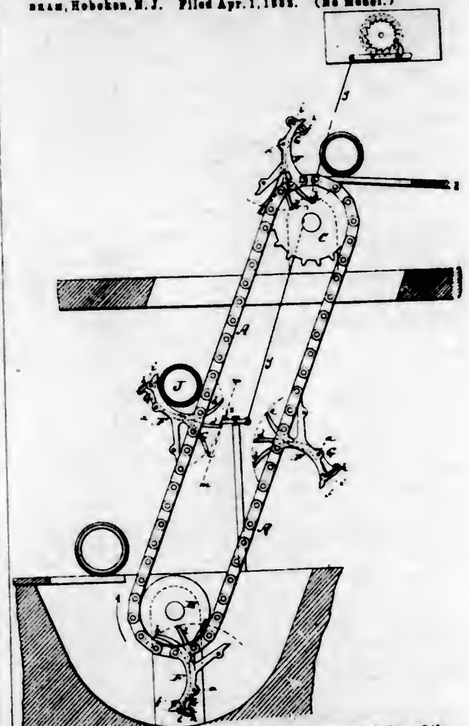
15. In combination with the valves 9 and 10, the levers 61 21, connected by a spring, 23, and having rollers 62 22, and the cams 44 45, as set forth.

16. In combination with the valves 9 and 10 and actuating-levers 61 21, the plate 70, having arms 74 75 and handle 73, as set forth.



17. In combination with the cam 44, the disk 64, sliding upon the shaft 33 and actuated by a suitable governor, as set forth.

259,737. MACHINE FOR SAWING AND OUTGAGING MATERIAL FOR BARGES. GEORGE W. WILKINS, Brattonville, Pa. Filed June 26, 1881. (No model.)



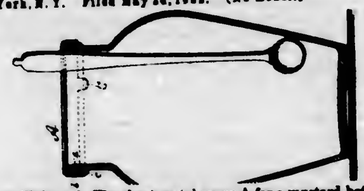
Claim.—In a machine for sawing and outgaging lumber, the combination of the fixed edging-saw C, for truing the edge of the plank, the rotating cutter *d*, arranged in line therewith and in rear thereof, for scarfing or outgaging the edge of the plank as it comes from the edging-saw, an adjustable edging-saw, C', for determining the width of the plank, together with suitable mechanism for actuating the saws and cutter, substantially as specified.

259,738. SWINGING CAN. F. CORTES WILSON, Chicago, Ill. Filed Mar. 8, 1881. (No model.)

Claim.—The combination, substantially as described, of the can provided on two opposite sides with protecting-pieces D, permanently secured thereto, with a case having two incomplete sides, the said protecting-pieces being of such size as to protect those parts of the can not covered by the incomplete sides of the case.

259,739. APPARATUS FOR REGISTERING THE SIZE AND NUMBER OF BARRELS AND PACKAGES. GEORGE W. WURSAM, Hoboken, N. J. Filed Apr. 1, 1881. (No model.)

Claim.—1. The barrel-recording mechanism consisting of the traveling hooks F and of the movable part or lever G, combined with them, all arranged so that said part or lever G will be brought into a different position by different-sized barrels placed on the hooks, and thereby into line with different recording mechanism, substantially as specified.

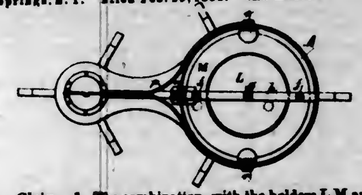


2. The endless chains A, combined with the hooks F and levers G, each lever G having two or more prongs, *b d*, and with two or more levers or triggers, *b' d'*, that are affected by said prongs in their order, substantially as specified.

3. In combination with the chain A, the hooks F, bolt *a*, lever G, having two or more prongs, *b d*, and upward projection *f*, substantially as described.

4. The lever G, made with projection *f* and slot *h*, and with two or more prongs, *b d*, for use in combination with the hooks F on endless carrier, and with two or more triggers or levers *b' d'*, substantially as described.

5. An endless carrier for barrels or packages, said carrier being provided with a movable plate or lever in such manner that said plate or lever will be brought into different positions by the different sizes of packages supported on the carrier, to indicate by its position the size of the package, substantially as specified.



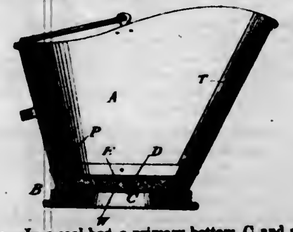
259,740. COVER FOR MUSTARD-BOTTLES. MAX ARB, New York, N. Y. Filed May 24, 1881. (No model.)

Claim.—1. The sheet-metal cover A for a mustard-bottle, having flange *b* and lugs *c* in one piece therewith, to engage beneath the neck of a mustard-bottle, substantially as specified.

2. The flanged sheet-metal cover A, having lugs *c* and a slot extending partly through its top plate and entirely through its flange, substantially as and for the purpose specified.

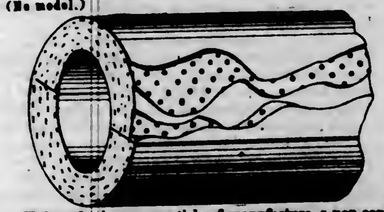
259,741. AIR-COMPRESSOR. JAMES H. HAMER, Saratoga Springs, N. Y. Filed Feb. 28, 1882. (No model.)

Claim.—1. The combination, with the holders L M and vessel A, of the air-tubes *b c d*, valves *c c'*, lever *p*, actuating-diaphragm, and inlet water-valve, substantially as set forth.



2. The combination, with the holders L M and vessel A, of the air-tubes and valves, the lever *p*, and the diaphragm *l*, the water-valve 9 and valve *a*, and diaphragm *s*, substantially as set forth.

259,742. SHOW-CASE FOR WATCH-CHAINS. HERBERT A. BLISS, Jersey City, N. J. Filed Jan. 28, 1882. (No model.)



Claim.—A show-case for watch-chains, consisting of an upright casing having glass panels, and of an interior cylinder, B, covered with velvet, turning in bearings of the top and bottom of the casing, and being provided with one or more circumferential bands, C, having suspension devices for the watch-chains, substantially as set forth.

259,743. COAL-HOD. WILLIAM H. BOYD, Mount Lebanon, Pa. Filed Nov. 15, 1881. (No model.)

Claim.—In a coal-hod, a primary bottom, C, and a filling, D, composed of paper and sheet-metal scraps embedded therein, in combination with an interior lining, L, consisting of the secondary bottom, E, the front T, the beveled edge P, and the wire-cloth W, as set forth.

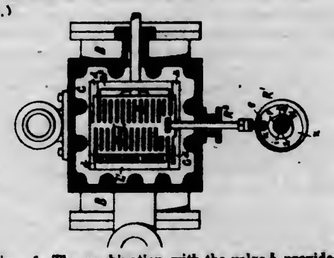
259,744. NON-CONDUCTING COVERING FOR STEAM-PIPES, &c. HENRY G. BRADLEY, Milwaukee, Wis. Filed Nov. 7, 1881. (No model.)

Claim.—1. As a new article of manufacture, a non-conducting covering for steam-pipes, boilers, and other surfaces, said covering being composed of two or more layers or wrappings of perforated material, the whole being cemented or pasted together, so as to form a series of confined air-spaces distributed throughout the entire material composing the covering.

2. A non-conducting covering for steam-pipes, boilers, and other surfaces, said covering being composed of two or more alternate layers or wrappings of perforated and non-perforated material, the whole being cemented or pasted together so as to form a series of confined air-spaces distributed throughout and within the material composing the covering.

259,745. SHOE-FASTENING. RICHARD P. BRYANT, San Francisco, Cal. Filed Mar. 4, 1882. (Model.)

Claim.—1. A shoe-fastening consisting of the raised plate *b*, having a V-shaped opening, *c*, cut in one side, and the dovetailed stud *e*, adapted to be inserted in the opening *c* and under the plate *b*, said parts *b* and *e* provided with suitable attaching means, substantially as set forth.

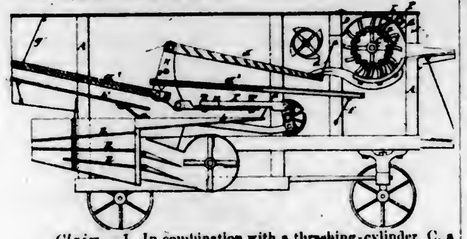


2. A shoe lacing or fastening consisting of the plate *b*, with its V-shaped slot secured on the under side of the overlapping edge, and the plate *d*, with its dovetail V-shaped stud *e* secured on the outside of the underlapping edge, in combination with the elastic strip F, interposed between the edge strip and the shoe-upper and its covering leather strip A, all combined and arranged substantially as described.

259,746. TOE-WEIGHT FOR HORSESHOES. CHAS. H. BURNHAM, Jr., West Hartford, assignor to himself and William W. Tucker, Hartford, Conn. Filed Apr. 14, 1882. (No model.)

Claim.—In combination with a toe-weight, as a means for attaching it to a horseshoe, the inclined fixed pin D, the inclined movable pin E, provided with the shoulder E' and screw-thread F, and the vertical pin G, operated by the pin E, substantially as described.

259,747. CUT-OFF VALVE AND GEAR. GEORGE F. BURTON and NOAH SHAW, Eau Claire, Wis. Filed Sept. 27, 1881. (No model.)

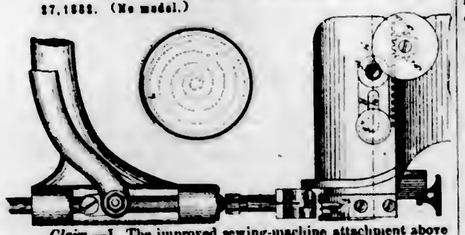


Claim.—1. The combination, with the valve *b*, provided with slats *c c*, which are in line with one another, of the auxiliary valve L, provided with slats *g g*, which are out of line with one another, and alternately correspond with the slats *c c* and with guides L' L', which hold it from moving lengthwise of the cylinder and with the main valve, while it is caused to move transversely upon said main valve, substantially as and for the purpose described.

2. The combination, with the valve *b*, provided with slats *c c*, which are in line with one another, of the auxiliary valve L, provided with slats *g g*, which are out of line with one another, and alternately correspond with the slats *c c* and with guides L' L', mechanism by which the valve L is operated, and the governor, substantially as and for the purpose described.

3. The combination of the valve *b*, having slats *c c*, the valve L, having slats *g g*, and guides L' L', steam-chest, stem R', slotted disk R', pin or roller *r*, cam-drum R', shaft N, sleeve I', gears *c' c' c' c'*, and shaft K, substantially as and for the purpose described.

259,748. THRASHING-MACHINE. RILEY H. COON, Oneida Lake, N. Y. Filed Feb. 3, 1882. (No model.)



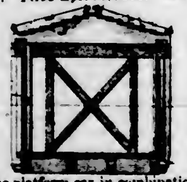
Claim.—1. In combination with a thrashing-cylinder, C, a longitudinal vibratory primary separating-rack, *a*, arranged to receive the delivery of the cylinder C, a secondary fine separating-rack, *a'*, arranged underneath the primary separator, to receive the grain, chaff, and fine straw, a tertiary separating-rack, *a²*, arranged under the rear or delivery end of both the primary and secondary separating-racks, to receive therefrom the straw and chaff, and grain-tables *b* and *b'*, arranged respectively under the secondary and tertiary separating-racks, and the sieves or riddles R R, all arranged and operating substantially as described, for the purpose specified.

2. In combination with the crank-shaft *c*, the racks *a a' a²*, rock-arm N, and the pitman P, formed with the adjusting-splice *n*, substantially as and for the purpose set forth.

3. The thrashing-cylinder C, formed with strips *s*, having teeth *t*, the slats *u*, removably inserted between the strips *s*, and set-screws *v*, as shown and described.

4. In combination with the cylinder C and its case D, the sliding gate G, the rack *r*, and the pinion *p*, arranged to operate as set forth and shown.

259,749. ATTACHMENT FOR USE IN SEWING WIRE INTO HATS. JOHN M. CURRY, South Framingham, Mass. Filed Apr 27, 1882. (No model.)



Claim.—1. The improved sewing-machine attachment above described, consisting of a base-plate provided with two parallel grooves, substantially as shown, and for the purposes set forth.

2. In a sewing-machine for wiring hat-brims, the combination of a double-grooved base-plate with an adjustable edge-guide, adapted when adjusted to be moved a limited distance, substantially as and for the purposes set forth.

3. For hat-wiring sewing-machines, an adjustable edge-guide having a double-slotted side plate, arranged, as described, so that the edge-guide, when adjusted by means of the longer slot, may be moved a distance limited by the shorter slot, substantially as and for the purposes set forth.

259,750. FREIGHT-CAR. JEAZMIR DAIGNEAU, St. Hyacinthe, Quebec, Canada. Filed Apr. 20, 1882. (No model.)

Claim.—1. The platform-car, in combination with the removable frame, the detachable side and roof boards, and means, substantially such as described, for securing said boards temporarily in place.

2. In a railway-car, the combination of the standards, the rabbeted corner-posts, and the clamping-bars to secure the side boards in place.

3. In combination with the rafters and the loose roof-boards, the presser-bars, substantially as described and shown, for holding the boards in place.

4. In combination with the roof-boards and the presser-bars, the rafters provided with points or studs to hold the boards, as set forth.

5. In a railway-car, the combination of a skeleton frame, loose side boards seated against the inside of the frame, and presser devices, substantially such as shown, acting against the inner sides of the boards to hold them temporarily in place.

6. The convertible railway-car consisting of a platform-car provided with a removable skeleton frame-work, sectional side walls and sectional roofing applied to said frame-work, and means, substantially as described, whereby the roof and the wall portions are secured in place independently of each other.

259,751. PICTURE-FRAME. JAMES H. DOWNES and LOUIS TURK, Brooklyn, N. Y., assignors of one-third to Edward McLaughlin, same place. Filed Apr. 1st, 1882. (No model.)

Claim.—As a new article of manufacture, a picture-frame adapted to be hung flatly against a wall, and provided with an overhanging bracket-shelf, substantially as described.

259,752. EXERCISING-CLUB. GEO. P. FISHER, Jr., Chicago, Ill. Filed Apr. 26, 1882. (No model.)

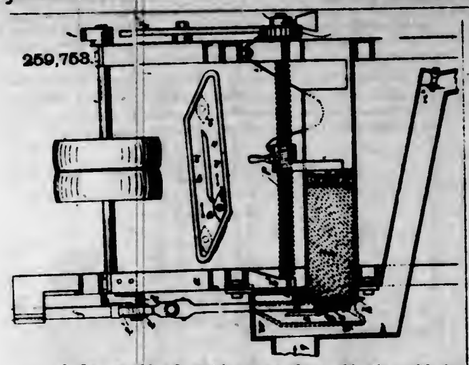
Claim.—1. As a new article of manufacture, a combined Indian club and dumb-bell, substantially as described.

2. An exercising-club having a handle or portion whereby the same may be grasped centrally for use as a dumb-bell and a handle or portion whereby the same may be grasped when swung as a club, substantially as described.

3. The combination, with an exercising-club or dumb-bell, of a weight or weights provided with a slot or its equivalent, to permit the same to be slipped over the club or dumb-bell from the side, substantially as described.

4. The combination, with an exercising-club or dumb-bell, of a removable weight or weights provided with a slot or its equivalent, to permit the same to be slipped over the club or dumb-bell from the side, and having a catch to retain said weights in place, substantially as described.

5. An exercising-club having a movable portion adapted to slide upon the handle of the club, said movable portion being provided with a latch affixed thereto to hold it in position, substantially as described.



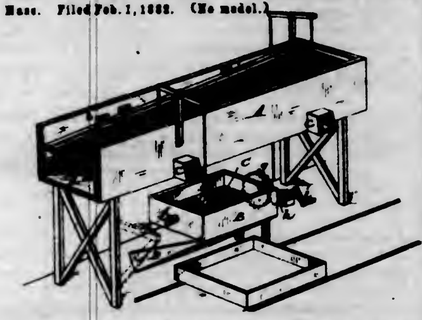
6. An exercising-club having a lower fixed portion, an upper movable portion, and intermediate removable weights, substantially as described.

259,753. MACHINE FOR GRANULATING SUGAR. EDWARD FOX, New York, N. Y., assignor to himself and Andrew Albright, Newark, N. J. Filed Apr. 10, 1882. (No model.)

Claim.—1. The combination, with the knife and knife-head, of the slide-rod *f*, yoke *e'*, actuating-shaft and crank-pin in the slot of the yoke, and mechanism moving the knife away from the sugar on the return-stroke, substantially as set forth.

2. In a machine for cutting sugar, the combination of a feeding trunk and screw, a knife and means for reciprocating the same, the knife-head, guide-slides with the grooves 4 and 5, and switch-gibs, substantially as set forth.

259,753.



3. In a machine for cutting sugar, the combination, with the feeding trunk and screw of a knife, a crank for reciprocating the same, a knife-head, guide-slides, the ratchet-wheel, pawl, and actuating mechanism, substantially as set forth.

4. In a machine for cutting sugar, the combination of a knife, a knife-head carrying the said knife at an inclination to the surface of the sugar, and a stationary brush or scraper to clean the back of the knife and knife-head next to the sugar, substantially as set forth.

5. The combination, with the knife and the means for holding the sugar while being cut, of a chute, through which the sugar is conveyed by a current of air, and a revolving separator receiving its motion from said current of air, substantially as specified.

259,754. FILTERING APPARATUS FOR WATER AND SEWAGE. RUSTUS H. FULLER and JOHN D. SEARRAVE, Worcester, Mass. Filed Feb. 1, 1882. (No model.)

Claim.—1. In a filtering apparatus, a supply-flume provided with one or more outlets and with a filtering-top or overflow, substantially as shown.

2. The flume A, provided with outlets *c* and inclined filtering-top *b*.

3. A filter-box divided into compartments, as shown and described, whereby the filtering material may be kept in position, varied, or renewed at any point, as described.

4. The herein-described filter-box provided with a slotted or open bottom, divided into compartments and supplied with filtering materials, and furnished with a perforate plate above said compartments, as shown.

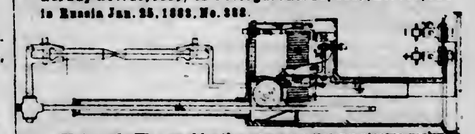
5. In a filtering apparatus, a filtering-box mounted upon trunnions, as shown and described, whereby it may be tipped to discharge the deposit therefrom.

6. In combination with the filter-box B, hung upon trunnions or journals *f*, the gear-wheel *g*, applied to one of said journals, and pinion A, meshing with said gear-wheel, and furnished with an operating crank or lever, substantially as shown and described.

7. A filter-box provided with a hinged perforate plate above the filtering material, substantially as and for the purpose set forth.

8. In combination with a tipping filter-box, a chute or board hinged thereto and extending to the receiving vessel or reservoir, substantially as and for the purpose explained.

9. In a filtering apparatus, the combination of a supply-flume, an outlet therefrom, a filter-box arranged to receive water from the outlet, a valve controlling said outlet, and a float located within the filter-box and connected with the valve, substantially as shown, whereby the float is caused to close the valve when the filter-box becomes choked or fails to permit the free escape of the water.



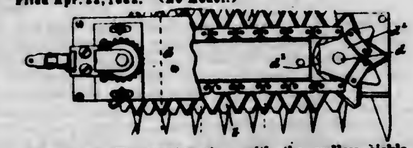
10. In a filtering apparatus, the combination of a supply-flume provided with an inlet-gate, a reservoir, and a float located within the reservoir and connected with the gate, substantially as shown, whereby it is adapted to control the supply of water to correspond with the demand.

259,755. MANUFACTURE OR TREATMENT OF SOAP. WILLIAM GREEN, St. Lawrence, County of Kent, England. Filed Jan. 10, 1882. (No specimens.) Patented in England June 18, 1881; No. 2,882.

Claim.—1. The described soap, made from mineral oils which have previously been treated with an alcoholic solution of chloride of potassium and caustic soda, then with about ten to twenty per cent. of animal or vegetable oil or fat, and the admixture of the soap so made with Castile or similar soap, substantially as described.

2. The soap described, made from mineral oils which have previously been treated with sea-weed, then with about five to ten per cent. of vegetable oil or fat, either with or without the addition to such oils of a saturated alcoholic solution of chloride of potassium and caustic soda, and the admixture of soaps so made with Castile or other soap possessing high lathering properties, substantially as described.

259,756. ELECTRIC-ARC LAMP. ROBERT J. GÜLCHER, Biala, Austria. Filed Nov. 17, 1881. (No model.) Patented in Germany Nov. 8, 1879, No. 10,333; in France Mar. 10, 1881, No. 141,633; in Austria Nov. 12, 1881, No. 35,431; in Hungary Nov. 12, 1881, No. 41,673; in Spain Nov. 22, 1881; in Italy Nov. 30, 1881, XV, 13,550, XXVII, 95; in Sweden Nov. 29, 1881; in Norway Nov. 29, 1881; in Portugal Jan. 12, 1882, No. 732, and in Russia Jan. 25, 1882, No. 332.



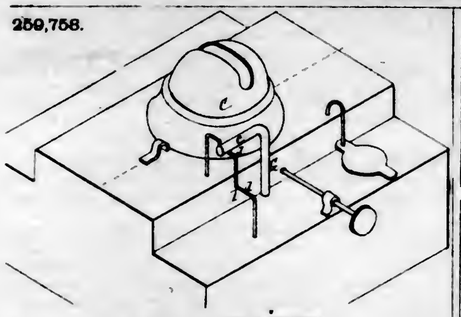
Claim.—1. The combination of an oscillating electro-magnet having enlarged poles with a fixed iron block below one pole and with the guide-rod of the upper-carbon holder being in contact with the opposite pole, substantially as set forth.

2. The combination of an oscillating electro-magnet having enlarged poles with a fixed iron block below one pole and with a magnetic brake at the same pole, for regulating the motion of the electro-magnet when starting the lamp, substantially as set forth.

3. The combination of an oscillating electro-magnet having enlarged poles with a fixed iron block below one pole, a spring-brake at the same pole, and a spring-stop above the pole, substantially as set forth.

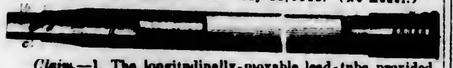
4. The combination of an oscillating electro-magnet supported in a pivoted ring-frame with an adjustable elbow-lever having a contact-spring which engages a stop-screw at the outer end of the ring, substantially as specified.

259,757. HARVESTER-SICKLE. DAN GRIFFILL, Elgin, Ill. Filed Apr. 22, 1882. (No model.)



Claim.—1. The combination, with the endless sickle *a*, sprocket-wheel *g'*, shaft *g*, and bevel-gear wheel *f²*, of the endless sickle *b*, sprocket-wheel *f'*, shaft *f* and gear-wheel *f²*, and gear-wheel *h* and shaft *h'*, substantially as and for the purposes set forth.

2. The combination, with the sickles *a* and *b*, of plate *d'*, supported on block *c* and extended rearward therefrom between the said sickles, substantially as shown and described.



259,758. STREET-LAMP. CHARLES T. HAM, Rochester, N. Y. Filed Dec. 12, 1881. (No model.)

Claim.—In a lamp, the combination of the perforated cup or receptacle E, for holding the wick, the swiveled shaft G, provided with the handle *e*, and the gage I, provided with the successive steps *d d*, as shown and described, and for the purpose specified.

259,758.

259,759. LEAD AND CRAYON HOLDER. JOSEPH HOFFMAN, New York, N. Y., assignor to Joseph Rockenderfer, same place. Filed Sept. 29, 1881. Renewed May 23, 1882. (No model.)

Claim.—1. The longitudinally-movable lead-tube provided with rearwardly-inclined slots or undercut openings *a*, in combination with the sheath provided with the slotted tip or nozzle, and the cross-pin passing loosely through the slots of both tip and tube, as herein shown and described.

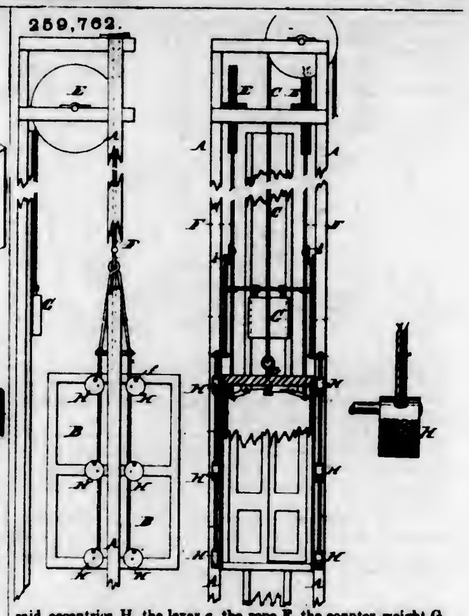
2. The longitudinally-movable lead-tube and the sheath, tip, or nozzle provided with reversely-inclined slots *a b*, as described, in combination with the loose cross-pin passing through said slots at their point of intersection, as and for the purposes herein shown and specified.

259,760. LUBRICANT. WILLIAM J. L. HOLLIS, London, England. Filed Jan. 27, 1882. (No specimens.)

Claim.—The improved lubricant described, consisting of a mixture of castor-oil with one of the vegetable oils described, and with mineral oil, and with tallow, if desired, in substantially the proportions named, to which is added another mixture composed of soda, silicate of soda, and water, and of caustic potash, if desired, in substantially the proportions named, the two mixtures being intermixed, as set forth.

259,761. LAMP-BURNER. RICHARD HUPPERTSBERG and BRUNO SCHWARZ, Berlin, Germany. Filed Apr. 10, 1882. (No model.)

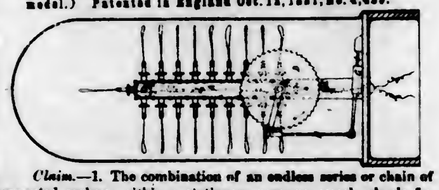
Claim.—1. In a lamp-burner, a ventilating-casing with oblique slits in its body and serrated upper edge helically arranged, in combination with a central flue and chimney-support provided with air-openings below the gallery, substantially as described.



2. In a lamp-burner, the ventilator-casing with air-openings in its body above the bottom of the chimney and serrated edge above the burner, in combination with the chimney-support provided with air-openings *c* below the gallery *a*, whereby an air-flue is formed between the said casing and chimney, and air supplied to the interior of the casing, substantially as described.

3. The ventilator-casing having openings in its body above the bottom of the chimney and serrated upper edge, in combination with the flue between the casing and chimney, the chimney-support provided with air-openings *c*, a flue inside the burner, and a chimney contracted near the top of the burner and enlarged downwardly, leaving an air-space between it and the casing, substantially as described.

259,762. SAFETY APPARATUS FOR PASSENGER AND OTHER ELEVATORS. HERRILL M. HUTCHINSON, New York, N. Y. Filed Feb. 13, 1882. (No model.)



Claim.—The herein-described oppositely-arranged eccentrics H, attached to the car or cage B, the post A, arranged between

259,762.

said eccentrics H, the lever *a*, the rope F, the counter-weight G, and means, substantially as described, for connecting the rope F with the oppositely-arranged eccentric H, so that in the event of the breaking of the hoisting-rope the counter-weight will hasten and promote the gripping and compressing action of the eccentrics upon the post between them, all substantially as and for the purpose herein set forth.

259,763. INCANDESCENT ELECTRIC LAMP. JOHN JAMESON, Newcastle-upon-Tyne, England. Filed Feb. 1, 1882. (No model.) Patented in England Oct. 12, 1881, No. 4,636.

Claim.—1. The combination of an endless series or chain of mounted carbons within a stationary vacuous vessel, wheels for supporting such chain, stationary contacts, and means, substantially as described, whereby the carbons may be brought successively in operative connection.

2. The combination, within a stationary vacuous vessel, of standards A A, rollers B B', the endless series of mounted carbons, ratchet-wheel D, pawl E, lever and pawl F, armature G, an electro-magnet, connecting-rod H, and wires J' J² and K' K², substantially as shown and described.

259,764. JOINT FOR DRAIN AND OTHER PIPES. CARL JAPTOK, New York, N. Y. Filed Mar. 16, 1882. (No model.)

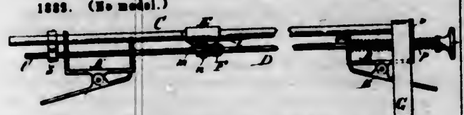
Claim.—1. A drain-pipe having an enlarged annular female portion contracted at the outer end and provided with a transverse segmental recess, substantially as set forth.

2. The combination of a pipe-section having an enlarged female portion, which is contracted at the outer end and recessed transversely at one side, with the male end of the adjoining pipe-section and a filling-layer of cement inserted into the space between the male and female portions of the pipe, substantially as described.

3. The combination of a pipe-section having an enlarged female portion, which is contracted at the outer end and provided with a transverse recess, with the male end of the adjoining pipe-

section, a cement filling, and a detachable section fitted into the recess of the female portion, substantially as specified.

4. The combination of a pipe-section, A, having an enlarged and recessed female portion, B, contracted at the outer end and provided with interior seats, *a' b'*, with a male portion, A', having a seat, *a*, a cement filling, and a detachable section or cover, B', fitting into the recess of the female portion B, substantially as set forth.



259,765. VEHICLE DEVICE FOR CHECKING HORSES. WM. P. KIRKLAND, Hanford, Cal. Filed Feb. 23, 1882. (No model.)

Claim.—1. The combination of the axle B, having journal-bases D E F, sheathered windlass-rod H, adapted to rotate and slide in said bases, and provided at one end with ratchet-teeth N, the recessed pinion L, journaled loosely on said shaft, and having internal pawls, P, adapted to engage with the ratchet, the internally-bent hand C, secured to the wheel-hub, bifurcated lever G, fulcrumed to an ears, *D'*, on the bearing D, and adapted to engage with the shaft H, and the strap Q, secured to said shaft, all constructed and arranged for joint operation, substantially as and for the purpose described.

2. The combination of the internally-toothed hub-band C, loosely-journaled pinion L, having internal pawls, P P P, arranged to engage during the forward motion of the vehicle with the ratchet-teeth N upon the end of the pinion-shaft or sliding windlass-rod H, having a strap, Q, and held in bearings J J J, secured upon the axle B, in which H is slid backward or forward by the pivoted hand-lever G, when constructed and arranged to operate substantially as shown and described.

259,766. LINE-INDICATOR. FRANK KITTELL and SAMUEL J. REINE, Chicago, Ill. Filed Apr. 3, 1881. Renewed Apr. 25, 1882. (No model.)

Claim.—1. In a line-indicator, the combination of a rod, mechanism for securing the same in position upon the page to be copied, a pointer adapted to slide upon the said rod, and mechanism to be operated by the hand adapted to carry the said pointer downward over uniform spaces, one space at a time, all substantially as described.

2. In a line-indicator, the combination of a rod, mechanism for securing the same in position upon the page to be copied, a pointer adapted to slide upon the said rod, mechanism to be operated by the hand adapted to carry the said pointer downward over uniform spaces, one space at a time, and adjusting mechanism for permitting the width of the spaces to be graduated at will, all substantially as described.

3. The combination of the stirrups A and A', rods C and D, thumb-nut *q*, spring *p*, pointer E, friction-pawl F, and mechanism for securing the device in position, the whole being constructed and arranged to operate substantially as described.

4. In combination with the stirrups A and A', rods C and D, thumb-nut *q*, spring *p*, pointer E, and friction-pawl F, combined and operating substantially as described, the graduating device, comprising the screw-nut *s* upon the outer end of the rod D, and provided with the extension *r*, entering a slot, *a*, in the rod C, as set forth.

259,767. SMOKE-CONSUMING FURNACE. MORTIMER D. LECOUNT, Cleveland, Ohio. Filed Mar. 13, 1882. (No model.)

Claim.—1. The combination, with a furnace, of a coking fuel feeder or hopper consisting of a solid or unperforated outer casing or shell provided with suitable registered air-inlets and a perforated inner casing or shell, the two shells being separated to form an intervening air-space, and a deflector placed above the mouth of said fuel feeder or hopper, substantially as set forth.

259,767.

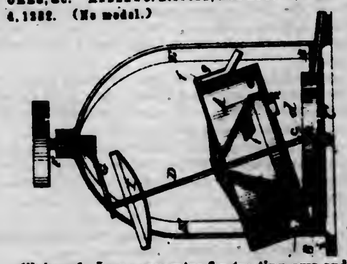
2. The combination, with a furnace, of a coking fuel feeder or hopper externally projecting from the furnace, and provided with the solid outer shell and the perforated inner shell and the intervening air-space, *a*, substantially as and for the purpose shown.

4. The combination, with a furnace, of a fuel-coking feeder or hopper having its inner or perforated shell non-perforated beyond the partition *c*, substantially as and for the purpose shown.

5. The combination, with a furnace, of a fuel-coking feeder or hopper consisting of two casings or shells with an air-space separating them, the outer shell being non-perforated, but provided with suitable registered air-inlets, and the inner shell or fuel-holder proper, having perforations in front of but not beyond a partition, *c*, substantially as and for the purposes shown.

6. In combination with a furnace, a coking fuel feeder or hopper provided with a partition, *c*, interposed between the inner and outer shells, and located between the perforated and non-perforated sections of the inner shell, substantially as and for the purpose shown.

7. The combination, in a furnace, of a coking fuel feeder or hopper consisting of an imperforate outer casing or shell provided with suitable registered air-inlets and a perforated inner casing or shell, the two shells being separated to form an intervening air-space, and a door or inlet, D, opening to the interior of the furnace above its floor or grate, substantially as set forth.



8. The combination, with a furnace, of a fuel-coking feeder or hopper consisting of two shells, one within the other and separated by an air-space, the outer shell constructed to supply a predetermined amount of air to the said air-space, and the inner shell, or fuel-holder proper, perforated to admit air from said air-space to the fuel, substantially as and for the purposes shown.

259,768. ILLUMINATING TILE-PLATE. WILLIAM A. LINDSAY, New York, N. Y., assignor of one-half to Charles E. Furman, same place. Filed Apr. 11, 1881. (No model.)

Claim.—The combination, with a rolled-metal plate, of re-enforcing cast-metal plates constructed with sockets *c*, carrying the lenses, substantially as and for the purposes described.

259,769. APPARATUS FOR TREATING AND REDUCING ORES, &c. ANDREW C. LIPPITT, New London, Conn. Filed Feb. 4, 1882. (No model.)

Claim.—1. In an apparatus for treating ores and other substances substantially as described, the combination of a pan or vessel supported at its center, and a track or bed located in a plane below the central support and supporting the pan at its circumference, whereby the weight of the vessel causes it to maintain an inclined position and to rest upon the track.

2. In an apparatus for treating ores and other substances, the combination of a pan or vessel, a raised central support, and a circumferential track, arranged as shown and described, whereby the operating mechanism is entirely relieved of the weight of the pan.

3. In combination with the base, having the central support and track B, the pan A, mounted thereon, and adapted to roll about the central support and to rest continuously upon the track, substantially as set forth.

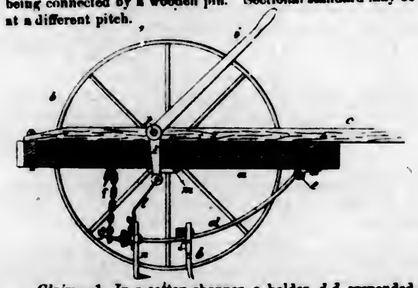
4. In combination with the pan or vessel A and its central support, the sustaining-track B at its circumference, and means, substantially such as shown and described, for causing the pan to roll about the central support.

5. In combination with the pan supported in an inclined position, as explained, by a central support and a circumferential track, and provided with a central shaft, an arm arranged, substantially as shown, to revolve in a horizontal plane and to act against the shaft, whereby the pan is caused to roll about its central support upon the track or bed.

6. In combination with the track B and pan A, the adjustable central support, *a*, substantially as shown and described.

7. In combination with the pan or vessel A, constructed substantially as shown and described, the base provided with troughs *i*, as and for the purpose explained.

8. The pan or vessel A, supported and driven as herein described and shown and provided with outlets *f*, as and for the purpose specified.



9. The pan or vessel A, mounted and driven as explained and shown, provided with screening-openings *f* and spouts *g h*, as and for the purpose explained.

10. The herein-described apparatus for treating and reducing ores and other substances, consisting of the pan or vessel A, supported by the central support and circumferential track, and operated substantially as described, and the rolling pounders and weights H, placed within said vessel, and operating substantially as explained.

11. The herein-described apparatus, consisting of the pan or vessel provided with shaft D, central support, *a*, track B, arm G, loosely connected with shaft D, and shaft F, provided with pulley or sweep, as explained.

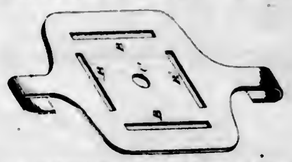
259,770. COTTON-CHOPPER. JACOB B. LISLE, Springfield, Ohio, assignor to himself and William J. Irwin, same place. Filed Nov. 23, 1881. (No model.)

Brief.—The machine is to be drawn across the rows. Choppers in a slotted cross-head susceptible of being changed or set at any distance apart are suspended by hinged flexible bars, the hinge being connected by a wooden pin. Sectional standard may be set at a different pitch.

Claim.—1. In a cotton-chopper, a holder, *d d*, suspended by two drag-bars, *d*, the movable sockets *p*, and cutters *s s'*, in combination with a lever, *i*, link *l*, chain *f*, and hook *h*, as and for the purpose specified.

2. A cotton-chopper provided with a holder, *d d*, flexibly connected to the frame, having a longitudinal slot for the reception of a series of movable sockets, *p*, in combination with a series of cutters, *s s'*, as and for the purposes specified.

3. A cotton-chopper provided with the sockets composed of parts *p q r s*, in combination with a slotted holder, *d d*, suspended by hinged bars, and cutters *s s'*, substantially as and for the purpose specified.



259,771. PICTURE-EXHIBITOR. REUBEN MCLOUGHLIN, Brooklyn, N. Y. Filed Apr. 18, 1882. (No model.)

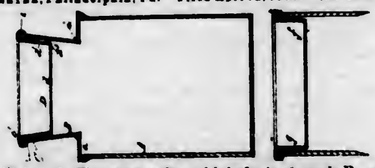
Claim.—1. A series of picture-frames provided with backs which are ornamented and are united at their edges by flexible connections which permit them to be folded to either side, substantially as described, whereby said connected frames may be readily mounted upon and around a suitable stand or serve as an ornamental reversible screen, as set forth.

2. In combination with a polygonal stand, a series of flexibly-connected picture-frames corresponding in number to the sides of the stand, said frames being detachably mounted thereon, substantially as and for the purpose described.

259,772. TRACE-CARRIER. JOHN W. O'DANIEL and CHARLES E. WALLS, Cloverdale, Ind. Filed Apr. 22, 1882. (Model.)

Claim.—A trace-carrier composed of the flat metal plate provided with slots B B', for the passage of the back and hip straps, the central rivet-hole, C, and the invertedly-turned hooks A A, one at each side, constructed and adapted to be applied to harness, as set forth.

259,773. CAR-BRAKE. J. LAPE POALE, Philadelphia, Pa. Filed Apr. 22, 1882. (No model.)



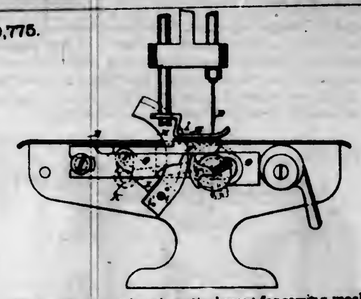
Claim.—1. The roller A, in combination with its fixed bearing B, said roller being movable vertically on said bearing, for the purpose set forth.

2. A vertically and laterally movable roller, in combination with a depressing and shifting lever and a fixed attachment of a car-truck, said truck and lever combining to wedge said roller against the rail of a track when said roller has been shifted into the proper position, as set forth.

3. The brake-shoe roller, in combination with the inclined face J of the hanger *b'*, the lever C, and operating mechanism of said lever, substantially as and for the purpose set forth.

4. The brake-shoe, in combination with elevating mechanism consisting of an inclined foot and a lever or arm which forces the shoe on and up said foot, substantially as and for the purpose set forth.

259,774. SHEET-METAL CAN. ISAAC PENTON and HARRY T. PENTON, Philadelphia, Pa. Filed Apr. 12, 1882. (No model.)



Claim.—1. The combination, with body A, of nozzle B, seamless ring C, soldered thereto and having internal shoulder, *c*, and flange *c'*, soft-metal cap D, and gasket or packing-ring *e*, the several parts being constructed and combined substantially as shown and described.

2. The combination, with the body of a can or nozzle, of seamless ring C, soldered thereto and having internal shoulder, *c*, and flange *c'*, and soft-metal cap D, substantially as shown, and for the purpose set forth.

259,775. TRIMMING ATTACHMENT FOR SEWING-MACHINES. R. WILLIAM RISSE, Philadelphia, assignor of one-half to John E. Jones, Germantown, Pa. Filed Feb. 15, 1882. (No model.)

259,775.

Claim.—1. In a trimming attachment for sewing-machines, a reciprocating curved cutter or knife which constantly presents a fresh cutting-edge to the goods to be cut, the cutting-edge of said cutter being concentric with its axis, in combination with means to reciprocate said cutter, substantially as and for the purpose specified.

2. In a trimming attachment for sewing-machines, a moving cutter which constantly presents new or fresh cutting-edges to the goods to be cut, said cutting-edge neither advancing nor receding during the act of cutting, in combination with means to move said cutter, and two feeds, one of which is arranged on each side of said cutter, substantially as and for the purpose specified.

3. The combination of cutter H, having the cutting-edge *h* concentric with its axis J, with the plate B, having slot *b*, and devices to rock said axis J and sew and feed the sewed goods against the cutting-edge *h*, substantially as and for the purpose specified.

4. The combination of the curved cutter H, having the cutting-edge *h* concentric with its axis J, with presser-foot E, having slot *e*, open in the rear, as shown and described.

5. The combination of the curved cutter H, having the cutting-edge *h* concentric with its axis J, with said axis, mechanism to rock said axis J, presser-foot E, having slot *e*, plate B, having slot *b*, and feeds F and P, one located on each side of said cutter H, as described.

6. The combination of shaft N, eccentric M, rod L, crank K, axle or shaft J, crank I, curved cutter H, having its cutting-edge *h* concentric with the axle J, presser-foot E, having slot *e*, and feeds F and P, one located on each side of said cutter H, substantially as and for the purpose specified.

259,776. CONNECTING-ROD. LOUIS SONNTS, Philadelphia, Pa. Filed Jan. 27, 1882. (No model.)

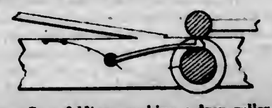
Claim.—1. In a connecting-rod, the combination of two or more parallel bars, the boxes or stub ends secured thereon, as shown, and means, substantially such as shown, to prevent the rotation of the rods within the boxes.

2. The combination of the two longitudinal rods or bars, the boxes applied thereon, the nuts, and the splines or feathers arranged, as shown, to prevent the rotation of the rods within the boxes, whereby a torsional motion of the parts is prevented.

3. As an improvement in connecting-rods, the combination of two or more rods having shoulders *c*, formed by reducing the ends of the rods, the detachable metallic collars *a* against the shoulders, the half-boxes seated against the collars, and means, substantially as shown, for securing the boxes in place.

4. The improved connecting-rod, consisting of the boxes or stub ends connected by two or more rods, each rod having its ends formed with reduced necks *b* and shoulders *c*, and being made of uniform diameter from one shoulder to the other, as described and shown, whereby their construction from rolled iron is permitted without the necessity of forging the same.

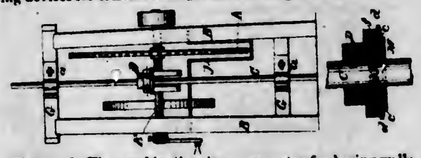
259,777. HARNESS-TUG. HENRY SMITH, New Haven, Conn. Filed Apr. 27, 1882. (No model.)



Claim.—The metal tug A, having its end *a* bent round the bar of the buckle, and provided with the slot *c*, through which the tongue of the buckle passes, also having its overlapping end *b*, provided with the slot *d*, through which the tongue of the buckle also passes, formed to make the space *e*, in which the leather loop B is clamped and riveted to the side of the tug, and also having the

259,777.

metal loop C fastened to the tug by the plate *a*, riveted to the tug, substantially as shown and set forth.

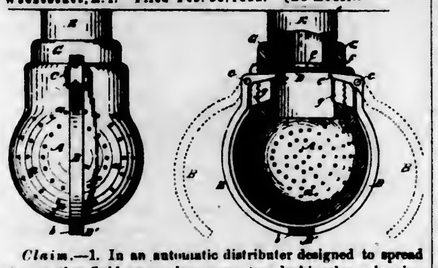


259,778. PAPER-FOLDING MACHINE. JOHN H. STODDARTS, Erie, Pa. Filed Nov. 23, 1880. (No model.)

Claim.—In a folding-machine, a drop-roller pivoted to the frame-work by arms which act as bearings for said roller, one of said arms being bent and pivoted, as shown, to form a lever, for the purpose set forth, in combination with a feed-roller having cylindrical grooves in its surface and a rock-shaft having gages attached thereto, a bent arm projecting from one end and in sliding contact with one of the journals of the drop-roller, which in dropping rocks the shaft and depresses the gages into the cylindrical grooves in the feed-roller, and a spring attached to the frame-work for reversing the action of the drop-roller upon the rock-shaft when said drop-roller has been lifted, substantially in the manner set forth.

259,779. ROCK-DRILL. THEO. H. STODER, Marion, Pa. Filed Feb. 15, 1882. (No model.)

Brief.—The drill-shaft is raised by a pair of cams of different lengths, one upon each side of the shaft. The longer of each cams bears upon the clutch on the drill-shaft after the shorter is out of contact, and by friction therewith imparts a rotary or turning movement to the drill. The cam-arms are provided with air-cushioning devices for lessening the jar in operating the machine.

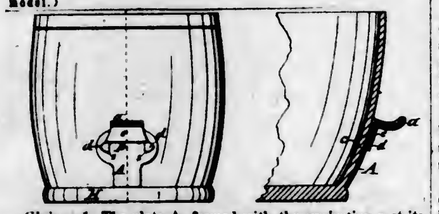


Claim.—1. The combination, in an apparatus for boring wells or rocks, consisting of the drill-shaft C, rotating cam-shaft E, provided with a pair of cams of different lengths, the said shaft having a clutch, whereby the cams are made by their rotating action to automatically turn the drill-shaft for a new cut, substantially as described.

2. In an apparatus for boring wells and rocks, the combination of the drill-shaft and the rotary cam-shaft, the latter being provided with cams of different lengths, as described, whereby the revolving motion of said cams imparts a turning movement to the drill-shaft, the said cams being provided with a combined spring and air-cushioning device in such manner that the thud or knock of the cams against the clutch is greatly lessened, all arranged and operating as shown.

3. The combination, in a well or rock boring machine, of the drill-shaft provided with a lifting clutch or chuck suitably attached thereto, the said chuck having in its face a cylindrical recess, a piston-head snugly fitting in said recess, a spring interposed between the piston-head and bottom of the recess, an air-duct, *f*, in the side of the clutch for induction and eduction of the air from said recess, the said piston-head forming a shoe or bearing for the cams to work against, and the spring and air forming a compound cushioning device, all arranged in the manner and for the purpose set forth and described.

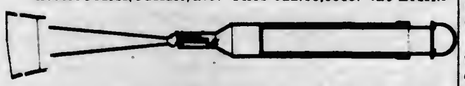
4. In an apparatus for boring wells or rock, the drill-shaft C, provided with clutch D, hinged journals *a a*, rotating cam-shaft E, having cams F F, angle-iron J, having support or projection *b*, for the drill-shaft to rest upon when not in use, the said hinged journals being adapted for the ready removal of the drill-shaft, and the operating mechanism, all combined and arranged for joint operation in the manner set forth and described.



259,780. AUTOMATIC SPRINKLER. CHARLES W. TALCOTT, Woonsocket, R. I. Filed Feb. 28, 1882. (No model.)

Claim.—1. In an automatic distributer designed to spread water or other fluid over a large area, two locking-bows lapping their outer ends, and said ends sweated together with solder fusible at a low degree of heat, said locking-bows passing through the wall of the distributer at points exactly opposite each other and pivoted therein, their inner ends forming goose-neck levers, said goose-neck levers being so shaped and arranged as to enable them to pass into slots provided within the inner wall of the distributer, so that the edges of said levers may come flush with the inside surface of said inner wall to allow for the passage of the diaphragm when the distributer is in the act of opening, but said goose-neck levers to serve as a bearing for said diaphragm when the distributer is locked, substantially as described.

2. In an automatic distributer designed to spread water or other fluid over a large area, the combination of the rose A, provided with perforations *a*, the two locking-bows B, arranged so that their outer ends, B', lap, said bows being hung upon the pivots *c*, the fusible metal *b*, sweating said ends B' together, the two inner ends, C, of the locking-bows B forming goose-neck levers, the collar G, provided with the two slots *g*, the diaphragm D, with slots *d*, the annular soft-metal packing *f*, and the supply-pipe E, with beveled end *e*, the whole constructed and arranged substantially as described and shown, and for the purpose set forth.

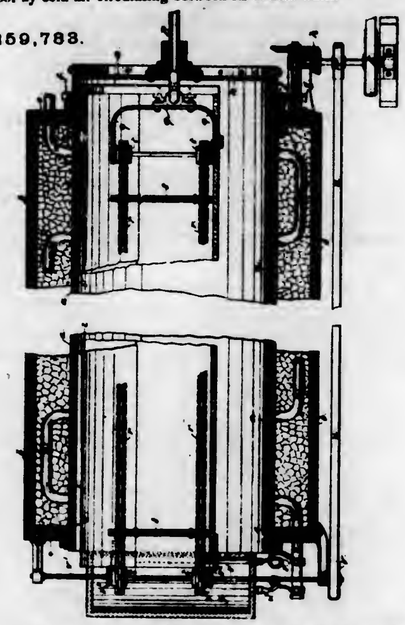


259,781. TOE-PIECE FOR THE HEELS OF RUBBER-SHOES. JUDSON L. THOMSON, Syracuse, N. Y. Filed Mar. 21, 1882. (No model.)

Claim.—1. The plate A, formed with the projection *a* at its upper end, and provided with the vertical slots *s s*, and having its base adapted to rest on the heel of the shoe, and the washer *e*, provided with clinches *d d*, all combined and adapted to be applied to the shoe, substantially in the manner described and shown.

2. The plate A, having its extension *a* adapted to rest upon the clinches *d d* when in place upon the shoe, substantially as described and shown, for the purpose set forth.

259,782. FOG-HORN. PETER TOPPEL, Jersey City, assignor to Robert Foulds, Passaic, N. J. Filed Jan. 18, 1882. (No model.)



Claim.—1. The combination, with the fog-horn or trumpet and the vibrator, of a conical concentrator with its larger end soldered to the base of the vibrator and its smaller end to the small end of the horn, substantially as set forth.

2. The improved fog-horn, composed of the air-forcing cylinder, a close-ended plunger, a screw-connection, a vibrator, a horn, and a conical concentrator between the base of the vibrator and the small end of the horn, substantially as set forth.

259,783. COOLING AND REFRIGERATING BUTTER, &c. WILLIAM TUBBYILL, New York, N. Y. Filed Nov. 4, 1881. (No model.)

Brief.—Melted butter, &c., flows through central pipe, *p*, into cooling-cylinder *a*, which rotates in ice-box with stationary trough *l* inside, with scrapers *i* to remove butter as cooled and carried up on inside of cylinder to said trough, from which scrapers *s* on endless chains carry it out of cylinder and drop it into trough *y*, kept cool by cold air circulating between its double walls.

Claim.—1. The combination, with the ice-box, of the cylinder *a*, passing through the ice-box, and packings or bearings for such cylinder at the openings in the ice-box, and means for supplying the liquid to be cooled within the cylinder, and a scraper for removing the cooled material from the inner surface of the cylinder, as set forth.

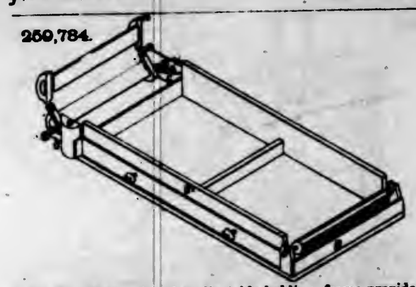
2. The trough *l*, having a scraper at one edge thereof, in combination with the revolving cylinder *a*, means for supporting the trough, an ice-box around the cylinder, and means for revolving the cylinder, substantially as set forth.

3. The combination, with the revolving cylinder and ice-box, of a trough and scraper supported within the cylinder, and an endless belt or chain and scrapers to remove the material from the trough, substantially as specified.

4. The combination, with the revolving cylinder and surrounding ice-box, of a trough for receiving the material that is cooled by contact with the surface of the cylinder, substantially as set forth.

5. The hollow trough, and means for supplying cold air into the same, in combination with the revolving cooling-cylinder and surrounding ice-box, substantially as set forth.

6. The combination, with the ice-box, revolving cylinder, and hollow trough, of a coil of pipes in the ice-box, and connecting-pipe from such coil to the hollow trough, and air-escape openings in the bottom of the trough, substantially as set forth.



7. The combination, with the delivery-trough, of the ice-box, the revolving cylinder *a*, passing through such ice-box, and buckets *r'* upon the inside of the said cylinder, substantially as set forth.

259,784. MACHINE FOR ARRANGING AND PILING CLOTH. EDGAR D. WATERMAN, Boston, Mass., assignor to Abner J. Tower, same place. Filed Apr. 20, 1881. (No model.)

Brief.—The tension device consists of two hinged bars formed at their ends with guide-pieces for the edges of the cloth, and is supported by means of screw-pivots to provide for lateral adjustment. The opening between the bars is varied for different thickness of cloth by means of a screw-threaded spring-catch, which screws into the lower bar and engages with a pin of the upper bar when the bars are closed. A spring is provided to hold the tension device at the desired position and to relieve the tension.

Claim.—1. The combination of the adjustable tension-bars

259,784.

having a guide with the adjustable holding-frame provided with a roll, substantially as and for the purposes set forth.

2. The adjustable hinged tension-bars provided with a guide for the edge of the cloth and an adjustable spring-catch, substantially as described, as and for the purposes set forth.

3. The combination of the pivoted adjustable tension-bars having a guide and tension relief spring with the cloth holder or frame, substantially as described, as and for the purposes set forth.

259,785. SIDE PIECE FOR CARRIAGE-BOWS. FREDERIC A. WITTICK, Ashtabula, Ohio, assignor of two-thirds to Rufus B. Bullock and William Hubbard, both of same place. Filed Mar. 17, 1882. (No model.)

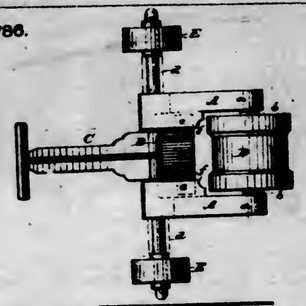
Claim.—1. The combination, with a casing formed from a single piece of sheet metal, the edges of said casing being separated at its upper end and converged and joined near its lower end, of a filler secured in position by rivets, the edges of the casing being free.

2. The combination, with a casing oval in cross-section and formed from a single piece of metal, the edges of said casing, which are brought in opposition on one side thereof, being separated at its upper end and converged and joined near its lower end, of a filler located in the casing, and rivets extending through the longer of the transverse axes of the casing and filler to secure the latter in position and to hold the side walls of the casing together, substantially as set forth.

3. The combination, with a casing formed from a single piece of metal, the opposing edges of which are separated, of a filler located in the casing and traversed by a groove, a flexible cover encircling the casing, the edges of the said cover being inserted in the groove in the filler through the opening between the separated edges of the casing, and a key inserted in the groove to retain the edges of the cover therein, said key being locked in position by the form of the groove.

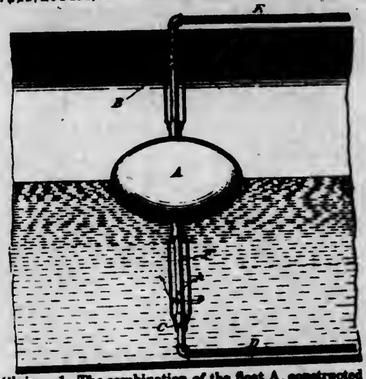
4. The combination, with a casing, of a filler located in it and traversed by a groove, a flexible cover encircling the casing, the edges of the cover being received in said groove, and a key inclosed in a metallic case and adapted to fit in the groove, the approaching outer walls of which lock it in place.

5. In a side piece, the combination, with an oval casing formed from a single piece of sheet metal, the edges of said casing, which are brought in opposition on one side thereof, being separated at its upper end and converged and joined near its lower end, of a filler secured in said casing and having a slot extending through the longer of its transverse axes, said slot being located at that point where the side piece rests upon the prop, and a short piece of steel inserted in the slot in the filler and impinging on the opposite inner walls of the casing, substantially as and for the purpose set forth.



259,786. MACHINE FOR SEAMING SHEET-METAL ROOFS. SAMUEL WOODMAN, West Troy, N. Y. Filed May 15, 1882. (No model.)

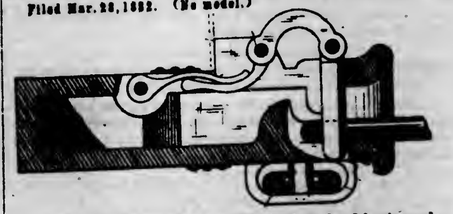
Claim.—1. In combination with the seaming-rollers E E and axle B, the side frames, A, and weighted roller D, adapted to be lifted or vibrated upon the axle B, substantially as and for the purpose set forth.



2. In combination with the rolls E, frames A, and weighted roller D, the handle C, pivoted to the axle and formed with the extension F, adapted to support the rolls E in an elevated position, as and for the purpose set forth.

3. The side frames, A, formed with the shoulders *f f*, in combination with the handle C, pivoted to the axle B, and provided with lateral wings *e e*, substantially as and for the purpose set forth.

259,786.

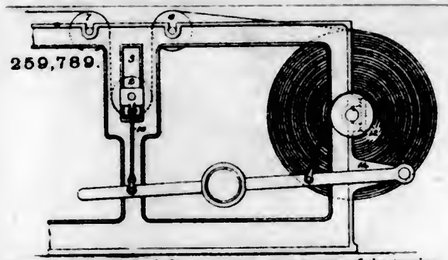


259,787. BOILER FEED-WATER REGULATOR. CHARLES C. WYMAN, Howard, Mo. Filed Mar. 2, 1882. (No model.)

Claim.—1. The combination of the float A, constructed upon the rod or pipe F, with the valves B and C, said valves regulating the steam which propels the pump that supplies the boiler, the inflow of water to the boiler, and the connection of the pump and boiler by the pipe E, which conducts steam from a valve in the boiler to the pump, substantially as set forth.

2. The combination, in steam-boilers, of a float with valves operating in connection with a pipe or pipes in the boiler, regulating the passage of steam from the boiler to the pump and the flow of water into the boiler, substantially as set forth, and for the purpose indicated.

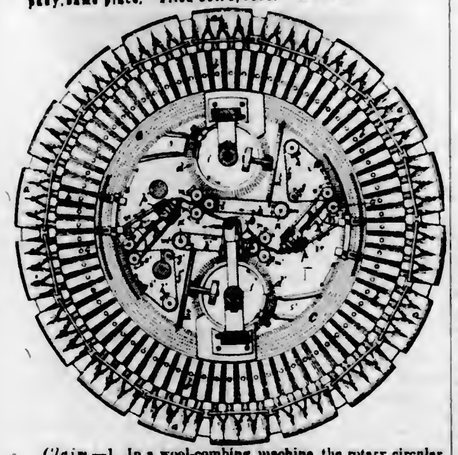
259,788. CAR-COUPLING. GEORGE H. ADAM, Louisville, Ky. Filed Mar. 28, 1882. (No model.)



Claim.—1. In combination with the draw-head having a depressed seat for the coupling-pin and an abrupt front wall and a gradually-curving rear wall, the coupling-pin pivoted to a lever, and the lever bearing against the rear of the coupling-pin lever, the whole arranged to be operated to couple or uncouple the cars, substantially as specified.

2. The draw-head provided with receptacles for an extra link and pins, to be employed in case of injury to the ordinary links and pins, substantially as and for the purposes specified.

259,789. TENSION DEVICE FOR UNWINDING ROLLS OF PAPER. EDWIN ANTHONY, Hereford, County of Hereford, England, assignor to E. Hoe & Co., New York, N. Y. Filed Aug. 7, 1880. (No model.)



Claim.—The combination, with a shaft carrying a roll of paper and brake acting thereon, of a tension-roller connected to the brake-lever and freely movable in a guiding-slot, whereby varia-

259,789.

tions in the tension of the paper cause movements of the tension-roll, and the latter in turn acts upon the brakes, substantially as described.

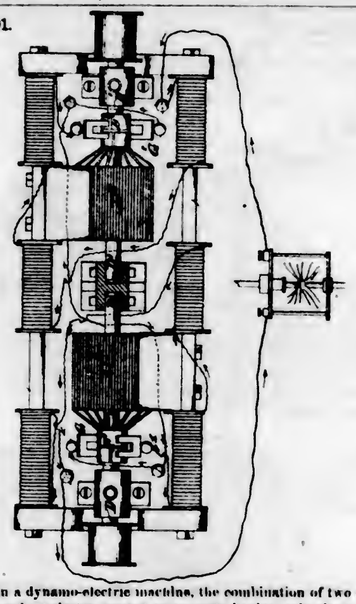
259,790. WOOL-COMBING MACHINE. JOS. AUSTIN, Newton, Mass., assignor of one-half to the Nonantum Worsted Company, same place. Filed Oct. 5, 1881. (No model.)

Claim.—1. In a wool-combing machine, the rotary circular comb *a*, its rollers *c* E, and carrying-apron *f*, in combination with the intermediate rotary tunnel, *p*, the rotary rollers *l r*, and delivery-tunnel O, and suitable means for operating said members, as and for the purpose set forth.

2. In a wool-combing machine, the rotary circular comb *c* and internal rotary comb, *d'*, rollers *e* E, carrying-apron *f*, rotary tunnel *p*, apron *k'*, rollers *l'*, *n'*, *s'*, and *r*, and the delivery-tunnel O, and suitable means for operating said members, all combined and arranged as and for the purpose set forth.

259,791. DYNAMO-ELECTRIC MACHINE. CHARLES E. BALL, Philadelphia, Pa. Filed Nov. 21, 1881. (No model.)

Brief.—The armatures are revolved before one pole only of the field-magnet. Two armatures are mounted on independent shafts and connected in series with each other and the field-magnet coils, each armature rotating before one pole of the field-magnet.



Claim.—1. In a dynamo-electric machine, a single electro-magnet and an armature located and adapted to rotate within the inductive field of only one of the poles of such magnet, substantially as set forth.

2. In a dynamo-electric machine, the combination of two armatures and an electro magnet or magnets, each of said armatures being arranged and adapted to rotate in the inductive field of only a single pole of such magnet or magnets, substantially as set forth.

3. In a dynamo-electric machine, the combination of two armatures and two poles of an electro magnet or magnets, each of said armatures rotating in the inductive field of only a single pole, and said armatures and magnet or magnets being in the same circuit, substantially as set forth.

4. In a dynamo-electric machine, the combination of two armatures on independent shafts, whereby they may be rotated in opposite directions, and an electro magnet or magnets in circuit therewith, each of said armatures being located and adapted to be rotated within the inductive field of only one pole of a magnet, substantially as set forth.

259,791.
